Geologically, too, America exhibits great variety. The north-east of the continent is formed of a mass of old, hard, crystalline rock called the Canadian Shield. The Appalachians are much older than the Rockies, and it is on their western side that great coalfields are found. Valuable oilfields occur on the flanks of both the Rockies and the Andes, and some districts of the United States and Canada are able to utilise wells of natural gas. Rich deposits of gold, silver, iron, copper, cobalt, and nickel exist in many regions, and the Pacific coastal strip of Chile has a flourishing nitrate industry. Useful timber is produced from the great forests of North America. Those on the Pacific slopes are notable for their giant sequoias and Douglas firs.

Early Civilizations

The earliest inhabitants of America known to history received the name of Indians because the first visitors from Europe supposed themselves to have reached the shores of India. They are also sometimes called Amerinds. They were of Mongolian stock. Their main physical characteristics were broad faces, moderate prognathism, shovel-shaped incisor teeth, straight black hair of round section, scanty beard and body hair, and dark skin ranging from yellowish to a coppery brown. They are believed to have arrived in the continent in small groups over a period of several thousand years, contemporaneous with the end of the Palaeolithic and beginning of the Neolithic periods in Europe. These primeval forerunners of the countless multitude of American immigrants came from the Pacific coast of Asia by way of Bering Strait and also from the Aleutian Islands.

In Mexico and South America, especially, some of them reached an advanced stage of civilization. The native cultures of the Incas, the Mayas, and the two Nashua nations of Toltecs and Aztecs may be compared to those of ancient Egypt and Mesopotamia. They have left memorials in the ruins of temples and palaces of a high order of architectural and mechanical skill. They developed a system of hieroglyphics, and manufactured paper and books. Their "codices" consisted of mythological and historical annals recorded in painted glyphs on

America. Map of the connected continent of North and South America, indicating the mountain systems along the western coasts

paper of maguey fibre. Their complicated calendar was based upon accurate astronomical observations. Some of these people were organized in an extreme form of communism under a ruling clan of reputed descent from the sun. In Mexico their religion was notable for its cruel human sacrifices carried out for the propitiation of their gods.

Linguistic relationships form the basis of the modern classification of these aborigines. About 75 linguistic families are recognized by experts among those of North America and 75 more in South America and the West Indies. The languages are mostly agglutinative, of the polysynthetic variety. There exists, of course, no certain knowledge of the number of the native population at the time of the discovery of America. Some estimates place it at as high a figure as 200 millions. Indians and people of partly Indian descent still constitute the bulk of the inhabitants of South and Central America. In the United States and Canada the proportion is much smaller. See American Indians.

European Settlers

The doom of native rule over a vast territory of America was virtually settled when Hernando Cortes landed in Mexico in 1519. Though he met desperate resistance from forces greatly outnumbering his own, his command of superior weapons of war enabled him to achieve within a few months the conquest of the powerful Aztec empire. In 1532 the invasion of Peru by Francisco

Pizarro brought a similar fate upon the empire of the Incas. Thenceforth, with the exception of Brazil, a colony of Portugal, the whole of South and Central America, together with a considerable portion of the North, became one of the richest provinces of the Spanish crown. Spain, however—and much the same may be said of Portugal—regarded her colonies merely as a gold mine to be worked by the inhabitants for her own benefit. The Spanish crown claimed one fifth of all produce.

This condition was tolerated for a long period in sullen submission, but in the early decades of the 19th century popular discontent broke into open and successful revolt in one country after another. This liberation from the foreign yoke was safeguarded by the promulgation in 1823 of the Monroe Doctrine, by which the United States declared that, whereas she would not interfere with the existing colonies or dependencies of any European power, she would not allow any European power to control the destiny of an American nation that had secured its

independence. Most of the freed nations immediately became republics. In many instances, though adopting the form of democracy, they lacked the substance of it, with the result that too often the government of the day obtained office through a military *coup d'état*.

Meanwhile the development of the continent to the north of Mexico had taken a very different course. The first English settlement, at Jamestown, Virginia, in 1607, was followed in 1620 by the landing of the Pilgrim Fathers at Plymouth Rock. From 1624 to 1664 New Amsterdam, now New York, was in the hands of the Dutch. The greater part of North America remained British until the Thirteen Colonies declared their independence in 1776, thus becoming the New World's first self-governing community entirely free from foreign control. Since that date the United States has made considerable important acquisitions on the mainland of the continent by purchase from Spain, France, and Russia. The authority of France in Canada, dating from the discoveries of Jacques Cartier, the French explorer, in the 16th century, came to an end, after a long struggle between that country and Great Britain, with the Treaty of Paris, 1763, by which Canada was ceded to the British.

Modern America

The present number of inhabitants of the continent is estimated at 170 millions in North America, 25 millions in Central America (including the islands), over 100 millions in South America. Its political divisions are as follows. In North America, in order of population, are the United States, Mexico, Canada with Newfoundland and Labrador. The isthmus forming the mainland of Central America is divided into the territories of the independent republics of Guatemala, Salvador, Honduras, Nicaragua, Costa Rica, and Panama, together with British Honduras. The islands of the West Indies include the Bahamas, Barbados, Jamaica, the Leeward Islands, the Windward Islands, Trinidad, and Tobago (British); Guadeloupe and Martinique (French); Curaçao (Dutch); Puerto Rico and the Virgin Islands (U.S.A.); and the republics of Cuba, Haiti, and Santo Domingo. The republics of South America are Brazil, Argentina, Colombia, Peru, Chile, Venezuela, Ecuador, Bolivia, Uruguay,

and Paraguay. Guiana is divided into British, Dutch, and French colonies, while the Falkland Islands are British.

From time to time demurring voices have been heard on either side of the border advocating the incorporation of Canada in the United States. Nothing, however, is likely to come of such propaganda while Canadians continue to prize their connexion with the British crown, involving as it does no impairment of their rights of self-government; or as long as politicians at Washington are doubtful whether the transformation of Canadian provinces into states of the Union would increase the Republican or the Democratic vote at Presidential and Congressional elections.

Even less probable is any federal union between the United States and the Latin American republics to the south. The Pan-American movement which has grown up in the 20th century has no such end in view. It means no more than a desire to cooperate in promoting such interests as all parts of the New World have in common. Latin America differs widely from the countries to the north of it not only in language, but in political, social, and cultural traditions and affinities and in national temperament and character. Moreover, not even the "good neighbour" policy of President F. D. Roosevelt helped to dispel the suspicions which many Latin Americans—not without some historical justification—entertained of "los Yanquis" as aspiring both to political domination and to commercial control over the rest of the continent. The series of Pan-American conferences, held from 1890 onwards, has, however, done much to improve mutual relations. Consult *The Rise of American Civilization*, C. A. and M. R. Beard, 1930.

America. In astronomy, a nebula so named because of its resemblance in shape to the continent of N. America. Among its features are a small intensely black hole, piercing what corresponds to the Isthmus of Panama, and a nebulous star off its New Jersey coast. Its light reveals itself fully only on the photographic plate. The elder Herschel had seen some indications of it, but its real discovery was made photographically by Dr. Max Wolf on a plate exposed by him, Dec. 12, 1890.

America Cup. Prize for an international yacht race, also

America Cup. Endeavour II, British challenger in 1936

called the America's Cup. It was originally named the Queen's Cup, and first offered by the Royal Yacht Squadron in 1851. Won over a course round the Isle of Wight by the U.S.A. schooner yacht America, and presented in 1857 by the owners of the winning boat

America Cup, yachting prize

to the New York Yacht Club, it has been known since as the America (or America's) Cup and held against all challengers. England sent over boats in 1870 and 1871, and Canadian yachts competed in the race in 1876 and 1881.

Later unsuccessful attempts to bring back the

cup were made by Great Britain with Sir Richard Sutton's Genesta in 1885; Lieut. Henn's Galatea, 1886; the Scottish boat Thistle, 1887; Lord Dunraven's Valkyrie II, 1893, and Valkyrie III, 1895; and Sir Thomas Lipton's yachts, Shamrock I, II, III, IV, and V, in 1899, 1901, 1903, 1920, and 1930. T. O. M. Sopwith's Endeavour lost to the U.S. Rainbow, 1934, and Endeavour II to Ranger, 1937. Most of the races in the U.S.A. have been sailed over a 30-m. triangular course round the Sandy Hook Lightship.

AMERICA : EUROPEAN NAVIGATORS WHO DISCOVERED THE WESTERN WORLD

American. River of California, U.S.A. Rising in three headstreams in the Sierra Nevada, it flows S.W. through deep and narrow ravines to the Sacramento, near Sacramento city. Gold has been found on banks of its head streams near Folsom.

American Blight (*Schizoneura lanigera*). Common pest infesting apple trees. It is distinguishable by its dark slaty-brown colour and its white, fluffy, cotton-like covering. In small gardens it can be eradicated by scrubbing the affected trees with carbolie soap, but in orchards the trunks must be sprayed in winter with a mixture composed of carbonate of potash 12 lb., caustic soda 1 lb., soft soap $\frac{1}{2}$ lb., and water 15 gallons. Another remedy in specimen cases is brushing

or grooming with methylated spirit.

American Bloomery. Adaptation of the Catalan forge, used in the U.S.A. in the production of iron. The hearth of the furnace is rectangular in section and formed of thick cast-iron plates. The air blast is heated to between 500° and 800° F. by the waste heat escaping from the furnace. In working, the hearth is first filled with charcoal, more charcoal being added with the crushed ore from time to time. The lump of semi-molten iron gradually increases in size and at the proper moment is removed and beaten into the required shape under the hammer. To work off a charge producing 300 lb. or 400 lb. of metal takes three to four hours. See Metallurgy; Iron.

conditions, which made the South an agricultural region peopled by landowners and their negro servants, while the North was an industrial region in which traders and workmen from Continental Europe settled. Practical folk came to loggerheads about the tariff wall built up by the North for the protection of its manufactures, while sentimentalists bickered about the slave question, and the war was coloured throughout by these radical differences. The South produced brilliant generals and enthusiastic troops, including much cavalry; the North had the advantage in numbers of infantry, and in armament on both sea and land. The blockade and the munitions question, it was seen, would end the war in favour of the North, unless the South could quickly destroy its fighting power or provoke neutral intervention.

The war, then, is the story of how the Southern States, which had claimed their right to secede from the Union, resisted invasion by sea and land; how the Northerners, or Federals, recovered possession of what they deemed to be national territory, and how President Lincoln put down the rival president, Jefferson Davis, who had set up his government at Richmond, Virginia, within 100 m. of Washington. The struggle for supremacy between improvised forces was directed by officers who had recently served together under the Stars and Stripes, after being trained together at West Point.

The operations grouped themselves into two main theatres divided by the Appalachian Mountains (*q.v.*). In the E., the state of Virginia was the scene of nearly 600 engagements; in the W.—in

AMERICAN CIVIL WAR: 1861-65

G. W. Redway, Author of *The War of Secession*

The writer describes in broad outline the struggle between the Northern and Southern States. Further information will be found in articles on the various battles, e.g. Chancellorsville; Gettysburg; Shiloh, etc., and in the biographies of Lincoln, Grant, Lee, and others

This great contest, called by the victors the War of the Rebellion, raged for four years over the vast territory bounded by the Atlantic and the Gulf of Mexico, by the trans-Mississippi States, and by the Ohio and Potomac rivers. The theatre of war, about 1,500 m. from E. to W. and about half that distance from N. to S., embraced dense forests and cultivated plains, mountain ranges and valleys, sea coasts and sounds, lakes and rivers, bayous and swamps.

After the bombardment of Fort Sumter by the Confederates, or rebels, on April 12, 1861, no fewer than 2,260 battles, sieges, and skirmishes took place before General Kirby Smith surrendered the last of the Confederate armies on May 26, 1865. The North began the war with a professional army of 30 regiments, but ultimately put into the field over 2,000 regiments of volunteers, or nearly 3,000,000 men. Statistics of the Southern, or rebel, armies are not available, but about 100,000 men finally surrendered, and their estimated loss in the principal battles was about 442,000 of all ranks. The losses of the North amounted to 360,000 in dead alone.

The interest of this war to the English-speaking race has increased with the flux of time. In every great war the cause of hostilities, the army system adopted, the conduct of the war, the methods of fighting are all topics of concern, but usually discussion is hampered by want of reliable infor-

mation. The American Civil War, however, can be more closely followed than any war known to history, since the victors have frankly published the whole of the military documents in their possession at its close. In consequence, the Londoner, the Australian, and the Canadian may read in his mother tongue the dispatches of generals, the orders for marches and combats, the reports of spies, and even the messages transmitted on the battlefield by the "electric telegraph."

The political cleavage between the Northern and Southern States of America had its roots in climatic

Painting by F. B. Carpenter in The Capitol, Washington

Tennessee, Missouri, Mississippi, Kentucky, Arkansas, Louisiana, and Georgia—nearly 1,300 combats took place. Until the third year of the war the Southern generals, Joseph Johnston and Robert E. Lee, in Virginia and Maryland, opposed Generals McClellan, Pope, Burnside, Hooker, and Meade, while in the W. the Southern generals, Albert Johnston, Hood, and Forrest, operated against Generals Grant, Sherman, Thomas, and Rosecrans. Almost every campaign of the war has had its special historian, and the careers of brilliant subordinates, e.g., "Stonewall" Jackson, "Jeb" Stuart, Sheridan and Wilson, have been set forth in elaborate biographies. Here it is only possible to outline the tremendous struggle on land, while the Federal navy patrolled the coast and the great waterways to prevent supplies reaching the Confederates by sea from Europe or overland from Mexico, in exchange for cotton and tobacco.

In 1861 the battle of Bull Run opened the war in the E., and the defeat of the Federals there on July 21 resulted in the formation of a large army, which in the spring of 1862 was landed on the Yorktown Peninsula, with the object of capturing Richmond, the Confederate capital. McClellan fought his way to the Chickahominy in May, 1862, but dallied there until he was attacked in succession by Johnston and Lee, and driven back to the James river, where he found support from the Federal navy. The remnants of his army were taken to Washington, and the general was dismissed.

Meanwhile, in the W., Grant had acted aggressively and with success against the rebels in the region where the Ohio flows into the Mississippi, and Belmont, Fort Donelson,

and Shiloh cost the Confederates 27,000 men and an able leader. Albert Johnston.

President Lincoln now formed a new army under General Pope to advance on Richmond overland, but General Lee met this force at Bull Run at the end of August and drove it back into Washington. He then crossed the Potomac and invaded Maryland, a movement which made the Federals fear for the safety of their capital. McClellan was again placed at the head of the army, and he succeeded in expelling Lee from Federal territory after the battle of Antietam. But his propensity to halt just when the Government looked for vigorous pursuit again caused his supersession, and General Burnside now took command of the Army of the Potomac. Burnside manoeuvred

to gain the road to Richmond by crossing the Rappahannock at Fredericksburg, where he was defeated by Lee in December. The year closed with a Federal success in Tennessee, at Stone's river, after the capture of Corinth rly. junction.

In 1863 General Hooker attempted to gain Lee's left flank at Chancellorsville, but fared no better than his predecessor, Burnside, and again Lee invaded Maryland. At Gettysburg, 70 m. N. of Washington, the Confederate leader met with a serious defeat at the hands of General Meade, who had succeeded Hooker, and this Confederate reverse in the E. was aggravated by the loss of Vicksburg, on the Mississippi, and by other defeats at Chattanooga and Chickamauga, on the river Tennessee. From this date fortune turned steadily against the Confederate cause. In 1864 the War Council at Washington brought General Grant to the E., and gave him control of all the Federal armies in order to finish the war.

Grant realized that he must conquer Lee, who was the principal figure in the war. He enunciated a doctrine of attrition, and said, on taking the field in Virginia, "he would fight it out on this line if it took all summer." He fought, at the Wilderness, at Spottsylvania Court House, and at Cold Harbor, battles which cost him 45,000 men, but he repaired his losses, and invariably operated to gain Lee's right flank and secure supplies and reinforcements by water. At the end of June he crossed the James river, to approach Richmond from the S., but Lee by a shorter road met him at

After Wenderoth

Petersburg. Then there ensued a species of siege. But Grant had left an able leader in the W. in General Sherman, who was steadily clearing the state of Tennessee and in September had reached Atlanta, in Georgia, with the ultimate intention of joining hands with Grant and attacking the rear of Lee's fast dwindling forces. The fall of Nashville in December resulted in 15,000 Confederate prisoners.

In 1865 the Confederate Government at Richmond was in danger of losing its communications with the S. and the W., from which points only could supplies arrive, when Grant set his army the task of breaking up the South Side and Danville railways. This proved to be the beginning of the end. Lee's tenacity in holding the lines of Petersburg, which cost Grant 27,000 men in nine months, could not avail to win the campaign. For nine months Lee had repulsed every attempt to force him from his works, but in April, 1865, the remnants of his fine army were in dire need of food and ammunition and he abandoned Petersburg to march W. and meet a supply train at Lynchburg. For this movement, however, Grant had prepared, and a mass of cavalry under Sheridan headed off the retreat at Appomattox Court House, where Lee, unable to cut his way through, offered his sword to his conqueror. His subordinates in the W. held out for a few weeks.

The work of the Federal navy should not be overlooked. As Mahan points out, the blockade of the Confederate ports was a purely strategic operation, "a steady and strangling pressure upon the enemy's lines of com-

munication, with the result of producing exhaustion through the failure of necessary resources." But for two years the Confederates held their own at sea, and blockade runners flourished. The famous Alabama sailed from the Mersey to become a commerce destroyer, and the depredations of a dozen such cruisers, whose origin was traced to Great Britain, gave rise to the Alabama claims, which cost Great Britain three million pounds to settle. The tactical operations at sea were also of interest. The newly invented ironclads, Monitor and Merrimac, fought in Hampton Roads for the command of the York and James rivers before McClellan's army could be moved from Washington.

But Federal monitors found they could not prevail against

mounds of earth and sand, which protected the coast batteries, and Admiral Dupont's squadron was disabled after an hour's engagement at Fort Sumter, near Charleston. Naval attempts to control the Mississippi failed until Grant's land operations secured Vicksburg. A naval expedition up the Red river to Shreveport was intercepted by obstructions at Alexandria Falls. The vessels, thus imprisoned 200 miles from blue water, were only extricated by the labours of an infantry brigade composed of Maine lumbermen. The mouth of the Sabine river was found unapproachable, and two Federal gunboats, subdued by the forts, there hauled down their flags. The Confederates may be credited with the first submarine, as well as the original ironclad, for the David, in Feb., 1864, outside Charleston harbour, passed under the keel of a Federal corvette, dragging a floating torpedo, which exploded on striking the blockading vessel.

When the Confederates evacuated Charleston on the approach of Sherman's army from the W., the invaders found a small fleet of rams and torpedo-boats in various stages of completion. But the Federal blockade had then been effective for two years, and, gradually destroying the contraband commerce of Charleston, had diminished its military value to the Confederates. In 1865 no fewer than forty harbours, inlets, and channel-ways had been closed to the outer world. The importance of the great waterways as internal communications during the war is shown by the fact that the larger armies were known by the names of these

action, and believes in raising the workers' standard of living within the framework of capitalist society. It is in friendly relation-

ship with the British T.U.C., but declined to join the World Federation of Trades Unions in 1945.

AMERICAN INDEPENDENCE: THE WAR OF 1775-83

Professor G. M. Wrong

In this article is given the history of the war from which Britain's American colonies emerged as the United States of America. For connected subjects see articles on Bunker Hill, Yorktown, and other engagements; also those on Washington and other leaders

The Seven Years' War, which ended in 1763, left Great Britain with a load of debt. The landowners, who dominated Parliament, were restive under the heavy tax on land and insisted that the English colonies should pay at least some of the cost of the army still kept in America. A considerable revenue was raised in England by the sale of stamps necessary to validate certain business papers, and it was decided to try this mode of taxation in America. The House of Commons passed the necessary resolutions Feb. 5, 1765, and at once two opposing tendencies met in sharp conflict.

In England George III led the ministry in the policy of organizing and controlling the great empire recently increased by victorious war. In America, on the other hand, populous colonies more than a century old, feeling strong in national life, resented any interference in their domestic affairs. They held that it was for them, and not for the British Parliament, to determine what taxes they should pay.

The Stamp Act was soon repealed. The ministry which passed it was driven from office before

the Act ever came into operation. Repeal in 1767 was, however, accompanied by a Declaratory Act asserting the full authority of the British Parliament over the colonies. The landlords continued to press for relief from taxation. It was easy to understand the objection of the colonies to taxation directly touching their internal affairs. They admitted, however, the right of Great Britain to control their external trade, and this control served to cover duties on goods entering the country.

In 1767, therefore, acting on this hint, a new chancellor of the exchequer, Charles Townshend, led the House of Commons in imposing a duty on glass, lead, painters' colours, paper, and tea. At once the colonies again raised vehement protests. It was unanimously resolved to use no English goods and to pay no debts in England until the Act was repealed. A new ministry, that of Lord North, coming into office in 1770, repealed the duties, retaining only that on tea, to assert an abstract right. The trouble in regard to this duty became acute a little later when, to get rid of surplus stock, the

American Independence. Battle of Lexington Common, April 19, 1775, when General Gage, on his way to Concord, defeated the local militia
From an old print

East India Company sent many cargoes of tea to America. It was thought the colonies would feel no grievance; they would pay three pence a pound, while the British consumer paid a shilling, but this forecast proved incorrect.

The real problem was one of political right, and a succession of unpleasant incidents aroused an obstinate temper on both sides. The British Ministry enforced unpopular restrictions on colonial trade. In 1770 a Boston mob attacked British soldiers in the street and the troops fired, with fatal results. In 1772 citizens of Providence, Rhode Island, burned a small British war vessel, the *Gaspee*, which ran aground there and had caused resentment by her efforts to stop illegal trade. In 1773 a party disguised as Indians threw into Boston harbour 340 chests of tea about to be landed from British ships.

Trouble came also from another direction. In 1774 there was a great clamour in the colonies when the British Parliament passed the Quebec Act. It offended colonial thought by its liberality to the Roman Catholic Church in Canada, and it placed the vast hinterland N. of the Ohio as far as the Mississippi under the rule of a despotic military governor at Quebec. The bill, it was said, menaced the liberty and the expansion of the colonies. The climax came when the British Parliament, as a penalty for the riotous incidents in Boston, passed in 1774 a bill closing the port of Boston until it should make amends. General Gage was made governor of Massachusetts, and had at hand a large military force.

War was now near. With Massachusetts and Virginia leading, a Continental Congress gathered at Philadelphia in the autumn of 1774 to unite the colonies in action.

General Gage saw that Massachusetts was preparing to fight, and on April 19, 1775, he sent out a force from Boston to Concord to destroy military stores collected there. At Lexington the column was attacked by armed farmers and, after effecting its purpose, returned to Boston only under a galling fire. Gage now found himself besieged in Boston. In May the second session of the Continental Congress began at Philadelphia. It made the cause of Massachusetts its own, and on June 15 it appointed Colonel George Washington of Virginia to the command of the colonial forces. While on his way to Boston he received the news of the battle of Bunker Hill. On June 16 the Americans had occupied Breed's (not Bunker) Hill overlooking Boston, and when on the next day Gage dislodged them, the effort had cost him 1,000 casualties in an attacking force of 3,000.

Washington now planned aggressive war. To make the union continental he thought it necessary to occupy Canada. Already in May, 1775, a Vermont leader,

Ethan Allen, had seized Fort Ticonderoga, commanding the route by Lake Champlain to Montreal, and in the late autumn the Americans held the St. Lawrence, with the British garrison under Sir Guy Carleton shut up in Quebec. The sea route to Quebec, however, remained open, and the arrival of a rescuing fleet in the spring of 1776 led to the entire withdrawal from Canada of the American forces. As early as March, 1776, the British evacuated Boston and sailed away to Halifax. Sir William Howe succeeded Gage in the command, and had a bold plan to seize New York and Philadelphia, cut off the North from the South, and conquer the sections in turn. By the middle of Sept. he was in possession of New York after defeating Washington in the battle of Long Island. No reverse, however, could shatter the resolve of Washington to fight on. Congress on July 4, 1776, had adopted a Declaration of Independence, a step which made retreat finally impossible, and its policy now was to make an alliance with France.

Washington's sense of the danger from Canada was justified when a British army under General Burgoyne gathered there and in the summer of 1777 invaded the state of New York by way of Lake Champlain. Had Howe advanced up the Hudson from New York to join Burgoyne, they might have cut off New England from the other colonies. Both leaders were, however, under the control of the English minister, Lord George Germain, and he had not instructed them to cooperate. While Burgoyne invaded New York, Howe was planning to take Philadelphia. In Sept. he threw his force against that place, defeated Washington at the Brandywine, and occupied the city on Sept. 26. The real crisis

American Independence. George Washington making his entry into New York after the close of the war in 1783

From a contemporary print

was, however, elsewhere. On the Hudson Burgoyne was in difficulty, and on Oct. 17, with 6,000 men, he surrendered to General Gates at Saratoga. This British disaster was irretrievable. On hearing the news, France, on Feb. 6, 1778, signed a treaty of alliance with the Colonists.

On the surface, however, the American cause fared ill after the fall of Philadelphia. Congress was driven from that place, and had no ministers or departments for the effective organization of war. Washington's army spent the winter of 1777-8 at Valley Forge under distressing conditions. None the less, the entry of France into the war forced a new policy upon the British. They decided to abandon extensive campaigns by land, to concentrate at New York, and to use their naval power in coast raids with a view to wearing out the enemy. Accordingly, in June Howe evacuated Philadelphia and marched across New Jersey to New York, harassed on the way by Washington and fighting the battle of Monmouth on June 28, 1778. With his chief post on the Hudson, Washington was able to check any advance to the interior.

A long period of inactivity followed, and the spirit and resolve of the Americans declined. Sir Henry Clinton succeeded Howe as British commander. In 1780 General Benedict Arnold, in command at West Point, was about to hand over that place to Clinton when the plot was detected. The treason showed how hopeless the American cause seemed in the eyes of one of its leaders.

▲ The South, divided in opinion, offered a promising field for British effort. In Dec., 1778, the British

occupied Savannah, Georgia, and in the next year overran that state. In May, 1780, they took Charleston, S. Carolina, a seaport as important to them in the South as was New York in the North. Lord Cornwallis, a really able general, defeated General Gates, the victor at Saratoga over Burgoyne, at Camden, South Carolina, on August 16, 1780. The whole South, to the borders of Virginia, was soon in British hands.

The aggressive policy of Cornwallis seemed to be justified. He met Greene, Washington's best general, at Guilford Court House, North Carolina, on March 15, 1781. The battle was drawn, but Cornwallis, relying on reinforcements by sea from New York, pressed on into Virginia. To master it was to gain the whole South; not to master it was to fail elsewhere. He overran a great part of the state. Greene, however, slipped past him

American Independence. The Liberty Bell which rang for the declaration of American Independence. It is kept in Independence Hall, Philadelphia

and entered upon a victorious campaign. In April he fought an engagement at Hobkirk's Hill and in Sept. one at Eutaw Springs and the result was that, after severe fighting, he had recovered most of the south and Cornwallis was confined to the district between the rivers York and James.

Washington's keen eye detected the weakness of Cornwallis's position. His support from the sea was insecure, for Holland and Spain had entered the war and with France were menacing Britain in the West Indies, so that her fleet was divided. Cornwallis made his headquarters in Virginia at Yorktown, an exposed position lying near the mouth of the York river. A French fleet under De Grasse cut off rescue by sea, and Washington closed in on Yorktown from the land. The masterly combination meant surrender or destruction, and on Oct. 19, 1781, Cornwallis surrendered with an army of 7,000 men. The disaster ended the war.

Negotiations for peace were soon begun, and in Nov., 1782, a provisional treaty was signed in Paris. Washington then declared hostilities at an end; on Sept. 3, 1783, the final treaty was signed, and the British evacuated New York, their last stronghold. The treaty recognized the independence of the thirteen states, and to the United States which they formed was given the sovereignty of the vast region between the Allegheny Mts. and the Mississippi. Other provisions adjusted differences between Great Britain on the one hand and France and Spain on the other. (See Paris, Treaties of.)

The American War of Independence influenced profoundly the whole western world. The Whigs in England said that the struggle was between reaction and advance. They rejoiced at American victories. Coke of Norfolk, a great Whig landowner, toasted daily at his table the cause led by Washington. Though the loose union of the thirteen states for war broke down on account of corruption and inefficiency, it yet led to a new federal constitution in 1787 under which the republic is now governed.

Trevelyan, new ed. 1905; The American War of Independence, Lt.-Col. F. E. Whittton, 1931.

American Indians. The original inhabitants of the American continent, both N. and S., are usually known as American Indians. The name Indian was given to them about 1493 by Columbus, who imagined he had reached India, when he was in reality in America. It has persisted, although the Indians, especially those of N. America, are sometimes known from their colour as Redskins, or Red Indians, and the contraction Amerind has been suggested as a substitute.

The balance of available evidence points to the arrival of American man in quaternary times from Asia, perhaps over a broad land-bridge extending across the Pacific as far S. as British Columbia. At the outset a dwarfish, wavy-haired, long-headed race may have worked down the Pacific margin into S. America, where it is still traceable in the Botocudos. A straight-haired, long-headed stock may have crossed with the reindeer, to survive in the Eskimos. A third stock, also straight-haired, but medium-headed or round-headed, arriving perhaps in two independent waves, may account for the Algonquins and the Athapascans. When these racial streams came, the N. slope of Asia was peopled by a generalised type, wherein the distinctive Mongolian characters were still in the making. Later other streams, more definitely Mongoloid, may have followed the same path.

Development of Aboriginal Culture

All these ethnic elements have been moulded into a general American type, which is entitled to be ranked as a sub-race. They brought into their new home that stone-age culture which preceded animal domestication (apart from the dog), cereal cultivation, and ore-smelting. Except the Eskimos, they were, and continued to be, lampless. Their primitive endowment was developed in a geographical environment embracing the habitable Arctic and the whole width of the temperate zones with the tropics between. Two important contact-periods introduced new impulses. One, from the W., was mainly cultural, and exerted recognizable influences, especially upon the ancient civilizations of the table-lands. The other, from the E., was racial as well, and was inaugurated by the arrival of Columbus in 1492. Except for the one, and until the advent of the other, America developed its aboriginal culture for the most part in isolation.

The palaeolithic immigrants spoke languages of a type hardly divergent

from the primeval forms of speech. This type is called holophrastic (Gr. *holos*, whole: whole-phrased), each sentence being a single verbal unit. American languages are still fundamentally holophrastic, although some have assumed marked polysynthetic forms. Almost every tribe—and the number exceeds 1,500—has its dialect, but much is being done towards their classification. Powell grouped those N. of Mexico into 58 linguistic families, a number since reduced, but only half-a-dozen are widely spoken.

Regional Classification

Neither race nor speech, however, offers a satisfactory basis for studying American ethnography. The merest glance at a contour map of the continent, and at one showing the animal and plant distribution, prepares the inquirer for wide diversities of culture. The material environment varies with the geography, and this affects the character of the arts and customs. Hence the most serviceable classification is a regional one, and a simplified arrangement is appended to the end of this article. The mt. chain extending from N. to S. is the most potent factor in the cultural distribution. In each half of the continent it marks off a region facing the Pacific from another facing the Atlantic. These two pairs of lateral regions are connected by a central region in middle America, and embraced at the outer ends by an arctic and an austral region respectively. In the appended list the prevailing ethnic characteristics of these regions are briefly indicated, together with the names of the principal tribes.

The study of aboriginal culture in America has its historical no less than its geographical aspect. The aboriginal life of the last four centuries involves two main elements, which respectively concern its history before and after contact with European culture.

The most constant physical characteristic is the lank, black hair. This, combined with the high cheek-bones, attests Asian origin. The sloping forehead, marked brow-ridges, especially in some long-heads, deep-set, dark-brown eyes, and broad-based straight or aquiline nose might be called pre-Mongolian or, better still, unspecialised. The skin colour is a coppery brown rather than red, paling into yellowish tints, especially in the south. Brave and reserved, indolent yet impatient of restraint, vain yet impassive, hospitable yet vindictive, the Amerind intelligence resembles in

some measure the Mongolian, and the differences are explicable by the different continental conditions.

The coastal, mountain, and forest tribes lived by the chase supplemented by wild vegetation. The means of locomotion were developed out of the food-quest. The Eskimo dog-sled, a remote invention, and borrowed by the Algonquins and Athapascans, was the only animal transport, except the Andean llama, before Columbus. So also the Eskimo sealskin canoe became a birch-bark canoe farther S. The dugout developed independent Pacific and Atlantic forms. In Californian waters rafts of bundled rushes represent navigation in its beginnings. The Sioux women used bison-hide coracles. All these craft, even the great seagoing pirogues of the Caribs, were paddled; the sail came afterwards from over sea.

Except the Andean alpaca and the Mexican turkey, animal domestication for flesh, milk, and egg food hardly existed. Before the arrival of Columbus cereal cultivation was represented by maize; the ancient civilizations also utilised cotton, tobacco, cacao, and the potato. In the plains and pampas the introduction of the horse and domestic cattle modified the externals of tribal life, without lifting its social institutions from savagery.

The Useful Arts

The local technology, developed out of a palaeolithic foundation, reached the art of polishing, but without the associated culture of the neolithic age in Europe. Chert and obsidian, nephrite (jade) and soapstone, were skilfully manipulated. Shell and bone implements were everywhere of high importance. Typical weapons of the chase are the bow, blowgun, and bolas. The spear-thrower is doubtless primeval. Basketry gave rise to coiled and other pottery forms, but the potter's wheel was never reached. Europe owes to aboriginal America snow-shoe and moccasin, toboggan and poncho, hammock and pemmican, tapioca and quinine. Decoration, always symbolic in origin, was applied to leatherwork, painted skins, basketry, weaving, and pottery. Animal motives prevailed. Graphic art tended towards record and communication; hence the pictorial annals preserved by the Dakotas in the so-called winter-counts.

The forms of the dwellings illustrate the level of family life. Between the Fuegian wind-shelter and the Eskimo sealskin tent lie the buffalo-skin tipi and bark wigwam of the plains, the forestal

leaf-hut, the Guiana pile-house, the Pawnee earth-lodge, the Bororo bachelor-hut, the clustered adobe houses of the Pueblos, and the massive architecture of Mexico and Peru. The art of burning bricks was never attained.

Social Institutions

At the time of the discovery the system of clans in which the woman and not the man was the dominating link was giving way in some tribal groups to the opposite system. The Hurons lived in long houses of interrelated families with a matron in charge. The separate family dwelling was rare. Polygamy, where permissible, was in practice limited by ways and means; many tribes are essentially monogamous. Prudential infanticide was practised here and there. Every clan had its totem name, but, except in some N.W. tribes, the totem system as a means to exogamy was less rigid than in Australia. Taboos usually had an exogamous purpose.

Tattooing, although less general than body-paint, was widely spread. This, as well as head-deformation and some other mutilations, probably came across the Pacific. The commoner form of head-flattening was accomplished by pressing cradleboards upon the forehead, as among the Choctaws; a rarer form produced a conical occiput. Initiation frequently involved torture. A poultice of living ants is used in the Amazon forests; red pepper is rubbed into the punctured backs of Carib girls; some young Algonquin braves were lashed to posts by thongs passed through incisions in the breast.

In the hunting communities tribal life tended to retain the primitive form of control by the elders. The confederacies of the N. plains recognized the hereditary principle in the election of chiefs, who among the Iroquois owed their position to the choice of the women. Agricultural land and hunting grounds were held in common by the tribe. On this account the so-called "nations" never reached the form of settled states, except so far as this term applies to the ancient civilizations.

Issues of peace and war were determined at tribal councils, whereat calumet and tomahawk were ceremonial accessories which have given rise to the phrases "the pipe of peace" and "burying the hatchet." In the Iroquois and Muskogee region enemy scalps, as trophies of war, were sometimes mounted on poles for the women's scalp-dances. Wampum comprises strings of shell beads used for orna-

ment and currency, which when formed into belts served as treaty records.

The universal tendency of the dead betokens, with one or two dubious exceptions, a belief in a life beyond the grave. A widespread custom was to enclose the unburned remains in baskets or urns. Cremation was rare, and, apart from the Aztecs, human sacrifice also. The primitive animism brought from Asia developed less into ancestor-worship than into nature-worship. Almost everywhere is found an order of spirit-mediators, usually called shamans, although American shamanism differs radically from the Asian. Some of these mediums discharged the functions of medicine-men as well.

Symbolic dancing was prevalent. Ceremonial halls or medicine-lodges are common throughout the N. The sweat-houses of many tribes had a ritual origin. Drums and rattles were the chief musical instruments; woodwind got as far as the rare whistle and flute, strings as far as the rarer musical bow. The Siouan buffalo dance, the Iroquoian corn dance, and the sun dance of the plains generally were magico-religious manifestations. The Hopi snake dance is a rain-making rite. A universal belief in a Great Spirit is wrongly attributed to N. America. There is a copious mythology of creation legends and explanations of natural phenomena. In 1918 G. W. Cronyn produced a volume of aboriginal American verse entitled *The Path on the Rainbow*, an anthology of songs and chants from the Indians of N. America.

The Present and the Future

At the discovery in 1492 the population N. of Mexico is estimated to have been 1,150,000. The present number, apart from the Eskimos, is (1941) 118,316 in Canada and (1943) 376,580 in the U.S.A. Mexico (1940) returned 4,620,880. The number for Central America is put at 9,400,000, for S. America 4,851,000. European and negro immigrations have led to much mixture of races, and this mixed element is a significant factor in the politics of Latin America. The N. American tribes have been plied by the Canadian and the U.S. governments for the most part in reservations. Although some are dying out, the total is thought to be increasing. Outstanding men, e.g. Hiawatha, Pontiac, Red Cloud, and Tecumseh, have been prominent in history, not to speak of the Aztec and Inca dynasties. Tammany, a Delaware sachem, is immortalised in a po-

litical nickname; a Zapotec, Benito Juarez, was president of Mexico. But the Amerind character lacks the quality of racial permanence in the presence of the more versatile ability of the white race.

CLASSIFICATION OF AMERICAN INDIANS. Arctic: Long-headed, short (5 ft. 2 ins. to 5 ft. 4 ins.). Eskimos, Aleuts.

N. Pacific slope: Round-headed, medium (5 ft. 6 ins.). Haidas, Tlingits, Nootkas, Tsimshians; Kwakiutis, Salishes.

N. Atlantic slope: Medium-headed, medium to tall (5 ft. 6 ins. to 5 ft. 9 ins.). Algonquian: N., Algonquins, Crees, Ojibwas (Chippewas); W., Blackfeet, N.E., Micmacs; E., Mohicans, (Mahicans, Mohegans). Athapascan: N., Athapascans, Chipewians, Hares; W., Hupa; S., Apaches, Navahos. Beothukan: Beothuks. Caddoan: Pawnees. Iroquoian: Iroquois (Cayugas, Oneidas, Onondagas, Senecas, Hurons), Cherokees, Mohawks, Tuscaroras. Muskogian: Muskogees, Creeks, Seminoles; Chickasaws, Choctaws; Natchez. Shoshonian: Shoshoni, Comanches, Utes; Hopi. Siouan: Sioux, Assiniboins, Dakotas, Blackfeet. Zunian: Zuni; Pueblo Indians.

Central: Round-headed, short. Shoshonian: Nahua, Aztec, Pipils. Sonoran: Opata, Pima, Huichols. Huastecan: Huastec, Maya, Queche, Toltec, Totonaec, Chontal and Lacandons. Otomi, Seri; Mixtec, Zapotec, Tarascan; Chorotegan; Nicarao; Sumo-Mosquito.

Andean (S. Pacific slope): Round-headed, short. Chibcha, Guetar, Talamancan, Quichua, Inca, Aymara, Calchaqui.

Forestal (S. Atlantic slope): Round-headed and medium-headed, short. Carao, Caribs, Tupi, Guarani, Guayanos, Cocamas, Omaguas, Umuas, Chiriguano, Chiquitos, Mojos, Panos, Carapunas, Cashibos, Conibos. Arawak, Anti, Warrau, Tacanas, Araunas, Jivaros. Guaycurus, Matacos, Mbayas, Abipones, Tobas; Charruas. Tall: Bororos. Long-headed: Botocudos, Aymores, Tapuya.

Austral: (a) Pampean: round-headed, short. Araucanians, Puelche, Pampas Indians. (b) Patagonian: round-headed, tall (5 ft. 10 ins.). Tehuelche (Patagonians). (c) Fuegian: medium-headed, short (5 ft. 2 ins.). Alakalufs; Onas; Yahgans.

AMERICAN INDIANS: TYPICAL REPRESENTATIVES OF THE REDSKIN RACES

Americanisms. According to the great work of Noah Webster, the Samuel Johnson of American lexicography, an Americanism is "a linguistic usage, especially a word or phrase, peculiar to English as developed in the United States." This definition, despite its high authority, is too narrow. For development implies growth, and some locutions generally recognized as Americanisms are examples not of progress but of stagnation. When an American declares that he has gotten a new secretary, or that he likes his meat rare, or that he is going abroad in the fall, he is not moving on, linguistically, but standing still. He is speaking the English of the Pilgrim Fathers. A list of linguistic usages now obsolete in England but still flourishing in the U.S. would run into scores.

Conservatism, however, is far from being the dominant note in American speech. A great many English words have suffered an entire change of meaning through crossing the Atlantic. Examples may be found in every department of human life and activity, e.g. apartment, first floor, porch, piazza, transom, davenport, dumb-waiter; boot, shoe, vest, suspenders, calico, broadcloth, muslin, haberdashery; lunch, dessert, corn, biscuit, doughnut, pie, cakes; public school, preparatory school, faculty, recitation; billion, hundredweight, penny; whig, tory, bill of rights, board of trade, premier, sheriff, franchise, secret service; transportation, right of way, caboose, wing (of car); jail delivery, penitentiary, brief (legal); city editor, cowman, solicitor, lifeguards, redcaps.

English visitors to the U.S. have to beware of pitfalls lurking in the changed meaning of other words which do not fall into groups, e.g. corporation, frontier, gait, guy, homely, majority, pavement, saloon, workhouse. Misunderstandings also frequently arise through differences in connotation. There is a distinction between the English and U.S. uses of the words colonial and politics.

New Words

Then they find in the American vocabulary a multitude of words that are quite strange to the ordinary Englishman. Not all of them are the product of American inventiveness. Some, especially those denoting natural objects unfamiliar to immigrants from Europe, were picked up from the speech of the natives: such as

hickory, persimmon, and squash. The various nationalities that have contributed to the American stock have left a few traces on the language, e.g. the Dutch stoop (steps leading up to the front door), the Spanish canyon, the French interne, and the German delicatessen.

The linguistic independence of the U.S. was declared long before her political independence, and the process of coining new terms is still being vigorously carried on. The additions to the vocabulary of everyday life are of infinite variety. They include, for instance, car barn, commutation ticket, contraption, custom suit, derby hat, disgruntled, dry goods, floorwalker, go-getter, gunman, handscrib, hobo, notion counter, office-holder, once-over, pan-handler, pop-eyed, prince albert, pushcart, pushpin, roomer, rough-house, sculduggery, sea-food, selectmen, shade-tree, side-check, slingshot, station agent, sunburst, tenderloin, trial lawyer, tuxedo, and windsor tie.

Vivid Metaphor

An outstanding feature of American speech is its wealth of metaphor. Herein the vocabulary of politics is especially rich, with such phrases as riding on the band wagon, frying fat, sawing wood, bolting one's ticket, coming out flat-footed, shaking the plum-tree, taking to the woods, and looking after one's fences, together with such terms as calamity howler, cracker-box politician, filibuster, the full dinner-pail, muck-raker, peanut politics, pie counter, pipe laying, pork-barrel legislation, presidential timber, pussysfooting, soft pedal, spellbinder, steering committee, straddle, and straw vote.

Outside politics the American gift for vivid metaphor is illustrated by such inventions as bouncer, corduroy road, dough-face, gold brick, hard sledding, hayseed, jug-handled, rubberneck, silk-stocking district, spite fence, still hunt, sucker, tabloid (paper), tenderfoot, and tightwad.

Americans frequently acquire what is practically a new word without the trouble of a fresh coinage by simply turning a noun into a verb (to contact, to page, to railroad, to recess), or a verb into a noun (divide, raise), or an adjective into a noun (alternate, sharp, spiritual, tough, transient), or a noun into an adjective (banner, dandy), or an adverb into a noun (sooner), or an intransitive verb into a transitive (to appeal,

to protest, to rank), or a transitive into an intransitive (to locate, to substitute). Such interchanges of parts of speech presumably occur in the history of every language, but in America they seem to come about with special frequency, and with little consideration of whether they are really necessary.

A great deal might be said of American preferences in the case of words of identical meaning. The American choice between two synonyms commonly falls upon the more grandiloquent, especially if there is a touch of Greek or Latin about it. Thus we find alumnus, auditorium, automobile, bureau, campus, data, elevator, forum, intermission, janitor, mucilage, operate, proposition, radio, reservation, schedule, semi-annual, sophomore, stenographer, traction, and vacation, where a simpler term would be used in England. So, too, there is a marked tendency towards a sort of euphemism—the magnifying of an office by applying to it a designation which really belongs to a position of higher status, e.g. clerk (shop assistant), help (servant), judge (magistrate), jurist (lawyer). The title of president may be given to the head of any kind of business organization—a bank, a railway, even a costermongers' trade union—and that of professor to a master in a secondary school.

Examples of other American preferences are administration (government), canned (tinned) goods, faucet (tap), hog (pig), mail (post), package (parcel), and pasteboard (cardboard). The words figure, file, fix, get, grade, and line suffer more from overwork in the U.S. than in Great Britain.

Prepositions

The choice of the preposition to use in various connexions often varies from that commonly made in Great Britain. Thus we hear or read of imprisonment at hard labour, five minutes of (or after) three, a new lease on life, the man on the street, playing on the eleven, and the laugh was on me. A common American tendency is to strengthen a verb by appending an adverb which, one might have supposed, it could quite well do without, e.g. start in, close down, check up.

Americans break away from the normal English usage much less in their writing than in their speaking. An American scientific study, or historical text-book, or volume of literary criticism, or theological treatise is likely to

contain few expressions unfamiliar to an English reader. This generalisation, of course, does not apply to the American drama; nor to the American novel, comprising as it does a large proportion of dialogue.

The invasion of England by Americanisms alarms Englishmen who are concerned about the purity of the language. There are some who are afraid that before long the King's English will be superseded by the President's English. Their fears, however natural, are not based upon any real cause for anxiety. The process of naturalisation has been going on from the very first, and in the main the language has been enriched by it. It would surprise most Englishmen to learn how many Americanisms, which originally had a hostile reception here, are now a part of their own speech. As late as the middle of the 19th century the use of progress as a verb was deprecated as un-English. Even the most extreme linguistic protectionist does not hesitate today to employ such American neologisms as boarding house, graveyard, outdoors, overcoat, patent leather, and telegram. The American film has exerted a considerable influence, but mainly in the substitution, through its greater picturesqueness and vivacity, of American for English slang. It may be doubted whether, apart from slang, either the Hollywood film or the billeting of U.S. troops in Great Britain has affected the Englishman's speech as much as some suppose. While he no longer needs an interpreter to explain to him what is meant by an elevator or a valise, he has not incorporated these terms in his own everyday vocabulary.

Herbert W. Horwill

Bibliography. An American Glossary, R. H. Thornton. 1912: A Dictionary of Modern American Usage, H. W. Horwill, 1944.

American Laurel (*Kalmia latifolia*). Evergreen shrub of the family Ericaceae, a native of N. America. The leathery leaves are oblong or lance-shaped, and the large pink or white flowers are massed in showy clusters. In the newly opened flower the ten sta-

mens are held in little pouches but when a nectar-seeking bee touches their filament they spring out and dust it with pollen. Alternative names are mountain laurel, calico bush, and spoonwood.

American, or Mountain, Laurel

American Legion. Organization of Americans who served as soldiers, sailors, or airmen in the First and Second Great Wars. It was organized in Paris in March,

American Legion. Official button

1919, at a meeting of representatives from all the divisions in France. It was afterwards established in the U.S.A., posts being set up in each state, with headquarters at Indianapolis. In 1945 membership was 1,417,446.

American Loan. For details of this financial arrangement of 1945-48, see N.V.

American Museum of Natural History. Museum in New York. It adjoins Central Park at West 79th Street. It is not only strong in collections illustrating the fauna of the continent, but contains the Tiffany collection of gems and a unique exhibit of Peruvian antiquities. The Rothschild collection, acquired in 1932, helps to make the study collection of birds the largest in the world, comprising 750,000 specimens.

American Museum of Natural History, New York, housing collections of immense value and interest

Many specimens of birds, etc., are arranged to show their environment and habits.

American Notes for General Circulation. The title of a work published in Oct., 1842, containing Charles Dickens's impressions of his visit to the U.S.A. and Canada in the first six months of that year. Boston, Lowell, New York, Philadelphia, Washington, Baltimore, Cincinnati, St. Louis, Lebanon, Toronto, Montreal, and Quebec were described, as were the Ohio, the Potomac, the Mississippi, Niagara, and the prairie. Dickens's strong criticisms of American institutions were hotly resented, but after his second visit in 1865 he arranged that a preface should be added to all subsequent editions stating that his criticisms had no longer any justification.

American Organ. Musical instrument of the harmonium type. The wind is drawn through the reeds, not blown through, as in the harmonium, which the American organ has largely superseded in the U.K.

American Volunteer Group. Group of U.S. airmen in the Second Great War, who resigned U.S. commissions to join the China Air Force and protect the U.S. lease-lend convoys passing along the Burma Road. They achieved a remarkable record against the Japanese in Burma, notably at Rangoon early in 1942. Formed early in 1941, under Col. (later Gen.) Chennault, the group was absorbed in July, 1942, into the U.S. Army Air Force in China, where the men were nicknamed the Flying Tigers.

American War of 1812-14. This war between Great Britain and the U.S.A. had its origin in Britain's great struggle against the French. The U.S.A. had prospered during the war by trading with the enemy, and resented British interference with its shipping, for many American ships were captured by British frigates and brought into British ports. There was exasperation on both sides, and the American retaliatory policy increased the tension. Again, the prosperous shipping trade of the U.S.A. had induced numbers of Englishmen to desert and take service in American ships, where they were eagerly welcomed. The British navy being at the time undermanned, British officers seized in return men out of American ships and impressed them for the British navy. It was said that no American seaman was safe from seizure, either on the high seas or

on the American coast. Public feeling became inflamed by what was described as fraud on one side and outrage on the other.

War was declared on Jan. 18, 1812, and soon the Americans moved on Canada at both ends of Lake Erie. Across the Detroit that country was invaded in July by a small army under General William Hull, but his men were driven back to Detroit and captured with the town by the British under Sir Isaac Brock, with whom was a force of Indians. The invasion of Canada made by the other route, the Niagara one, was also a failure. There was an engagement at Queenstown Heights in Oct., in which Brock was killed, but the victory remained with his men, who captured 900 American soldiers. A third attempt also failed.

The war was also waged on the water, and some of its incidents soon gave a rude shock to the British navy, then at its zenith. The Americans had no ships of the line, but in the United States, Constitution, and President they had three splendid 44-gun frigates, superior to anything of the kind that Britain possessed. These ships were in a state of high efficiency, to which they had been brought partly by deserters from the British navy, while some of the American seamen had seen service in the Tripoli war. Captain Philip Broke went out with a squadron to cruise against the United States, his broad pennant being in the Shannon. None of his frigates carried more than 38 guns. Captain Isaac Hull, in the Constitution, eluded him, but on Aug. 19 encountered the British 38-gun frigate Guerrière, and by sheer weight of fire reduced her to such a condition that she had to be

American War of 1812-14. Famous battle of Boston Harbour, June 1, 1813, in which H.M.S. Shannon engaged and defeated the American Chesapeake

Painting by T. Whitcombe

destroyed. A few weeks later, on Oct. 25, off the Canaries, the frigate United States, commanded by Captain Stephen Decatur, captured, after a spirited action, the British frigate Macedonian, to which in every respect except speed she was superior. On Dec. 29 the British 38-gun frigate Java was captured by the U.S. frigate Constitution, in an action which combined skilful manoeuvre with good gunnery.

The most celebrated action of the whole war was the duel on June 1, 1813, between the Shannon of 38 guns, Captain Broke, and the Chesapeake, Captain Lawrence, which carried 36 guns, but had two more carronades than the Shannon. Approximately the ships were of equal strength; both were highly efficient, and were commanded by equally gallant men. Broke had written a courteous challenge to Lawrence to

come out for a single-ship action "whenever it is most convenient to you." It was a fight yard-arm to yard-arm, and the victory of the British ship was complete. Lawrence was killed, with many of his officers, and his ship was captured by boarding. The American coasts were afterwards blockaded and the U.S. frigates were held fast, but there were many sloop actions and British commerce was attacked. There was a good deal of fighting, too, on the Great Lakes. The naval battle on Lake Erie on Sept. 10, 1813, in which the Americans were successful, caused the British to lose Detroit and Michigan.

In 1813 on land the British invaded the States, and won an engagement at Frenchtown, but in August their attempt on Fort Sandusky was repulsed. They abandoned the line of the Niagara and lost Fort George in May, while in Oct. they were beaten in a battle near the river Thames and the Americans got part of Ontario. The Americans sent a force, which landed at York, afterwards Toronto, in April and burned some of its buildings, but their efforts to reach Montreal were balked, their army being beaten at Williamsburg in Oct., while their gains near Niagara were soon lost.

In 1814 the Americans again tried the Niagara route into Canada and won a battle at Chippewa on July 5. The engagement at Lundy's Lane on July 25, the most serious of the war, was indecisive, both sides claiming the victory, but the attempted invasion was abandoned. In Dec. the Americans lost the fight called after Chrystler's Farm. The last attempts of the British, who were

American War of 1812-14. Death of Capt. Lawrence, of the Chesapeake, on the boarding of his ship, June 1, 1813, by sailors of H.M.S. Shannon

From an old engraving

now able to send over veterans of the Peninsular War, were more ambitious. General Ross, with an army and a fleet, sailed into Chesapeake Bay, brushed the Americans from his path at Bladensburg on Aug. 24, and, in return for the damage done at York, burned the public buildings of Washington. He then advanced towards Baltimore, but was killed in an engagement, and, when within a few miles of the city, his men withdrew.

Another combined operation of army and navy, also in 1814, was the attack on Plattsburg on Lake Champlain. This was captured and there was some desperate fighting on the lake. Victory, however, remained eventually with the Americans, and the troops under Sir George Prevost, who were advancing up the W. side of Lake Champlain, retired into Canada.

The last engagement of the war was the attack on New Orleans under General Pakenham, in which that officer lost his life. The greatest gallantry was displayed on both sides, but the expedition was utterly mismanaged owing to the divided counsels of the British commanders. The assault was delivered at a number of different points on Jan. 8, 1815, and failed owing to want of cooperation. The slaughter was so terrible that General Lambert, who had succeeded to the command, decided to withdraw. It could not be known at the time that the convention of Ghent had been signed on Dec. 24, 1814, ending a war of which the Canadians alone could be proud.

Americium. This element, named in 1946, is mentioned in the footnote to the table of Chemical Elements, p. 1987.

Amerighi, MICHELANGELO (1589-1609). Italian painter, known, from his birthplace, as Caravaggio (*q.v.*).

Amerind. Term denoting the aboriginal American race. It was introduced in 1898, at the suggestion of Dr. C. P. J. Scott, by Major J. W. Powell, director of the Bureau of American Ethnology, as a compendious synonym for American Indian (*q.v.*) or Redskin.

Amerongen. Village of Holland, in Utrecht province. It is 20 m. S.E. of Utrecht and contains the castle of Amerongen, the seat of Count Bentinck, to which the German emperor, William II, fled on the conclusion of the First Great War.

Amersfoort. Town of Holland, Utrecht province. It is on the Eem, 14 m. by rly. N.E. of Utrecht,

manufactures cottons and woollens, silk, glass, and beer, and trades in grain and tobacco. Pop. 48,079.

Amersham. Market town of Buckinghamshire, England. Increasingly popular as a residential area, it is 24 m. W.N.W. of London by rly. and London Transport, and has chairmaking, flour-milling, straw-plait, brewing, and other industries. Here is a government centre for atomic and radio-activity research. In S. Mary's church, a fine old building with brasses and other monuments, John Knox is said to have preached against Queen Mary. In the main street are the market house, built in 1682, and some almshouses of earlier date. The old name, mentioned in Domesday, was Agmondesham. Pop. 6,121.

Amery, LEOPOLD CHARLES MAURICE STENNETT (b. 1873). British politician. Born at Gorakhpur, India, Nov. 22, 1873, and educated at Harrow and Balliol College, Oxford, he became a fellow of All Souls and a barrister. Joining the editorial staff of *The Times* in 1899, he acted as its chief war correspondent in the South African war. Elected M.P. for S. Birmingham (later Sparkbrook) in 1911, and retaining the seat until 1945, he became assistant secretary to the War Cabinet in 1917, First Lord of the Admiralty 1922, secretary of state for the Colonies 1924-29, secretary of state for India and for Burma 1940-45. After his electoral defeat in July, 1945, he was made Companion of Honour.

For the activities and trial of John Amery (1912-45) see Treason.

Ames, LESLIE (b. 1905). English professional cricketer. Born at Elham, Kent, Dec. 5, 1905, he joined the staff of the Kent county cricket club in 1924 and became a regular member of the county XI in 1926. Although a fine forcing batsman, scoring over 2,000 runs in 1932, and over 3,000 in 1933, it was as wicket-keeper that he first played for England against Australia in 1930 (having toured Australia in 1928-29 without playing in test matches). From 1932 to 1939 he was England's first choice as a wicket-keeper. In 1939 he won the Lawrence trophy for the fastest

century in a county match with 100 runs in 67 minutes at Kennington Oval.

Amesbury. Market town of Wiltshire, England, on the Avon near the S.E. edge of Salisbury Plain. A former Benedictine abbey is traditionally known as the retreat of Guinevere, wife of King Arthur. Here in 1727, as the guest of the Queensberry family, John Gay (*q.v.*) wrote *The Beggar's Opera*. There is a large Norman and Early English church. Earthworks known as Vespasian's Camp are probably prehistoric, and 2 m. W. lies Stonehenge (*q.v.*). Pop. 2,488.

Amethyst. Name of a lilac to purple coloured quartz used as a gem-stone. The colour is due to a small amount of manganese present as an impurity. It is in all cases deposited from solution and occurs in mineral veins, more especially those of iron and manganese, and lining cavities in pebbles. Amethysts are of low specific gravity (only about 2.66) and moderately hard. They are of a twin molecular structure, the individuals having alternately right-handed and left-handed helical twists, which give the stones their peculiar rippled fracture; and they are often built up of dark and light layers. The richest stones come from Brazil and Uruguay. The amethyst was supposed by the ancients to be a remedy against drunkenness (Gr. *amethystos*)—hence the name. Oriental amethyst is a natural corundum of gem quality.

Amethyst. British frigate which on July 30, 1949, having been cut off for three months in the upper reaches of the Yang-tse, escaped to the open sea under Chinese Communist gun-fire. See N.V.

Amhara. Northern portion of Abyssinia. It includes Gojjam and was at one time a powerful state. The capital, Gondar, was the residence of the Abyssinian emperors until the middle of the 19th century.

Amhara was one of the centres of fighting in the Italo-Abyssinian war (1935-1936) and was finally subjugated by the Italians. In 1941 it became a vast battlefield in the fighting between Imperial forces and Italian troops. With the capture of Gondar by E. African troops, Nov. 27, 1941, the liberation of Abyssinia was completed. See Abyssinia; Gondar.

Amharic. A Semitic language spoken throughout Abyssinia. Originally a provincial dialect, Amharic gradually displaced Ge'ez or

L. C. M. S. Amery.
British politician

Ethiopic, the ancient language, and is now the court and official language Geez being used only by scholars and in the church. Amharic is written in Geez characters. Near Ashmunin, in upper Egypt, 8 rolls of papyrus with Amharic writing, the first to be found on papyri, were unearthed in 1945.

Amherst. Coast town of Nova Scotia, Canada. The capital of Cumberland county, it is situated at the N.E. extremity of Chignecto Bay, 135 m. N.N.W. of Halifax by the C.N. Rly. It is the centre of a rich farming area, and trades largely in rolling stock, lumber, and coal, and has shipbuilding yards, boot, shoe, leather, and woollen factories, and iron foundries. Pop. 8,620.

Amherst. Coast town and district of Tenasserim, Lower Burma. The town is 30 m. S.W. of Moulmein, and dates from 1826. It is now little more than a fishing village and a bathing resort for the inhabitants of Moulmein. The district, 7,062 sq. m. in area, is bounded E. by Siam and W. by the Gulf of Martaban. Salt is produced in the district.

During the Second Great War, Amherst was occupied by the Japanese for three years, after the latter had launched a powerful offensive against Tenasserim during the last week of Jan., 1942. With the liberation of Rangoon by the British 14th army in May, 1945, Japanese troops withdrew from the area.

Amherst. Town of Massachusetts, U.S.A., in Hampshire county. It is 97 m. W. of Boston, on the Central Vermont and the Boston and Maine rlys. The town dates from about 1700, but received its present name about 1759, in honour of Jeffrey Amherst. It is the seat of Amherst College, founded by the Congregationalists in 1821. Pop. 6,410.

Amherst, EARL. British title created in 1826. Sir Jeffrey Amherst (1717-97) was made a baron in 1776, and his nephew, William Pitt Amherst (1773-1857), governor-general of India, was the first earl. The earl's eldest son is known as Viscount Holmesdale. The barony of Amherst of Hackney must be distinguished from the earldom. It was bestowed in 1892 upon a Norfolk M.P., W. A. Tyssen-Amherst. The 3rd baron succeeded his grandmother in 1919.

Amherst, JEFFREY AMHERST, BARON (1717-97). British soldier. Born of a Kentish family, Jan. 29, 1717, he entered the Guards as an

Baron Amherst, British soldier and colonial governor
After Sir Joshua Reynolds

ensign in 1731. In 1758 Pitt made him commander of an expedition against the French in Canada. He captured Louisburg and led one of the three columns which, converging on Montreal, entered that city in Sept., 1760. Amherst was then chosen governor-general of the British possessions in N. America and in 1761 was knighted. In 1763 he returned to England, in 1770 was made governor of Guernsey, in 1772 a privy councillor, and in 1776 was raised to the peerage as Baron Amherst of Montreal. After acting for several years as commander-in-chief he was made a field-marshal in 1796. He died Aug. 3, 1797.

Amherst, WILLIAM PITT AMHERST, EARL (1773-1857). British diplomatist. Born in Jan., 1773, he owed his Christian names to the friendship of his uncle Jeffrey, Lord Amherst, with Pitt. Succeeding under

Earl Amherst, British diplomat
Portrait Sir T. Lawrence

a special remainder to the barony of Amherst in 1797, he went in 1816 as British envoy to Peking, to obtain more satisfactory treatment for British merchants in China. The mission was fruitless, Amherst refusing to perform the kow-tow, or act of homage, to the emperor. From 1823-8 he was governor-general of India, and on the successful issue of the first Burmese war, 1826, he was created Earl Amherst of Arakan. He died in March, 1857. *Consult* Lord Amherst and the Advance to Burma, A. T. Ritchie and R. Evans, 1894.

Amherstburg. Town of Ontario, Canada. On the Detroit river and the Michigan Central Rly., which here crosses the river, it is 18 m. S. of Windsor, in Essex county, and is a calling place for boats engaged in the traffic of the Great Lakes. It has cement and iron manufactures, and carries on a large trade in timber. Pop. 2,769.

Amianth OR **AMIANT** (Greek *amiantos*, undefiled). Name given to the finest variety of the mineral asbestos. It consists of long flexible filaments, and from its resemblance to flax is sometimes called mountain or earth flax. It is incombustible and is used for lamp wicks and as a filling for gas fires. The name is also applied to a fine fibrous serpentine. The form amianth is due to confusion with the Greek word *anthos*, flower.

Amice (Lat. *amicire*, to throw round). Oblong piece of linen worn by the celebrant at Mass and by assistant ministers when the alb is worn. Rested for a moment on the head, it is then spread on the shoulders and tied with strings. It is said to symbolise the helmet of salvation or faith, or the linen rag with which the Jews blindfolded Christ (Luke 22). The hood or cloak with long ends made of or lined with grey fur, worn by monks and pilgrims, was also called an amice. *Pron.* Am'-iss.

Amicus Curiae. Latin term meaning a friend of the court, used in English, as it was in Roman law. When a barrister who is not retained in a cause intervenes, either of his own motion or at the judge's request, to assist the court, e.g. by reminding the judge of some precedent that neither party has yet cited, he is known as *amicus curiae*.

Amides. Bodies derived from ammonia (NH_3) by replacing one of the hydrogen (H) atoms by a metal or organic radical. When two atoms of the hydrogen are replaced the product is an imide, or secondary amide, and if the whole of the hydrogen is displaced by a trivalent radical a nitrile or tertiary amide results. Amides are thus compound ammonias. They are made by the action of ammonia on acid chlorides or on ethers, or by heating ammonium salts. Amides are crystalline solids, the lower amides being soluble in water and alcohol. They are decomposed by bacteria, as, for instance, urea, which is broken down into carbon dioxide and ammonia. Amide powder is a name applied to an explosive made from ammonium nitrate, salt-petre, and charcoal.

Amidines. Organic compounds that contain amidogen (NH_2) and imidogen (NH) attached to the same carbon atom. Acetamidine, for example, may have its formula written $\text{C}_2\text{H}_5\text{N}_2$ or, to express the constitution referred to above, $\text{CH}_3\cdot\text{C}(\text{NH})\cdot\text{NH}_2$.

Amidol OR DIAMINO-PHENOL HYDROCHLORIDE. Photographic developer discovered by Gauche in 1869. It is used by dissolving $1\frac{1}{2}$ gr. in a solution of 48 gr. of sodium sulphite in 1 oz. of water.

Amidopyrine. Powerful analgesic drug of the coal-tar group, symbol $\text{C}_{13}\text{H}_{17}\text{ON}_3$. White, crystalline, odourless powder, made by the reduction of nitrosophenazone and subsequent treatment with methyl iodide. Prolonged administration may cause the blood disease known as agranulocytosis.

Amiel, HENRI FRÉDÉRIC (1821-81). Swiss author. Born at Geneva, Sept. 27, 1821, he was an orphan at the age of twelve. He spent a wandering student life in Germany, Italy, and elsewhere in Europe, contributed to the *Bibliothèque Universelle de*

Henri F. Amiel,
Swiss author

Genève, became professor first of aesthetics and French literature and then of moral philosophy at Geneva, and wrote verse, but is best remembered for his posthumous *Journal Intime* of 17,000 MS. pages, 1848-81. Parts of the *Journal* were published in 1883-4, with an introduction by Amiel's friend Edmond Scherer. An English translation by Mrs. Humphry Ward appeared in 1885.

The *Journal*, which has been compared, not very happily, with Sénancour's *Obermann* and Rousseau's *Confessions*, is saturated with the spirit of a devout melancholy, influenced profoundly by Buddhist philosophy and current German pessimism. While an example of the paralysis caused by excessive introspection, it reveals, as Matthew Arnold pointed out in a memorable essay, fine gifts of mind in its literary and social criticism. Amiel died at Geneva, May 11, 1881. *Consult* *Essays in Criticism*, Matthew Arnold, repr. 1903.

Amiens. A city of France. It stands on the Somme, mainly on the left bank, 81 m. N. of Paris, and is the capital of the department of Somme. The river divides into a number of branches, and

these, with its tributaries the Avre and the Selle, form canals in the lower part of the town. It has hence been called the Little Venice. The oldest part of the city is on the right bank; the business quarters are on the left bank and around them are modern suburbs. The old town has narrow irregular streets. Boulevards occupy the site of the old fortifications.

The finest building in Amiens is the Gothic cathedral. It was built mainly in the 13th century and is remarkable for its size, for the wonderful stonework of the W. façade, and for its choir stalls. It was restored by Viollet-le-Duc. Other important churches are S. Germain, S. Leu, S. Remi, and the modern S. Jacques.

The citadel dates from the 16th century and the prefecture from the 18th. The hôtel de ville has been almost entirely rebuilt. Modern buildings include the palais

de justice, the public library, colleges, and schools. There are many old houses and some fine squares. The Museum of Picardy has a valuable collection of paintings, antiquities, etc., including frescoes by Puvion de Chavannes. The Promenade de la Hotoie is a fine open space, while

the belfry and the Hôtel Dieu may be mentioned. There is a special workmen's quarter.

Amiens is an important manufacturing and distributing centre. Its industries include the spinning and weaving of textiles—cotton, wool, flax, silk, etc.—and the making of velvet, hosiery, etc. Machinery, chemicals, and sugar are also produced. The industrial importance of Amiens dates from the 12th century, and it is the cradle of the French cotton manufactures. In the neighbourhood to the N.E. market-gardening is largely carried on, and the produce, with that of the local farms, is a considerable item of trade. Amiens is an important railway centre and has quays for the shipping on the river. Trolley-buses run through many of the streets.

Amiens in History

Amiens was a Gallic settlement and in the 4th century the seat of a bishop. Later it was part of Flanders until 1185, when it became French. From 1435 to 1477 it was included in Burgundy, but, recovered by France, it was until the Revolution the capital of Picardy. It surrendered to the Germans on Nov. 28, 1870. During the First Great War, after a German occupation that lasted only a few days before the battle of the Marne in Sept., 1914, it became chief centre of military communications in northern France. The German offensive of March, 1918, brought it within gunfire and for several weeks it was in danger. Shells caused some damage to the cathedral. The Allies were unable to use the main trunk line from Amiens to Paris until the battle of Amiens (*q.v.*) finally cleared the town in Aug., 1918.

In the Second Great War, German troops reached Amiens on

Amiens. The Museum of Picardy, built 1854-64; and (above) 18th century portion of the hôtel de ville

Amiens arms

Amiens. West façade of the Cathedral, regarded as the finest example of Gothic ecclesiastical architecture in France. It was built in the 13th century

May 18, 1940, in their thrust to the Channel ports, and the town was fully occupied by May 21. Rly. yards and other important military targets were heavily bombed by R.A.F. and U.S.A.A.F. aircraft in Aug., 1942, and April, 1944. The town was liberated by the British 2nd army on Sept. 2, 1944. Pop. (pre-war) 93,773.

Amiens, BATTLE OF. Operation of the First Great War, fought Aug. 8-12, 1918. It marked the opening of the British counter-offensive, and came as a great shock to the German staff, which imagined that the British army had been permanently paralysed by the German spring offensives. The object of the British attack was to clear Amiens and the important railways there, and to penetrate to the junction of Chaulnes. For the operation the 1st French army (Débeney) was placed under Sir D. Haig, while the British 4th army (Rawlinson)

was reinforced by the Canadian corps and two additional British divisions. On the Allied front 13 infantry and 3 cavalry divisions were employed against 20 German divisions under von der Marwitz, with von Hutier's army to the S. of him. Special care was taken to mislead the Germans and make them suppose the attack was coming in Flanders. Canadian troops, greatly feared as a shock force, were put into the line near Kemmel. Tanks were concentrated at St. Pol and the German aircraft were allowed to photograph them. Troops and tanks were then moved secretly south. The tanks were to be used as in the first battle of Cambrai, where they took the enemy completely by surprise. Meanwhile the artillery (2,000 guns) were not permitted to test aim and range by firing in advance: by accurate calculation it had become possible to dispense with such registration.

As a result of all these measures, the Germans made ready for an attack S. of Ypres and were off their guard near Amiens. See map on p. 390.

The British attack was to open at 4.20 a.m. on Aug. 8, from Morlancourt to Domart, and was to be followed one hour later by the advance of the 1st French army, the latter gradually extending its front S. to Braches. Thick fog covered the ground when the artillery opened fire and simultaneously 400 tanks and the British infantry moved up behind a creeping barrage. Many German batteries were at once overwhelmed by the fast light "whippet" tanks. They were not well entrenched, intending attack rather than defence. The first objectives were rapidly seized; a whole German brigade, marching out of the trenches, surrendered. Cavalry, light tanks, and armoured cars, piloted by aircraft, with fresh infantry, passed through the British line and went forward to exploit the victory. At dusk the British had penetrated to a depth of 6 or 7 miles. Nothing could have exceeded the confusion behind the German lines. The French attacked von Hutier, stormed Morisel, enveloped Moreuil and Montdidier. At nightfall the Germans were blowing up dumps and moving east under a torrent of bombs and machine-gun bullets.

On Aug. 9, N. of the Somme, the British with one American regiment pushed E. of Morlancourt; S. of the river they reached the outskirts of Proyard and Lihons. A new French army, the 3rd (Humbert), entered the battle by attacking S.E. of Montdidier, suddenly and without any artillery preparation. The Germans began to withdraw from that town next morning, but a large part of their garrison was surrounded and surrendered. By the night of Aug. 11 the British and French S. of the Somme had reached at most points the old line of German defences as it existed before the battles of the Somme and Hindenburg's retreat of 1917 and had gained the rly. S. of Chaulnes. There the Germans were able to stand, as time was required for the advance of Allied heavy artillery.

The victory was by far the greatest that the Allies had won up to that date in the West. Over 38,500 prisoners and 800 guns were taken. Amiens was cleared; Paris was relieved of constant bombardment. The Germans' losses of material and

ammunition and the extent of their casualties obliged them to carry out retirements farther north. The prestige of the German staff was shattered; Ludendorff immediately advised his government to make peace. He subsequently referred to Aug. 8 as the "black day" in the history of the German army. The effect on the British army was most inspiring. Great success had been won by the skill and determination of the troops, of whom the Canadians and Australians received special praise from Haig. An advance was made to a total depth of 12 miles, such as had been equalled in no previous Allied offensive in the same time. This victory was the more remarkable for two further reasons: it followed the defeats which the British army had suffered in the great German offensive, and proved that army to be more than a match for the enemy in open warfare, a point on which there had been some doubt.

Amiens, MISE OF. Name given to the award of Louis IX of France in a dispute between the English king Henry III and his barons, Jan. 23, 1264. The two parties were at war, the future Edward I fighting for his father, who had refused to abide by the Provisions of Oxford. Neither side could gain any marked advantage, and they decided to refer the matter to the arbitration of the French king. He heard both sides, and then issued his *mise* or award. This freed Henry from the hated Provisions, restoring to him full power and free jurisdiction. It was confirmed by Pope Urban IV. The English barons, however, refused to accept the decision and therefore the civil war was renewed. See *Barons' War*.

Amiens, TREATY OF. Signed between Great Britain and France on March 25-27, 1802. Spain and Holland were parties, but merely as the vassals of Napoleon. Nego-

tiations began in March, 1801. Napoleon agreed to some concessions, and a preliminary treaty was signed on Oct. 1. The final treaty provided that Malta should be returned to the Knights of S. John, Britain should restore all her conquests except Ceylon and Trinidad, and France should compensate the prince of Orange for the loss of his possessions. Egypt

replacing the hydrogen atoms of ammonia (NH_3) by one or more alcohol radicals, such as methyl, ethyl, and propyl. They are divided into primary, secondary, or tertiary, according as one, two, or three of the hydrogen atoms have been replaced. A fourth type, called the quaternary compounds, is known. The classes of amines differ in chemical properties. The amines are found as decomposition products of animal and vegetable matter. To the methyl amines, for example, is due the odour of decomposing fish. Increasing use is being found for the amines in the manufacture of pharmaceutical products, dyes, and detergents.

Amirantes Islands (Portuguese *Ilhas do Almirante*, Admiral's Islands). British archipelago in the Indian Ocean, S.W. of the Seychelles, consisting of the following groups: African Is. (4), St. Joseph (8), Porvre (9), and Alphonso (3). Of coral formation and fertile, they produce coconut oil and are visited for turtle fishing. British since 1814, they are a dependency of the Seychelles. They were named after Vasco da Gama, who received the title of admiral of India in 1502.

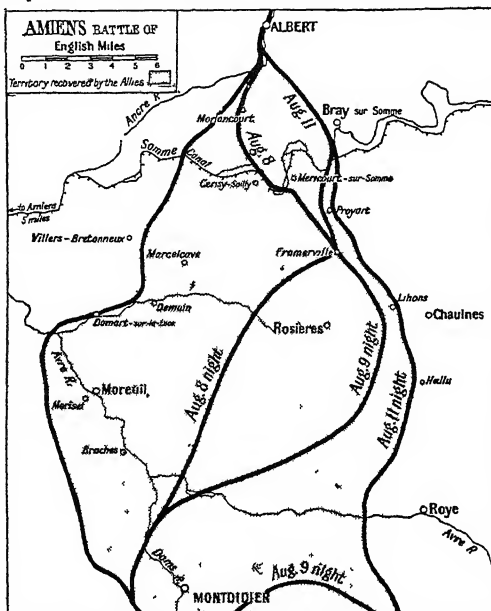

Amity. Village in Colorado, U.S.A. It is on the Arkansas river and was created a colony in 1898 by the industrial division of the Salvation Army. The broad alluvial flats are well suited for the production, on irrigated land, of sugar beets. It is 495 m. W. of Kansas City on the Santa Fé route to Los Angeles.

Amlwch. Urban district, seaside resort, and seaport of Anglesey, Wales. The port is dry at low water. It is on the N. coast, 24 m. N.W. of Bangor by the railway. Once famous for copper mines, shipbuilding, and iron and brass founding, it has an old church and some antiquarian relics. Pop. 2,500.

Amman. Capital of Transjordan. The Rabbath-Ammon of the Bible, and the Philadelphia of the Greeks, it lies on the E. side of the Jordan, 30 m. in a direct line E. of Jericho.

In the First Great War Amman formed an important Turkish base on the Hejaz rly., but was finally captured by Allenby's troops on Sept. 25, 1918.

Ammanford. Urban district of Carmarthenshire, Wales, 12 m. N. of Swansea, well served by rlys. The industries include coal mining, tin working, and the manufacture of springs. Pop. 7,160.

Amiens battlefield, showing the extent of territory recovered from the Germans in four days of fighting

was to be restored to Turkey and the Cape of Good Hope to the Dutch, while France was to withdraw from Rome and Naples. The chief representative of Britain was the Marquess Cornwallis and of France Joseph Bonaparte. It was merely a truce in the long struggle, for the war broke out again in May, 1803.

Amindivi OR **AMINI.** The northern group of the Laccadive coral islands, which are administratively a part of the province of Madras, India. They are five in number—Chetlat, Kiltan, Kardamat, Amini, and Bitra, of which only the first three are inhabited, and are ruled locally by native headmen. The people are Mahomedans, and they speak Malayalam. They depend for their existence upon coconut palms, with which the islands are densely planted; nuts, and, in a smaller degree, coir and mats are traded for rice with the mainland.

Amines OR **AMMONIA BASES.** Chemical substances formed by

Ammer See. One of the river-formed lakes of the Bavarian Alps, the waters of which flow to the Danube

Ammer See. Lake of Bavaria, 20 m. S.W. of Munich. Formed by the river Ammer, which traverses it from S. to N., it is 10 m. long by 4 m., and 1,750 ft. above sea level. It is one of the monotonous river-formed lakes which characterise the plateau between the Alps and the Jura, and which drain into the upper Danube.

Ammeter OR AMPERE-METER. Form of galvanometer for measuring currents of electricity directly in units of amperes. A common type consists of a coil of low resistance connected in series with the circuit, so that the whole of the current to be measured flows through the wire forming the coil. The passage of the current through the coil endows it with magnetic properties, and causes it to affect a small permanent magnet mounted on pivots within the magnetic field. The intensity of the coil magnetism, and therefore of its action upon the permanent magnet, varies with the strength of the current; hence an opposing force, which may be furnished by a light coiled hair spring or by gravity, tending to restore the permanent magnet to its zero position, is necessary. A light pointer is attached to the magnet to indicate the current strength in amperes on a graduated scale.

Ammeters with fixed permanent magnets and a moving coil are of greater precision. As a coil able to carry the whole of the current would be too large, only a definite proportion, termed a shunt, is passed through the instrument. Another form of ammeter is provided with a soft iron, instead of a permanently magnetised, moving portion. Placed near it is a fixed piece of soft iron, and under the influence of the coil both pieces of iron become magnetised with

the same polarity, and the moving piece is consequently repelled by the fixed piece. An ammeter of this type may be used for the purpose of measuring alternating currents.

For high frequency and radio-frequency currents the hot-wire or thermal type is employed. The current passing through a thin wire or strip causes it to expand, the movement being transferred and multiplied through a straining wire to the pointer on the instrument dial. Another very accurate form of ammeter employs the principle of the thermo-couple (see Thermo-electricity).

For laboratory purposes instruments of the dynamometer type are used. A simple kind of dynamometer consists of two coils at right angles to each other, one fixed and the other suspended by a silk thread. The current to be measured passes through both coils, connexions to the swinging coil being made through little cups of mercury into which the ends of the coil dip. When a current is passed through the coils, the swinging coil tends to place itself parallel to the fixed coil. The deflection, which is opposed by a light spiral spring, is proportional to the square of the current. In recording ammeters the pointer is furnished with a pen fed with aniline dye. The pen traces a line on a drum revolved by clockwork, and the height of the line above a datum line indicates the current that has passed at any given time. See Galvanometer; Voltmeter.

Ammianus Marcellinus (c. A.D. 326-391). Author of a history of Rome from Nerva to Valens (96-378). Originally in thirty-one books, only the last eighteen, dealing with the period 352-78, are extant. A Greek of Antioch, his Latin is

harsh and obscure, but the work gives a valuable account of the history of his own times, especially the reign of Julian the Apostate, whom he accompanied to Persia (363), in addition to interesting descriptions of the manners, customs, and topography of different countries with which he was acquainted. There is an English translation by C. D. Yonge, 1894.

Ammon, AMEN, OR AMEN-RA. God of the ancient Egyptians. Originally a local god of S. Egypt, whose shrine at Thebes was founded or rebuilt about 2500 B.C., when the kings of Thebes became masters of the North, his importance grew until he came to be regarded as the supreme god. To maintain his position the priests identified him with Ra, the oldest of the Egyptian gods, and in time he assumed the attributes of the other great gods.

The name signified hidden, and Amen-Ra was described as representing the hidden and mysterious power which created and sustained the universe, with the sun as symbol of that power.

Ammon, CHARLES GEORGE AMMON, 1ST BARON (b. 1875). British politician. Educated at public elementary schools, and for 24 years in the Post Office service, he was a member of the L.C.C. 1919-25 and again from 1934, being chairman 1941-42. He was Labour M.P. for North Camberwell, 1922-31 and again 1935-44, when he was raised to the peerage. In the Labour governments of 1923 and 1929-31 he was parliamentary secretary to the Admiralty. In 1938 he was a member of the West African commission, and in 1943 leader of a government mission to Newfoundland. In 1944 he was appointed chairman of the National Dock Labour Corporation, Ltd.

Ammon, god of the Egyptians
British Museum

Ammonal. Name given to an important class of high explosives which contain ammonium nitrate and powdered aluminium (hence the name). The use of aluminium in explosives appears first to have been suggested by Escales, a German chemist, in 1899, and patents covering the manufacture and use of explosives of this type were taken out by a Viennese manufacturer, Carl Roth, in 1900. Aluminium is employed on account of its high temperature of combustion, as, the explosion gases being highly heated, greater power is developed by the explosive.

The aluminium is usually prepared by disintegrating a jet of liquid metal with a blast of steam or air. The quantity of aluminium employed varies considerably, according to the purpose for which the explosive is to be used, being as small as 5 p.c. in safety explosives, where it is essential that the temperature of explosion be kept low, and as high as 22 p.c. in military explosives.

The Austrians in the First Great War used ammonal extensively for filling shells and other projectiles, the usual percentages being aluminium 22, trinitrotoluene 30, ammonium nitrate 47, and charcoal 1. In the British service ammonal was very largely used for filling bombs and hand grenades and for mines, the composition being similar to the above; but the trinitrotoluene did not exceed 10 p.c., and the aluminium from 3 p.c. to 15 p.c. of the mixture.

Military ammonal is a comparatively insensitive explosive, and its use in the field is limited by the fact that it is difficult to ensure complete detonation when filled at high densities. See Explosives.

Safety explosives containing aluminium have been prepared with both nitrate and chlorate bases.

Ammon-Carbonite. A safety explosive. It consists of ammonium nitrate (82 p.c.), sensitised with nitroglycerine (4 p.c.), potassium nitrate (10 p.c.), and flour (4 p.c.). It is permitted for use in coal mines under the Belgian regulations. Being rather sensitive to detonation by impact, it is unsuitable for military use.

Ammonia (Greek *ammoniakon*, rock-salt). A colourless gas with a pungent characteristic odour, best known in a state of solution, consisting of water saturated with the gas. Ammonia turns red litmus paper blue and neutralises acids. It is chemically a compound of three equivalents of

hydrogen and one of nitrogen (NH_3). The gas is poisonous when breathed owing to its strongly alkaline properties, which result in the destruction of the mucous membrane. Ammonia is used in the manufacture of fertilisers, as a reagent in organic chemistry, in medicine, in dyeing, and in refrigerating plants. It is also of major importance in the manufacture of various explosives.

Although ammonia in some forms, probably a crude sal ammoniac (ammonium chloride), was known to the ancients—Pliny and Dioscorides (*q.v.*) both mention it in their works—it was not until 1774 that the existence of free ammonia was clearly recognized. In that year Priestley obtained the gas in a pure state by distilling sal ammoniac with quicklime and collecting the gas over mercury. Recognizing its alkaline property, Priestley called the gas "alkaline air" but it was also known as volatile air and spirit of hartshorn, having been formerly prepared by distilling hoofs and horns. Its composition was finally established in 1805 by Berthollet, who decomposed it by means of the electric spark.

Production of Ammonia

Although ammonia, especially as carbonate, is found almost everywhere in soil, water, and air as a product of the decomposition of organic bodies, none of these natural sources is of any technical importance. Ammonia is produced by two main processes: (1) by direct synthesis from hydrogen and atmospheric nitrogen, (2) from the destructive distillation of coal or lignite. The former process, which has predominated during recent years as a means of producing ammonia, consists in direct combination of the two gases. It was first thought to be impossible to cause hydrogen and nitrogen to combine directly to form ammonia, but in 1913 the first of the Haber-Bosch synthetic ammonia plants became an accomplished fact. The elements may be made to combine by passing the mixed gases, under pressures of 200 or more atmospheres, over a catalyst (see Catalysis). Considerable experimentation has been carried out to find the most effective catalysts and a wide range of materials is covered by patents. Most synthetic ammonia plants now in operation employ some form of iron compound for this purpose. Practically all the hydrogen used in ammonia synthesis is derived from water-gas,

coke-oven gas, or the electrolysis of water, while nitrogen is almost all obtained from the air. The gases used in this process require to be of great purity, as the presence of even minute quantities of carbon monoxide renders the catalyst inactive. During the Second Great War a large amount of synthetic ammonia was produced in connexion with the manufacture of explosives. In Canada, for example, where supplementary production was maintained remote from the danger of attack, the regular output of anhydrous ammonia greatly increased. Some Canadian ammonium nitrate was subsequently adapted to meet the peace-time need for fertiliser.

Sources and Compounds

The principal source of ammonia was formerly coal, for it is one of the by-products obtained in the manufacture of town gas. Town gas is purified in its making by subjection to cooling and washing processes, the gas-liquor obtained consisting of tar and ammonia. This gas-liquor is either saturated with sulphuric acid to form sulphate of ammonia, or it is subjected to distillation in stills, which work on a similar plan to the Coffey still used in preparing and refining alcohol. A form much used is the Feldman still.

By the interaction of ammonia gas and hydrochloric acid, ammonium chloride (NH_4Cl), or sal ammoniac, is formed; other salts, such as the nitrate and oxalate, can be made by a similar reaction. Ammonia combines with oils to form a white compound (chemically, a soap); where olive oil is employed, the product is known as hartshorn and oil. Solution of ammonia, *i.e.* the gas dissolved in water, is obtainable commercially in two strengths. The stronger, containing 36.6 p.c. by weight of ammonia, is known as "880," that being approximately the sp. gr. of the liquid. The weaker solution contains 10 p.c. of ammonia, and is sometimes referred to as spirit of hartshorn.

Bibliography. Coal-tar and Ammonia, G. Lunge, Part III, 5th ed., 1916; Design and Working of Ammonia Stills, Parrish, 1924; Fixed Nitrogen, American Chemical Society, 1932.

Ammoniaccum. Gum-resin obtained from *Dorema ammoniacum*, a herb growing in Persia and S. Siberia. It contains some volatile oil, which renders it of use in medicine for stimulating the flow of saliva and gastric juice, but

is now seldom administered. It was formerly used in chronic bronchitis to stimulate the bronchial mucous membrane and increase expectoration.

Ammonite. Extinct marine mollusc allied to the living nautilus and belonging to the class Cephalopoda. The name comprises several distinct genera which are found in a fossil state. The shell is coiled into a plane spiral and is variously ornamented by ribs, nodules, or spines. The successive coils, or whorls, may overlap each other by varying amounts or be merely in contact.

These fossils are found abundantly in the Mesozoic rocks and, on account of their short individual life and free-swimming powers, occur over wide areas in marine sediments of no great thickness. They are of the greatest value in aiding the correlation of geological formations, certain generic types and species everywhere succeeding each other in a definite order. They first appear in the marine

89 p.c., dinitronaphthalene 11-13 p.c., and up to 1 p.c. of moisture, but was later rendered safer by the addition of salt. A permitted explosive, ammonite 2 contains 4.5 to 6.5 p.c. dinitronaphthalene, 77.5 to 80.5 p.c. ammonium nitrate, 14 to 16 p.c. sodium chloride, and up to 2 p.c. moisture. It is prepared by grinding the dry ingredients together in an edge runner mill, the pan of which is heated to aid drying and secure closer incorporation.

The operation usually lasts about two and a half hours, when the pulverised mass is formed into cartridges, which are dipped in paraffin wax to protect them from moisture. Ammonite cannot be exploded by the application of a flame or safety fuse, a detonator being required. If ignited with a flame it merely burns.

Ammonite. Name of a fertiliser containing a high proportion of nitrogen. It is made from the offal of rendering establishments. The name is derived from ammonia, the nitrogen of the decomposed organic matter becoming ammonia gas. See Fertilisers.

Ammonites. A semi-savage people who inhabited the region S. of the Jabbok (Nahr ez-Zerka) and E. of the Jordan. Descendants of Ben-Ammi, son of Lot's second daughter (Gen. 19), and identified as the Beth-Ammon of the Assyrian inscriptions, their capital was Rabbah, or Rabbath-Ammon, in the 3rd century rebuilt by Ptolemy Philadelphus and renamed Philadelphia, amid the ruins of which stands the modern city of Amman. With their kindred the Moabites they were forbidden entry into the congregation of the Lord because they hired Balaam to curse Israel (Deut. 23; Neh. 13). Addicted to child-sacrifice, worshippers of Moloch, the Milcom of the O.T., and enemies of Israel and Judah, they were denounced by Amos and other prophets, defeated by Jephthah (Judg. 11), Saul (1 Sam. 11), David and Joab (2 Sam. 10-12), and Judas Maccabaeus (1 Mac. 5), and were absorbed, about the 1st century A.D., by the Nabataean Arabs.

Ammonium. In chemistry, the compound radical, NH_4 , contained in the ammonium salts, i.e. salts formed by neutralising ammonia by acids. Of the ammonium salts, ammonium chloride NH_4Cl , is formed by the action of hydrochloric acid, and is known as sal ammoniac. It is used as a flux in soldering, in the galvanising of iron and steel, and (very largely) as the activating agent in carbon-

zinc electric cells (Leclanché type and the so-called dry cells). The chloride is made commercially from the ammoniacal liquor which is a by-product at gasworks. Ammonium carbonate— $(\text{NH}_4)_2\text{CO}_3$ —is made by passing carbon dioxide, ammonia gas, and steam into lead chambers or water. Known popularly as lump ammonia, the carbonate is used as a household cleansing agent; also for scouring wool. It is an ingredient of baking powders and smelling salts. Sal volatile is a solution in alcohol of the carbonate and ammonia. Ammonium sulphate, $(\text{NH}_4)_2\text{SO}_4$, is a gasworks product, obtained from the ammoniacal liquor. It is also largely obtained from synthetic ammonia. Its main use is as a fertiliser. Ammonium nitrate, NH_4NO_3 , is made by the action of ammonia on nitric acid. When heated, the nitrate breaks up into nitrous oxide (the gas commonly used as an anaesthetic by dentists) and water. Ammonium nitrate is a constituent of many explosives, e.g. ammonal (q.v.) and amatol (q.v.), and is used also as a fertiliser. Ammonium bromide, NH_4Br ; A. iodide, NH_4I ; and A. acetate, $\text{NH}_4\text{C}_2\text{H}_3\text{O}_2$, are used in medicine. Ammonium fluoride, NH_4F , is employed for etching glass and as a disinfectant. Ammonium picrate made by agitating picric acid with an excess of aqueous ammonia and crystallising out the picrate, is a military explosive.

Ammonius. Name of three Greeks of Alexandria.

(1) Ammonius Saccas (c. A.D. 175-242), generally regarded as the founder of neo-Platonism. He is said to have been a street-porter in his youth, whence his name Saccas, bag-carrier. Belonging to a Christian family, he reverted to paganism, and endeavoured to reconcile the different systems of ancient philosophy, especially those of Plato and Aristotle. Plotinus and Origen were his pupils. An excellent teacher and no mean orator, he wrote little and confined himself to oral instruction. Some ancient ecclesiastical authorities deny that he was originally a Christian.

(2) Flourished about A.D. 400. A teacher at Constantinople, he was the author of an extant work on the use of synonyms.

(3) The son of Hermias, flourished about A.D. 500. He was known for his commentaries on Porphyry and Aristotle, some of which are extant, and as a mathematician.

Ammonite. Specimens of a fossil marine mollusc allied to the nautilus

Triassic deposits of the Alps and Tirol and of the Salt Range in India, being descended from earlier coiled cephalopods found in the Palaeozoic rocks. They range through the Jurassic rocks of the world, occurring abundantly in Britain, but are less common and show less variety of form in the Cretaceous system, and become extinct in the early Tertiary period. See Fossils; consult also Yorkshire Type Ammonites, S. S. Buckman, 1919.

Ammonite. British safety explosive of the Favier type. In its original form ammonite consisted of ammonium nitrate 87 to

AMMUNITION: HISTORICAL & MODERN

Lt.-Col. A. Macgregor, Military College of Science

This article, classifying all the many modern types of military ammunition, is complementary to the one on Artillery, while other related articles include those on Armour; Bomb; Explosives; Fuse; Grenade; Small Arms

The word ammunition is derived from the Latin *munire*, to provide, through the French, in which *la munition* became corrupted to *l'ammunition*. Though it was formerly employed to indicate military stores of all descriptions, its present significance as a substantive is limited to warlike stores embodying explosive of any kind or used expendably in direct association with any form of explosive. The adjective in certain instances retains the significance of the older usage, as in "ammunition boots."

HISTORICAL. The introduction of explosives can be traced back to the first inventors interested in the possibility not only of breaking up large or small structures by the suddenly liberated energy of the explosive, but also of projecting missiles for distances greater than those attainable by purely mechanical devices. Early in the 14th century gunpowder was used to propel existing types of projectile, e.g. arrows, leather-bound to make them a reasonably close fit in the bore of the tubes from which they were projected. Spherical missiles, frequently of stone, appeared in 1340, to be replaced towards the end of the 16th century by metal cannon balls, usually of iron. Lead and iron bullets for small weapons appeared somewhat earlier.

The Rocket Principle

The possibilities that are inherent in rockets have always interested soldiers, and the application of the rocket principle has developed along lines parallel to the development of the gun. The mistake should not be made of considering the two developments as rivals in a race to achieve the same objective. The capabilities of each are distinct. Later were introduced special missiles, as opposed to the missile whose only offensive power was associated with its kinetic energy. These can best be reviewed individually.

Incendiary missiles first took the form of a projectile treated with an inflammatory coating which was ignited before or as the projectile left the gun. With the introduction of metal cannon, a more reliable effect was obtained by heating the cannon ball to red heat, the pre-ignition of the

propellant charge being prevented by the interposition of a suitable wad between the charge and the heated ball.

Case shot was an attempt to increase the anti-personnel effect of the projectile. It represented a development in shape also, since it was substantially in the form of a thin cylindrical body filled with small missiles. On leaving the muzzle of the gun, the case disintegrated and the contents were distributed over a considerable area fairly close to the gun. To some extent case shot was the forerunner of the shrapnel shell. In its simplest form it has survived for use in certain specific tasks at short range.

Grape shot was intended to produce a short range anti-personnel effect similar to that achieved by case shot; but there was no case.

With chain shot two or more missiles linked by a chain were loaded in the same piece and used where ropes, spars, and wires formed the target, as in the ships of the time. Here, again, the principle persisted until as recently as the First Great War, when it was regularly used against barbed wire entanglements.

Bursting shell, e.g. spherical shell filled with a charge of explosive to break them up, were employed as early as 1560. They were time-fused, and their anti-personnel effect was largely discounted by the almost inevitable delay in functioning after arrival. This allowed individuals in the vicinity to take cover. The difficulty was partly remedied in the middle of the 19th century by the introduction, firstly, of a time fuse which was ignited by a cap fired by the shock of discharge in the gun, and secondly, by the introduction of a percussion fuse, which caused the projectile to burst on impact with the target. The earliest types of shrapnel shell were spherical and filled with a mixture of bullets and gunpowder; later, with bullets and gunpowder separately.

MODERN AMMUNITION. The development of modern gun ammunition may be said to begin with the introduction, firstly, of the rifled gun, and, secondly, of the principle of breech-loading. The problems of the flight of a

cylindrical projectile, in regard to its stability and the air-resistance encountered, were solved by the production of a cylindrical projectile with a pointed head, having its centre of gravity towards the rear, and caused to follow the trajectory nose forward by imparting to it an adequate rate of spin about its longitudinal axis. The necessity for adequate spin presented mechanical problems as to how this could be imparted during the short time the projectile was accelerating in the gun.

The broad general principle consists in giving the bore of the gun a non-circular longitudinally twisted form, and by reason of the tight fit of the projectile in the bore, forcing the projectile to twist in the gun during its passage up the bore. Many proposals conforming to this principle were put forward. A gun with a hexagonal cross-section to the bore and a correspondingly formed projectile was suggested. Helical grooves (rifling) in the cylindrical surface of the bore were more usual proposals, the grooves to accommodate studs, a layer of soft metal surrounding the projectile or, the modern conventional solution, a ridge of soft metal being attached towards the rear of the cylindrical portion of the projectile, and commonly referred to as the driving band.

Breech-loading Weapons

The introduction of the breech-loading rifled gun, firing the pointed projectile, gave a considerable improvement in range and in ballistic performance, which set new standards for propellant efficiency and regularity that gunpowder was hardly able to meet. The evolution of the modern types of gun propellant dates from the latter third of the 19th century, and by 1900 the earliest of the present-day nitrocellulose powders and the double-based propellants (cordite) had appeared. Also the evolution of high explosives in the latter part of the 19th century and the development of large scale production introduced entirely new conceptions of explosives. From the effect upon tactics of more efficient weapons, and from the introduction of increased protection against artillery fire, modern gun ammunition has become increasingly specialised in character.

EXPLOSIVES. These can usefully be divided, considered as ammunition, into three groups:

(1) The propellants, used to eject a projectile from a gun.

Propellants are composed of a combustible content associated with a source of oxygen to support the combustion, and their operation is essentially one of burning to produce a large quantity of hot gas. In modern propellants the fuel and the oxygen exist side by side in the same chemical substance, *e.g.* nitrocellulose, and consequently their behaviour is much more regular than that of gunpowder, whose fuel (charcoal and sulphur) is distinct from the source of oxygen (potassium nitrate), the components merely being finely divided and mixed intimately together. Propellants produce a conflagration which can be controlled by adjustment of the physical conditions obtaining. This is the basis of the ballistic regularity attained with modern guns.

(2) The high explosives, which differ fundamentally from the propellants in their application. The high explosive is properly so called when it can be caused to break down with great rapidity on being subjected to adequate mechanical shock. Such detonation takes place much more rapidly than does the burning of the propellant, with the consequence that the liberation of considerable energy, which occurs almost instantaneously, is much more destructive locally than when a similar amount of energy is liberated relatively slowly, as in the burning of a propellant. Detonation is in effect the passage of a high intensity shock through the material of the high explosive, and its rate of transmission is typical of the high explosive and is substantially uncontrollable.

(3) A miscellaneous class largely composed of the pyrotechnic compositions, with which it is convenient to class gunpowder. They are compositions which burn and which are employed for the purpose of producing effects other than the propulsion of projectiles. Examples are incendiary, smoke, and flare compositions.

TYPES OF GUN AMMUNITION
Modern gun ammunition falls into two main categories. The first is that known under the initials Q.F. (originally quick-firing), the distinguishing characteristic of which is the use of a metal case which performs the function of obturating the chamber of the gun, *i.e.* preventing the escape of the propellant gases past the breech block.

Q.F. ammunition is capable of sub-division into three sub-groups:

Ammunition. Typical bursting smoke field howitzer shell and cartridge

(a) Fixed Q.F. ammunition, in which the projectile is firmly attached to the mouth of the case and the entity so constituted loaded in one operation; (b) separate Q.F. ammunition, in which projectile and cartridge are supplied, handled, and loaded separately, the mouth of the cartridge being closed suitably to protect the contents; (c) semi-fixed ammunition, in which projectile and cartridge are separate or readily separable, but are assembled into a complete round for loading.

The second category is known under the nomenclature B.L. Originally these letters were an abbreviation for breech-loading, but this significance is now entirely lost. Instead, B.L. ammunition indicates ammunition in which the cartridge is not required to play any part in the obturation of the gun chamber, this being secured by the breech block. Thus a B.L. cartridge normally comprises a bundle of propellant contained in a fabric bag with an igniter attached.

In Q.F. cartridges the ignition is normally effected by means of a primer screwed into the base of the case. Primers may be operated by percussion, or electrically. The primer has a cap containing a composition sensitive to a striker blow (in percussion primers) or a filling sensitive to heat (in electric primers). The primer also has a

"magazine" containing gunpowder to build up the flash, and in modern primers a gas-sealing device to prevent the escape of gases rearwardly through the primer. The Q.F. cartridge may also contain an igniter to build up the flash in the chamber still further. Ignition in B.L. cartridges is effected by the agency of a tube, which is essentially a small Q.F. cartridge, with a flash-producing filling. The tube may be fired by the impact of a striker (a percussion tube) or by the passage of an electric current (an electric tube). The tube is held by means of a lock in the rear end of a central passage or vent passing through the breech block, and on firing projects flash into the gun chamber where it impinges on the igniter. The igniter, normally containing gunpowder, chosen partly because of its susceptibility to flash, is used to increase the flash in the chamber sufficiently to ignite the propellant uniformly.

ARTILLERY PROJECTILES. Projectiles in modern gun ammunition can be divided into three

Ammunition. Typical field Q.F. howitzer H.E. shell and cartridge

main classes: (a) shot; (b) high explosive shell; (c) carrier shell.

A shot is a projectile in which the effect at the target end is based entirely upon the kinetic striking energy of the projectile. A high explosive shell is used to carry a charge of high explosive to the target where at a selected instant it is detonated so as to produce a destructive effect by reason of the energy imparted to the shell case fragments, or of the blast created, or in some instances by utilising both results. High explosive shell may be thin-walled when not required to penetrate hard targets before detonation of the filling, in which case they are usually nose-fused, or they may be very strong with relatively small cavities when they are required to penetrate hard targets, such as armour plate, and to detonate effectively after penetration. The latter shell are called piercing shell, and are frequently made of special steel, with very strong noses. The fuses in piercing shell are arranged in the base (or rear) of the shell to protect them from the severe stresses to which the nose of the shell is subjected. Carrier shell are employed to convey a filling other than high explosive to a selected point and there to discharge it. Typical carrier shell are smoke shell, shrapnel shell, and star shell.

TRACERS. In some applications, the man at the gun wishes to follow the flight of the projectile with his naked eye. To enable him to do this the projectile may be provided with a tracer, or filling of pyrotechnic composition, which burns with a distinctive light of sufficient brilliance to be observable under the conditions of use. The tracer composition may be filled into a cavity in the base of the projectile, or it may be carried in a tracer body secured to the base of the projectile. Either way it is usually ignited by the propellant gases in the gun.

GUN AMMUNITION FUSES. The steady development of modern warfare methods has led to the development of an increasing number of types of gun ammunition fuses. These can be classified as follows.

(1) *Percussion Fuses.* These are fuses which function on arrival at a target. There are two sub-divisions: (a) The direct action fuses, which require a blow on a member protruding at the nose of the projectile to cause the fuse to function; (b) The graze fuses,

which only require adequate deceleration in the direction of the nose of the projectile to cause the fuse to function.

(2) *Time Fuses.* These are of two main types: (a) The combustion type, which rely upon the steady burning of a powder train the length of which can be varied to give a desired time of burning, so causing the shell to function at a pre-determined time after leaving the gun; (b) The mechanical type, which consist of a pre-set alarm clock which is started as the shell leaves the gun and triggers a firing mechanism at the time determined by the setting.

A percussion fuse may have a delaying mechanism designed to provide a short fixed delay in the final functioning of the shell at the target after the mechanical members in the percussion mechanism have been operated, thus allowing penetration of the target before detonation of the shell. All types of fuse may be either disruptive, i.e. suitable for use for the direct detonation of the high explosive filling in a high explosive shell, or igniferous, in which the explosive resulting from the fuse is flash suitable only for igniting the next component in the explosive train.

The speed of action and sensitivity of percussion fuses is of importance in relation to the nature of the targets attacked and the result desired. Thus, great

Ammunition. Diagram of an armour-piercing shell and cartridge

Ammunition. Typical anti-tank armour-piercing round

variation in both these characteristics is found between different designs of fuses of this class.

EXAMPLES OF GUN AMMUNITION AND CARRIER SHELLS.

(1) Q.F. cartridge with armour piercing shot for attack of armour. In small calibre high velocity guns for attack of armour, the alloy steel projectile with tracer incorporated is secured in the mouth of the cartridge case by indenting the metal of the case into a cannellure in the projectile.

(2) A B.L. round with a piercing shell. In this case the cartridge consists of propellant, usually of stick form, tied into a compact bundle and inserted into a strong, tightly fitting bag of suitable fabric. The igniter, suitably secured to the cartridge, normally takes the form of a thin layer of gunpowder carried in a suitable flat pocket of fabric. The projectile is a piercing shell with a base fuse which may have a delay (possibly optional) incorporated. The piercing shell may also have a penetrative cap of metal on the nose and also possibly a ballistic

cap to improve its ranging capabilities. The shell cavity is relatively small and is filled with a high explosive sufficiently insensitive to withstand the shock of impact on a hard target. The fuse is a base detonating fuse, and between it and the high explosive filling is a quantity of high explosive.

(3) A heavy anti-aircraft artillery cartridge. This is a fixed Q.F. round normally with a percussion primer in the cartridge. The shell is relatively thin-walled and is fused with a mechanical time fuse. To convert the flash from the fuse to detonation there is arranged below the fuse a component known as a gaine. Below the gaine is the exploder system and then the bursting charge.

(4) A light anti-aircraft artillery cartridge. This consists of a high explosive shell fitted with a very sensitive nose percussion fuse, and secured in a cartridge case to constitute a fixed Q.F. round. Equipments firing such cartridges are frequently fully automatic, and therefore to avoid covering friendly ground with a large number of lethal projectiles these are provided with a "self-destroying" system whereby, at a fixed time after leaving the gun, the projectile is broken up into fairly innocuous fragments.

(5) A separate Q.F. cartridge with a nose-fused high explosive shell. Such a round can be used in field artillery guns, and has the advantage of ease of handling coupled with the possibility of varying the charge at will.

(6) The shrapnel shell. This consists of a steel body with a nose time fuse of igniferous character adapted to ignite a gunpowder charge in the rear of the shell cavity by way of a flash channel down the centre of the shell. Forward of the gunpowder charge and surrounding the flash channel is a compact mass of resin and lead balls. When the gunpowder charge is fired, the fuse, or the front end of the shell, deliberately weakened in its attachment to the remaining part of the projectile, is blown out and followed by the lead bullets

which spread in front of the shell case in a conically shaped distribution. The decline in the use of shrapnel is a result of the lengthening range of artillery and the tendency to use higher trajectories with steep angles of descent, both of which contribute to the difficulty of bursting the shell at a steady effective height, while the second tends to restrict the size of the area effectively swept by the ejected bullets. Moreover, experience shows that modern H.E. shell burst in the air can be more generally effective and cheaper than the corresponding shrapnel shell. Shrapnel is, however, retained in certain short-range high trajectory equipments where it can be fairly accurately burst, in which case it is useful against troops in entrenchments.

(7) The phosphorus smoke bursting shell. This is a percussion-fused shell in which in effect the cavity is filled with white phosphorus, and the shell functions on impact as the result of the detonation of a relatively small high explosive charge carried in a burster container at the nose of the shell.

(8) Star shell. These are, in principle, similar to shrapnel shell except that ejection of the contents is effected through the base of the shell instead of through the nose. The principle of base ejection is

Ammunition. Sectional diagrams of (left) a heavy anti-aircraft round, and (right) a light anti-aircraft round

applied to a wide variety of carrier shell.

SMALL ARMS AMMUNITION. Although no definite limit exists, the term is applied in Great Britain to ammunition for rifles, machine-guns, pistols, machine carbines, and shot-guns of calibre up to and including one inch. Small arms ammunition has developed from a spherical ball of lead fired from a smooth bore weapon, by means of a charge of gunpowder ignited by a "match" or the spark from a flint, to the modern cartridge, a self-contained unit or round, consisting of an elongated enveloped bullet placed in the mouth of a brass or steel cartridge case, from which the bullet is discharged up the rifled barrel by one of the modern nitrocellulose or double base propellants ignited by the flash from a sensitive

composition carried in the cap at the base of the case.

The ball round, a lead alloy core enclosed in a copper alloy or steel envelope—the nomenclature remaining from the original spherical bullets—is useful only in hunting and for the attack of human beings and very light structures. Military requirements necessitate more specialised types of bullet. Tracer bullets are

Ammunition. Q.F. field shrapnel round, a shell now seldom used

required in various types of machine-gun to indicate the relation between bullet trajectory and the target and so to make it possible to correct the aiming of the gun. Armour-piercing bullets to penetrate light armour, e.g. gun shields, have a hard steel core surrounded by a lead sleeve: this assembly is enclosed in

SHOT GUN CARTRIDGE

attack of small game, are used under much less stringent conditions than most other types of small arms ammunition and consist of a quantity of lead balls or shot carried in a cardboard case which is reinforced at the base by a brass or steel cup and a compressed paper wad. The propellant—gunpowder is still used in many of these cartridges—is separated from the shot by a felt wad and is ignited by a cap fixed in the base of the cartridge.

ARMOUR PIERCING

the normal metal envelope, while, in order to attack modern aircraft successfully, 20-mm. ammunition is produced to much the same design as artillery shells with a nose fuse and a filling of H.E. and incendiary composition. In smaller calibres, in which fuses cannot be used, incendiary ammunition has been developed to ignite the petrol which occupies a large volume of all military aircraft.

Pistol and machine carbine ammunition designed for short-range attack differs from the rifle and machine-gun types in having a much smaller propellant charge to project a comparatively heavy bullet at low velocity. Shot-gun cartridges, fired from a smooth bore weapon and designed for the

Amnesty (Gr. *amnestia*, forgetting an offence). Term used for a collective or general pardon. From early Greek times such pardons have been granted to rebels and other offenders against the state, the leading culprits, however, being usually excluded. Most governments have granted amnesties, famous instances being the amnesty promised by Charles II on his restoration in 1660, and that declared in 1868 after the American Civil War. The former was also referred to as an indemnity, though it does not carry quite the same idea of total oblivion as the Greek word. Indemnities are granted now less to deliberate offenders than to public servants who, in any sudden crisis in the state, may be obliged to transgress the law for the common good.

Amnion (Greek, little lamb).

Term in embryology and natural history denoting an anatomical structure found in mammals, birds, and reptiles. The amnion is the innermost membrane which envelops the embryo during development. See Anatomy.

Amoeba (Gr. *amoibe*, alternation). Genus of the Protozoa, or lowest forms of animal life. Of the several species most are common in the mud and decaying vegetable matter of ponds. While some can just be seen with the naked eye, others are much more minute.

The amoeba, a one-celled organism, consists of a tiny shapeless mass of protoplasm, resembling a minute blob of jelly. It has no limbs or appendages, but can push out parts of its substance, which are termed pseudopodia (Gr., false feet), and by this means flows forward rather than crawls. Its shape is constantly varying. It is rather firmer on the outer margin than within, and contains numerous granules of a proteid or fatty nature and a central nucleus. Possessing no mouth or other aperture for ingestion or excretion, it takes in its food, which

consists of diatoms and other minute vegetable matter, by flowing over and around it. When the process of digestion is complete, the residue is then pushed out through any part of the amoeba's substance.

Amoeba. The method of progression of this minute organism is (left) to extend a part of its substance and to continue the process (centre) until it gradually attenuates its mass in one direction (right)

Photomicrographs, J. J. Ward

Small cavities or vacuoles may be seen in the cell substance, and these appear to perform an excretory function.

When full-grown, the amoeba splits in two, and thus forms two individuals in the place of one. This form of reproduction by fission takes place in many of the humblest types of animal life. Occasionally two individuals coalesce and spores are formed, in which case the process of reproduction is less simple. The method of reproduction by splitting has given rise to the paradox of the immortality of the amoeba. As the process goes on indefinitely, it follows that all the amoebae in existence are simply fractions of the original amoeba of long ago, which still exists in them, because they have not descended from it but split off from it. But it does not follow that an individual amoeba cannot perish before it has had time to split and multiply itself. One species causes dysentery.

Amoebean Verse (Gr. *amoi-baios*, alternate). Metrical dialogue, in which the interlocutors answer each other in alternate lines on the same subject. It is a familiar device in pastoral poetry, illustrated by Virgil in his Eclogues and by Theocritus in his Idylls. See Poetry.

Amok or **AMUCK**. Homicidal frenzy prevalent among Malays. Under its influence the Malay runs through the streets indiscriminately laying about him with his kris until he is killed. Some cases are due to sudden madness, to disease, to the heat of the peninsula, and to the use of drugs. The typical amok may be connected with the wish to die fighting.

In Malay vernacular the word means to attack furiously. Both word and mania may have originated in India, where cases of running amok have been known from early times. In 1634 Shah Jahan, Mogul emperor of Delhi, narrowly escaped death at the hands of a raja who had run amok. Early travellers in the East refer to certain desperadoes in Malabar as amouchi or amuco, and in the 17th century the term amar-khan was applied to men who, in accordance with local custom, attempted to kill in open assembly the zamorin (chief) of Calicut after a reign of twelve years. English writers have sometimes regarded the "a" as the indefinite article, cf. Dryden, "And runs an Indian muck at all he meets." and Byron, in Don Juan, "running mucks."

Amol. Town of Mazanderan province, Persia. It is situated on

the Heraz, which flows into the Caspian on its S. side.

Amontillado. Wine grown at Montilla, near Cordova, Spain. Akin to sherry, usually light in colour, sweet, and full-bodied, it is subdivided into *fino* and *oloroso*, the former being the more delicate, the latter having the greater bouquet.

Amor (Lat., love). In Roman mythology, the counterpart of the Greek Eros. He was the son of Aphrodite (Venus) and the god of love. See Cupid.

Amore. In music, the Italian words *con amore* (literally, with love) mean tenderly, lovingly.

Amorites. Semitic race who settled in Palestine about 2500 B.C. They were allied to and

Amorites. Typical heads of a conquered western Asiatic race, from ancient sculpture
British Museum

sometimes identified with the Canaanites, who may have succeeded them in a wave of immigration. The Babylonian dynasty of Hammurabi was Amorite. The Amorites settled in the highlands of Palestine and Syria, and were conquered by the Israelites, who, under Moses, overcame Og and Sihon, and, under Joshua, smote other Amorite kings at Beth-horon (Deut. 3; Josh. 10). The Amorites are referred to in Assyrian, Babylonian, and Egyptian records. See Early History of Syria and Palestine, L. B. Paton, 1902; Amurru, the Home of the Northern Semites, A. T. Clay, 1909; The Empire of the Amorites, A. T. Clay, 1919.

Amoroso. Italian word used in music for *con amore*, lovingly.

Amorphous (Greek *umorphos*, formless). Term in chemistry applied to solids which exhibit no crystalline structure. Amorphous phosphorus is one of the forms of phosphorus which has no regular structure. An amorphous alkaloid cannot be obtained in a crystalline form. In geology the term is applied to continuity of mass or absence of stratification or cleavage.

Amortisation (Fr. *mort*, death). Financial term meaning the extinction of a capital liability, such as bonds and debentures. These may be redeemed periodically by annual drawings, the money being

provided by a sinking fund, or purchased in the market and cancelled, or extinguished by a single payment to creditors. In law, amortisation means the transfer in perpetuity of lands to a corporation.

Amos. Shepherd of Tekoa, Judah, and earliest of the Hebrew prophets whose writings are extant. He lived in the days of Uzziah and Jeroboam II (c. 750 B.C.). Wealth and luxury had demoralised Israel and Judah, and the poor were oppressed. Insisting that Jehovah was God of the whole earth, Amos foretold that the Day of the Lord was to be a day of judgement on the Hebrews and surrounding nations. Amaziah, chief priest of Beth-el, tried in vain to suppress him. The book of Amos, which closes with anticipations, perhaps from a later hand, of a larger hope, is marked by clear, vigorous, and picturesque diction, imagery of country life, and a remarkable power of social observation. See Amos and Hosea, W.R. Harper, 1910.

Amour Médecin, L' (Love, the Doctor). Title of a comedy ballet by Molière. Produced at Versailles, Sept. 15, 1665, it was sketched, written, learnt, and acted in five days. The character of Sganarelle—the doctor and widower who does not wish his daughter to marry—was acted by Molière. The comedy is in three acts, and is a skit on the medical profession, four well-known Parisian doctors of the period being amusingly caricatured. The scene is Paris and the airs were by Lully. In a note to the reader Molière made use of the often-quoted remark that "comedies are written only to be acted."

Amoy. City and former treaty port of China, in Fukien prov. Standing on the island of Haimen (Hiamen), at the mouth of the Lung-kiang, its walls date from the Ming dynasty. The East India Company first traded here in 1670, and it was one of the five ports to be opened to foreign trade by the Treaty of Nanking (1842), but a customs station was not established until 1862. The foreign settlement is on a small island $\frac{1}{2}$ m. distant, the waterway between the two islands forming the inner port, one of the best harbours on the coast. From 1899 the Japanese had a separate concession at Tiger Hill to the S. of the city. Amoy, formerly important as a tea centre, had, up to 1939, an extensive foreign trade, of an annual value of over £2,500,000. It exported sugar, camphor, paper, and various other articles. There was steamer communication with Hong-Kong and

other Chinese ports. The city was occupied by the Japanese, 1939-45. Pop. (1936) 234,159.

Ampere. Practical unit of electric current. The international standard ampere, defined 1908, is that current which when passed through a 15 per cent solution of silver nitrate in water deposits 0.001118 grammes of silver per sec. The "absolute" ampere (in force from Jan. 1, 1948) equals 0.99985 of the international ampere. It was named after André M. Ampère.

Ampère, ANDRÉ MARIE (1775-1836). French scientist. Born at Lyons, Jan. 22, 1775, his genius for

A. M. Ampère,
French scientist
A. Tardieu, 1835

mathematics was marked at an early age. In 1793 his father was guillotined, and from that time until 1801, when he began to teach at Lyons, young Ampère devoted himself to science. He moved to Paris, 1805, became a member of the Academy of Sciences, 1814, and professor in the Collège de France, 1824. He died at Marseilles, June 10, 1836. His great work was to establish the nature of the connexion between electricity and magnetism and to work out the theory of electrodynamics. His only son, Jean Jacques Ampère (1800-64), was a philologist and traveller.

Ampersand. The name of the sign &, frequently used for "and." It is of mongrel, Latin and English, origin, being a contraction of the four words—and, *per se* (by itself), and. In form, it is a combination of the letters e and t, *et* being the Latin word for and.

Ampezzo. A district in Tirol. The people are Ladins. The chief place in the area is Cortina d'Ampezzo, which is situated in the Dolomites, 25 m. S.E. of Bressanone. It is 4,000 ft. high and a tourist centre. The Ampezzo pass, crossed by a carriage road, runs from Toblach to Cortina at an alt. of 5,000 ft. The Ampezzo valley is surrounded by several of the finest summits of the Eastern Alps, notably Monte Cristallo, 10,495 ft.; the Sorapis, 10,595 ft.; Monte Antelao, 10,710 ft.; and Monte Civetta, 10,565 ft.

Amphiaraus. In Greek legend, brother-in-law of Adrastus, the prime mover in the Argive expedition against Thebes. Amphiaraus, being possessed of the gift

of prophecy, desired to take no part in it, knowing that he was doomed to perish. He went into hiding, but his wife Eriphyle, bribed by Polynices with the necklace of Harmonia, revealed his whereabouts. During the flight of the Argive chiefs from Thebes Amphiaraus and his chariot were swallowed up by the earth. After death he was worshipped as a god.

Amphibia OR **BATRACHIA** (Gr. *amphibios*, living a double life). In zoology, one of the chief classes into which the Chordata or back-boned animals are divided. They include frogs, toads, newts, salamanders, and certain wormlike forms such as the caecilians. In their earlier stage they usually have gills and live in the water, while the adults are provided with lungs and can live on land.

In almost all cases the life history of amphibia consists of a series of metamorphoses. The eggs are usually laid in fresh water, and generally connected in a jelly-like mass or string. They are hatched by the heat of the sun, and the young in their larval stage possess a long flat tail, by wriggling which they swim freely. External branched gills at first exist, and in some species persist during a considerable part of the animal's life. The limbs presently begin to appear. In frogs and toads the tail is gradually absorbed; in newts and salamanders it becomes modified. A change in the length of the intestinal canal marks the change from vegetarian to flesh diet.

Amphibians have a naked and soft skin, with glands which secrete a milky fluid. A dog that has picked up a toad exhibits great symptoms of distress and cannot be induced to repeat the experiment. Though the secretion has little effect on the human skin, it will often produce serious symptoms if injected into the blood. Amphibians do not drink, but absorb moisture through the skin, and cannot exist unless the skin be kept moist. Hence they are almost invariably found in damp places or near water. In dry localities they keep out of the sunshine during the day and move about at night, when the dew is on the ground. Many amphibians change the hue of their skin to suit their surroundings. If a frog is placed in a white box exposed to the light, and another in a black box, the former soon becomes lighter in colour than the latter.

Amphibians are found in nearly all parts of the world, and there are about 900 known species.

They are specially abundant in the swamps of the tropics. None can endure salt water, and their presence on an island points either to their accidental introduction or to the island having been connected with the mainland. Their chief food consists of insects, worms, slugs, and other small animals. Thus frogs and toads are useful in a garden. They can live for a long time without food, and many species hibernate. The stories told about toads and other amphibians having been found imbedded in solid rock or coal are due to inaccurate observation. They cannot live without air, or without food for more than a year or so.

Fossil Amphibia

The chief fossil representatives of the amphibia belong to the order Stegocephalia, or roof-headed, so called from the heads being covered with bony plates. They first appeared during Lower Carboniferous times, and their remains are preserved in rocks of this age in W. Europe, but they reached their maximum development in Permian times. Many of these animals were small and externally resembled lizards; such are well represented in the coal-bearing rocks of Nova Scotia and in the Lower Permian of Saxony and Bohemia. The larger Stegocephalia or labyrinthodonts appeared first in the Coal Measures and attained their maximum in Permian times. They are well represented in the Permian rocks of Prussia and Texas, and also occur in the Triassic rocks of S. Africa and Australia. In Britain and Germany large footprints on the bedding-planes of Triassic sandstones may be attributed to these animals. Consult Tailless Batrachians of Europe, G. A. Boulenger, 1897-98; Amphibia and Reptiles, H. F. Gadow, 1901 (Cambridge Natural History, vol. VIII).

Amphibious Craft. Craft designed to carry troops, equipment, or stores during invasion by sea or in fording rivers during land operations. As developed and used by the Allies in Europe, Asia, and the Pacific during the Second Great War, these craft included amphibians such as the "duck," "buffalo," and "weasel." U.S.-British amphibious craft played a conspicuous part in the success of the N. Africa landings (Nov., 1942), the invasion of Sicily and Italy (1943), and the great assault against the Germans in France and Holland (1944). They were employed also in the Pacific by American forces in the

invasion of islands held by the Japanese and in Burma by the British 14th army.

The LVT (Landing Vehicle, Tracked), known as the alligator, 20 ft. long, was used for assault purposes, particularly in the Pacific. It was able to swim through the surf by fluke-like tracks for water traction and to climb on to beaches with a 55-degree angle of climb. This craft was lightly armoured and carried machine-guns. The water buffalo, a development of the LVT, was in effect an amphibious tank. It

has six wheels and a propeller. Belonging to the same class, the water weasel was a tracked, half-ton truck. LCM (Landing Craft, Mechanised), 50 ft. long, were used chiefly for landing tanks, trucks, bulldozers, and guns. LCVP (Landing Craft, Vehicle, Personnel), 36 ft. long, primarily used for ship-to-shore work in landing infantry, formed part of the British contribution to the evolution of special ships and craft for amphibious operations that subsequently became standard equipment for the U.S. navy. A

in somewhat slender prisms, but occasionally assume a fibrous habit, as in asbestos. A certain number of the amphiboles contain an appreciable amount of soda.

Amphibrach (Gr. *amphi*, on both sides; *brachys*, short). In prosody, a trisyllabic foot with a long, or accented, syllable set between two that are short, or unaccented. The Latin *āmārē* is a quantitative amphibrach, the English revealing is an accentual amphibrach.

Amphictyonic Council (Gr. *amphictyones*, dwellers around). Representative council in ancient Greece of neighbouring states originally united in worship at a common temple. Such a council met at Delos and was in existence in the 7th century B.C. or earlier. The most important consisted of twelve states, and its first shrine was at Anthela, near Thermopylae, but at a later date Delphi became its headquarters.

The council for these states was composed of 36 members, three from each state, and Athens was at one time represented on it. The council pledged itself to the protection of the temple, and mutual defence of its members. This council continued for some time after the beginning of the Christian era. See Greece: History.

Amphimacer (Gr. *amphi*, on both sides; *makros*, long). In prosody, a trisyllabic foot with a short, or unaccented, syllable set between two long, or accented, syllables. The Latin *mīlētēs* is a quantitative, the English pantaloan an accentual amphimacer.

Amphion. In Greek mythology, son of Zeus by Antiope, wife of Lycus, king of Boeotia, who had divorced her in favour of his second wife Dircē. Amphion and his twin brother Zethus were placed when born on Mt. Cithaeron, but there they were found and brought up by shepherds. On reaching manhood the two brothers learned of the cruelty of Lycus and Dircē to their mother, and avenged her by killing them both, Dircē being tied to the horns of a bull. Obtaining possession of the city of Thebes, where Lycus reigned, they erected fortifications, the stones, it is said, moving to their places when Amphion played on the lyre, an accomplishment learned in his youth from Hermes. The group of statuary called the Farnese Bull, now at Naples, represents the punishment of Dircē.

Amphioxus (Gr. *amphi*, on both sides; *oxus*, sharp). Scientific name for the primitive fish commonly known as lancelet (*q.v.*).

Amphibious Craft. Punt-like army amphibious trucks, known as "ducks," in which Canadians landed at Reggio, Italy, on Sept. 3, 1943
Photo, British Official

carried a 37-mm. cannon and two 0.50 machine-guns. Smaller than the alligator, the buffalo was used at Arnhem (*q.v.*), in Holland, in Sept., 1944, when both ducks and buffaloes, laden with ammunition and food for the relief of the encircled 1st airborne div., negotiated the German-held fen and dyke country. Out of the trapped force of some 8,000 men dropped in the Arnhem area, about 2,000 were ferried by buffalo across the lower Rhine to the British lines. The buffalo also proved of the utmost value during the fighting in other flooded areas of Holland in 1944 and 1945. LCR (Landing Craft, Rubber) was a rubber craft with a 7-man or 10-man capacity. It could be packed in a small space and inflated in 30 seconds. It was used for landing infantry groups and for reconnaissance and river crossings.

Among the best-known of the amphibious craft were ducks, so called from their factory serial letters DUKW. These army amphibious trucks, used for landing troops and weapons and carrying 20 men or the equivalent in cargo, were first used in the S.W. Pacific, and subsequently during the landings in Europe, notably in the assault upon the Normandy beaches in June, 1944. Shaped like huge punts, they had

vast fleet of these craft was assembled on the W. bank of the Rhine, and manned by British and American naval personnel during the storming of that river in March, 1945.

Amphibole (Gr. *amphibolos*, ambiguous). Group of minerals, complex silicates of calcium, iron, and magnesium, with or without aluminium. They are natural crystalline substances, which enter largely into the composition of certain igneous and metamorphic rocks. Those members of the group containing aluminium, and including common hornblende, are most usually found in igneous rocks such as diorites, hornblende-syenites, hornblende-andesites, and certain lamprophyres, to which they give distinctive characters. The non-aluminous amphiboles rich in iron and magnesia, *e.g.* actinolite, as well as those containing much calcium, *e.g.* tremolite, are more common in metamorphic rocks, respectively in altered igneous and calcareous rocks.

With the exception of aegirine, which is triclinic, and of anthophyllite, which is orthorhombic, all these minerals belong to the monoclinic system. They are mainly of various shades of brown and green, those richest in calcium being palest in colour. They usually occur crystallised

Amphipoda A fresh-water shrimp, typical example of the order

Amphipoda (Greek *amphi*, around; *pous*, foot). Order of small crustaceans with laterally compressed bodies. They have usually six pairs of legs, of which the anterior three are swimming limbs the posterior being specially developed for use in jumping. They are found in salt and fresh water, fresh-water shrimps, sand hoppers and beach fleas being familiar examples. See Crustacea.

Amphipolis (Gr. *amphi*, round; *polis*, city). A town of ancient Macedonia. Formerly called Ennea Hodoi, nine ways, it was situated between two arms of the Strymon. After several attempts the Athenians overcame the original Thracian inhabitants and founded a colony in 437 B.C. Taken by the Spartan Brasidas in 424, Amphipolis refused to return to its allegiance to the mother country. It maintained its independence until 358, when it was occupied by Philip of Macedon, and remained Macedonian until 168, when it came into the hands of the Romans, who made it the capital of one of their four Macedonian provinces. Favorably situated, in an important strategic position, with its excellent harbour Eion, and rich in oil, timber, gold and silver, it was a flourishing town. Referred to in Acts 17, it is represented by the modern Neokhori.

Amphisbaena (Greek *amphis*, both ways; *bainein*, to go). Group of lizards which have the power of moving equally well backwards or

Amphisbaena. A. Americana, one of the legless lizards from Central America

forwards. The true amphisbaenas are found in Central America and in Africa, and include some thirty species. They are wormlike in appearance and live underground. One species has external limbs.

Amphitheatre (Greek *amphi*, around; *theatron*, seeing-place or theatre). Structure, slightly elliptical in form, specially designed for the gladiatorial exhibitions of the ancient Roman world. The structure was built round an open space reserved for the combatants. This space, the *arena*, was separated from the spectators' portion (*cavea*) by a wall (*podium*) sufficiently high to protect the spectators from the wild beasts introduced into

form a special women's gallery. Amphitheatres were originally built of wood, the first in Rome being erected by Gaius Scribonius Curio in 59 B.C. The first stone one was built by Statilius Taurus in 29 B.C. The most notable was the Colosseum, or Flavian amphitheatre, built by Vespasian and Titus, to hold some 50,000 spectators. Part of the Colosseum is still standing, and in all parts of the Roman empire in Europe examples

Amphitheatre at Verona Italy. Built about the first century A.D., but little remains beyond the interior, the seating of which has been often restored

the arena. At each extremity of the arena were doors in the *podium* through which the gladiators and the wild beasts from their subterranean cages entered. From behind the *podium* the spectators' seats rose in tiers. These tiers were divided into several sections (*moeniana*) by concentric gangways, and at intervals in the back wall of the gangway were openings for ingress and egress (*vomitoria*). The *vomitoria* led from the *cavea* into corridors, from which staircases descended to the ground outside the amphitheatre. Opposite the *vomitoria*, cutting the *moeniana* at intervals, were long flights of steps, by which the spectators passed to and from their seats. The *moenianum* nearest the arena was reserved for people of consequence, while the section farthest away from the arena was roofed over in order to

of the amphitheatre, in greater or less degree of preservation, are to be found. The amphitheatre at Verona is the best preserved. Other remains are at Arles and Nîmes, France, and Dorchester, England. Gladiatorial shows in the amphitheatre were prohibited in A.D. 404, but contests with wild beasts continued for more than a century afterwards. The term is now applied in the modern theatre to rows of seats immediately below the gallery. See Colosseum.

Amphitrite, wife of the Greek sea-god Poseidon
Villa Albani, Rome

Amphitrite. In Greek mythology, wife of Poseidon, the sea god and herself goddess of the sea.

Amphitryon OR AMPHITRYON. In Greek mythology, a Theban prince whose wife Alcmena gave birth to Heracles (Hercules), Zeus (Jupiter) having visited her in the form of her husband. The story forms the subject of comedies by Plautus, Molière, and Dryden. From the reference in Molière's play, the name has come to mean a host or entertainer. Jupiter, representing Amphitryon, gives a banquet, during which the real Amphitryon arrives. A slave, called in to settle the question of identity, decides that "Le véritable Amphitryon c'est l'Amphitryon où l'on dîne," that is, the real master of the house is the giver of the banquet. Molière's comedy, in three acts, was based on a French adaptation of Plautus. It was produced at the Palais-Royal, Paris, Jan. 13, 1668, Molière playing Sosia, Amphitryon's slave.

Amphora. Ancient earthenware vessel, with two handles and tapering to a point at the bottom, which was fixed in a stand or in the ground. It was chiefly used for keeping wines, and later as a cinerary urn. The amphora was also a measure of capacity, and was the standard for estimating the carrying capacity of ships, just as the ton is the standard now. The Greek amphoreus held approximately nine gallons; the Latin amphora six.

Ampleforth. Village of Yorkshire (N.R.), England, 9 m. E. of Thirsk, on the S. slope of the Hambleton Hills. The Roman Catholic public school for 350 boys was founded in 1802, having been transferred from Dieulouard, Lorraine. The Benedictine priory of S. Lawrence is modern.

Amplifier. Apparatus used in radio sets and in other electronic appliances to magnify electrical impulses passing through the circuits. Low, or audio-frequency, currents (for sound reproduction) and high, or radio-frequency, currents are passed through thermionic valves, each valve amplifying the output current of the previous one. Sound-reproducing apparatus,

such as public address systems and telephone equipment, use amplifiers; in much other apparatus amplifiers are employed to increase the strength of otherwise feeble aural or visual indications. See Radio; Sound Reproduction.

Amplitude. In astronomy, the space in degrees by which a star or other celestial body rises wide of due E. or sets wide of due W. In the theory of waves and vibrations, amplitude is a term expressing the height of the wave, or the extent to which the vibrating body deviates from its mean position.

Ampthill. Urban district and market town of Bedfordshire, England. It lies 8 m. S.S.W. of Bedford, is on the rly., and has an old church, S. Andrew's, restored in the 19th century, some almshouses, ironworks, and a brewery. Ampthill castle, now destroyed, was the residence of Catherine of

Aragon just before her trial. Built in the 15th century by Lord Fanhope, it became crown property, was later in the possession of Lord Ashburnham, and still later of the Russell family. The ambassador, Lord Odo Russell, took his title from here. Ampthill House was long the residence of his family, and its park is famous for its oaks and limes. There is a home for retired Oxford college servants at Ampthill. Pop. 2,167.

Amptill, ODO WILLIAM LEOPOLD RUSSELL, 1ST BARON (1829-84). British diplomatist. Born at Florence, Feb. 20, 1829, the son of Lord George William Russell, he was privately educated and began his diplomatic career in 1849 as attaché at Vienna, and later filled various diplomatic posts—in Paris, Vienna, Constantinople (under Lord Stratford de Redcliffe during the Crimean war), Washington, and Rome. From 1858-70 he was unofficial minister at the Vatican. In 1870 he was made assistant under-secretary for foreign affairs, and in Oct., 1871, was appointed ambassador at Berlin. In 1872 he was made a privy councillor and in 1881 raised to the peerage. He died Aug. 25, 1884, at Potsdam.

His eldest son, Arthur Oliver Villiers Russell, 2nd baron, was

born in Rome, Feb. 19, 1869, and educated at Eton and New College, Oxford, where he achieved reputation as an oarsman. He served as governor of Madras, 1899-1906, and acting viceroy of India, 1904. He was a leading freemason, being pro-grand master of the Grand Lodge of England at the time of his death, July 7, 1935.

Ampulla. Vessel used by the Romans to contain liquids. It was in the shape of a bottle, sometimes with handles and sometimes without, and was employed for holding the oils with which both living and dead were anointed. It passed for a like purpose

Ampulla used at English coronations

into the service of the Christian Church, and the ampulla is still the name of the vessel containing the consecrated oil or holy cream used in the Roman Catholic and Greek Churches in certain of the sacraments, e.g. confirmation, and at coronations. That used at English coronations is of gold, in the shape of an eagle with outstretched wings. The word is Latin, a diminutive of amphora (q.v.).

Medically, an ampulla means any flask-like dilatation, such as the dilated end of the semicircular canal of the ear. Inflammation of an ampulla is known as ampullitis.

Amputation (Latin *ambi*, round; *putare*, to prune, trim). Removal of some portion of the body which is injured or diseased in such a way as to endanger the patient's life or to preclude any hope of its restoration to a normal or useful function.

Previous to the discovery of anaesthesia it was necessary to perform amputations in the shortest possible time. Now, however, the operation can be carried out without hurry. Amputations of different limbs, and of organs, e.g. the breast, require different methods for their performance, but an essential feature in all cases is to leave flaps of sufficient tissue and skin which, after allowing for their contraction in the process of healing, will provide an adequate covering for the severed end of the bone and closing of the wound. The danger of haemorrhage can be avoided by the application of pressure on the blood vessels above the site of the amputation

Amphora. A fine example of Greek red-figure ware
British Museum

by means of tourniquets and similar devices.

The dangers following amputation are shock, secondary haemorrhage, and septic infection. Shock can be reduced to a minimum by skilful administration of the anaesthetic, injection of saline solutions, if necessary, and administration of stimulants. Secondary haemorrhage is a fresh bleeding from the vessels, occurring a few hours or days after the operation has been completed, a serious condition almost always due to septic infection of the wound, though now rare because antiseptic methods have reached so high a degree of excellence.

As regards special amputations, the removal of a finger is frequently required after machine accidents, and is attended with little risk; amputations of the forearm are relatively simple and usually satisfactory; disarticulation at the shoulder joint is a more serious operation. Amputations of the toes, foot, and lower part of the leg are generally unattended by complications, but amputation through the thigh is a severe operation, and disarticulation at the hip-joint is always one of great gravity. Amputation of the breast is an operation frequently performed for cancer, and when the disease is limited is not seriously dangerous; extension of the disease, however, to the arm and other parts may necessitate an operation of considerable magnitude and difficulty. Amputation of the uterus (womb), or part of that organ, also most often performed for cancer, has resulted very satisfactorily. *See* Surgery; Anaesthesia.

Amraoti OR **UMRAWATTEE**. A town in Berar, Central Provinces, India. The capital of Amraoti district, it is 6 m. N. of Badnera junction on the Great Indian Peninsula Rly. It is situated in the valley of the Purna, a tributary of the Taptis, at the end of an extensive alluvial plain. A great cotton mart and grain market, it is famous for its temples, that of Bhawani being 1,000 years old. Amraoti district has an area of 4,733 sq. m. and contains numerous steam factories for the ginning and pressing of cotton, as well as many cotton mills. There is a college affiliated to Nagpur university. Three-quarters of the people are Hindus. Pop. 74,309.

Amrāvati OR **AMARAVATI**. Ruined Indian city, in Kistna district, Madras, near Dharanikota, on the right bank of the Kistna,

Amritsar, India, religious centre of the Sikhs. The Golden Temple standing by the Pool of Immortality

20 m. N.W. of Guntur. One of the centres of the Buddhist kingdom of Vengi, its tope (monument) is famous. The carvings, illustrating the life of Buddha, are preserved in the British and Madras museums.

Amreli. Division and town of the former state of Baroda, India. In Kathiawar peninsula, a few miles N. of the Satrunji river, the town is a cotton-trade centre; the div. covers 1,347 sq. m.

Amritsar. District and city of India, in the E. Punjab province. The area of the district is 1,601 sq. m. The city is 32 m. E. of Lahore, on the North-Western rly., and is the religious centre of the Sikhs, the site of the Golden Temple, with its tank or Pool of Immortality, having been chosen by Ram Das, the fourth leader of the sect, in 1574. Amritsar has carpet, cashmere shawl, and silk manufactures, and was long a trading centre for Kashmir and the N.W. Frontier province. Pop. 391,000.

Grave rioting took place in the city April 10-11, 1919, following the removal of two agitators; the mobs burned banks, government buildings, and rly. premises. On April 13 troops commanded by Brig.-Gen. Dyer fired on a large meeting of unarmed persons, of whom 400-500 were killed and about 1,500 wounded. The "massacre" was the subject of a public enquiry, which condemned Dyer's action. (*See* Dyer, R.E.H.)

When in 1947, at the partition of India, Amritsar city and dist. were included in the E. Punjab prov. of India, there was much violence and bloodshed, and almost the entire Muslim pop. (about 50 per cent of the total) fled from the city. The arrival of refugee Sikhs from W. Punjab, Pakistan, added to the confusion, the life of the city was brought to a standstill, and its prosperity suffered for some time.

Amrom OR **AMRUM**. One of the North Frisian Islands. Off the

W. coast of Slesvig, it is about 10 sq. m. in area, and at low water can be reached by vehicle. To the N. of Amrom lies Sylt, and to the N.E., Fohr.

Amru-el-Kais. Author of the first of the Mo'allakat or collections of the best poems of certain writers. He flourished in the 6th century A.D. and was regarded by Mahomet as the most distinguished of Arabian pre-Islamic poets. Sir William Jones included Amru-el-Kais's poems in the translation of the seven Mo'allakat which he brought out in 1783. The word Mo'allakat means exalted.

Amshaspands. Six immortal holy ones of Persian mythology. They are associated with Ormuzd in ruling the world.

Amstel. River of the Netherlands. Formed by the union of the Drecht and the Mydrecht, it flows to the Zuider Zee, through Amsterdam. It is about 10 m. long.

Amstelian. In geology, a division of the Pliocene system as occurring in Holland, and the equivalent of the Red Crag of the east of England. It has many fossils of Arctic affinities.

Amsterdam (Latin *Amstelredamum*: formerly Amstelredam, dyke of the Amstel). The commercial capital, largest city, and a seaport of the Netherlands: area 18½ sq. m. In the prov. of N. Holland, it

Amsterdam arms

is on the Amstel river, where it joins the IJ or Y, an inlet of the Zuider Zee.

A fishing village before 1200, Amsterdam was a town with many privileges when William the Silent united the provinces in 1585. It benefited by the commercial ruin of Antwerp in the second half of the 16th century, and it was constantly vitalised by refugees, who

found it an asylum. The establishment of the Dutch East India Company in 1602 made it the foremost mercantile city in Europe, and its fortunes suffered little visible decline until the English wars of 1780-84. The Prussians entered it in 1787, the French in 1795, and during 1806-13 it was incorporated in the French empire.

The site being fen, the city is built on piles. Based on the Y, the oldest portions lie round the Dam, a great square. Later extensions are marked by concentric crescents of house-lined canals (*grachten*), some filled in (*gedempt*), which form its main structural lines. The harbour and docks were remodelled and extended in the North Sea Canal construction begun in 1872, from which also date three artificial islands containing the central railway station and numerous quays. In 1585 the walls ran along the old Singel and Kloveniers Burgwal. By 1600 the crescent Heeren-gracht marked the line of the city walls. These enclosed the Schreyerstoren or "Weepers' Tower" (1482) at the original harbour; S. Anthonie's Waag (weigh-house); the Oude Kerk (Old Church, c. 1300), behind the Warmoesstraat; and the Nieuwe Kerk (New Church, 1408), beside the palace on the Dam. Coronations are held in the Nieuwe Kerk. The palace, magnificent within, but lacking every domestic convenience, was built in 1648-55 by Jacob van Kampen as a town hall, and still belongs to the city. During the 17th century Amsterdam expanded, by the stately Heeren and Keizer-grachts or avenues, as far as the present Lynbaans-gracht, including the French exiles' quarter (c. 1612), with streets and canals named after flowers, and hence known as De

Jordan, from the French *le jardin* (the garden). Since then the city has overflowed in new suburbs, sometimes of a rather dreary meanness, but often laid out with beautiful canals and spacious parks. Many handsome new buildings were erected in the period between the two Great Wars.

Before the German occupation in the Second Great War, Amsterdam was Holland's chief money market and an important European mercantile centre. With good harbourage and wide-reaching ocean traffic, it was hampered in shipping and transport by difficult access to the open sea. To remedy this were undertaken the North-Holland (1819-25) and North Sea (1865-95) canals. The harbour was protected by a fort at its entrance, but the city depended for security against attack principally on a system of dykes and sluices, whereby the surrounding district could be readily inundated.

Besides tobacco, rice, spices, and other colonial produce, timber, petroleum, grain, ores, coal, and drugs were largely imported. Diamond polishing was at one time almost Amsterdam's monopoly, but latterly a considerable part of the industry had moved to Antwerp, production costs being cheaper there. Other industries were shipbuilding, engineering, sugar-refining, printing, brewing, dyeing, and the making of glass, clothing,

paper, cocoa and chocolate, aeroplanes and bicycles, oils, cements, and chemicals. In addition to extensive sea, river, road, and tram communications, the city was closely linked up with Holland's network of inland canals. From Amsterdam's airport at Schiphol, 6 m. S.W. of the city, regular services were operated to other European cities and to the Netherlands East Indies.

Normally the city's administration is vested in a burgomaster, wethouders (aldermen), and a municipal council. It is represented in the Second Chamber on the principle of proportional representation. Rates are high, hence very many Amsterdammers reside in other communes. Amsterdam has a full educational equipment on the Dutch model. The old university, with a library of 350,000 vols., dates from 1632; a second, denominational, was opened in 1880.

There are several theatres. Music is much cultivated, though there is no opera-house. There are three sports stadiums. The narrow

Amsterdam. Below, the Open Harbour, showing Prins Hendrik quay on the left and the railway station on the right. Top right, picturesque old houses in rose-red brick and, behind, the Church of S. Nicholas

Kalverstraat is historical as a burgher promenade, where newspapers in all languages can be seen at the cafés.

Amsterdam's chief glory is associated with Dutch art. In the Rijks (National) Museum (1808; present building 1877-85, but since extended) is the most representative collection of Dutch painting in the world, with examples of Dutch sculpture and ecclesiastical art. Other galleries are the Municipal Museum, the Fodor the Six, and Rembrandt House. The city has a botanic garden and one of the finest zoological gardens in Europe. Vondel and Bredero, Holland's greatest poet and greatest comic dramatist respectively,

Amsterdam. Plan of the central part of the Dutch commercial capital, termed "Venice of the North." It is one of the principal seaports of the Netherlands

were natives of Amsterdam, and Spinoza was born (1632) in its Jewish quarter, where Rembrandt lived for over twenty years. The population at the census of 1939 was 793,526.

During the Second Great War less immediate damage was sustained by Amsterdam than by other cities of Holland. But on the day of the German invasion, May 10, 1940, the city was heavily raided by German bombers. Serious fighting broke out in the streets during the following days, and the capital was occupied by the Germans on May 15. After that date the R.A.F. repeatedly bombed the harbour and oil tanks. In Feb., 1941, following riots, the Germans imposed upon the city fines amounting to £2,000,000. Deportations of workers to Germany made a steady drain on the population throughout the years of occupation. The Jewish population, 100,000 in 1940, had declined to 10,000 by 1945.

In the final months of the war in Europe the city, in common with the rest of Western Holland, suffered from lack of food, and the death rate from starvation rose alarmingly. Relief came only with the liberation of the entire Netherlands in May, 1945.

AMSTERDAM OR NEW AMSTERDAM. Island in the Indian Ocean. Lying almost equidistant from S.

Africa and Tasmania, it is an extinct volcano, 2,980 ft. above sea level, with an area of about 25 sq. m. Discovered by Van Diemen in 1663, and acquired by France in 1893, the island is barren and uninhabited.

Amu-Daria. River of Central Asia. It rises on the Pamir plateau in two headstreams, the Ab-i-Panja and the Ak-su or Murghab, and during its course of about 1,500 m. forms part of the boundary between Afghanistan and first Tadzhik and then Uzbek S.S.R., whence it takes a general N.W. trend to enter the Aral Sea by two main branches. It is less utilised as a commercial waterway than for irrigation. At Leninsk it is crossed by the Trans-Caspian Rly. It is the ancient Oxus and the Persian Jihun.

Amulet. Object worn as a charm against evil. Researches in Babylonia, Assyria, and Egypt have brought to light a vast number of specimens, of which the scarabaeus and the eye of Isis are familiar examples. It has been suggested that phylacteries, containing extracts from the Law of Moses, were worn by the Hebrews not only as tokens of piety, but also as amulets. Mahomedans wear small cases containing extracts from the Koran. In Italy the peasants very commonly wear little figures of animals, or a closed

hand with extended index and little finger representing the sacred horns, as charms against the Evil Eye. In Great Britain flint arrowheads and small pebbles with holes in them served a similar purpose. While the superstitious use of the amulet was condemned by the Church in the 8th century, the wearing of Christian symbols as amulets has always been common. See Evil Eye.

Amulree, WILLIAM WARREN-DER MACKENZIE, 1ST BARON (1860-1942). British judge and labour mediator. Born August 19, 1860, near Perth, he was educated at Edinburgh University, and University College, London, and was called to the Bar in 1886. He was president of the Industrial Court, 1919-1926, and successfully conducted a number of inquiries into industrial matters and arbitrations of trade disputes. He was chairman of the Royal Commissions on licensing laws and Newfoundland. In 1929 he was raised to the peerage, and in the following year became secretary of state for air in the 2nd Labour govt. He died at Winterbourne Stoke, Wilts., May 5, 1942.

Amundsen, ROALD (1872-1928). Norwegian explorer. Born at Borje, July 16, 1872, the son of a shipowner, Amundsen, after studying medicine, went to sea. About 1901 he joined an exploring expedition into the Arctic seas. In 1905 he led a party through the North-West Passage, and in 1910 set out in the Fram for the northern seas, but changed his mind and sailed for the Antarctic. He remained there for over a year, and on Dec. 16, 1911, reached the South Pole, the first man to do so. After his return he wrote a book, *The South Pole*, 1913, and lectured on his travels. In 1918 he started on a North Polar expedition, reaching Nome, Alaska, in July, 1920. He crossed the North Pole from Spitzbergen to Alaska in an Italian-built airship piloted by Gen. Nobile, May, 1926. On June 18, 1928, he left Tromsø, Norway, in a seaplane, to search for traces of the missing Gen. Nobile and his Arctic expedition. Months later bits of floating wreckage from his plane told of his tragic end. Consult Roald Amundsen, Explorer, C. Turley, 1935.

Roald Amundsen, Norwegian explorer

Amur River, near Nikolaievsk, the town near its mouth. It flows into the sea opposite the northern end of the island of Sakhalin

Amur. River of Asia. Known also as the Sakhalin-ula and the Heilung Kiang, it is formed at Ust-Stryelka by the union of the Argun and Shilka, which rise in the Stanovoi Mts. In its upper course the Amur proper follows a S.E. direction and separates Manchuria from the Far Eastern prov. of Amur, and, after receiving the Sungari from the S., flows N.E., passes Khabarovsk, forces its way through the Khingan ranges, and enters the sea at Nikolaievsk, opposite the N. end of Sakhalin island. Frozen for half the year, it is navigable by large steamers for 1,500 m. from May to Oct. Besides the Sungari, its chief tributaries are the Ussuri on the S. and the Zeya, Bureya, and Amgun on the N. It is 2,920 m. long from the source of the Argun; the Amur proper is 1,800 m.

Amur. Name given to part of the Far Eastern Region of the U.S.S.R., lying between the Stanovoi Mts. on the N. and the Amur river, which marks the entire S. boundary. Its area is 154,795 sq. m. From the lofty plateau in the N.W. the surface falls away to a series of fertile plateaux, bounded on the E. by the Little Khingan Mts., beyond which occurs a broad strip of marshy lowland. There is rich pasture and much soil suitable for cultivation, but the climate—severely cold in winter and wet in summer—is against agriculture, which nevertheless gives employment to about one-third of the people. Gold is worked extensively in the vicinity of the Stanovoi Mts., and coal of a poor quality is mined in the basins of the Zeya, Bureya, and Silinja. The rly. from Stretensk to Khabarovsk traverses the S.W. of the area, and one branch goes to Blagovyeschensk, chief town of the area. Amur was ceded to Russia by China in 1858.

Amurath. Variant of the name Murad, borne by five sultans of Turkey. See Murad.

Amurnath. Cave in the mts. of N.E. Kashmir. About 30 yds. high, with a depth of 20 yds., it is reputed to be the dwelling-place of the god Siva, and is a favourite resort of pilgrims.

Amyclae. Ancient Greek town of Laconia, 2 m. S.E. of Sparta. The reputed home of Castor and Pollux, the Amyclaeans brothers, and originally the chief town of the Achaeans, it long maintained its independence after the Dorian conquest. A tomb of its princes contained two gold cups, magnificent examples of Mycenaean art, found at Vaphio, and the bronze statue of Apollo in his temple was famous.

The Italian Amyclae, on the Lago di Fondi (*Lacus Amyclanus*), on the coast of Latium, destroyed about the fifth century B.C., was supposed to have been founded by Greek colonists from Laconia.

Amygdalin (Greek *amygdalē*, almond). A glucoside discovered in 1830 by Robiquet and Boutron-Charlard in bitter almonds to the extent of 2.8 p.c. to 4 p.c. It is also contained in peach kernels (2.35 p.c.), cherry kernels (0.82 p.c.), and other vegetable products. To prepare amygdalin, bitter almonds are pressed to extract the fixed oil, and the cake remaining is boiled with alcohol, from which the amygdalin crystallises on cooling. By the action upon amygdalin of a ferment known as emulsin, also contained in almonds, glucose, hydrocyanic acid, and benzoic aldehyde (bitter almond oil) are formed. These are the flavouring agents in cherry brandy, noyau, ratafia, and maraschino.

Amygdaloid (Greek *amygdalē*, almond; *oidos*, form). Geological name for a lava in which most of the steam-cavities have been filled with mineral matter since the lava became solid. These secondary mineral masses are known as amygdaloids, from the fact that they are often almond-shaped. Steam-cavities in a lava, lengthened in the direction of flow, and not filled with secondary material, are known as amygdaloidal cavities. See Vesicles.

Amyl (Gr. *amylon*, starch) or PENTYL. Alcohol radical of the pentacarbon series. The term amyl alcohol may be applied to eight different isomeric compounds. Fusel oil is amyl alcohol and is obtained in the rectification of alcohol, particularly that prepared from potatoes. A mixture of alcohols, chiefly iso-amyl alcohol, with varying amounts of active amyl alcohol and smaller quantities of other alcohols, is used in the manufacture of synthetic rubber, and as a solvent for pyroxylin varnishes. Fusel oil is more poisonous than ordinary alcohol and has a more lasting effect. Amyl acetate is known as jargonelle pear oil and is used for flavouring purposes. Amyl valerate has the flavour of apples. Amyl nitrite when inhaled produces sudden dilatation of the blood vessels, and is used in medicine to relieve angina pectoris. See Alcohol; Rubber, Synthetic.

Amyloid or LARDACEIN (Gr. *amylon*, starch; *eidos*, form). Albuminoid formed in the disease known as waxy degeneration of the liver and spleen. It gives the same colour reaction with iodine as starch, and on this account Virchow named it amyloid. Vegetable amyloid is prepared from the cell wall of plants.

Amylopsin (Gr. *amylon*, starch; *opsis*, appearance). Name of a ferment secreted in the pancreas or sweetbread. It acts on starch in the process of digestion, converting it into maltose, a form of sugar.

Amyot, JACQUES (1513-93). A French ecclesiastic and scholar. Born Oct. 30, 1513, at Melun, he was educated at the universities of Paris and Bourges. He became tutor to the sons of Henry II of France and was made bishop of Auxerre. Except for the

Jacques Amyot,
French scholar

hostility of the Leaguers, who suspected him of complicity in the assassination of the duke of Guise, Amyot led a peaceful life, occupied with the affairs of his diocese and his famous translations of classical authors. These include Heliodorus's Theagenes and Chariclea, 1547; seven books of Diodorus Siculus, 1554; Plutarch's Lives of Illustrious Men, 1559 (on which North's translation, used by Shakespeare, was founded); and Plutarch's Morals, 1572. Amyot died Feb. 6, 1593.

Anabaptists (Gr. *anabaptizein*, to baptize again). Title of a fanatical Protestant sect that arose at Zwickau under the leadership of Thomas Münzer in 1520. The name was taken from one of their doctrines, which rejected infant baptism and required rebaptism in later life. Hence it has been applied occasionally to other sects which hold this particular tenet, and throughout the 16th century was used indiscriminately for all Protestants whose doctrines appeared to be subversive of ecclesiastical and political order.

The original Anabaptists held that the existing order ought to be destroyed and a new divine order substituted, which should do away with all inequalities and private property, ideas which developed into a negation of all moral laws. Münzer's doctrines helped to bring about the Peasant Revolt in Germany in 1525. He himself was put to death, but the Anabaptists were not suppressed. In 1533, led by John of Leiden, they took forcible possession of the town of Munster. John asserted that he was a king, the successor of David, and that his actions were dictated by heavenly visions. Polygamy and other excesses were practised. In 1535 the town was recaptured by the German prince-bishop and John and his chief followers were executed. As an actual sect the Anabaptists disappeared. See

Rise and Fall of the Anabaptists, E. B. Bax, 1903.

Anabasis (Gr., going up). Historical work by the Greek general and writer Xenophon. In 401 B.C. Cyrus the younger collected a force at Sardis in Asia Minor to attack his elder brother Artaxerxes, king of Persia. The backbone of this force consisted of some 10,000 Greek mercenaries under Clearchus, with whom Xenophon served as a volunteer. The force reached the interior, and gained a victory in the battle of Cunaxa, in which, however, Cyrus was killed. The Greek generals having been treacherously murdered by the Persians, the command devolved upon Xenophon. In a masterly retreat, famous as the Retreat of the Ten Thousand, he led his fellow countrymen through difficult and often hostile country back safely to the coast after a journey of five months. The sea was reached at Trapezus, the modern Trabzon. The style of Xenophon's narrative is conspicuous for its simplicity and directness. Anabasis is also the title of Arrian's account of the campaigns of Alexander the Great.

Anableps. Small fresh-water fish of the family of Cyprinodontids, found in Central and S. America, and remarkable for the structure of the eye which enables it to see both above and below the water. It swims on the surface, and the

eyes, which project strongly, are each horizontally divided by a band or partition into two parts for vision in the air and the water respectively. Hence its popular name of *cuatro ojos* or the four-eyed fish.

Anabolism (Gr. *anabolē*, anything thrown up). In biology, the chemical and physical processes involved in building up simple substances into complex ones by a living organism. The primary anabolic processes in plants are the syntheses of organic matter from inorganic substances. In all organisms the ultimate anabolic processes result in protoplasm. See Metabolism.

Anachronism (Gr. *ana*, back; *chronos*, time). Assignment of events or things or persons to a period earlier or later than that to which they actually belong. Literature abounds in examples of such mistakes in fact, especially in historical drama and fiction, owing to imperfect acquaintance with the more or less remote period dealt with or to mere carelessness.

Where the work is poetical and not primarily intended to give an historically exact picture of a period, mistakes of this kind are relatively unimportant. A far more serious mistake is made by those who insist upon strict accuracy in fact as a cardinal principle, but yet attribute to a period a style of language and a mode of thought which belong to their own time.

Anabasis. Map showing the march, generally called the Anabasis, of the Ten Thousand Greeks under Cyrus the younger, 401 B.C., from Sardis to Cunaxa, and the return, known as the Catabasis, to Trapezus, with the route thence to Pergamus, as described by Xenophon, who led the retreat

Anacoluthon (Gr. *anakolouthos*, not following). Inconsistent construction of a sentence, in which the writer or speaker passes from one form of construction to another before the first is complete. It is often deliberately employed for the sake of effect, but is more commonly the result of carelessness—e.g. having opened the window, the candle went out.

Anaconda. A snake of the python or boa family, a native of Brazil and Guiana. Brown in colour, with large black spots on the back and smaller ones with white centres along the sides, it is 25 to 30 ft. long one of the largest snakes in the world, certainly the largest in the American continent. It inhabits the forest rivers and preys upon animals and birds.

Anaconda. City of Montana, U.S.A., the co. seat of Deer Lodge county. It is 27 m. N.W. of Butte. The copper-smelting works of the Anaconda Copper Mining Co. are the largest in the world. They are

genuine extant fragments are distinguished by grace and charm, but lack depth of sentiment. At a much later date a collection of pieces, tasteless imitations of the real Anacreon, was published under his name. They were translated by Cowley and Moore, but are undoubtedly spurious.

Anacrusis (Gr. *ana*, up; *krouein*, to push). In prosody, an upward beat of one or more short, or unaccented, syllables before the beginning of the proper rhythm. Thus, if

He en | ded and | a bit | ter m | terval
be scanned

He | ended | and a | bitter | inter | val,
in the second example *He* becomes an anacrusis.

Anadyomene (Gr., rising). In Greek mythology, a name given to Aphrodite (Venus). It refers to her supposed birth from the foam of the sea. See *Venus*.

Anadyr. River of the Far Eastern Region of the U.S.S.R. Rising in the Yablonoi Mts., it

flows S.W. and then E. through a desolate, thinly populated region, collecting several tributaries in a course of nearly 500 m., and emptying in the Gulf of Anadyr. The gulf, which forms part of Bering Sea, is a resort of whalers. Anadyr is also the name of a town,

chief place of the Chukchi people.

Anaemia (Gr. *an-*, not; *haima*, blood). Although the term means strictly "absence of blood," it is usually applied to conditions in which there are deficiencies in the composition of the blood. Anaemia is not a disease by itself, but a symptom of abnormality elsewhere in the body. The modern tendency is to divide the anaemias into three classes, depending on the cause of the condition: (1) Anaemias due to failure or abnormality in blood-production; (2) anaemias due to abnormal loss of blood, e.g. following acute or chronic haemorrhage; (3) anaemias due to excessive destruction of blood, e.g. caused by infections or chemical poisons.

An example of the first class is seen in the simple anaemia of infants, which is due to deficiency of iron in otherwise healthy subjects. The anaemia usually starts gradually and is more common in premature infants and those of low

birth-weight. Children so affected are generally more susceptible to infections such as recurrent colds, diarrhoea, enteritis, etc. Treatment consists of administration of iron and attention to the diet.

In the 19th century one of the commonest anaemias affecting young females was "chlorosis." The disease generally begins between the fourteenth and seventeenth years and was frequently found among ill-fed girls who did not obtain sufficient fresh air and exercise. The improvement in living conditions and the more active and wholesome life led by women probably account for the disappearance of the disease.

The Liver Diet

The treatment of pernicious anaemia, a disease of adult life occurring most frequently above the age of 40, and affecting men and women alike, underwent a dramatic change in 1926 when Minot and Murphy discovered the effect of the liver diet. Pernicious anaemia, as understood at present, is a deficiency disease due to the lack of a specific substance found especially in liver. Isolated in 1948 and called by some scientists vitamin B₁₂, it is as specific in the treatment of pernicious anaemia as insulin is in diabetes. Symptoms of pernicious anaemia include gastro-intestinal disorders, nervous disturbances, and general weakness. Treatment consists in giving adequate amounts of the specific factor. It is no longer necessary to rely on the inclusion of fresh liver in the diet, as various dry extracts and solutions are available as well as preparations for injection. In 1929 it was demonstrated that dried hog's stomach was as valuable as liver, but this substance can be given only by mouth.

The anaemia associated with sprue, a disease occurring most frequently in tropical and sub-tropical countries, is also due to deficiency of the factor lacking in pernicious anaemia. Treatment is by adequate doses of liver extract. Another disease in which anaemia is a symptom, and which is caused by deficiency of an essential factor, is scurvy, the cause being lack of vitamin C.

Anaemias following haemorrhage may result from sudden or repeated loss of blood, from haemophilia, or from other causes. Anaemias due to increased destruction of the red cells of the blood often follow infections, e.g. malaria, or the absorption of a chemical poison such as lead.

Anaconda, a large snake of the python family, sometimes 30 ft. in length. It is a native of South America

principally fed by the Butte mines, also owned by the company. The giant stack of the smelter, one of the largest in existence, is the most conspicuous artificial object in the Deer Lodge Valley. Zinc, manganese and chrome are also produced, and other industries are iron and brass founding and the manufacture of railroad equipment and machinery. The city stands over 5,300 ft. above sea level. Pop. 11,004.

Anacreon (563–478 B.C.). Greek lyric poet. He was born at Teos in Ionia, and fled before the invading Persians to Abdera in Thrace. Later he lived at the court of Polycrates, tyrant of Samos, until 525, then under the Peisistratidae at Athens, and perhaps lastly in Thessaly. He is said to have died at the age of 85, choked by a grape-stone. He wrote in the Ionic dialect. His language is simple, like that of everyday life, and his themes are love, wine, dancing, and enjoyment. The

ANAESTHESIA: ITS ORIGIN AND USES

K. M. Woodruff, M.B., M.R.C.S

The history of the use of anaesthetics in surgery and particulars of the various drugs employed in producing a state of anaesthesia, general or local, are here reviewed. Consult also articles on Chloroform; Cocaine; Ether; Laughing Gas; Surgery, etc.

Anaesthesia (Greek, *an-*, not; *aisthēsis*, feeling) is the term used to describe a loss of feeling or sensation in the whole or part of the body. Anaesthesia may result from injury to, or disease of, the brain or nerves, but is generally understood to mean the condition produced artificially by means of certain drugs which are known as anaesthetics.

HISTORY. From the earliest times man has sought to assuage grief and pain by dulling consciousness. The different methods first employed were the inhalation of fumes from different substances, swallowing or injection of various drugs such as poppy or hyoscyamus or alcohol, or pressure applied to important nerves and blood vessels, or hypnotism. Homer in the *Odyssey* says: "Helen dropped into the wine a drug, an antidote of grief and pain to lull all sorrow and induce oblivion to all ills." Herodotus (c. 484-425 B.C.) told of the custom of inhaling the fumes of hemp (*Cannabis indica*) to produce intoxication. In the second century A.D. the physician Galen wrote of the power of mandragora to paralyse sensation and motion; and later, Lucian, the Greek writer, referred to the narcotic effects of mandragora. The Chinese were the first to use Indian hemp (hashish) to dull consciousness of pain.

The use of anaesthetics in the modern sense started in the middle of the 19th century. In 1772 Joseph Priestley (*q.v.*) discovered nitrous oxide, and in 1800 Sir Humphry Davy suggested the use of the gas as an anaesthetic; but it was not until 1820 that Henry Hill Hickman, a young physician, began to experiment on animals by causing them to inhale carbon dioxide and, later, nitrous oxide gas.

The discovery of anaesthesia proper introduces the names of four investigators in America: Crawford W. Long, of Georgia; W. T. G. Morton, of Hartford; Horace Wells, of Hartford; and Charles T. Jackson, of Boston. In 1842 Crawford Long performed the first painless operation under ether for a tumour of the neck, but did not publish the results. In 1844 Horace Wells had a tooth extracted under nitrous oxide

and he used this gas upon his patients with such good effect that he gave a demonstration at the Harvard University medical school. The exhibition, however, was a failure, and so disheartened him that he later committed suicide.

In 1846 W. T. G. Morton, a student under Wells, was familiar with the use of nitrous oxide, and while serving as a medical student under Charles Jackson, a chemist, was induced by the latter to use ether instead of nitrous oxide. Morton did so, and gave a successful demonstration at the Massachusetts general hospital. The method was brought to Great Britain the same year, the first operation under ether anaesthesia being carried out at University College Hospital, London, by Robert Liston.

Chloroform, which largely replaced ether for a time in Great Britain, was introduced by Sir James Young Simpson, an Edinburgh obstetrician, on the recommendation of Waldie, a chemist of Liverpool, as an inhalation for the relief of childbirth pains.

LOCAL ANAESTHETICS. The drugs are applied to, or injected into, or around the part to be operated upon. Extensive areas of the body can be anaesthetised in this manner, consciousness being retained throughout. In 1867 Sir B. W. Richardson introduced the ether spray with the object of freezing the affected part. Of greater importance was the introduction in 1884, by Karl Koller of Vienna, of the first local anaesthetic, cocaine, an alkaloid occurring in the leaves of *Erythroxylon coca*, a shrub native to South America. More recently, however, other less toxic drugs have been introduced, such as procaine, novocaine, nupercaine, amethocaine, eucaine, and stovaine, as well as other combinations such as quinine and urea.

Various techniques are employed for the administration of local anaesthetics, *e.g.* surface anaesthesia, in which the drug is applied to a mucous surface such as that of the eye, nose, throat, and genital organs; infiltration anaesthesia, which aims at paralyzing the nerve endings at the site of operation; and regional anaesthesia, in which the nerve trunk

supplying the sensory nerves in the area to be operated upon is affected by creating a block in the path of these nerves at a point remote from the field of operation. A more extensive type of block called spinal anaesthesia consists in the production of anaesthesia in the lower extremities and in the lower part of the body below the diaphragm by the injection into the sub-arachnoid space of the spinal cord of a drug which paralyzes the spinal nerves, as they enter and leave the spinal cord. This was first attempted in 1896 by August Bier, a Greifswald surgeon, but it was not brought into general use until 1906. The main disadvantage of spinal anaesthesia is that it may cause a severe fall in blood pressure. Freezing of small areas of skin with ethyl chloride spray is in common use, and larger areas, such as the limbs, can be rendered analgesic by refrigeration, in which crushed ice is packed round the limb.

BEFORE OPERATING. Drugs given to patients before operations have two main actions. They diminish the flow of mucus and saliva resulting from the use of some general anaesthetics, and they produce drowsiness, thus allaying anxiety. The drugs most commonly employed are morphine, atropine, and scopolamine (hyoscyne), given about an hour before operation. Scopolamine and morphine are the active agents in twilight sleep used for obstetrical analgesia.

BASAL ANAESTHESIA. It is now almost a universal practice to produce general anaesthesia by the combined action of a non-volatile narcotic with a volatile or gaseous anaesthetic. The former drug, termed a basal narcotic, is used to render the patient unconscious before the administration of the anaesthetic. The advantages of this method include absence of apprehension by the patient and a decrease in unpleasant after-effects, such as nausea and vomiting. Paraldehyde, introduced in 1884, is used chiefly with children. It is administered in a 10 p.c. solution in water and run slowly into the rectum at blood heat.

Avertin (tribromethyl alcohol), first used in 1926, is given in the same manner, the strength of the solution being 2½ p.c. Other basal narcotics include pernocton, amytal, nembutal, evipan, and pentothal (the last being most frequently used), and are usually given intravenously.

PROPERTIES. Nitrous oxide, N_2O ("laughing gas"), is the only inorganic gas capable of being used as an anaesthetic agent. Inhaled undiluted, it causes rapid but light anaesthesia and may be employed for short operations such as extraction of teeth. Longer periods of anaesthesia may be obtained by using a mixture of nitrous oxide with oxygen or air. With oxygen the gas is given by means of a special apparatus, such as the Boyle flowmeter machine.

Ether is a readily volatile liquid, and is largely used at the present time, especially in combination with nitrous oxide and oxygen. It may be given by the "open drop" method or by means of an inhaler. In the former method ether is dropped at a suitable rate upon a gauze mask held close over the nose and mouth, the face and eyes being protected by a pad of cotton wool.

Chloroform, like ether, is usually given by the open method. It is, however, rarely given alone, but is sometimes added to nitrous oxide and oxygen. It is a powerful anaesthetic, but because of its toxicity it is associated with risk to the patient.

In certain operations, e.g. on the head and neck, the method of endotracheal anaesthesia may be used, the anaesthetic being delivered to the lungs by a tube passed through the nose or mouth into the trachea.

Of the more recently introduced anaesthetics, ethylene, acetylene, and cyclopropane are gases, and can be used in the same way as nitrous oxide. Ethylene is an unsaturated hydrocarbon of the olefin series, with a slightly sweet taste and a rather pleasant smell. It is used to a certain extent in America but not at all in Great Britain. Acetylene is a colourless explosive gas with a faint ethereal odour when pure. It has been extensively used in Germany under the name of narycylen, in combination with oxygen. Cyclopropane, or trimethylene, was first prepared in 1882 by Freund,

Anaesthesia. Boyle's gas anaesthetic apparatus with Coxeter-Mushin carbon dioxide absorber
A. Charles King, Ltd.

and is now extensively used. It is a colourless gas, heavier than air, with a characteristic odour. It is administered by means of a closed-circuit apparatus which allows the gas to be re-breathed over and over again. Trichlorethylene (CCl_2CHCl) is a colourless, sweet-smelling, volatile liquid. The drug is now increasingly used as an anaesthetic in Great Britain.

THE SECOND GREAT WAR. Anaesthetics played an important part in the Second Great War, as in the First, by permitting the performance of essential operations that saved many lives and limbs. Experience gained during air raids and under Service conditions has once again emphasised the sensitiveness to anaesthetics of badly shocked patients. Experience gained after Pearl Harbour, however, emphasised the value of ether, given by the open drop method, notwithstanding the variety and severity of casualties. Many anaesthetists prefer to use nitrous oxide and oxygen, and to add cyclopropane instead of ether to deepen the anaesthesia. In circumstances in which inhalation methods cannot be used, the intravenous barbiturates, such as pentothal sodium, are most successful.

Fatalities due entirely to the employment of overdoses of

anaesthetics are extremely rare. In spite of the enormous number of persons anaesthetised every year, the number of deaths reported to the coroner is exceedingly small. In many instances it may be most difficult to determine the cause of death, as factors such as the state of health of the patient, the severity of the injury, or the gravity of the operation have to be taken into account and are often of more importance in the causation of death than the administration of the anaesthetic itself.

Bibliography. Theory and Practice of Anaesthesia, M. D. Nosworthy, 1935; Triumph over Pain, R. Fulop-Miller, 1938; Pharmacological Basis of Therapeutics, Goodman and Gilman, 1941; Recent Advances in Anaesthesia and Analgesia, C. L. Hewer, 1944.

Anagni. Town of Italy in Frosinone prov. It stands on a hill 1,500 ft. above sea level, and is 46 m. by rly. E.S.E. of Rome. The chief city of the ancient Hernici and a bishopric since 487, it possesses an 11th century cathedral, an early 12th century town hall, and remains of ancient walls. It was the birthplace of four popes and the scene of Adrian IV's death. During the Allied advance through central Italy in the Second Great War the town was liberated from German occupation by troops of the British 8th army on June 3, 1944.

Anagram (Greek *ana*, back; *gramma*, anything written). Word, phrase, or sentence made up of all the letters forming another word, phrase, or sentence, as in the instances: Matrimony, "Into my arm"; Florence Nightingale, "Flit on, cheering angel." An old scholastic example is that of Pilate's question *Quid est veritas?* (What is truth?), turned into *Est vir qui adest* (It is the man before you). The anagram has been used by several authors in devising pseudonyms, notably by François Rabelais, who turned the letters of his name into "Alcoffibras Nasier." In modern times the device has become familiar through its regular use in "cryptic" clues to cross-word puzzles.

Anaheim. City of California, U.S.A., in Orange Co., 25 m. by rly. S.E. of Los Angeles. It lies in a fruit-growing plain irrigated from the Santa Ana river. The earliest S. Californian settlement, due to cooperative purchase by some Germans in 1857, it was incorporated 1870 and chartered 1888. Pop. 11 031.

Anahuac. Name by which the great central plateau of Mexico is known, formerly applied to the ancient kingdom of Mexico. The region extends between the Rio Grande in the N. and the isthmus of Tehuantepec in the S., and was extensively covered by lakes, hence its name, meaning amid the waters.

Anaitis. Iranian goddess, sometimes called the Persian Artemis. The name is the Greek form of the Persian Anahita. The goddess of fertilising waters, she passed into Mazdeism, and was described in the Avesta. She was invoked in aid of marriage and childbirth, and the Persian Artaxerxes Mnemon erected images of her throughout his empire. Her cult spread to Armenia and Asia Minor.

Anakapalle. Town of Madras, India. It is 18 m. S.W. of Vizagapatam, on the rly. to Rajahmundry, has a trade in agriculture, and exports sugar, cotton, etc. Pop. 20,360, mostly Hindus.

Anakie. Mining village in Springsure district, Queensland, Australia, 193 m. W. of Rockhampton, on the rly. to Longreach. The very small population is interested in the mining and cutting of sapphires and the mining of corundum, valued as an abrasive.

Anakim OR **ANAKIMS.** Giant race who inhabited the hill country of Hebron, S. Canaan. They were overthrown by Joshua and Caleb (Num. 13; Josh. 11, 14, 15; Judg. 1). They are regarded as Cushite wanderers from Babel.

Analcime OR **ANALCITE** (Greek *an-*, not; *alkē*, strength). Hydrous metasilicate of sodium and aluminium. It usually occurs in well-formed colourless or white crystals of regular growth belonging to the cubic system. It is commonly a secondary mineral, a member of the zeolite group, and occurs like other zeolites filling amygdaloidal cavities in basalt lavas, such as those of the Faroe Islands, Antrim, the West of Scotland, Iceland, and Greenland. As an original constituent of igneous rocks, it is the latest product of consolidation in certain basalts (analcime-basalts and teschenites) and in the monchiquites (*q.v.*).

Analgesia (Gr. *an-*, not; *algēsia*, feeling of pain). Medical term denoting specifically loss of sensibility to pain without loss of the sense of touch. Analgia is a variant.

Analogy (Gr. *ana*, up to; *logos*, proportion). A certain similarity in things in other respects unlike. In language, it creates forms and even alters whole words after the model of others already familiar. Biological analogy is resemblance in function, not in form. In logic,

it is a process of reasoning in which it is assumed that if two or more things possess similar essential, non-contingent attributes, their other attributes will probably be similar. This method of reasoning is an incomplete induction, and its degree of certainty will vary with the number and importance of the similar attributes.

In theology, the argument from analogy is mainly of use for apologetic or evidential purposes. Proof of the existence of God, or of the truth of any particular religious doctrine or system of doctrines, cannot be demonstrated mathematically. The most that can be reached is a degree of probability that amounts to a moral certainty, and not only justifies but reasonably demands acceptance of a doctrine or compliance with a precept.

In the department of nature, where we have the evidence of sight and of the other senses, what we are in the habit of regarding as certainties often only amount to overwhelming probabilities. The world has seen the sun rise every morning throughout its history, and it is convinced that it will rise again to-morrow morning as usual. Such a conviction is justified by experience, but it does not amount to absolute certainty.

So in the realm of spiritual things, where the direct evidences of the senses are not available, where experience is less than universal and uniform, and where we deal with matters which belong to a plane only partly within our knowledge, it is vain to seek demonstrative proof. We can only find such a degree of probability as will exclude reasonable doubt, and afford a sufficient ground for belief and practice; and in the establishment of such a degree of probability, analogy plays a large and important part.

Analogy of Religion, THE. A treatise on the philosophy of religion, by Joseph Butler, bishop of Durham. It was published in 1736 with the title of *The Analogy of Religion, both Natural and Revealed, to the Constitution and Course of Nature*. It was based on the statement of Origen: "He who believes the Scriptures to have proceeded from Him who is the author of Nature may well expect to find the same difficulties in it as are found in the constitution of Nature." A whole literature of exposition and comment has grown up around *The Analogy of Religion*. See Butler, Joseph; consult also *Studies Subsidiary to the Works of Bishop Butler*, W. E. Gladstone, 1896.

Analysis (Gr., decomposition). Separation of any whole into the parts of which it consists. Its correlative is synthesis (putting together), without which it is incomplete. Thus, to obtain the true conception of a tree, it is necessary to consider separately its trunk, branches, leaves, etc., and then to put them together to form a whole. Grammatical analysis is the formal splitting of a sentence into its functional components, *i.e.* subject, predicate, object, etc.

Analysis. In chemistry, term implying the determination of the composition of a substance, or the quantity of extraneous matter present. If only the elements present are identified, the analysis is said to be qualitative, but if the quantities are determined, the process is termed quantitative. In the case of quantitative analysis, this is either gravimetric or volumetric, according as the components are weighed or measured.

Analysis is applied to a great variety of substances, but it is well to recognize that many important vegetable compounds are not amenable to accurate chemical analysis. Students are taught to analyse mixtures of chemicals by observing the physical characters of the compound and carrying out in a definite order a series of tests. In the case of the analysis of food, the analyst applies tests to ascertain whether it conforms to certain well-defined characteristics which experience has taught to be those of a pure article. See Chemistry.

Analysis. In mathematics, term employed to denote the process by which a problem is reduced to its simplest elements. It is more specifically applied to those branches of mathematics which investigate the relations of variable or indeterminate quantities by means of symbols. Thus analytical geometry investigates the character of lines, curves, and surfaces, by the employment of algebraic symbols. The process is carried farther in some branches of the infinitesimal calculus. Harmonic analysis is a mathematical method by which irregular agglomerations of quantities can be reduced to forms in which they show themselves amenable to grouping. Thus harmonic analysis applied to a vast number of statistics, such as statistics of rainfall, is used in attempts to discover a law governing the figures.

Analysis. In music, term used for the species of study concerned with the details of the construction of a composition. Such are its phrase building, its

harmonic or contrapuntal texture, its broader design, and the relationship of section to section.

Analyst, Public. Person appointed by a local authority—county or town council in Great Britain—under the provisions of the Food and Drugs Act, 1938. Public analysts have to possess "competent knowledge, skill, and experience as analysts of all articles of food and drugs." The appointment, terms of appointment, and removal of public analysts require the approval of the ministry of Health. Where there is only one public analyst a deputy may be appointed. Every person appointed as a public analyst must either already hold such an appointment or hold the diploma of the Fellowship or Associateship of the Royal Institute of Chemistry and a certificate from the Institute after an examination in the chemistry (including microscopy) of food, drugs, and water. The ministry of Health may approve other qualifications. A deputy public analyst must be similarly qualified.

It is especially provided in the Food and Drugs Act that the analyst must not be engaged directly or indirectly in any trade or business connected with the sale of food or drugs in the place for which he is appointed. It is usual to pay a fixed annual salary or retaining fee to an analyst and a separate fee for each analysis made, the terms varying with different public authorities.

Any private individual who has purchased a food or drug is entitled to submit it to the public analyst for the place where the purchase is made, and to receive a certificate of the result of his analysis, on payment in advance of a fee not exceeding £1 15s. Private individuals who take samples for analysis, or officials entrusted with that duty by local authorities, are required, after completing the purchase, to observe strictly the formalities of dividing the sample into three parts, sealing them up, and leaving one part with the seller if required to do so. The form in which the analyst's certificate must be made out is prescribed by the ministry of Health, and this certificate is accepted as evidence where prosecutions result. In case of dispute the reserve samples are submitted to the Government before the case is decided. The public analyst may be called to give evidence as to his analysis, and he is required by law to make quarterly

reports of the number of articles analysed by him. The report is made to the local authority.

The Society of Public and Other Analysts, founded in 1874 as the Society of Analysts, was incorporated as a limited company under its present name in 1907. Originally concerned only with the efficiency of food adulteration laws and improvements in the methods of detecting adulterations, its researches are now extended to deal with the inorganic side of analytical chemistry. The society publishes a monthly journal, *The Analyst*. The offices are at 7-8, Idol Lane, London, E.C.3.

Anamalai Hills OR **ELEPHANT HILLS**. Mt. range in Travancore, S. India. Part of the W. Ghats, these hills form a great tableland from 2,000 ft. to 8,000 ft. high and contain Anamudi (elephant forehead), 8,850 ft., the highest peak in S. India. An important station in the forest service, Mount Stuart, is situated in the midst of a dense bamboo jungle. The elephant, bison, and ibex abound, elephants being caught in pits and tamed; on the lower hills teak, tea, and coffee are grown.

Anamalai University. Founded 1928, at Anamalinagar, in the Madras presidency (now a prov.), it was formed from the Sri Minakshi college for higher instruction in English, the Sri Minakshi Tamil college, and the Sri Minakshi Sanskrit college, all long maintained by Rajah Sir S. R. M. Anamalai Chettiar of Chettinad. The government of Madras added to the endowment a sum equivalent to that given by the rajah.

Ananda MAHDOL (1925-46). King of Siam (Thailand). Born Sept. 20, 1925, he ascended the throne as constitutional monarch on March 2, 1935, on the abdication of his uncle Prajadhipok. He was at school at Lausanne, Switzerland, at the time, returning there after his coronation in 1938. A council of regency governed in his name (1941-45, under the control of the Japanese). On June 10, 1946, he was found dead in his Bangkok palace, and later it was officially announced that he was the victim of either suicide or assassination.

Ananias. The name of three persons mentioned in the Acts of the Apostles. (1). A convert who made a false declaration concerning the sale of a piece of land for the church; he and his wife Sapphira fell dead before the rebuke of Peter (Acts 5). (2) A disciple at Damascus to whom

Christ appeared in a vision and directed him to baptize Saul of Tarsus, who was afterwards known as Paul (Acts 9 and 22). (3) The Jewish high priest who was one of Paul's accusers before Felix (Acts 23-24). The first-named is the one most often referred to, his name having become a synonym for liar.

Ananiev. Town of Ukraine S.S.R., in the Moldavia A.S.S.R. It stands on the Tiligul, 95 m. N. of Odessa, and its chief industry is connected with agricultural produce. Pop. 20,000.

Anapaest (Greek *ana*, back; *paiein*, to strike). In prosody, a trisyllabic foot consisting of a long, or accented, syllable preceded by two short, or unaccented, syllables. It is so called because it is a dactyl reversed. Although the English language contains few words that are anapaests—domineer is an example—anapaestic verse, especially the anapaestic tetrameter, has established itself firmly in English literature. William Walsh (1663-1708) was one of the first to use the form, of which most effective use has been made by many poets, notably by Swinburne. An example of this measure is to be found in Wordsworth's poem beginning: At the corner of Wood Street when daylight appears. See Poetry.

Anaphylaxis (Gr. *ana*, back; *phylassein*, to guard). Medical term applied to the condition of exaggerated susceptibility, or sensitisation, to the action of an injected (albuminous) substance following a first injection of the same substance. The effect has been observed following antitoxin injections including blood serum. If the injections are given daily or weekly no sensitisation occurs, but an interval of 12 to 14 days between injections may result in anaphylactic shock, a dangerous condition in some cases. It is avoided by desensitising the patient by injecting a small dose of serum subcutaneously some hours before the antitoxin serum. It is thought to be due to the reaction of a protein foreign to the human organism. See Allergy.

Anarchism (Gr. *an-*, not; *archē*, rule). Revolutionary doctrine in opposition to all law and order as enforced by a government. In its original sense the Greek word anarchy meant no government whatever, and it is so used today.

Anarchism, however, is held by its more intelligent advocates to be a system of voluntary government not relying on the sanctions

of the state. It is rather a movement directed towards destroying the tyranny of the state and giving fuller play to natural economic forces and the principle of mutual aid. This, it is thought, would produce a state of society in which social order would rest not on repression, but on goodwill. In this sense anarchism is the antithesis of socialism, which implies more rigorous government. This line of thought owes much to the French thinker Proudhon and the Russian Bakunin, and was developed by Prince Kropotkin. Anarchism and socialism are in agreement that land and capital are to pass from private ownership. History gives no support to the theory of anarchism, except possibly for a small community. Although the philosophy of anarchism is not concerned with violence, its supporters generally are avowed advocates of forcible methods and of propaganda by deed. Before the First Great War anarchist societies were common in Europe, especially in Russia and Spain, and also in the U.S.A., while the trade unions of Italy and France were anarchist rather than socialist. After the war, up to and during the Spanish civil war of 1936-39, the anarchist organization in Catalonia, the *Federación Anarquista Ibera*, was a power in Spanish political life on the extreme republican side. In Spain and elsewhere anarchism has shown marked affinity with Syndicalism (*q.v.*). Small anarchist groups have existed in England since 1885. *Consult* Anarchy, P. A. Kropotkin, Eng. trans. 1897.

Anastasius. Name of four popes. Anastasius I, pope 398-401, is chiefly remembered for his condemnation of certain points in the teaching of Origen. He was canonised and his feast is kept on April 27. Anastasius II, pope 496-8, sought in vain to reconcile the Eastern and Western churches. Both Anastasius III, 911-13, and

Anastasius IV, 1153-4, were undistinguished.

Anastasius I (c. 430-518). East Roman emperor. Born at Dyrachium of humble parentage, he became a palace usher and in 491 succeeded Zeno, whose widow Ariadne he married, as emperor, changing his name from Silentiarius to Anastasius. In 493

Anastasius I. This ivory diptych commemorates the consulship of Anastasius, a court official who was later appointed successor to the emperor Zeno, and ruled the Eastern empire with conspicuous success

British Museum (cast)

he defeated Zeno's brother Longinus at Cotyaeum (Kutaya), and in 506, after a three years' war, made peace with Persia. In 512 he built the long wall, called after him the Anastasian wall, to protect Constantinople from Bulgar and Slav raids.

Anastasius II (d. 721). East Roman emperor, originally named Artemius. He was secretary to the emperor Philipppicus Bardanes, whom he succeeded in 713. A mutiny at Rhodes in 716 resulted in his deposition in favour of a tax-gatherer, Theodosius, who was succeeded by Anastasius's former general, Leo the Isaurian. In 721 Anastasius, who had lived

for five years as a monk at Thessalonica, besieged Constantinople, but was captured by Leo and put to death.

Anastigmat. Lens for photography free from the defect of astigmatism (*q.v.*). Anastigmats, first introduced in 1892, yield photographs of great sharpness, utilise a great amount of light, and cover a relatively large plate. In these respects they proved to be superior to any previous type of lens. *See* Photography.

Anastomosis (Greek, mouth opening). In anatomy, the union or communication of blood vessels in the form of a fine network. The term is also applied to operations in which nerves or the bowel are joined up. Arterial anastomosis is of practical importance because if one artery is blocked, either by injury or by a ligature, its branches can be supplied with blood through those of another artery.

Anatase (Gr. *ana*, back : *temnēn*, to stretch). Oxide of titanium. It is of the same composition as rutile and brookite, but differs from them in crystalline form. It occurs as small tetragonal pyramids and tables, and as brilliant crystals, like diamonds, from Brazil. In the form of microscopic crystals it is of common occurrence among the heavier constituents of most sands and sandstones.

Anathema. Greek word used in the Church in passing sentence of excommunication. Its literal meaning is "something set up," and it was originally applied to gifts to the gods or to animals designated for sacrifice. In the latter connexion it gained its later meaning of condemned to destruction, and it is in this sense that S. Paul uses the term : "If any man love not the Lord Jesus Christ, let him be anathema" (1 Cor. 16).

Anatolia. The late Greek name (Anatolē, the East) for Asia Minor (*q.v.*). It was revived by the Turks, who called it Anadoli.

Anatolian Railway. Railway in Asiatic Turkey. Beginning on the outskirts of Uskudar (Scutari), on the Bosphorus opposite Istanbul, it traverses the whole of Asia Minor. The first portion to Izmit, along the shore of the Sea of Marmara, was opened in 1872. In 1889 building to Eskişehir commenced, and largely at the persuasion of the German emperor the line was soon extended E. to Angora (now Ankara) and S.E. to Konieh, the branches being opened respectively in 1892 and 1896. From Afyon Karahissar on the S.E. branch, connexion was

secured with the Izmir group of rlys. by means of a line to Alashehr. In 1902 the Turkish government gave powers to what was practically the Anatolian Railway, otherwise the Deutsche Bank, to construct a line from Konieh through Adana to Iraq and the Persian Gulf.

Anatomist, THE. Play by James Bridie. Produced on Oct. 7.

ANATOMY: STUDY OF BODY STRUCTURE

Sir Arthur Keith, F.R.S., Author *The Engines of the Human Body*

In this article is given an account of what the science of anatomy is, and of the branches into which it is divisible. Its information should be supplemented by reference to articles on such special subjects as Embryology; Osteology; Morphology; Surgery; etc.

Derived from the Greek *anatemnein*, to cut up, the word anatomy is applied to the scientific study of the bodily structure of man and other animals. It has also been described as the art or practice of dissection, as it is only by dissecting the body that the necessary knowledge about the structure of its parts is obtained.

Study in the Dissecting Room

Every medical student, when he enters the dissecting room to study the structure or anatomy of the human body, carries with him two things essential for his outfit—a dissecting case containing a knife, forceps or pinchers, scissors, and hooks, and a dissecting manual or text-book of practical anatomy, to guide him in exposing, recognizing, and separating the various structures, organs, and tissues which make up the human body. In the dissecting room he finds a demonstrator of anatomy to assist him in the difficulties which he is certain to encounter, while in the neighbouring lecture theatre a professor of anatomy explains to him the parts of the body, according to the systems in which the parts are built up, i.e. according to systematic anatomy.

The systems of the body are (1) the alimentary system or the parts and organs which have to do with the mastication, transmission, digestion, and absorption of food; (2) the absorbent or lymphatic system, which is concerned in conveying to the blood certain products absorbed from the alimentary system and also waste products from the tissues which compose every part of the living body; (3) the respiratory system, comprising the lungs and breath passages, by which oxygen enters the body and the waste gas—carbon dioxide—is thrown out; (4) the circulatory system, made up of a muscular pump—the heart—which forces blood containing oxygen and the nutrient needed

1931, on the opening of the Westminster Theatre, where it ran for 127 performances, it portrayed the sinister Dr. Knox, the Edinburgh surgeon who lived at the beginning of the 19th century. Knox was supplied by the professional murderers Burke and Hare (*q.v.*) with corpses which he used for surgical dissection. The part was played by Henry Ainley.

by living tissues along arteries into a system of minute vessels or capillaries, from which the living tissues are fed; while from the capillaries the blood, laden with waste products from the tissues, particularly carbon dioxide, passes into veins, by which it is conveyed back to the heart, (5) the locomotive system, comprising the numerous muscles of the limbs, trunk, and face, which give living beings a power of moving one part upon another; the bones or skeleton, which serve as levers to the muscles and give support, solidity, and protection to the body; and the joints, where bones come in contact and move on each other. Muscles are yoked to the bones by tendons or sinews; ligaments are the fibrous bands which unite bones and surround joints; cartilage or gristle is the substance or tissue which covers the rubbing or articulating ends of bones or, as in the front part of the chest, may actually replace bone, where flexibility in place of rigidity is needed; (6) the nervous system, which comprises the brain, spinal cord, nerves, and organs of sense, such as the eye, the ear, the nose, the tongue, and the palate. In this system must also be included the skin, which not only serves as an organ of sense, but also protects the body and helps in regulating its temperature.

Practical and Systematic Anatomy

When the student leaves the dissecting room and lecture theatre and proceeds to the wards and operating theatre of the hospital, he applies his knowledge of practical and systematic anatomy to the recognition and treatment of diseased conditions. He studies the anatomy of the human body in order to be able to assist in preventing a breakdown or repairing a defect.

Besides human anatomy, there is another applied branch, veterinary anatomy; this includes a

knowledge of the structure of domestic animals, such as that of the horse, ox, and dog, and has to be mastered by all students of veterinary medicine. Artistic anatomy is another branch of knowledge, in which the structure of the human or animal body is studied in order that the artist may rightly interpret and delineate the external form of the living body in its various postures. (*See Drawing.*)

No doubt physicians were the first to study anatomy, but in the 4th century B.C. inquiring men like Aristotle found it necessary to dissect animals and study the plans on which their structures were arranged before it was possible to discover the affinity of one kind of animal to another. Hence began that great branch of knowledge known as comparative anatomy, but it was not until the close of the 18th century that it was rightly cultivated. At that time naturalists, stimulated by the example of the French anatomist Cuvier, set out to classify all living animals into groups, not according to their external appearance, but in accordance with their internal structure or anatomy. Then, in the middle of the 19th century, appeared Charles Darwin, who explained by his theory of evolution why certain animal groups should show varying degrees of community of structure because they are related in a varying degree by descent.

Founder of Functional Anatomy

Before Cuvier's time John Hunter, the greatest anatomist that Britain has produced, dissected animals, not to classify them, but to understand the mechanism of their bodies. He is the real founder of what is known as functional anatomy. Morphology is the study of the architecture of the animal body; it is the opposite of functional anatomy, for in this study no reference is made to function, only to form. The study of comparative anatomy showed that the discovery of a single bone was sufficient to give a clue to the kind of animal of which it had formed a part. Hence it became possible to reconstruct from fossilised bones the complete form of an animal which had lived on the earth or in the sea many millions of years ago. The study and reconstruction of extinct animals form that branch of knowledge named palaeontology.

Two other branches of anatomy remain to be mentioned, both of them of recent growth. One is microscopic anatomy and the other embryology—or the study of the structure and growth or developing of foetal forms of animals. The

present state of microscopic anatomy is the result of a century of endeavour and experiment. We have learned to treat soft tissues of animal bodies with chemicals so that they become fixed and solid, and how to permeate small parts of such tissues with a solid substance so that they can be cut into slices of the utmost thinness. Instruments called microtomes have been invented to shave off slice after slice of uniform tenuity; dyes have been discovered which pick out each element by a distinctive colouring; microscopes have been improved so that any degree of magnification of the cells or elements which compose the tissues can be obtained; methods have been devised of modelling in wax a magnification of each microscopic section of the part cut, and thus, by adjusting and fixing the wax magnifications together, a reconstruction on an enlarged scale can be obtained of minute organs or of small parts of great organs. In the same way the minute, soft gelatinous embryo can be exactly reproduced as an enlarged wax model. The method is laborious, but the results yielded are final.

Artistic anatomy is the study by painters, sculptors, etc., of the superficial aspects of the body, human or animal. Study is usually confined to the skeleton and the appearance of surface muscles in repose or action.

Bibliography. Manual of Anatomy of Vertebrated Animals, T. H. Huxley, 1871; Human Embryology and Morphology, Arthur Keith, 5th ed. 1933; Text-book of Anatomy, D. J. Cunningham, 7th ed. 1937; Anatomy, Descriptive and Applied, H. Gray, 27th ed. 1938; Anatomy of the Human Skeleton, J. E. Frazer, 4th ed. 1939.

Anatomy of Melancholy, THE. Literary work by Robert Burton. It was first published in 1621 as *The Anatomy of Melancholy. What it is. With all the Kinds, Causes, Symptoms, Prognostics, and several Cures of it. In Three Main Partitions, with their Several Sections, Members and Sub-Sections.* Philosophically, Medicinally, Historically opened and cut up. By Democritus Junior. The characteristic fullness and verbal richness of the work, which embodies quotations from authors of all ages, reflects Burton's unique individuality. There were seven further editions before the close of the 17th century, and many good modern editions have been published.

Anau. Delta-oasis near Ashkabad, in Turkmen S.S.R. Two prehistoric kurgans or tumuli were excavated by H. Schmidt, 1904,

Anatomy. Front and back views of skeleton, with the terms used in anatomy for indicating the various bones that build up the human frame

for the Pumpelly expedition of the Carnegie Institution, Washington. The N. kurgan yielded animal remains and hand-made pottery, allied to the Neolithic levels in Elam and elsewhere, and passing into the Copper Age. Metal-using was more fully developed in the S. kurgan, where terra-cotta votive figurines and wheel-made pottery suggest Sumerian contact. The lower strata revealed cultivated wheat and barley, and wild animals, succeeded by the domesticated ox, pig, horse, and sheep; the upper strata added the goat, dog, and camel. *See* Domestication.

Anaxagoras (c. 500–423 B.C.). Greek philosopher. Born at Clazomenae in Asia Minor, he settled at Athens, where he found an influential patron in Pericles. Whereas older philosophers had endeavoured to reduce the material universe to one element, such as fire or water, Anaxagoras held that the universe was composed of an infinite number of seeds of the different kinds of matter. In the beginning these seeds were in a

state of chaos, but with the advent of *nous*, or intelligence, a rotatory impulse was given to the mass, as a result of which all cognate seeds gradually came together to form the different substances.

His speculations brought Anaxagoras into conflict with the forces of orthodoxy at Athens. His suggestion that the sun and moon were not divinities, but merely fiery lumps, was condemned as atheistic, and he was forced to leave the city. He died at Lampsacus in Asia Minor.

Anaximander (c. 610–547 B.C.). Greek philosopher. Born at Miletus in Asia Minor, he was the friend of Thales and lived for many years at the court of Polycrates of Samos. He held that all the material substances which make the universe are derived from one element—which he called *apeiron*, or indeterminate matter—which contained and governed all things, being itself immortal and imperishable. He is also credited with various inventions, e.g. a sundial and celestial globe.

Anaximenes. A Greek philosopher who flourished in the 6th century B.C. Born at Miletus in Asia Minor, he held that all the substances of which the material universe is composed are derived from one natural element, air, as the result of its rarefaction and condensation.

Anbury. Name of a parasitic turnip disease. *See* Club-root.

Ancash. Coastal department of Peru. It is S. of Libertad and N. of Lima and extends E. to the Marañon river. It is governed by a prefect, responsible to the Peruvian supreme court of justice. Mainly mountainous, it is rich in minerals, including gold, silver, copper, lead, tin, and antimony, and grows cereals in its irrigated valleys. Area, 14,700 sq. m. Pop. 424,975. Capital, Huaraz.

Ancaster, DUKE and EARL OF. English titles, that of Duke of Ancaster and Kesteven being held

First Earl of Ancaster Second Earl of Ancaster

by the family of Bertie 1715-1809, and that of earl of Ancaster by the family of Heathcote-Drummond-Willoughby since 1892. Robert Bertie (1660-1723), 4th earl of Lindsey, was made a marquess and then duke of Ancaster, and the title was held by his descendants until the 5th duke died in 1809. He also held the old barony of Willoughby de Eresby, and in 1871 this was revived in favour of the widow of Lord Aveland, that lady being descended from the Berties. Her son and successor, Gilbert H. Heathcote-Drummond-Willoughby, was made earl of Ancaster in 1892, his son Gilbert (b. 1867) succeeding him in 1910. The earl is joint hereditary great chamberlain of England, an office held by the dukes of Ancaster.

Ancestor-worship. Expression in ritual of reverence for departed ancestors, parental or remote. It should be distinguished from the general cult or tendence of the dead, which is a widespread concomitant of animism. This cruder cult, traceable to prehistoric Europe, has profoundly affected the methods adopted by mankind for the disposal of the dead. It was designed to keep the ghost away, and much so-called ancestor-worship is no more than this, in-

volving no idea of propitiation. Cooked rice and coconut milk are offered by the Veddas to the spirits of the recently deceased; in the Solomon Islands miniature huts are built for ancestral skulls. Death cults of this order are observed by half the human race.

In its stricter form ancestor-worship belongs to a later culture, when settled husbandry and patriarchal rule first developed outstanding men. It is this aspect of it that makes the Bantu practice more advanced than that of the W. African negroes, who do not deify their ancestors. In this form, too, it dominated early Greek religion, with its deification of heroes. It persisted as a private worship in imperial Rome by the side of the national polytheism, and was converted, in early Christianity, to devotion to the saints. Its chief home to-day is China, where the motive is filial piety rather than the hope of objective benefits. *See* Animism.

Anchises. In Greek legend, ruler of Dardanus in the Troad. By his beauty he attracted the goddess Aphrodite, who became by him the mother of the Trojan hero Aeneas (q.v.). In the story in Virgil's Aeneid the aged Anchises was carried off by his son after the fall of Troy, and died in Sicily.

Anchor (Lat. *ancora*, a hook). Implement of iron or steel attached to a cable and thrown overboard to hold a ship stationary. A

large ship will carry several anchors—bower, sheet, stream, waist, and spare anchors. The sheet anchor is presumed to be the best and to be used only in case of emergency. Hence the popular expression, "to be the sheet anchor of," meaning to be the mainstay of any person or thing. Modern ships' anchors are mostly stockless. Types of small anchors are the grapnel, which has several flukes, used for dragging, and in olden times employed for grappling ships, the kedg, and the killick. A sea anchor is made of wood and canvas and acts as a brake upon a ship. By "shoeing the anchor" is meant covering its flukes

with wood so as to make them hold better in soft ground.

Anchorage. Place where ships can lie safely at anchor; usually a bay or a sheltered roadstead. By anchorage is sometimes meant the dues which vessels have to pay for mooring in a haven.

Anchor Ice. Ice formed on the bed of a stream. The waters of a stream are mechanically mixed by continual movement, so that when the air temperature is very low the whole mass is occasionally reduced to freezing point. In these conditions anchor or ground ice would be formed on the bed, where there is less movement than at the surface. This ice usually clings to stones and other loose bodies. When an increase of temperature occurs, the ice rises to the surface and floats away, carrying with it the loose matter frozen into it. In the Baltic Sea ice formed in this manner has been known to raise even heavy iron chains and anchors. The phenomenon has been frequently observed in the Thames.

Anchorite (Greek, *anu*, back; *chorein*, to retire). One who retires from the world and lives apart for religious meditation. Anchorites arose about the 3rd century in Egypt, where at one time some thousands lived in the deserts. In later days the anchorite or anchoress usually occupied a cell or small house connected with a church. *See* Asceticism.

Anchors of different types: 1. Admiralty pattern. 2. Close stowing anchor. 3. Mushroom anchor, used for lightships. 4. Stockless anchor. Types 1, 2, and 4 are used in the Royal Navy. 5. Grapnel, used from small boats

Anchor Line. British steamship company. The first Anchor Line originated in a service established in 1852 between the Clyde and Portuguese and Spanish ports. Additional services began some years later between Glasgow and New York, and from Glasgow and Liverpool to Bombay and Calcutta. In Dec., 1911, a controlling interest in the Anchor Line was acquired by the Cunard Steamship Co., Ltd. In 1916 an agreement was concluded for a fusion of interests of the Anchor and Donaldson Lines in passenger and freight service between Glasgow and Canada. The original Anchor Line Company went into liquidation in 1935 and a completely new company, with new shareholders, Anchor Line (1935) Ltd., was formed. The date has since been dropped from the title.

Anchor Line vessels lost as a result of enemy action during the Second Great War included the *Caledonia* (renamed *Scotstoun*) and *Transylvania*, 17,000-ton vessels built in 1925. Both were sunk in 1940.

Anchovy (*Engraulis encrasi-cholus*). Small fish of the herring family. It is found in abundance in the Mediterranean. It occurs more or less around all the European coasts, except in the extreme north, and is not uncommon off Cornwall and Devonshire. It is characterised by a deeply forked

Anchovy, a small fish of the herring family, common in European waters

tail and a conical snout which projects considerably beyond the lower jaw. The anchovy in its preserved state is much in demand as a relish and for sauce-making.

Anchovy Pear (*Grias cauliflora*). Fruit produced in Jamaica and the W. Indies by a tall slender tree of the order *Lecythidiaceae*. The tree has an unbranched stem and a crown of drooping, lance-shaped, glossy leaves, often 3 ft. in length. The flowers are large and white with four leathery petals. The fruit is plum-like and russet-brown, 3 ins. or more long. It is pickled and tastes like the mango.

Anchusa. For these familiar flowers of garden and hedgerow see *Alkanet*.

Ancien Régime. Term used for the social and political system which was established in France before the French Revolution

Ancient Mariner. An artist's grim rendering of the lines in Coleridge's great poem "Instead of the cross, the Albatross about my neck was hung". Painting by Percy W. Gibbs. By permission of the artist

It gained additional currency as the result of De Tocqueville's popular work, *L'Ancien Régime et la Révolution*, 1856.

Ancient (late Latin *antianus*, old). Word of various applications. Among special uses of it, ancient, as distinct from medieval or modern, history is concerned with the period before the fall of the

Western Roman Empire, A.D. 476. By the ancients is generally understood the civilized peoples of antiquity, and sometimes the early Greek and Roman authors. The word often implied seniority, hence influence and position. In the book of Isaiah the ancients of his people are the rulers. The final scene of Bernard Shaw's play *Back to Methuselah* introduces a superior class of humans known as ancients, who, extending their lives by hundreds of years, had acquired infinite wisdom. The senior members of the Inns of Court and Chancery were called ancients. The Ancient of Days is a title of God. As a corruption of ensign, the word formerly meant a flag or flag-bearer, cf. Shakespeare's *Ancient Pistol*.

Ancient Buildings, Society for the Protection of. Founded in 1877 by William Morris, its function is to secure the repair and maintenance of ancient buildings, including churches, castles, town walls and bridges, stone crosses, tithe barns, historic houses, and windmills. Its offices are at 55, Gt. Ormond St., London, W.C.1.

Anchovy pear, showing the curious inflorescence and a section of the fruit

Ancient Demesne (Lat. *dominium*). Term used in England for land which had long been in possession of the Crown and whose tenants were thus granted certain advantages, mainly in the direction of exemptions from public burdens. Medieval lawyers used it for manors mentioned in Domesday Book as owned by Edward the Confessor or William the Conqueror. It was held that the king could take a tallage, or toll, from his tenants in ancient demesne without consent of Parliament, and until 1852 actions about the ownership of such land followed a procedure somewhat different from that of cases affecting land of other kinds. See Land Laws.

Ancient Lights. English legal term. At common law, if a building had a window which had been there since time immemorial, the owner of the building had the right to an uninterrupted flow of light to that window, and it was called an ancient light. This meant that no adjoining owner might put up anything which would shut out a reasonable flow of light to the window. By the Prescription Act, 1832, a light is ancient if it has been uninterrupted for 20 years.

Ancient Mariner, THE RIME OF THE. Poem by S. T. Coleridge (*q.v.*). It is founded on a dream told him by a friend. Wordsworth and Coleridge discussed the theme during a country walk, Nov., 1797, and arranged to write the poem in collaboration, but the former contributed only about half a dozen lines. It was first published in their joint volume of anonymous Lyrical Ballads in 1798. The poem, in which the mariner relates his sufferings after the wanton killing of an albatross, is masterly as an example of lyrical narrative, and in its powerful suggestion of horror.

Ancient Monuments, PROTECTION OF. In Great Britain this movement has made much progress in recent decades, and public opinion is now alive to its desirability. Various royal commissions on ancient and historical monuments were entrusted with the task of compiling inventories of the monuments of each county in Great Britain. The Ancient Monuments Acts, 1910 and 1933, have empowered the Commissioners of Works, now the Ministry of Works, or a local authority, to purchase or take charge of buildings of historic or architectural interest. Apart from Crown property like the royal palaces and the Tower of London, the ministry

now has authority over two classes of buildings: (1) those which have been given to or purchased by the ministry or placed by owners under the ministry's guardianship, *e.g.* Stonehenge, Hadrian's wall, Rievaulx and Tintern abbeys, Pevensey castle, altogether about 300 in 1945; (2) "scheduled" buildings or monuments (including earthworks), the owners of which must give notice to the ministry if any alterations are contemplated, such alterations being liable to prevention by the ministry under a preservation order.

The Ancient Monuments Acts do not give the ministry any powers over ecclesiastical buildings in use or over inhabited houses, unless the latter be given or purchased by agreement. The ministry is, however, empowered to promote preservation schemes to protect not so much the monument as its amenities, restricting the use to be made of the im-

Ancona (Greek *ankon*, elbow, bend). Seaport and episc. city of Italy. The capital of Ancona province, it stands on the Adriatic, 130 m. direct and 185 m. by rly. N.E. of Rome. The harbour, one of the best in Italy, is protected by two fine piers, one built by Trajan in 115 and bearing a triumphal arch in his honour.

Ancona manufactures soft soap, ship's rigging, leather, and tobacco, and exports goat and lamb skins, hemp, coral, and asphalt. The city was founded about 385 B.C. by Greeks from Syracuse, became a Roman colony, and was made a naval station in the Illyrian war, 178 B.C. Caesar took it on his famous march north; Trajan enlarged it; Goths, Lombards, and Saracens sacked it; and in 1532 it was handed over to Pope Clement VII. It was captured by the Austrians in 1849 and bombarded by them from the sea during the First Great War. During the Second Great War,

Ancona Pre-war view of the Italian seaport, with Monte Guasco, crowned by the cathedral, in the background

mediate surroundings. Such a preservation scheme has been made in respect of the surroundings of Hadrian's wall. See also National Trust.

Ancon. Hospital quarter of Panama city, Central America. It stands on a hill near Panama city, and was founded during the construction of the Panama Canal. Its great hospital, with 1,600 beds, was built for the canal workers.

Ancon or Port Ancon. Coast town of Peru. It is 30 m. by rly. N.W. of Lima. It is less populous than formerly, although it is much visited for bathing. Lord Cochrane, leading the Chilean navy against the Spaniards in Peru, entered the harbour in 1820. A Chilean army landed here in 1838, and the Chileans bombarded the town in 1880. It gave its name to the peace that ended the war between Chile and Peru in 1883.

Ancona, occupied by German forces, was captured by Polish troops on July 18, 1944. Some 2,000 Germans were taken prisoner. The harbour was blocked by the Germans with sunken vessels. A lamentable loss to art resulted from the bombing and shelling. Among wrecked buildings was the cathedral dating from the 12th century, standing on the site of a temple of Venus, of which ten original columns survived. The museum and several historic churches and palaces were also destroyed. Pop. 89,198.

Ancona. Prov. of N.E. Italy, in the Marches. It slopes N.E. from the Apennines to the Adriatic, is mountainous in the S.W., level in the N.E., and has an area of 748 sq. m. Fruit and cereals are produced, silkworms are bred, sulphur is mined, and paper, sugar, and bricks are manufactured.

The coast towns are served by the Brindisi Rly. The March of Ancona (Marca d'Ancona) was one of the old divisions of central Italy. It formed part of the Papal States annexed by Victor Emmanuel in 1860.

Ancona Fowl. Offshoot of the Leghorn breed. It was imported into Great Britain in the 19th

Ancona Fowl. Rosecomb pullet, prize-winning specimen

century. The breed is very precocious, the pullets often laying at eighteen weeks old, and their eggs are large and white-shelled. As a table bird, however, it has few qualifications. Like all active breeds, it is a great forager, and is thus suited to the farmer who has plenty of space. The general colouring of the plumage is a beetle green, each feather being tipped with white. The legs are yellow mottled with black or brown, the face is bright red, and the earlobes are white. See Poultry.

Ancre. River of N. France. Rising a few miles S.W. of Bapaume, in the department of Pas-de-Calais, it flows generally W. and S.W. for about 25 m. and joins the Somme below Albert. In addition to Albert, Thiepval, Grandcourt, and Miraumont, all prominent in the First Great War, lie on or near its banks.

Ancre, BATTLES OF THE. Series of British attacks in the First Great War, Nov., 1916—March, 1917. They resulted in the first important surrender of territory by the Germans in the west. General Joffre, to relieve the pressure on Rumania, had been anxious to maintain the attack on the Somme, and in the autumn of 1916 Sir D. Haig determined to assault the Ancre salient. This consisted of the German-held fortified villages of Beaumont-Hamel, Grandcourt, Beaucourt, and St. Pierre Divion. Haig employed General Gough's 5th army, one division to attack the German works S. of the Ancre

river. The German force in the salient numbered seven divisions. Tangles of trenches with concrete machine-gun posts and barbed wire of extraordinary thickness and depth covered the countryside. The ground across which the British were to advance was of great difficulty, a shell-ploughed waste, full of quagmires and craters: and the bombardment, though necessary for the purpose of cutting the wire, tore up the soil and deepened the mud.

On Nov. 13 at 5.42 a.m. the British left their trenches for the advance. To the W. the attack was delivered from a point N. of Serre as far as the Ancre, on a front of 5,000 yards, the artillery covering the advance with a creeping barrage. At Serre the attack was repulsed with heavy loss. Troops of the 31st division, after penetrating two German lines, had to be withdrawn at night as they could not be supported.

The 3rd division, S. of the 31st, struck the terrific works N. of Beaumont-Hamel, found the wire an almost insuperable obstacle, and met a fearful fire. The 2nd division could not make progress because of the defeat of the attack farther N., which left its flank exposed. The 51st (Highland) division succeeded, however, in capturing Beaumont-Hamel with 1,500 prisoners after savage fighting, while the 63rd (Naval) division pushed to the outskirts of Beaucourt, though its centre was held back by a formidable German redoubt until next morning, when a tank arrived and the Germans immediately surrendered. Through the fine leadership and personal gallantry of Lt.-Col. Freyberg, V.C. (g.v.), Beaucourt was stormed on the morning of Nov. 14. South

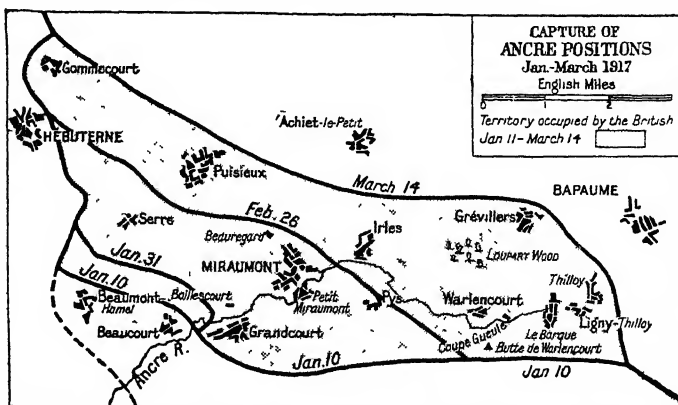

of the Ancre the 39th division entered St. Pierre Divion, suffering casualties from the British barrage which it overran in its impetuosity. Over 1,400 Germans were forced by the swiftness of this attack to lay down their arms.

On Nov. 15 the Germans delivered a counter-attack, which was crushed without the loss of any of the points gained. Up to this date over 6,000 prisoners had been taken, the largest number yet captured in any battle on this part of the western front. On Nov. 17 the British right made a small advance S. of Grandcourt, but against a fierce resistance the troops could not maintain themselves there. The Germans, however, were left in a difficult position at Grandcourt, which could now be enfiladed and attacked from both flanks.

This was the closing episode of the series of battles on the Somme, and it so weakened the German positions there as to render a retreat inevitable. The British armies, after continuous fighting for more than four months in cruel weather conditions, also needed a respite. Casualties were heavy on both sides.

Local Attacks

As the winter prevented large-scale operations, the British command now decided to carry out local attacks. On Jan. 11, 1917, the ridge E. of Beaumont-Hamel was stormed after a prolonged artillery preparation. On Feb. 6 the German line S. of the river was abandoned as far as a point lying S.W. of Miraumont. On Feb. 17 an attack was delivered on both sides of the Ancre. On Feb. 24, after several fruitless counter-attacks on the British front, the enemy evacuated their

Ancre Battles. Plan showing the territory taken by the British during the renewal of the contest in the opening months of 1917

advanced line S. of Miraumont and Pys, and next day British troops occupied Serre, Miraumont, Pys, and Warlencourt, with the commanding ground near. Owing to the break-up of the intense frost which had followed an unusually wet autumn, close pursuit of the Germans was impossible while the whole country became a sea of deep mud. Iries, however, was stormed on March 10, and on March 13, after a terrific bombardment, Gréville and Loupart Wood were seized by the British. Then followed the German retirement "according to plan" to the Hindenburg line (q.v.).

Ancren Riwle. A manual for anchoresses, attributed to Richard Poor, bishop of Durham. It prescribes a rule of life for three ladies, who, with a small company of lay sisters, led a religious life at Tarrant-Kaines in Dorset. The rule is dictated by a spirit of wisdom and common sense, forbidding excessive austerity, and is pointed by distinct and racy humour; it is further animated by a spirit of holiness that finds expression in many passages of extreme devotional beauty. The manual is usually attributed to the early 13th century, but is possibly older. *Consult* Ancren Riwle, ed. J. Morton, Camden Society, 1853.

Ancrum. Parish and village of Roxburghshire, Scotland, 3½ m. N.N.W. of Jedburgh. It was at Ancrum Moor, 2 m. N.W., that 5,000 English were defeated on Feb. 17, 1545, by the Scots. A monument marks the spot where Lilliard, a Scottish maiden, is said to have distinguished herself in battle. Of great antiquity, Ancrum has one of the best-preserved crosses in the Border country. Pop. 858.

Ancus Marcius. Fourth legendary king of Rome, 640-616 B.C. The reputed grandson of King Numa, he is credited with the foundation of the port of Ostia, at the mouth of the Tiber, and the fortification of the Janiculum, which he connected with the city by a wooden bridge, called the Pons Sublicus or bridge of piles. He is also said to have built the first Roman prison. He subdued the Latins, and brought some of them to the Aventine.

Ancyra. Ancient town of Asia Minor, site of the Ankara of today. Stone lion reliefs attest its importance in late Hittite times. Fortified about 250 B.C. by Gallic immigrants, it was made in 25 B.C. the chief town of the Roman province of Galatia. A marble tem-

Andalusian Fowl. Cockerel that won many prizes as a typical specimen

ple to Augustus contains the *Monumentum Ancyranum*, a mural record of the emperor's life-work. The Christian church is mentioned A.D. 192, and an ecclesiastical council was held here in 314.

Andalusia. Region of Spain, formerly one of the provinces. The name is variously said to be a corruption of Vandalusia, i.e. the land of the Vandals, or derived from the Moorish Andalus, land of the West. The region now comprises eight provinces: Almeria, Granada, Malaga, Cadiz, Jaén, Cordova, Seville, and Huelva. Its area is 33,777 sq. m.

Andalusia is in the S. of the country and, lying as it does on either side of Cape Trafalgar, its coasts front both the Atlantic and the Mediterranean. The land boundaries are Portugal, New Castile, and Murcia. It includes some of the most historic and interesting parts of Spain, e.g. the Moorish kingdom of Granada, the cities of Cordova and Seville, and the seaport of Cadiz. It chiefly consists of the valley of the Guadalquivir with the southern slopes of the Sierra Morena and the bulk of the Sierra Nevada between the river and the Mediterranean coast. It produces copper, principally from the rich Rio Tinto mines, and manganese, molybdenum, and platinum, also oranges, olives, and other sub-tropical fruits. It was a Roman province, and after the withdrawal of the Romans became the prey of various barbarian invaders. For about 800 years it was under the Moors, whose influence is still seen everywhere. Pop. 4,592,621.

Andalusian Fowl. A Spanish breed of poultry introduced into England in 1851 from Andalusia. In egg production it compares favourably with other Mediterranean

breeds, laying a large, white-shelled egg. As it thrives equally well in confinement or at liberty, and is hardy and robust, it is adapted to farmer and backyarder alike. The body colour is a slate blue, laced with feathers of a darker tint; the legs are a dark leaden hue, earlobes white. The average weight of the cocks is 7 lb. to 8 lb.; and of the hens 4½ lb. to 5½ lb.

Andalusite. Aluminium silicate, of the same composition as sillimanite and cyanite. It crystallises in forms belonging to the orthorhombic system, is a product of the thermal metamorphism of aluminous sediments, and occurs most commonly in argillaceous rocks that have been heated by the intrusion of large masses of igneous rocks. The temperature required for its formation is less than that needed for sillimanite. It often contains foreign matter arranged in a symmetrical manner, and is then called chiasstolite (q.v.). Andalusite is used as a refractory material and for making porcelain cores for sparking plugs.

Andamanese. Aboriginal race inhabiting the Andaman Islands, said to be the last pure remnant of Palaeolithic man. Numbering 62 in 1941, dark-skinned and frizzy-haired, they are of negrito stock, averaging 4 ft. 10½ ins. in height. They hunt land animals and fish with arrows, and turtle and shark with detachable harpoons in dug-out canoes. Their utensils are largely of shell; their huts often lean-tos, roofed with cane leaves. Their animism is primitive. Skulls of relatives are worn round the neck. They are the only people who do not know how to make fire. Belonging to a dozen tribes, they live in groups of

Andamanese. Tribal chief of the North Andaman aborigines

coast-men and jungle-men, and speak dialects of remote origin and with no living affinities.

Andaman Islands. Group of islands in the Bay of Bengal, 120 m. S.W. of Burma. Together with the Nicobar Islands, they form a province of India. They consist of six main islands—North, Middle, South and Little Andaman, Baratang, and Rutland—and about 200 small islands and islets, and have an area of 2,508 sq. m. They are covered with dense tropical jungle, volcanic, and hilly, attaining a maximum elevation of 2,402 ft. in Saddle Peak, in North Andaman, and have several well-sheltered natural harbours, the chief being Port Blair, the capital, Port Cornwallis, and Stewart Sound, which are used as refuges during stormy weather in the Bay of Bengal. From the forests large quantities of timber are obtained. Tea and coconuts are cultivated. The islands were utilised from 1858 by the Indian government as a penal settlement; 6,165 convicts were on the islands in 1941, about one-fifth of whom were ticket-of-leave men supporting themselves. Transportation to the Andamans ceased in 1921, and in 1945 the Indian government announced that the penal settlement would be abolished. The islands are notoriously unhealthy. Pop. 21,483.

During the Second Great War the islands were occupied by the Japanese, enemy planes first flying over Port Blair and bombing that target on Feb. 24, 1942, and again on Feb. 26. Very little opposition could at that time be offered. The British population was therefore evacuated, and everything of value destroyed. Japanese troops landed on Mar. 26, and established bases from which their bombers and flying boats could harry Indian waters and attack the Indian coastal towns. On April 4, U.S. Fortresses stationed in India made a heavy

attack on Japanese shipping off the Andaman Islands, sinking a cruiser and setting a troopship ablaze. U.S.-British raids continued until the end of the war to prevent the Japanese from using

Andaman Islands. Lying in the Bay of Bengal, they were of strategic importance in the Second Great War

the islands as a base for any attack on India.

Andante (Ital., going slowly). Musical term, meaning at a moderate pace. In practice, such terms as *andante* and *allegro* are often used as nouns to distinguish particular parts of a musical work, e.g. the *andante* of a symphony, i.e. the movement marked *andante* in the score. The diminutive, *andantino*, means slower than *andante*.

Anderida. Roman flint fort at Pevensey, Sussex, England. It was probably erected by the count of the Saxon shore early in the 4th century. It was beset by the Saxon invaders under Ella and Cissa in A.D. 491, and later became their settlement of *Andredeceaster*. Much of its masonry was incorporated in the Norman castle of Pevensey. See Pevensey.

Andermatt. Village of Switzerland, in the canton of Uri. It lies in the upper valley of the Reuss, 3 m. S. of Göschenen, and stands 4,738 ft. above sea level, near the junction, at Hospenthal, of the roads over the Furka and St. Gotthard passes. It is famous as a centre for winter sports.

Andernach. Town of Germany. On the left bank of the Rhine, it is about 10 m. N.W. of Coblenz.

Originally a Roman station, it was afterwards a free city, and later came under the electors of Cologne. It became Prussian in 1815. Chemicals, cigars, and malt were manufactured, and there was trade in wine. Pop. 10,771.

During the Second Great War railways and marshalling yards at Andernach were R.A.F. targets on Dec. 27, 1944. The U.S. 3rd army occupied the town, in the fighting for the approaches to the Rhine, on March 9, 1945.

Anders, GENERAL WLADYSLAW (b. 1892). Polish soldier. Before the First Great War he was a student of mechanical engineering at Riga. He served in the Imperial Russian army 1914-17, but fought for Poland during the Russo-Polish hostilities of 1919-20. On the outbreak of the Second Great War in 1939 he commanded a Polish cavalry brigade, but was taken prisoner by the Russians and sent to Russia, where he spent 20 months in solitary confinement. After the Russo-Polish pact of July, 1941, Anders was freed to form new Polish divisions in the fight against the Germans. Later sent to Persia, these troops received intensive training as the Polish army of the Middle East.

In Feb., 1944, Anders took command of the Polish 2nd corps fighting in Italy. His services there were rewarded with the Order of the Bath. A year later the Polish Govt. in London appointed him acting C.-in-C. of Polish armed forces, until Gen. Bor-Komorowski (leader of the Warsaw rising, Aug., 1944) was released and resumed command in May, 1945. Anders returned to England in Aug., 1946, to supervise the demobilisation of the Polish 2nd corps. He was deprived of his nationality by the Warsaw govt., Sept. 27, 1946.

Andersen, HANS CHRISTIAN (1805-75). Danish story-teller and poet. Born at Odense, Fünen, Denmark, April 2, 1805, the son of a shoemaker, he had little schooling. Possessed of a natural gift for singing, he sought an engagement in the Copenhagen theatre, but was unfitted for the stage.

In 1830 Andersen published his first volume of poems, including the widely translated *Dying Child*. Three years later he received from the Danish king a pension, which enabled him to travel in Germany, England, Spain, and the East. A prolific writer, he produced an almost continuous series of poems, dramas, novels, and narrative

descriptions of scenery and manners. It is, however, for his wonderful short tales for children that he is best remembered, and will be longest known. These include *The Ugly Duckling*, *The Tin Soldier*, *The Little Match Girl*. On his 70th birthday Christian IX decorated him with the Grand Cross of the Dannebrog, and an album containing one of his tales in fifteen languages was presented to him by his admirers. He died at Copenhagen, Aug. 4, 1875. *Consult* *Life*, S. Toksvig, 1933.

Anderson. Chief city of Madison county, Indiana, U.S.A. It stands on the White river, at the junction of several rlys., 35 m. N.E. of Indianapolis. It has manufactures of iron, steel, brass, paper, and glass. Pop. 41,572.

Anderson, CARL DAVID (b. 1905). American physicist. Born Sept. 3, 1905, in New York, he was educated at Los Angeles and Pasadena, and the Californian Institute of Technology, becoming lecturer in physics there, 1927, research fellow in 1930, professor in 1939. Devoting himself to research in gamma and cosmic rays, he discovered the positron (*q.v.*), and was awarded the Nobel prize for physics in 1936.

Anderson, ELIZABETH GARRETT (1836-1917). First British woman doctor. Born in London, she

E. Garrett Anderson.
British doctor
Olive Edis

began to study medicine in 1860, but was unable to obtain admittance to any of the British medical schools. In 1865 the Society of Apothecaries gave her the degree of L.S.A., and in 1866 she opened a dispensary in London, which developed into the New Hospital for Women in Euston Road, of which she was senior physician for 24 years. Graduating at Paris as M.D. in 1870, she was for 23 years lecturer and ten years dean of the London School of Medicine for Women. Dr. Anderson was a member of the first London School Board, 1870. Her greatest victory, perhaps, was the formal admission of women to the degrees of the

British Medical Association in 1892. In 1908 she became mayor of Aldeburgh, Suffolk, the first woman to hold mayoral office in England. She died at Aldeburgh, Dec. 17, 1917. She married J. G. S. Anderson, a ship-owner, in 1871. Their son, Sir Alan Garrett Anderson, was controller of the navy during 1917-18 and in 1941 became controller of railways under the ministry of War Transport and chairman of the railway executive. Their daughter, Dr. Louisa Garrett Anderson, organized during the First Great War the first army hospital which was managed and officered by women in France. She wrote a *Life of Elizabeth Garrett Anderson*, 1939.

Anderson, JAMES (1739-1808). Scottish agricultural economist. Born at Hermiston, near Edinburgh, he became a farmer when little more than a boy, at first near his birthplace, then in Aberdeenshire. He studied chemistry and sought to apply science to the service of agriculture; and is regarded as the inventor of the Scottish plough, a small two-horse plough without wheels. In 1773, in one of his pamphlets, he anticipated Ricardo's theory of rent. In 1783 he gave up his farm and settled in Edinburgh, where for some years he conducted a weekly paper. His last years were passed at Isleworth, where he continued his experiments in agricultural processes. He died Oct. 15, 1808.

Anderson, SIR JOHN (b. 1882). British administrator and politician. Born July 8, 1882, and educated at George Watson College, Edinburgh, and the universities of Edinburgh and Leipzig, he entered the colonial office in 1905. In 1912 he was principal clerk in the office of the Insurance Commissioners and in the following year their secretary. From 1917-19 he was secretary to the ministry of Shipping; and after serving at the Local Government Board and the ministry of Health he was chairman of the board of Inland Revenue, 1919-22, chief under-secretary to the lord lieutenant of Ireland 1920, and permanent under-secretary of state to the home office, 1922-32. During 1932-37 he was governor of Bengal.

Sir John Anderson,
British politician

Returning to the U.K. he was elected National M.P. for the Scottish Universities and appointed lord privy seal in Chamberlain's cabinet, 1938-39 and home secretary and minister of Home Security, 1939-40, when he became lord president of the council. From 1943 to 1945 he was chancellor of the exchequer, and during 1945-48 was chairman of the atomic energy advisory committee. *See* *Anderson Shelter*.

Anderson, SIR KENNETH ARTHUR NOEL (b. 1891). British soldier. Born on Christmas day, 1891, he was educated at Charterhouse and Sandhurst. In the First Great War he served with distinction, and during 1930-31 he was stationed on the N.W. frontier of India. During the Second Great War he commanded a division at Dunkirk in 1940, and was appointed G.O.C.-in-C. Eastern Command in April, 1942. In Nov. of the same year he was appointed commander of the British 1st army in the N. Africa campaign, and assisted, under Gen. Alexander, in carrying out the strategy which led to the final defeat of the Axis in N. Africa (*see* *Tunisia*, *Battle of*). G.O.C.-in-C. in E. Africa, 1945-46, Anderson was appointed governor and c.-in-c. Gibraltar in 1947.

Anderson, MARY ANTOINETTE (1859-1940). American actress. She was born at Sacramento, California, July 28.

Mary Anderson,
American actress

1859, and was the daughter of an English father and a German mother. When she was only six months old her parents moved to Louisville, Kentucky, where she was educated at a convent. She made her first appearance on the stage as Juliet, Nov. 27, 1875. After achieving enormous success in her own country, in 1883-87 she had seasons in London, occupying the Lyceum Theatre during the absences of Henry Irving in America. Her chief productions were *Ingomar*, *The Lady of Lyons*, *Gilbert's Pygmalion and Galatea*, *Romeo and Juliet*, and *A Winter's Tale*, in which she doubled the parts of *Hermione* and *Perdita*. In 1889 she retired from the stage, and in 1890 married Antonio de Navarro, and settled in England, where she died May 29, 1940. She published *A Few Memories*, 1896.

Anderson, MAXWELL (b. 1888). American author and playwright. Born at Atlantic City, Pa., Dec. 13, 1888, and educated at North Dakota and Stanford universities, he became a journalist, writing for papers in San Francisco and New York. From 1923 he wrote many plays, including *Saturday's Children*, 1927, and *Both Your Houses*, 1933, which was awarded the Pulitzer Prize. He is notable for his success with plays written in blank verse on modern themes, e.g., *Winterset*, 1935. He has also written poems and essays.

Anderson, SHERWOOD (1876-1941). American novelist. Born in Camden, Ohio, Sept. 13, 1876, the son of a harness-maker, he was largely self-educated, and started his career in an advertising agent's office. His first novel, *Windy Macpherson's Son*, appeared in 1916. *Winesburg, Ohio* (short stories), 1919, was his first popular success, and he followed it with many books dealing with the life and aspirations of small American towns. He also published two volumes of verse, *Mid-American Chants*, 1918, and *A Note Book and a New Testament*, 1926.

Anderson, SIR WILLIAM (1835-98). British engineer. Born Jan. 5, 1835, at St. Petersburg, and educated there, he afterwards studied applied science at King's College, London, and, joining a London firm of engineers in 1864, ultimately became its head. In 1888 he was invited by the British War Office to design machinery for the manufacture of cordite, and in 1889 was appointed director-general of ordnance factories. At Woolwich he conducted important investigations in connexion with the manufacture of large guns. He was created K.C.B. in 1897, and died at Woolwich Arsenal, Dec. 11, 1898.

Anderson Shelter. Small domestic air-raid shelter, designed and invented by William Patterson, an engineer friend of Sir John Anderson (*q.v.*). The patent was presented to the nation. The scheme, which provided for pressed and rolled sectional shelters ready for home assembly, to be supplied to 20,000,000 persons living in houses with no other suitable protection, was subsequently submitted to a committee of engineers. With certain modifications the shelter was adopted in Dec., 1938. On the outbreak of war in 1939, Anderson shelters were supplied free to those with incomes under £250 p.a., whose households included two children of under

school-leaving age. This income limit was raised if there were more children. The efficacy of the shelter, which was designed to hold four adults or two adults and four children, was proved in the heavy German air raids on the United Kingdom, 1940-41. It withstood the impact of debris and blast, and saved the lives of countless people in the bombed areas. Its name was given in compliment to Sir John Anderson,

home secretary at the time of its adoption. See *Air Raid Shelter*.

Andersonville. A village of Georgia, U.S.A., in Sumter county. It is 60 m. S.S.W. of Macon. In the prison, used by the Confederates in the Civil War, nearly 13,000 prisoners out of some 50,000 died between Feb., 1864, and April, 1865. The Governor, Henry Wirz, was hanged for his cruelties in the following Nov. The prison grounds are now a national park.

ANDES: MOUNTAINS OF SOUTH AMERICA

C. Reginald Enock, Author of *The Andes* and *The Amazon*

Information in this general survey should be supplemented by reference to the article on South America and those on separate states, such as Bolivia, Colombia, Ecuador; towns such as Bogotá, Quito; and individual mountains, such as Chimborazo, Cotopaxi

The mountain system of the Andes extends in an almost unbroken line throughout S. America from N. to S., a distance of over 4,000 m., traversing Colombia, Ecuador, Peru, Bolivia, and Chile, with Argentina, and contains some of the highest peaks and most stupendous mountain scenery in the world.

The great Cordillera, as the Andes are in general termed locally, rises to an elevation throughout the main part of its course of 14,000 ft., with the higher summits over 20,000 ft., paralleling the Pacific coast at no great distance therefrom; and forms a gigantic barrier between the E. and W. portions of the continent, crowned in many places with perpetual snow. The system embodies various well-defined parallel ranges connected at intervals by *nudos* or knots, enclosing lofty, bleak and arid tablelands, or, separated by deep valleys, the basins of rivers which flow either to the Atlantic or to the Pacific, mainly the former. The Andes are treeless, except in the ravines, but the uplands are generally covered with coarse grass, the natural food of the llama and the vicuña.

Groups of the Cordillera

The Cordillera reaches its greatest development about mid-way in its course, and is broadest near that portion where its direction changes from N.N.W. to almost due S., where it is about 500 m. wide. In Colombia it splits into four ranges, the Eastern, Central, Western, and Chocó, and in the valleys thus formed flow the Magdalena, Cauca, and Atrato rivers. The high *páramos*, or mountain plateaux, with their abrupt edges, form conspicuous landmarks, and the central range culminates in a line of volcanoes rising from 2,000

ft. to 3,000 ft. above the snow line, which here is found at about 15,000 ft. The Mesa de Herveo, an extinct crater six miles in diameter, presents a striking appearance with its 3,000 ft. of snowy drapery. The most important, however, is the Eastern Cordillera, along the eastern flanks of which is situated the main population of Colombia, including that of the city of Bogotá.

The Snow-clad Ecuadorian Peaks

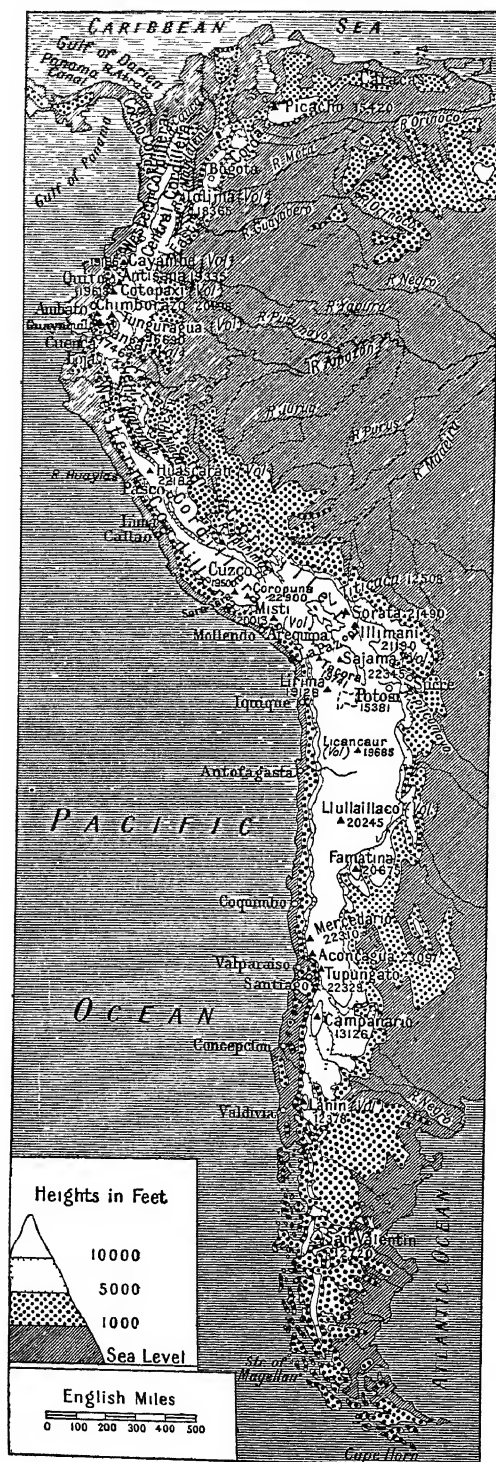

The Andes in Ecuador embody two great chains, known as the Eastern and the Western Cordillera, continuations of the Western and Central Chains of Colombia, enclosing the basins or tablelands of Quito, Ambato, and Cuenca. Overlooking these, and grouped in remarkable symmetry on either side, forming as it were an immense avenue, are the snow-clad Ecuadorian peaks, some of which are active volcanoes.

Grouped almost within sight of each other are twenty-two such peaks, the W. chain containing the highest and the E. the greatest number. Among them are Chimborazo, 20,498 ft., rising 5,000 ft. above the snow line, its double dome generally covered with mists; Cotopaxi, the highest active volcano in the world, 19,613 ft., with a cloud column of smoke always above its cone, and dreaded for its constant eruptions; Antisana, 19,335 ft.; Cayambe, 19,186 ft.; and others ranging downwards to 15,000 ft. The high Andes of Ecuador give birth to several of the large affluents of the Amazon, some of which break through the Eastern Cordillera. The railway which ascends the W. slope from Guayaquil reaches a height of 11,841 ft. on the base of Chimborazo and also skirts the foot of Cotopaxi, on its way to Quito.

1. Rocky pinnacled mass known as Los Penitentes (The Penitents) 2. In the Uspallata Pass, Chile 3. Christ of the Andes, colossal statue at Puente del Inca, on the Argentine-Chile border. 4. View in the Andes showing the character of the slopes. 5. Cerro Tolosa, above the snow line. 6. A natural rock bridge known as the Bridge of the Inca

ANDES: AMONG HIGH PLACES IN THE GREAT MOUNTAIN SYSTEM OF SOUTH AMERICA

Andes Map of the western coast of South America illustrating the relative elevations of the great mountain chain from the north-west coast to Cape Horn

In Peru the Andes consist of three main chains: the Western, the Central, and the Eastern Cordillera, of which the Western and the Eastern are the most important. They are joined transversely by the knots of Loja (Ecuadorian border), Pasco, Viltcanoa or Cuzco, and Potosi (Bolivian border). As in Ecuador, great basins or tablelands are enclosed by these features, with deep river valleys or great lakes. The main ranges rise to from 14,000 ft. to 16,000 ft., and the perpetual snow line is at about 14,000 ft. There is one low gap in the chain, in N. Peru, of about 7,000 ft. The highest peaks are the Huascarán, 22,822 ft., forming part of the White Cordillera of Ancachs; Huandoy, 21,088 ft.; Coropuna, 22,900 ft.; the Misti, 20,013 ft.; Sara-Sara, 19,500 ft.; Lirima, 19,128 ft.; and Tacora, 19,741 ft. Some of the Peruvian peaks are volcanoes, but generally quiescent. The Central Cordillera forms the water-parting. The Peruvian coastal slope and plains are generally less than 100 m. wide, and form a rainless belt, due to the interception of the moisture-laden wind from the Amazon valley by the Andes. The Silurian, Carboniferous, Jurassic, and Cretaceous formations are encountered. Enormous fossil ammonites are found in places, and the tilted strata of the summits are often of striking appearance. In the depressions between the Cordilleras flow the great Amazon affluents: the Marañon, the Huallaga, the Apurimac, and others have their sources in the snowcap, and break through the ranges in a series of remarkable cañons on their way N. to join the Amazon; while the Huaylas river flows to the Pacific. In the S. of Peru the Central Cordillera disappears, and the Eastern and Western enclose the basin of the great lake, Titicaca, 165 m. long and 12,508 ft. above sea level.

The Andes in Bolivia form one of the most impressive mountain masses on the globe. The Eastern and Western Cordilleras continue their course with a number of high peaks, chief of which are Sorata, 21,490 ft., and Illimani, 21,190 ft. Between these extends perhaps the most striking snowy range of the whole system. Huaini-Potosi reaches 20,260 ft.

In Chile the Andes form one main chain, with a lesser maritime Cordillera, and the system approaches much nearer the coast. The great peak of Aconcagua, 23,097 ft., is the highest mountain in the New World. For some 1,500 m. the snowy Cordillera forms the boundary between Chile and Argentina. Between the main and the maritime ranges of much older formation lies the long Vale of Chile. The height of the Andes decreases in the S. of Chile, and the glaciers end in the sea. It is held that some portions of the Andes are rising, others sinking.

These mountains are rich in metalliferous and other minerals, notably gold, silver, copper, tin, lead, quicksilver, zinc, and, in places, coal. They are ascended by several lines of railway, including the Guayaquil-Quito line; the Oroya and the Southern, in Peru, reaching 15,660 ft. and 14,660 ft.; and the Transandine, in Chile. Earthquakes, due mainly to tectonic action, and tidal waves following thereon have often been the cause of loss of life and property throughout the Andine region and Pacific littoral.

Among the principal ascents of the Andes peaks are those of Chimborazo in 1802 by Humboldt, in 1831 by Boussingault and Hall, and in 1880 by Whymper; Cotopaxi in 1872 by Reiss and in 1880 by Whymper; Aconcagua in 1897 by Zurbriggen and Vines, in 1898 and 1900 by Conway, and in 1902 by Rankin; Huascarán in 1905 by Enock and others.

Bibliography. Travels Amongst the Great Andes of the Equator, E. Whymper, 1892; Wanderings in the Peruvian Andes, A. M. Renwick, 1939; The Face of S. America, T. L. Rich, 1942.

Andesine. Member of sodalime or plagioclase feldspar group. It has a composition between oligoclase and labradorite, and occurs as small crystals in igneous rocks, especially lavas. It is known only as a product from fusion.

Andesite. Lava characterised by the presence of plagioclase feldspar, chiefly andesine, a moderately high percentage of silica, and usually a porphyritic structure. Glassy matter commonly forms the matrix of such rocks. They are subdivided, according to the prevalence of the ferro-magnesian minerals present, into groups, e.g. augite-andesite, mica-andesite, and hornblende-andesite. They are well represented among the lavas of the Andean chain, from which they take their name, but are widely distributed rock-types and occur in most regions of volcanic activity.

Andijan. A town of Uzbek S.S.R., Soviet Central Asia. It stands near the Syr-Daria, 84 m. E.N.E. of Khokand by the Transcaspian Rly., of which it is the E. terminus. A centre of the cotton industry and noted for horticulture, Andijan was almost entirely destroyed by earthquake in 1902, but has been rebuilt. It was the capital of the Khokand khanate. Pop. 83,691.

Andirons (old French *andier*, mod. *landier*) or FIREDOGS. Iron supports for logs, commonly in use before the discovery of coal, when wood fires were universal, and still used in parts of France and elsewhere where wood is abundant. Firedogs are now generally mere decorative survivals, or used as hearth-rests for fire-irons. In ancient times they were placed in the centre of the room or hall and supported a fixed lower and a movable upper bar; on the lower bar logs were placed criss-cross for burning, the upper one being used for grilling. After the 16th century firedogs for important rooms were arranged to be a little in advance of both sides of the fire. Usually they were of iron in rather a plain design, though sometimes of most elaborate and exquisitely pierced steel work, and occasionally even of solid silver.

Andirons, old design, from Godington, Kent

Andkhui. Khanate and town of Afghan Turkistan, on the Russian border. The town is 100 m. W. of Balk and was subject to Bokhara until 1820, when Mahmud Khan

Andorra, the small mountain republic between France and Spain. Upper picture: The capital, Andorra, showing terraced fields on the mountain slope. Lower picture: In the valley of Andorra, with Parliament House on the right

captured and destroyed it. The khanate was formally annexed to Afghanistan in 1885. Its unhealthy climate, and the prevalence of swarms of flies and scorpions, have earned it the sobriquet of hell upon earth.

Andocides (c. 440-c. 390 B.C.). Athenian orator. In 415 B.C. he was forced to leave Athens under suspicion of being concerned with Alcibiades in the mutilation of the statues of Hermes. After two unsuccessful attempts, in 399 he cleared himself of the charge. Of his three surviving speeches the most important was that delivered in 390, in which he advocated peace with Sparta on her own terms. He was included among the "ten" Attic orators.

Andorra (Arab. *Aldarra*). Republic in the eastern Pyrenees. It lies between the Spanish prov. of Lerida and the French department of Ariège. Surrounded by mts., the territory comprises the upper part of the valley of the Balira, an affluent of the Segre, and adjacent valleys of the Pyrenees, and covers an area of 190 sq. m. Its pop. is 5,230. Much of the revenue accruing to the state was formerly derived from timber, but the forests are rapidly disappearing. Agriculture thrives where the soil is suited to tillage, rye, barley, vines, and tobacco being cultivated. There is also

abundant mineral wealth, especially iron and lead, but transport difficulties make its exploitation doubtful. The inhabitants pay great attention to stockbreeding. Smuggling is fairly general. The natives speak a Catalan dialect.

Andorra is under the joint suzerainty of France and the bishop of Urgel, and its government is entrusted to a council, consisting of twenty-four members holding office for four years, who elect a first and second syndic to preside. The executive rests with the first syndic, while a civil judge and two *viguers*, or magistrates, alternately appointed by the suzerains, exercise judicial power. French interests are guarded by a permanent delegate, the prefect of the Pyrénées-Orientales. An annual payment of 960 fr. is made to the French government and about 460 pesetas to the bishop of Urgel, obtained by a pastures tax. Andorra is reputed to have received its independence from Charlemagne. Andorra la Vieja is the capital.

Andover arms

Andover. Mun. borough and market town of Hampshire, England. On the Anton river, Andover is 57 m. W.S.W. of London by the

ry. Situated in an agricultural district, it carries on malting and ironworking. Here are the R.A.F. staff college and an airfield. Andover was a borough before 1176. In 994 the Norwegian King Olaf was baptized here by S. Alphege. Market day, Fri. Pop. 9,692.

Andover. A town of Massachusetts, U.S.A., in Essex county. It is 23 m. N. of Boston, on the Boston and Maine rly. Settled c. 1643 and named after Andover in England, it became notorious for its witchcraft trials c. 1692. Harriet Beecher Stowe, author of *Uncle Tom's Cabin*, lived and was buried here. Pop. 11,122.

Andrada e Sylva, BONIFACIO José d' (1765-1838). Brazilian statesman. Born at Santos, he studied in Europe, where he was professor of geology at Coimbra. Returning to Brazil in 1819, he took a prominent part in the movement for independence, became minister of the interior and of foreign affairs, 1822, and in 1823 was banished on account of his democratic activities. He took refuge in France, but returned to Brazil in 1829, and died near Rio, April 6, 1838. He published works on mineralogy and a volume of poems.

Andrade, EDWARD NEVILLE DA COSTA (b. 1887). British scientist. Born in London, he was educated at S. Dunstan's College, Catford, University College, London, and in research departments

E. N. da C. Andrade,
British scientist
Elliott & Fry

at Heidelberg, Cambridge, and Manchester universities, gaining numerous prizes and distinctions. In 1920 he was appointed professor of physics at the Artillery College, Woolwich; in 1928 he became Quain prof. of physics at London university, and in 1960 director of the Davy Faraday research laboratory at the Royal Institution. A fellow of the Royal Society since 1935, he was pres. of the Physical Society in 1943. In the Second Great War he was scientific adviser to the ministry of Supply, 1939-43. One of the popularisers of the results of research, he wrote *The Structure of the Atom*, *Engines*, *The Mechanism of Nature*; and also a volume of verse. Participation in the B.B.C. Brains Trust and other broadcasts made his voice familiar to millions.

Andover, Hampshire, England. High Street in the ancient borough, which is one of the principal agricultural centres of the county

Andrassy, JULIUS, COUNT (1823-90). A Hungarian statesman. He was born March 8, 1823, and was elected to the Pressburg diet in 1847. He took

an active part in the revolution of 1848, and remained in exile until 1857. In 1861 he was again elected to the Hungarian diet, and on the formation of the Dual Monarchy in 1867 was appointed prime minister of Hungary. He was instrumental in the emancipation of the Jews. From 1871 to 1879 he was foreign minister of Austria-Hungary. He represented Austria-Hungary at the Congress of Berlin in 1878 and negotiated the Austro-German alliance with Bismarck in 1879. In 1876 he drew up the Andrassy Note urging reforms upon the Porte. He died Feb. 18, 1890. His second son, Julius Andrassy (1860-1929), held several offices in various Austrian governments, including that of foreign minister towards the end of the First Great War. He wrote *Diplomacy and the World War*, 1920.

André, JOHN (1751-80). British soldier. He was born in London of Franco-Swiss parentage, and during the American War of Independence he joined the British army in Canada, 1774, and became aide-de-camp to Sir Henry Clinton. In this capacity he acted as intermediary in the negotiations between Clinton and the American general, Benedict Arnold, who was planning to betray West Point to the British. André and Arnold met, and on the return journey to the British lines

Major John André,
British soldier
Drawn by himself

André, in civilian clothes, fell into the hands of the Americans. After a court-martial he was sentenced to death as a spy and hanged at Tappan, New York, Oct. 2, 1780. André's fate, just though it was, aroused a great deal of sympathy. A monument was erected to him in Westminster Abbey, and his remains were reinterred there in 1821. See *Narrative of the Causes which led to the Death of Major André*. J. H. Smith, 1808; *Vindication of the Captors of Major André*, E. Benson, repr. 1865.

André, LOUIS JOSEPH NICOLAS (1838-1913). French soldier and politician. He served during the siege of Paris and became a general in 1893. In 1900 he was made minister for war, and in that capacity won notoriety by the measures he took to stamp out monarchical and clerical sympathies among officers. He resigned in Nov., 1904, and died March 18, 1913.

Gen. L. J. N. André,
French soldier

Andrea del Sarto OR ANDREA D'AGNOLO (1486-1531). Italian painter. Born at Florence, and called del Sarto from his father Agnolo's occupation as a tailor, he studied under Giovanni Barile and Piero di Cosimo. While a pupil of the latter he became intimate with Franciabigio, and the two collaborated in *The Baptism of Christ*, the first of twelve frescoes for the Scalzo Cloister. About 1512-13 Andrea married the beautiful Lucrezia del Fede, who squandered his earnings. Some six years later he was invited by Francis I of France to visit that country; and while there, he painted the famous *Charity*, now in the Louvre.

A complaining letter from his wife brought Andrea back to Florence in 1519, and in her society he forgot his solemn promise to the French king to return. He even

Andrea del Sarto. His well-known
"Portrait of the Artist"
National Gallery, London

misappropriated funds entrusted to him for the purchase of works of art. Though plentifully employed in Florence, he gradually sank into indigence, and finally fell a victim to the plague, Jan. 22, 1531.

He is finely represented at the Uffizi and Pitti galleries, and in the National Gallery, London, by a Holy Family and a portrait of himself. His famous frescoes include the Cenacolo of the S. Salvi Convent, the series of S. Philip Benizzi in the Church of the Annunziata at Florence, and the Scalzo series. Del Sarto, contemporarily nicknamed "the faultless painter," had an imitative and a creative genius, a great sense of structure, drawing, and colour, and a marked homeliness of style. The conflict between his art and his amours is the subject of a discerning narrative poem by Browning.

Andreani, ANDREA (c. 1560-1623). An Italian wood engraver. He was a native of Mantua. He engraved pictures after Mantegna, Raphael, Titian, Parmigiano, Boccacini, and other masters. He drew in a free and vigorous style and obtained his chiaroscuro by printing from several blocks of various shades, much after the method employed in chromolithography. His prints are rare.

Andreas. Unsigned poem attributed to Cynewulf, preserved in the Early English MS. known as the Vercelli Book. The story is based on the Acts of S. Andrew and S. Matthew, a Greek MS. which contains the adventures of those apostles among cannibals of Africa. In the Andreas both the speech and the setting are changed to English. S. Andrew sails to England with a company of thanes

and angels, with Christ among them. After landing he rescues S. Matthew and suffers persecution; most of his persecutors are destroyed by flood and fire, and after converting the remainder he founds a church and puts to sea.

Andredswæld. Early English name of a woodland waste extending from Folkestone to Southampton Water, between the N. and S. Downs. This uninhabited wild—now the Weald—long formed a barrier between the Sussex and Wessex kingdoms, traversed only by Stane Street (*q.v.*). Its timber was afterwards employed for smelting Sussex iron. Scattered relics of the original forest remain in Ashdown and Tilgate, as well as in avenues along many of the roads, and in long lines of trees separating the farmers' fields.

Andrée, SALOMON AUGUST (1854-97). Swedish balloonist. He was born at Grenna, Oct. 18, 1854. He showed early a marked interest in ballooning, and worked at a plan for reaching the North Pole in this way. In July, 1897, accordingly, he left Danes Island, Spitzbergen, with two others. Nothing more was learnt of him until the summer of 1930, when a party of Norwegian scientists discovered the bodies of Andrée, Strindberg, and Fraenkel on the ice at White Island, near Franz Josef Land. With the bodies were found logs and diaries recording the balloon's progress and descent on the ice, also many valuable photographic negatives.

Andrew (Gr. *andrios*, manly). Masculine Christian name. It is

especially popular in Scotland, largely because S. Andrew became the patron saint of that country. It is also used in countries where the Greek Church is dominant, *e.g.* Russia and Greece.

Andrew, SAINT. One of Christ's apostles. A native of Bethsaida, a fisherman, and a follower of John the Baptist, he left the latter to follow Jesus (John 1), to Whom he immediately brought his brother Simon Peter. With his brother he was one of the two first called to apostleship (Mark 1), to be "fishers of men." Prominent at the feeding of the 5,000 (John 6), and on the occasion when certain Greeks sought to see Jesus (John 12), he was one of those who on the Mount of Olives heard the prophecy of the fall of Jerusalem (Mark 13). The accounts of his later life are purely traditional. He is said to have preached in Scythia and so to have become patron saint of Russia, and to have suffered martyrdom at Patrae about A.D. 70, being bound with cords to a cross decussate (X). A woman named Maximela had his body embalmed and suitably interred, and part of his cross is said to be in one of the piers supporting the dome of S. Peter's at Rome. Tradition adds that his relics were removed to Constantinople, whence some of them were taken in the 8th century to Scotland, of which country he is also the patron saint. As S. Andrew's day, Nov. 30, is the festival nearest to Advent Sunday, it must always fall either at the beginning or at the end of the Church year.

Andrew The martyrdom of S. Andrew, one of Christ's apostles, depicted by the great Spanish painter Murillo
Madrid

Andrew I OR ARPAD (d. 1061). King of Hungary. Cousin of King Stephen, he owed his accession in 1046 to a pagan rebellion, which he crushed. In 1049 he invoked the aid of his warrior brother Bela against the emperor Henry III, who in 1052 acknowledged the independence of Hungary. While childless Andrew had promised the succession to Bela, but on the birth of a son a feud arose between the brothers, ending in the defeat and death of Andrew near the river Theiss. He was succeeded by Bela.

Andrew II OR ARPAD (d. 1235). King of Hungary. The younger son of Bela III, he succeeded his nephew Ladislas in 1205. and in 1217 led a futile crusade to the Holy Land. His reckless policy of endowing the nobles with the estates of the crown left him at the mercy of the nobility, and in 1222 he was compelled to promulgate the charter known as the Golden Bull, under which the nobles were exempted from both taxation and foreign military service. In 1234 he defeated the invading army of Frederick of Austria.

Andrew III OR ARPAD (d. 1301). King of Hungary. The grandson of Andrew II and son of Stephen by an Italian mother, he was born and educated in Venice, where his father had settled in early life. He succeeded Ladislas as king in 1290, and was the last male representative of the Arpad dynasty, founded in the 10th century (*see* Arpad). The last seven years of his reign were disturbed by civil war. He died suddenly, and was succeeded by Charles Robert of Naples.

Andrewes, LANCELOT (1555-1626). Anglican divine. Born in the parish of All Hallows', Barking, London, and educated at Pembroke Hall, Cambridge, of which he was appointed master in 1589, he was ordained in 1580. His loyalty to the Church of England was recognized by Elizabeth, who made him vicar of S. Giles's, Cripplegate, 1589, a court chaplain, 1590, and dean of Westminster, 1601; and by James I, who promoted him to the bishoprics of Chichester, 1605, Ely, 1609, and Winchester, 1619. He took part in the Hampton Court Conference 1603-4, and in the preparation of the Authorised Version of the Bible. On his death, Sept. 26, 1626, Milton, then only 17 years old, wrote a Latin elegy.

Of his literary work, which fills eight volumes in the Library of Anglo-Catholic Theology, the Manual of Private Devotions has

made the widest appeal, and has been frequently reprinted. A strong supporter of the royal supremacy and the divine right of kings, Andrewes was no flatterer, an equally strong High Churchman, he imposed no penalty on those who differed from him. As a controversialist against Rome his talents are fully displayed in the replies to Cardinal Bellarmine on the subject of the oath of allegiance demanded by James I. His preaching and personal character were alike extolled by contemporaries. Bishop Andrewes is buried at S. Saviour's, Southwark, and in 1919 his tomb was moved from the Lady Chapel to a position on the south side of the high altar.

Andrews, CHARLES FREER (1871-1940). English missionary. Born in Newcastle-on-Tyne, Feb. 12, 1871, he was educated at Pembroke College, Cambridge, and in 1896 became head of the Pembroke College mission in the London slums. In 1904 he went to India and joined the Cambridge Brotherhood at Delhi. Having become a close friend of Gandhi, he cooperated with him in his attempts to secure Anglo-Indian understanding. In 1913 he became a member, later president, of Sir Rabindranath Tagore's Institute at Santiniketan, and died there April 4, 1940. He wrote on the application of Christianity to modern problems, and also a biography of Gandhi.

Andrews, JOHN MILLER (b. 1871). Northern Irish statesman. Born July 17, 1871, he was educated at the Royal Academical Institution, Belfast, and developed his interests as a flax spinner and landowner. He was elected as a Unionist by Co. Down to the parliament of N. Ireland, 1921, and was a cabinet minister for 19 years, having charge of labour until 1937, then of finance. In 1940 he succeeded Lord Craigavon as premier, retiring 1943 in favour of Sir Basil Brooke.

Andrews, ROY CHAPMAN (b. 1884). American naturalist and explorer. Born at Beloit, Wisconsin, Jan. 26, 1884, he was educated at Beloit college and Columbia university, and joined the staff at the American Museum of Natural History, New York. He was a member of an exploring expedition to Alaska in 1908 in 1909-10 he was naturalist on board U.S.S. Albatross on a voyage to the Netherlands East Indies, Borneo, and Celebes; in 1911-12 he explored Korea; and in 1913 he was a member of the

Borden expedition to Alaska. Subsequently he led three expeditions to Central Asia on behalf of the American Museum of Natural History, achieving results of the greatest value to science. Fields rich in fossils were discovered in Mongolia, and large areas of the Gobi Desert were mapped out, showing parts of it fit for commercial motor traffic. Bones of prehistoric animals were discovered on the central Asian plateau, also the first dinosaur eggs known to science, as well as evidences of primitive human life. From 1935-42 he was director of the Museum. He wrote a number of books, including *Whale Hunting with Gun and Camera*, 1916. *Ends of the Earth*, 1929; *The New Conquest of Central Asia*, 1932; and *This Amazing Planet*, 1940.

Andreyev, LEONID NICOLAEVITCH (1870-1919). Russian novelist and dramatist. He was born at Orel. Suffering from melancholia in his youth, he is said to have thrice attempted suicide. His stories, which display vivid imagination and something of a morbid delight in the horrible, particularly in the analysis of the psychology of madness, gave the author a position which rivalled that of Maxim Gorky. The first collection was published in 1901. Later he wrote plays, some of which enjoyed considerable success, a Biblical Trilogy—*Judas Iscariot*, *Eleazar*, and *Ben Tobit*—tr. W. H. Lowe, 1910, and a grim description of war, *The Red Laugh*. *Silence and Other Stories* was translated into English by W. H. Lowe, 1910.

Andria. Town and episc. see of Italy, in Bari province. It is 35 m. W. of Bari, with which a lightly connects it, and has a trade in almonds, olive oil, and majolica ware. Its cathedral, dating from the 11th century, was destroyed by fire in 1916. Pop. 60,000.

Androcles OR ANDROCLUS. A Roman slave, who is said to have lived in the 1st century A.D. He is famous for his friendship with a lion. Condemned to die in the arena, the lion sent to devour him fawned upon him, and proved to be the lion from whose paw Androcles, when hiding from his cruel master in a cave in Africa, had extracted a thorn. Androcles was forthwith pardoned and presented with the lion. The episode is mentioned in Aulus Gellius and Aelian's collection of animal stories.

Androcles and the Lion. A drama dealing with the persecution of the early Christians, written

"THE CAPTIVE ANDROMACHĒ": ONE OF THE FINEST EXAMPLES OF LORD LEIGHTON'S PAINTINGS OF CLASSICAL THEMES
Manchester Art Gallery

by Bernard Shaw. It was produced Sept. 1, 1913, at The St. James's, London, where it had a short run. The piece is an attempt to remove the halo from the first martyrs and to analyse the psychology of martyrdom, slaves of various temperaments, including Androcles, being contrasted with the brave patrician lady, Lavinia (played by Lillah McCarthy).

Andromachē. In Greek legend, wife of Hector. Homer's description of Hector's parting with his wife and infant son, Astyanax, before going to his fatal duel with Achilles is one of the finest passages in literature. After the taking of Troy, Andromachē became the captive of Neoptolemus, son of Achilles, who took her back with him to his kingdom of Epirus. She afterwards married Helenus, a brother of Hector. The sorrows of Andromachē are the subject of a tragedy by Euripides.

Andromeda. In Greek mythology, the daughter of Cepheus, king of Ethiopia. Her mother, Cassiopeia, having boasted that Andromeda was more beautiful than the Nereids, Poseidon, persuaded by the latter, sent a monster to ravage her country. An oracle declared that the monster could be got rid of if Andromeda were sacrificed to it, and so the unfortunate maiden was chained to a rock, to await her doom. She was saved, however, by Perseus, who turned the monster to stone by showing it the head of the Gorgon Medusa.

Andromeda. Constellation in the northern hemisphere, most readily identified in such latitudes during the autumn. It forms one of a group of constellations which preserve the legend of Perseus and Andromeda. It is easily detected by reference to the well-known Cassiopeia's

Chair. Below the Chair and slightly to the left is a group of stars which, like those of Cassiopeia, form a W in the sky, larger but less distinct than the Chair. Below this again, and to the right, is the great square of Pegasus. The extreme left star of this and the extreme right star of the large W are the Alpha and Beta of Andromeda.

Andromeda Nebula. One of the brightest and nearest spiral nebulae, of which the central region is just visible to the naked eye as a hazy patch of light half as big as the full moon. Long-exposure photographs through large telescopes show it to extend over an area 15 times that of the full moon. Until the erection of the 100-inch telescope on Mt. Wilson in California, it was not certain whether the nebula was a mass of gas in our own galaxy (like the Orion nebula) or whether it was an assemblage of stars like the sun at a much greater distance. In 1924-25, photographs on this telescope showed separate stars in the outer regions, and in 1942 a special technique using red-sensitive photographic plates showed stars even in the central regions. Variable stars in the nebula show that it is 680,000 light years from the sun, whence the larger diameter of the system is found to be 80,000 light years. It is 1,700 million times as bright as the sun, and probably contains about this number of stars, though the stars visible on photographs are intrinsically much brighter than the sun. It probably resembles fairly closely what our own galaxy looks like from outside, the plane of the flattened system corresponding to the line of the Milky Way.

Andromedids. Meteors which fall due in Nov., and follow the Leonids, which arrive earlier in the month. The point from which they appear to come, their "radiant," is visible throughout the night. They are slowly travelling meteors and their colour is yellow, which suggests that sodium may be their chief constituent. They are part of a meteoric orbit which appears to recede half-way between the orbits of Jupiter and Saturn, and their orbital period is therefore one of $6\frac{1}{2}$ years. There were notable showers in 1872, 1885, and 1892. That of Nov. 27, 1872, demonstrated that the meteor swarm was moving along the same path as the Biela comet which broke in halves in 1846 and had not been seen since 1852, when it returned still in two portions. It is almost certain, therefore, that the Andro-

Andromeda Nebula. This great spiral nebula is so immensely distant from the earth that its light takes a million years to reach us

medids, also called Bielids, are the remains of the Biela comet. Unlike the Leonid shower of the same month, which appears to be falling later, the Andromedids are advancing their date to a period earlier in Nov. See Meteors.

Andronicus I COMNENUS (c.1110-85). East Roman emperor 1183 to 1185. Grandson of Alexius I, he suffered twelve years' imprisonment for plotting against the emperor Manuel. He escaped in 1165 to Kiev, and by inducing the Russian prince Yaroslav to join in the invasion of Hungary regained Manuel's favour, 1168. A year later he was sent to govern Cilicia, but was forced into retirement after eloping with Theodora, the emperor's niece. From the death of Manuel in 1180 Andronicus, taking advantage of the disorders at Constantinople, reigned jointly with Alexius II until 1183, when the latter, a mere boy, was murdered and Andronicus therefore became sole emperor.

In less than two years he restored order in the city and brought prosperity to the empire. He reduced

the power of the nobles, and on their revolt crushed the rising. While he was absent from Constantinople Isaac Angelus, a descendant of Alexius I, roused a faction against him and was proclaimed emperor, and Andronicus, on his return, fell into the hands of his many enemies. He was tortured for three days and then slain, Sept. 12, 1185.

Andronicus II PALAEOLOGUS (c. 1260-1332). East Roman emperor, from 1282 to 1328. The son of Michael Palaeologus, whom he succeeded in 1282, he reigned jointly with his son, Michael IX, from 1295 to 1320. The two emperors defeated the Turks with the help of the Spanish adventurer Roger di Flor and his Grand Catalan Company, who eventually turned against them. On the death of Michael IX in 1325 Andronicus was forced to acknowledge his grandson, Andronicus III, as joint emperor. He abdicated in 1328 and retired to a monastery.

Andronicus III PALAEOLOGUS (c. 1296-1341). East Roman emperor 1328-41. The son of Michael

IX and grandson of Andronicus II, in 1325 he became joint emperor and in 1328 forced his grandfather to abdicate. He took Chios and parts of Acarnania, Epirus, and Thessaly, but lost most of Asia Minor to the Turks.

Androphagi (Gr. *anēr*, man; *phagein*, to eat). Tribe of man-eaters described by Herodotus as dwelling north of Scythia. Finnish nomads of savage culture, they came from the N.E. and settled in the region now called Poltava. There is no cannibal tradition in the folklore of the Mordvins, who may be ethnically their surviving representatives.

Andros OR **ANDRO**. Island of the Greek Archipelago. The most N. of the Cyclades, it is 25 m. long and 9 m. broad, mountainous, but very productive. Andros, on the E. coast, is the chief town.

Andros. Largest island of the Bahamas. It is 110 m. long and from 10 m. to 45 m. wide. Low and swampy, it is divided by lagoons into three principal and many minor parts. It is well wooded and yields woodland sponges. Pop. 6,718.

Andros, **SIR EDMUND** (1637-1714). English administrator. He was governor of the province of

New York between 1674-81. In 1678 he was knighted. In 1685 he was appointed governor of New England, where his policy of a strong central council, complete

Sir Edmund Andros, English administrator

liberty of conscience, and a strong army and navy, the former to oppose the Indians and the latter the pirates, brought him an increasing unpopularity. In April, 1689, he was suddenly arrested by the citizens of Boston, and was sent to England for trial with a committee of accusers, but was released at once without trial. As governor of Virginia, 1692-8, he founded William and Mary College. Governor of Guernsey, 1704-6, he died in London Feb. 27, 1714.

Androscoggin. River of New Hampshire and Maine, U.S.A. Issuing from lake Umbagog, it flows mainly S. about 160 m. to join the Kennebec near Bath, 15 m. from the Atlantic. It gives its name to a county in Maine.

Andro-Sphinx. Egyptian carved figure of a lion couchant with a human head. A large alabaster example, assigned to the reign of Rameses II, was dis-

Andro-Sphinx. Discovered at Memphis, Egypt, in 1912, this sculpture dates probably from about 1250 B.C. Photo, H. Fawcett

covered at Memphis by Mackay in 1912. Two andro-sphinxes from the reign of Thothmes III stand outside the Cairo museum. Several were produced by the royal workshops at Karnak.

Andujar. Town of Spain, in Jaén province. On the Guadalquivir, 48 m. by rly. E.N.E. of Cordova, it is noted for porous earthenware jars made from local white clay for keeping water cold. Pop. 18,000.

Anecdote. Term now used for a short narrative of an event in the life of a man or woman, more particularly when such narrative illustrates some peculiar characteristic of the person about whom it is told. It is in this sense that the Percy Anecdotes, by T. Byerley and J. C. Robertson, 1820-3, and J. Spence's 18th Century Anecdotes, first published 1820, are named. From the habit which certain persons have in old age of recalling trivial stories of people whom they knew in early life, De Quincey devised the word anecdote in 1823.

The word comes from Gr. *anecdota* (not published), and was originally employed to signify secret history. In this sense it was employed by Procopius for his Anecdota of the Emperor Justinian. In the sense of newly collected details it was used by L. A. Muratori, in his *Anecdota ex Ambrosianae Bibliothecae*, 1697-8, and *Anecdota Graeca*, 1709.

Anegada (Spanish, drowned). Northernmost isle of the Virgin Islands, British West Indies. It is of coral formation, low and flat, about 10 m. long, and very narrow. The encircling reefs are dangerous.

Aneizeh OR **ANEYSA**. Town of Nejd, Arabia. It stands on the Wadi Rummah, and is the centre of several caravan routes with considerable trade. It is renowned among Arabs as the birthplace of

Abd-ul-Wahab, the founder of the Wahabis. Pop. 10,000.

Anemochord (Gr. *anemos*, wind; *chordē*, string). A musical instrument of the harpsichord kind, played by jets of compressed air. It was invented by Johann Schnell, of Wurttemberg, in 1784, to reproduce the tones of the aeolian harp, and was played with great success by the inventor and by the German pianist Hummel. Marie Antoinette offered a large sum for it. The secret of its construction died with its discoverer.

Anemometer (Gr. *anemos*, wind; *metron*, measure). An appliance used for measuring the pressure or velocity of wind. The most common type is the Robinson anemometer. The Kew pattern of this instrument consists of four metal cups, each 9 ins. in diameter, fixed on crossbars, the distance from the centre of the cup to the centre of the axle being 24 ins. The cup type of anemometer was later largely superseded by the Dines pressure tube. The revolutions turn cog-wheels, thereby causing an indicator to move on a dial on which a scale is printed. By means of the scale the velocity of the wind may be read. Wind velocities are recorded in miles per hour, and are given in British weather reports by the Beaufort index numbers, the equivalent velocity of which is shown below. See Beaufort Scale.

Anemometer, for measuring wind velocity

Beaufort Numbers.	Wind.	Equivalent velocity in miles per hour.
0	Calm ..	0
1	Light air ..	1-3
2	Slight breeze ..	4-7
3	Gentle ..	8-12
4	Moderate ..	13-18
5	Fresh ..	19-24
6	Strong ..	25-31
7	High wind ..	32-38
8	Gale ..	39-46
9	Strong gale ..	47-54
10	Whole ..	55-63
11	Storm ..	64-75
12	Hurricane ..	Above 75

Two classes of specification are given for winds on this scale, one for use at sea, the other for use inland.

A similar instrument is used by organ builders for the measurement of wind pressure.

Anemone OR **WINDFLOWER**. A genus of perennial herbs of the family Ranunculaceae, consisting of about 70 species, generally distributed in temperate and Alpine

regions. They have thickened or tuberous rootstocks, from which the divided or lobed leaves spring direct. In spite of the fact that they have no petals, they all have handsome flowers, the sepals being large and brightly coloured.

One of the most charming species is the wild wood anemone (*A. nemorosa*), of N. Europe and

Anemone. Wood anemones (*A. nemorosa*), familiar in English coppices

N. America, that fills the woods in spring with its solitary white flowers and purple-tinged buds. The familiar garden anemones, the poppy anemone (*A. coronaria*) and the flame anemone (*A. hortensis*), are natives of the Mediterranean region, whence they were introduced into English gardens at the end of the 16th century. These have tuberous roots. The hepatica (*A. hepatica*) and the Japanese anemone (*A. japonica*), the white variety of which is so popular in gardens, have, like the wood anemone, long, fleshy, creeping rootstocks. The first of these two is wild in Europe, and the second, as its name indicates, is a native of Japan. *A. apennina*, from S. Europe, has bright blue flowers, and *A. ranunculoides*, also European, has blossoms of golden yellow, a colour rare among anemones. The pasque-flower (*A. pulsatilla*) has dull purple flowers covered outside with silky hairs. The tuberous kinds flourish in rich loam in sunny, moist positions, and hence are excellent for the rock-garden, but the herbaceous kinds need shady corners. The tubers should be planted in the autumn and the herbaceous roots in the spring.

Anerley. Suburb of London. It is in Kent, and within the mun. bor. of Beckenham, $7\frac{1}{2}$ m. S. of London Bridge by railway.

Aneroid OR **ANEROID BAROMETER** (Gr. *a*, not; *nēros*, liquid; *eidos*, form). Instrument for measuring the pressure of the atmosphere. It has for its first essential a cylindrical metal box, the lid of which is a thin corrugated metal plate. The inside of this box is exhausted by means of an air pump, leaving a more or less perfect vacuum. The pressure of the outside air, therefore, forces the

thin lid inwards. As the pressure of the air varies, the bending of the lid varies, and the amount of its bending is registered through a system of delicate levers by the movement of a pointer which passes over a graduated scale.

Aneroids can be made to register variations in air pressure with extreme delicacy. One, for comparative observations of the variation of gravity at sea, consisted of a number of metal diaphragms in connexion with one another, and recorded the differing weights of the atmosphere above it at the levels of the lower and topmost decks of a ship.

Altimeters (*q.v.*), the instruments which register height in a flying aircraft, are also constructed on the aneroid principle. Sealed thin metal capsules, evacuated of air, are interconnected to increase sensitivity and accuracy. See Atmosphere.

Aneroid, showing the principle on which it works. 1. Hand turning on pivot. 2. Hair spring. 3. Chain that turns the hand. 4. Lever fixed to pivot. 5. Lever. 6. Lever rod from spring. 7. Spring pulling against the air pressure on box. 8. Rod. 9. Part of round metal vacuum box. 10. Box pressed in by increased air pressure. 11. Spring pulled down by lowered top of box. 12. Lever rod lowered. 13. Levers lowered. 14. Chain unwound by levers. 15. Hand pivot pulled round by chain

Aneurism (Greek *aneurysmos*, widening). A localised dilatation of an artery which may eventually become so extreme as to form a sac or bag communicating with the artery. The condition, much commoner in men than in women, is frequently the result of syphilitic disease of the arteries, heavy muscular work and alcoholism being contributory causes. An aneurism of the main arteries in the chest may cause serious symptoms by displacement of the heart, pressure on the lungs, and interference with the act of swallowing. Sudden death may occur from

Aneurism of the aorta pressing on the vagus nerve

rupture of an aneurism. Surgical treatment is occasionally helpful, but usually the condition is best treated by prolonged rest and by the careful avoidance of muscular effort and excess.

Anfield. A northern suburb of Liverpool, England. Included in Walton-on-the-Hill parish, it has a railway station named Walton and Anfield. The ground of Liverpool football club is in this suburb. To the S. is Stanley Park, 96 acres.

Angamos Point. Promontory of Chile, about 50 m. N. of Antofagasta. Off this cape, Oct. 8, 1879, the Chilean ironclads, Blanco Encalada and Almirante Cochrane, defeated the Peruvian battleship Huascar.

Angara. River of Siberia. It rises as the Selenga in the Klongai Mts. of Mongolia, and as the Tola in the Yablonoi Mts. of Transbaikalia, passes through Lake Baikal,

flows thence N. through Irkutsk to Tuskama, whence it follows a W. course to join the Yenisei above Yeniseisk. It is navigable to Irkutsk, and for steamers as far as its junction with the Ilim, to which point it is known also as the Upper Tunguska. The stream, usually labelled the Upper Angara, which flows into Lake Baikal at its northern extremity, is not the upper part of this great river. Part of its valley near the lake is utilised for the Trans-Siberian rly. The river is frozen for six months of the year. Its length is about 1,300 m. Gold-bearing reefs near its sources have been opened up and developed since 1920.

Angary. Term used in international law. Angaros was originally the name of the imperial Persian dispatch-riders, and angarium the system under which the transmission of dispatches was carried out. The furnishing of horses and messengers gradually

Angel. Raphael, "one of the seven holy angels which present the prayers of the saints," and Tobias. By the Italian painter Raphael
Louvre, Paris

came to be regarded as obligatory, only certain classes of citizens, such as soldiers and professors, being exempt. Later, angary was used for any kind of feudal burden or forced service, and, in the Middle Ages, for the right of a belligerent to seize neutral merchantmen and their crews for warlike purposes.

The modern definition of the right of angary (*droit d'angarie*) is "an act of the state by which foreign as well as private domestic vessels which happen to be within the jurisdiction of the state, are seized and compelled to transport soldiers, ammunition, or instruments of war; in other words, to become parties against their will to carrying on direct hostilities against a power with whom they are at peace." During the Franco-Prussian War of 1870-1, some English vessels in the Seine were sunk by Germans to prevent French war vessels from entering the river. The

plea of military necessity was set up and accepted, and the owners were compensated. The Hague regulations allow railway and other materials belonging to neutrals to be commandeered and even destroyed. During the First Great War, the Allies claimed by virtue of this custom the right to seize and make use of Dutch and other neutral vessels lying in British and American harbours.

Angas, GEORGE FIFE (1789-1879). British colonist. Born at Newcastle-on-Tyne, May 1, 1789, he made a fortune as shipowner and merchant, and in 1833 retired to Devonshire. Becoming interested in colonial development, he was appointed a commissioner under the Act of 1834 establishing the colony of South Australia, and guaranteed £35,000 to the South Australian Company for purchase of land and settlement of emigrants. Having suffered heavy

losses through his colonial agents, he himself went out to Adelaide in 1851 and spent the rest of his life in the colony, devoting to it all his energies and means. He was a founder of the National Provincial Bank of England, the Bank of South Australia, and the Union Bank of Australia. He died at Adelaide on May 15, 1879. The S. Australian township of Angaston, 51 m. by rly. N.E. of Adelaide, was named after him.

Angel (Gr. *angelos*, messenger). Spiritual being intermediate between God and man, to whom frequent reference is made in the Bible and in Babylonian and Zoroastrian literature. According to the O.T. angels were created by God (Ps. 48), and have two functions: (1) They are the messengers of God sent to guide and assist His people, the common and usual work ascribed to them. (2) They are the attendants upon God's throne, in the hierarchy of heaven. Mention is rarer in this connexion, but see Dan. 7 and Ps. 96.

In the N.T. the same functions are recorded. An angel announces to the Virgin Mary that she is to be the mother of Christ; angels are seen at the birth of Christ, and in Revelation they are described as ministering in heaven. On many occasions in the N.T. angels serve and assist Christ, as later they serve certain of the apostles. Christ refers to their good offices more than once, and in Matt. 18 alludes to them as guardian angels. While the general rule is that angels are sinless beings solely devoted to God's service, reference is also made in the Bible to fallen angels, whose function is the trial and temptation of man. Satan is referred to in Job and in Matt. 25 as the chief of these, and the dragon in Revelation may be taken as a similar example. Unlike the Zoroastrian ministers of darkness, who serve an eternal principle of evil, the fallen angels of the Bible are subject to God.

In the hierarchy of heaven four angels are named as archangels: Uriel, Michael, the warrior of Revelation, Gabriel of the Annunciation, and Raphael of the book of Tobit. Angels being creations of God, the members of the Christian church are forbidden to offer them worship due to God; but from the 4th century they have been objects of veneration. The reference to the angels of the seven churches in Revelation is variously interpreted, the most commonly accepted view being that the bishops of the churches were designated by it.

Angel. English gold coin. Struck in 1465 and known as the angel-noble, it bore a representation of the Archangel Michael slaying the dragon. It continued to be coined until the reign of Charles I. and ranged in value from 6s. 8d. to 10s. See Numismatics.

Angel. The Angel Gabriel of the Annunciation, by Melozzo da Forlì
Uffizi Gallery, Florence

Angel Fish (*Angelus squatinus*). Fish of the shark order. One species, also known as the monk fish, is common on the British coasts, especially off Scotland. It somewhat resembles a ray or skate. It is often five ft. long.

Angelica. Genus of Umbelliferae, natives of the N. temperate and sub-Arctic regions, including about 70 species. They are perennial herbs with very handsome compound leaves and large umbels of white or purplish flowers. The name indicates the former belief in the protective virtues of the plant in cases of poison, infection, and enchantment. The most powerful species from this point of view was the Archangelica (*A. archangelica*), a plant of N. Europe, the

Angel. Michael depicted by the great Italian painter Raphael
Louvre, Paris

stalks of which are candied and used as a sweetmeat.

Formerly the leaf stalks were blanched and then eaten like celery. Another European species is *A. sylvestris*, which is common in damp woods and near streams throughout Britain. It attains a height of 5 ft., and has pinnate wedge-shaped leaves as much as 2 ft. long, while at the base of the leaf-stalk is a large egg-shaped expansion. The angelica tree is the popular name of a N. American shrub, *Aralia spinosa*. The berries are infused in wine or spirit to make a medicine for rheumatism, toothache, and colic. See Rice-paper plant.

Angelica

Angelico, Fra (Lat. *frater*, brother). Italian painter, in full IL BEATO FRA GIOVANNI ANGELICO DA FIESOLE (1387-1455). He was born at Castello di Vecchio, was christened Guido, and in 1407 entered the Dominican order at Fiesole, taking the name of Giovanni. Called the Angelico, on account of his sweet disposition, he passed his novitiate at Cortona. Eleven years later he

was installed at Fiesole, and in 1436 was transferred to the priory of San Marco at Florence. Here, as at Fiesole, he decorated the convent and church with frescoes. In 1445, commissioned by Pope Nicholas V to

Angel Fish. Genus of the same piscine order as the shark

Angel. English gold coin of the reign of Edward IV, slightly reduced

paint a chapel in the Vatican, he removed to Rome, where he died March 18, 1455, being buried in Santa Maria sopra Minerva.

Fra Angelico's art is remarkable for its elaborate figure composition, rich colouring, and ecstatic though simple sentiment. He had the training and instinct of an illuminator, and the precious quality of his craft is easily discernible even in his largest paintings. He is best represented at Florence, where, in addition to the San Marco frescoes, there are numerous works in the Academy and the Uffizi Gallery. Among the most celebrated of these are the Madonna of the Linen-weavers (1433), in the Uffizi, and the Deposition, the Last Judgement, and 35 small panels of the life of Christ, in the Academy. One of his early works, an altar-piece of the Virgin and Child with saints, is in the Church of S. Domenico, Cortona; others are at Rome, Orvieto, Parma, Perugia, Fiesole, and Pisa. The National Gallery, London, possesses a Resurrection, formerly the lower panel of the S. Domenico altar-piece, and the Louvre has the Coronation of the Virgin. *Consult* Lives, V. M. Crawford, 1900; L. Douglas, 1900.

Angel Inn. Former London hostelry, converted into a café in 1921. Situated at the N. end of the City Road and the corner of Pentonville Road and High Street, Islington, it was rebuilt in 1819 and 1880. One of the old posting inns, it was the first stop for those travelling northwards from London, and the original building had the customary galleries running round the yard. Here in 1790 Thomas Paine wrote *The Rights of Man*.

Angell, Sir NORMAN (b. 1874). British author. Born on Dec. 26, 1874, his full name was Ralph Norman Angell Lane. He was educated privately, in France and at Geneva. Going to western America as a youth, he was in turn prospector, rancher, and journalist. Returning to Europe in 1898 as European correspondent for several American newspapers, he settled in Paris, where he edited *Galignani's Messenger*, 1899-1903. He was general

Sir Norman Angell.
British author

manager of the *Paris Daily Mail*, 1903-14. An ardent advocate of peaceful international cooperation, he wrote as Norman Angell on this subject before and during the two Great Wars, the best known of many writings being the book entitled *The Great Illusion*, 1910, which passed through many editions in several languages. Angell was Labour M.P. for N. Bradford, 1929-31, was knighted in 1931, and received the Nobel Peace Prize in 1933. He invented *The Money Game*, a series of card games teaching the principles of elementary economics. Returning to the U.S.A., Angell became an editorial writer of *Free World*, New York, and did much other writing for the American press. Among his later publications are *America's Dilemma*, 1940, and *Let The People Know* (a statement of the British war case), 1943.

Angelo. Leading male character in Shakespeare's *Measure for Measure*. Left as his deputy by Vincentio, duke of Vienna, he revives certain laws against incontinence under which Claudio is arrested and sentenced to death. Besought by Isabella, Claudio's sister, to pardon her brother, he

Angelus. Millet's famous picture, painted 1859, in which the great French artist shows a French peasant couple pausing in their work in the fields to pray when they hear the ringing of the Angelus bell
Jean François Millet, Louvre, Paris

agrees to grant her request on condition that she gives herself to him. This condition having, as he thinks, been complied with, he orders the instant execution of Claudio, whose life, however, is saved by the intervention of the duke, who forces Angelo to marry Mariana, a lady whom he had discarded. See Measure for Measure.

Angelot. Old French gold coin. It was first struck by Philip VI in 1340, and had a weight of from 87 to 97 grains. The word means little angel, and the coin was so called because it bore the figure

Angelot. French gold coin of the time of Philip VI, one-third reduced

of the archangel, Michael, killing the dragon. Henry VI of England coined an angelot for his dominions in France.

Angels of Mons, THE. Popular delusion of the First Great War. During the retreat from Mons,

Aug., 1914, it was asserted that S. George, with attendant angels, interposed between the advancing Germans and the British, saving the latter from destruction. The legend arose out of an imaginative fiction written by Arthur Machen in *The Evening News* (London) and reprinted in *The Bowmen and other Legends* (Aug., 1915). Many soldiers who took part in the retreat positively asserted they had seen the heavenly company, the explanation being that owing to weariness their imaginations were not normal.

Angelus. Service in the Roman Catholic Church in honour of the Annunciation of the Virgin Mary. It is quite short, and is said three times a day—at 6 a.m., noon, and 6 p.m. The name comes from its opening sentence, *Angelus Domini nuntiavit Mariæ*. It is to announce this service, dating from the 14th century, that the angelus bell is rung in churches and convents.

Anger. Feeling of uneasiness or discomposure of the mind upon the receipt of any injury, with a present purpose of revenge (Locke). One of the sthenic or active emotions, it produces excitement and energetic muscular action. It is combined with an element of pleasure, that of looking forward to securing satisfaction for injury or injustice. Anger may be caused by contemptuous treatment, by impediments to the accomplishment of our wishes, or by actual wrong. Wounded self-love is generally its prime cause. Bain's opinion that the chief element of deliberate

Angel Inn, Islington. Courtyard of the old hostelry
From an old print

anger is the impulse to inflict suffering upon another in order to gratify oneself seems extreme.

Angerman. River of Sweden. Rising near the Norwegian border, it flows S.E. and enters the Gulf of Bothnia through a long estuary N. of Hernösand. Its length, including the headstream and some lakes, is 242 m. The river is used for floating timber from the extensive forests through which it flows. With its tributaries it drains 12,600 sq. m., and it is navigable by small craft for about 70 m.

Angers. City of France, formerly the capital of the duchy and prov. of Anjou. Standing on the Maine, a few miles above its junction with the Loire, 212 m. by rly. S.W. of Paris, it is the chief town of the department of Maine-et-Loire. Here the rivers Sarthe and Mayenne meet to form the Maine, and the town is a natural converging point of roads and railways. Around the ancient town lie new and spacious suburbs. Its commercial prosperity is due to its position in a fertile district where abundant vegetables, fruit, and

some picturesque old houses and an episcopal palace; its modern buildings include the palais de justice and a hospital. The ancient Andegavum, its early importance began when it became the residence of the counts, afterwards dukes, of Anjou. Until the Revolution it had a famous university. Pop. 87,988.

From Nov., 1939, to June, 1940, Angers was the seat of the refugee Polish government. The city was bombed by Allied aircraft on June 3, 1944, and liberated by U.S. troops on Aug. 11, 1944.

Angerstein, JOHN JULIUS (1735-1823). Russo-British art connoisseur. Born at St. Petersburg of Russian descent, he came to London in 1749. He amassed a fortune which he spent in philanthropy and on a remarkable art collection. After his death at Blackheath, Jan. 22, 1823, on the advice of Sir Thomas Law-

Angevin, being another grandson of Edward III, is more usually regarded as the first king of the house of Lancaster. These Angevin kings are generally known as Plantagenets. See Plantagenet.

Angilbert (d. 814). A French saint and poet. He was educated at the court of Charlemagne, where, under Alcuin, he studied Latin and Greek. He became count of the palace to Pepin when that prince was crowned king of Italy in 782. Returning to France, he fell in love with Charlemagne's unmarried daughter, Bertha, and became by her the father of two children, one of whom was the chronicler Nithard. In 790, on the advice of Alcuin, then abbot of Tours, and with the consent

Angers, capital of the old French province of Anjou General view of the city as seen from the castle. Above: Entry to the castle

flowers are grown, to the small coal mines and slate quarries close by, and to manufactures of liqueurs, wine, and clothing.

Angers has been the seat of a bishop since the 3rd century, and its cathedral, dedicated to S. Maurice, was built in the 12th and 13th centuries, and added to in the 16th. S. Serge's is another old and interesting church. The castle, formerly a stronghold of the dukes and now an armoury, is a fine example of its kind, and dates from the 13th century. The Hôtel d'Anjou dates from three centuries later. In the city are the medieval abbey of S. Aubin and hospital of S. John. Angers has

rency and other connoisseurs the Government asked for and obtained a grant of £60,000 for the purchase of his pictures, and they formed the nucleus around which have grown the treasures in the National Gallery (*q.v.*).

Angevins. A family to which eight of the English kings belonged. Henry II of England was the son of Geoffrey, count of Anjou, and he himself became count in 1151. These counts are, therefore, known as Angevins, Henry and his descendants on the English throne, of whom Richard II was the last, being often called the Angevin kings. His successor, Henry IV, also an

of Charlemagne and Bertha, he became abbot of Centula, later known as S. Riquier, in Picardy. He rebuilt the abbey and endowed it with a library. He was three times sent as envoy to the pope. He died Feb. 19, 814, and by popular and unofficial canonisation figures in the calendar of saints. It is doubtful if he is the author of a fragment of an epic dealing with Charlemagne and Leo III, attributed to him, but he probably composed portions of the *Annales Laurisenses*.

Angina Pectoris (Lat. *angina*, choking; *pectoris*, of the breast). Severe paroxysmal pain in the heart. It is not an independent disease, but a symptom of various abnormal conditions of the heart, particularly those associated with degenerative changes in the coronary arteries supplying the heart, or in the great main blood-vessel termed the aorta.

Angina pectoris is a disease of adult life, and much more frequent in men than in women. The chief causes are syphilitic disease of the arteries, gout, and diabetes, and less frequently influenza. The pain comes on suddenly, usually in consequence of muscular effort or strong emotion, such as a fit of anger. Dyspepsia and sudden exposure to cold in bathing or getting out of bed are other exciting

causes. The pain is described as feeling as though the heart was held in a vice, and it radiates into the neck and down the arm. The face is pale and the body may be covered with sweat. The paroxysm lasts from a few seconds to a minute or two, and during the height of the attack the patient may faint or drop dead. Inhalation of nitrite of amyl is often of great value in relieving the pain. There is no known method of curing the condition, but by leading a quiet life and avoiding muscular effort and excitement the frequency of the attacks can be reduced.

Pseudo-angina, or false angina pectoris, is a condition of paroxysmal pain in the heart which is often mistaken for the true form, but is much less serious. It occurs most often in women and is usually an indication of neurasthenia or hysteria. It may be distinguished from the true angina pectoris by the attacks being less severe and often periodical and occurring at night, by the pain coming on without muscular effort and lasting for perhaps one or two hours, and also by the indications of other disturbance of the nervous system. Pseudo-angina is never fatal. The treatment of the condition is the same as for other forms of neurasthenia. A very similar pain in the heart may arise from excessive indulgence in tobacco, tea, coffee, and other stimulants. This form is sometimes termed toxic angina. See Heart.

Angiosperms (Greek *angeion*, vessel, *sperma*, seed). One of the two sub-classes of seed-bearing plants (Spermatophytes). It embraces all those natural orders whose seeds are produced in a seed vessel, as opposed to gymnosperms, whose seeds are naked.

Angiosperm.
Horse-chestnut

Angkor or **NAGARA THOM**. Ruined city and the ancient capital of Cambodia. It stands on the Siem-Reap, to the N. of the Tonle Sap or Great Lake. Enclosed by walls 30 ft. high, it covers an area 2 m. square, has five splendidly wrought gates, and also contains remains of some royal palaces and several temples. To the S. is the temple of Angkor Vat, a wonderful building where Brahma and later Buddha were worshipped. One of the finest remaining examples of Khmer architecture, it stands in a moated park and according to Aymeria dates from the opening half of the 12th century.

Angle (Lat. *angulus*, corner). In the simplest terms, the point where two lines meet, or the line where two surfaces meet. The point of meeting is called the vertex, and when meeting lines are under consideration, the figure formed by the lines emanating from the vertex is the angle.

In the strict mathematical sense, the angle is the measurement of the amount of rotation which would be necessary to make one of the lines coincide with the other. The amount is usually expressed in degrees. When one line is perpendicular to another the number of degrees between them is 90 and the angle is called a right angle. If the angle is less than this it is called an acute angle; if greater, an obtuse angle.

Alternate angles are formed when a line crosses two parallel lines:

Here the angle at A and the angle at D are alternate angles, as are also the angles at B and at C. Complementary angles are those which make up a right angle, e.g. the angle A D B and the angle

B D C. The term "angle of parallelism" is used in non-Euclidean geometry to denote the angle made by one parallel with a transversal which is at right angles to the other parallel.

A polyhedral angle is a solid angle formed by the meeting of more than three planes. A trihedral angle, as in a triangle pyramid, is one made by the meeting of three planes. A solid angle, in more general terms, is the figure formed by plane or curved surfaces passing through a point and intersecting a plane not containing the point in a closed curve or broken line. See Geometry.

In optics, the angle of incidence is the angle between the line of a ray of light striking a surface and a perpendicular drawn at the point where the ray strikes the surface. The angle of reflection is the angle between the direction of the ray reflected from a surface and the perpendicular. The angle of refraction is the angle between the line which a ray of light takes when it is bent in passing from one medium to another, and the

perpendicular to the surface of separation of the two media. See Mathematics.

Angle. In aeronautics, a number of factors related to angles are of fundamental importance in designing aircraft and also to the performance of the machine and the manner in which it is controlled by the pilot. One of these is the angle of incidence. This is the angle at which the wings are attached to the fuselage or body of an aircraft, the measurement being taken between the longitudinal axis of the machine and the chord line of the wing. The chord line is the imaginary line drawn from the leading edge to the trailing edge of the wing. As the wing is progressively inclined from the edge-on position to the airflow, it experiences an increasing normal pressure and thus the amount of lift produced varies. For slow flying, a comparatively large angle is required. When the aim is high speed, a small angle of incidence is necessary.

The angle of attack is the angle at which the airflow meets the aerofoil, i.e. the wing of an aircraft. The effect of this is twofold. The airflow forces the wing upward and at the same time induces a backward pressure. The former is known as lift, the latter as drag. The relationship of these two forces is termed the lift/drag ratio and its variation depends on the angle of attack.

When the wings of an aircraft are attached to the fuselage so that they are inclined at an upward angle in relation to the centre line of the aircraft, the angle so formed is termed the dihedral angle. Wings are arranged in this way to provide stability in the rolling plane and so to relieve the pilot of the task of correcting the attitude of the machine when it is violently tilted by air disturbances during flight. When it is tilted over sideways by any cause the wing which drops assumes an angle of attack which is greater than that of the upper wing. The lift therefore becomes greater, and so the wing rises and the aircraft is restored to its normal level flying attitude. The dihedral angle is usually between 2° and 7°. See Dihedral.

Dihedral Angle

Angle. Diagram showing the dihedral angle of an aeroplane

1. General view of the massive and profusely ornamented ruins of the temple. It was built in the 7th cent. of multi-coloured sandstone, and was used for Hindu worship before being finally consecrated to Buddhism.

Angler Fish (*Lophius piscatorius*) A fish of the order of Teleostei, or bony fishes. Common around the British coasts, it ranges in length from 3 ft. to 5 ft., and is known also as the sea devil,

Angler fish One of the bony fishes common round the British coast

the fishing frog, and the gab. It is dark brown on the upper surface and white beneath, but the nature of the sea bottom modifies its colour considerably. Extremely ugly and awkward in movement, it usually lurks in the weeds by the shore, where it can walk along the bottom by means of its paired fins. Its conspicuous feature is its enormous head. It has a huge mouth, with backward-pointed teeth, and a series of fringed tentacles or appendages above the mouth and on the body. It derives its name from lying in wait on the sand or mud, with the bones of the first back fin stalks waving like fronds of seaweed. These attract small fish, which are promptly snapped up. Other species inhabit deep water, and in these the fringed tip of the main head rod is phosphorescent.

Angles. Name of the tribe which gave its name to England or Angleland. Of Teutonic stock, the Angles lived in the district of Slesvig-Holstein known as Angeln. In the 5th century they invaded England. They settled in East Anglia, and, according to Bede, founded the kingdoms of Mercia, Deira, and Bernicia. See England: History.

Anglesey or **ANGLESEA.** Island and county of North Wales. It has a length of 21 m., a breadth of 28 m., and an area of 275 sq. m. Menai Strait, which is spanned by the Menai Suspension Bridge and the Britannia Suspension Bridge, separates it from the mainland of Wales.

Anglesey has generally a flat, unpicturesque surface, relieved by

slight hills, the highest point being Holyhead Hill, over 700 ft., a fertile well-cultivated soil, and a mild climate. Minerals are plentiful. Copper is extensively worked at the Parys and Mona mines, near Amlwch, and zinc, limestone, lead ore, marble (the green serpentine of Holyhead Island), coal, granite, and soapstone are found. Agriculture and

cattle-rearing receive considerable attention, but there is little manufacturing. Beaumaris is the county town, but Holyhead, the port for mail steamers to Dublin, situated in the extreme W. on Holyhead Island, is more important. There is a B.B.C. transmitter a few miles to the N.E. of Beaumaris. The co. is served by British Rlys. One member is returned to Parliament. The pop. at the census of 1931 was 49,029.

The Mona of Tacitus, Anglesey was then a stronghold of the Druids, and was subjugated by the Romans A.D. 61 and 78, and finally, in 1272, by Edward I, who built Beaumaris Castle. Ancient remains abound; Holyhead has remnants of a Roman camp. Off the E. coast is Puffin Island, the scene of the wreck of the Rothesay Castle, 1831. See Druids.

Anglesey, EARL AND MARQUESS of English titles held in turn by the two families of Annesley and Paget. In 1661 Arthur Annesley, Viscount Valentia, was made earl of Anglesey, a reward for his services in helping to restore Charles II. His son James succeeded him, and the title passed to his descendants

until Richard, the 6th earl, died in 1761. Richard left a son Arthur, but there was some doubt about his paternity and the English House of Lords would not allow him to succeed. The Irish House held a contrary opinion, and he became Viscount Valentia and afterwards earl of Mountnorris.

William Paget, a Londoner, was secretary of state under Henry

Anglesey. Island county off the coast of N Wales it was the last stronghold of the British Druids

VIII and Edward VI, and was made a peer as Lord Paget of Beaudeston in 1552. He obtained extensive lands in Staffordshire, but his fortunes in later years were somewhat chequered. The barony passed to his descendants, of whom William, the 6th lord, was a supporter of William of Orange and later an active diplomatist. The 7th lord was made earl of Uxbridge in 1714, but this title became extinct when his grandson died in 1769. The barony, however, passed to a cousin, who was made earl of Uxbridge in 1784. His son, the famous cavalry officer at Waterloo, and later lord-lieutenant of Ireland, became 1st marquess of Anglesey in 1815, and the title is still held by his descendants. The 5th marquess was notorious

Anglesey. The South Stack lighthouse off Holyhead Island, the most westerly point of the county. The port of Holyhead is on this island

Anglesey arms

for his eccentricities and extravagance. George (b. 1922), 7th marquess, succeeded 1947. An eldest son is called earl of Uxbridge, and the family seat is Plas Newydd, Anglesey. *See* Paget.

Anglesey, ARTHUR ANNESLEY, EARL OF (1614–86). English politician. Son of Sir Francis Annesley, afterwards Lord Mountnorris, he was born at Dublin, July 10, 1614, and was educated at Magdalen College, Oxford. After twice acting as parliamentary commissioner in Ireland, in 1645 and 1647, he sat for Dublin city in Richard Cromwell's parliament, 1658, and for Carmarthen borough in the Convention parliament, 1660. In 1661 he was made earl of Anglesey. He was vice-treasurer and receiver-general for Ireland 1660–7, when he became treasurer of the navy. In 1672 Anglesey was made lord privy seal, but ten years later was dismissed for criticising the Government. He exercised a moderating influence at the Restoration, and showed courage and independence in resisting the so-called popish plot in 1680. He died April 26, 1686.

Anglesey, HENRY WILLIAM PAGET, 1st MARQUESS OF (1768–1854). A British soldier and statesman. He was the eldest son of the 1st earl of Uxbridge, was educated at Westminster and Christ Church, Oxford, and after sitting in the House of Commons 1790–6

Lawrence
Portrait, Sir T. Lawrence

and 1806–12, he succeeded his father as earl of Uxbridge in 1812. He served in Flanders in 1794 and with marked distinction under Sir John Moore in Spain. In command of the British cavalry through the Waterloo campaign, 1815, he lost a leg in the memorable charge on June 18, and was made marquess of Anglesey. In 1828 Anglesey was appointed lord-lieutenant of Ireland, but for his support of Catholic emancipation was recalled by Wellington, to be reappointed by Grey in 1830. He left Ireland in 1833 after setting up the Board of Education. From 1846–52 he was master-general of the ordnance in the Whig ministry. He died, a field-marshal, April 29, 1854, and was buried in Lichfield cathedral. One of his sons, Lord George Paget (1818–80), was a cavalry leader in the Crimean War

Anglesite. Mineral found in many lead regions. A sulphate of lead ($PbSO_4$), it is insoluble in water, but soluble in acids, potash, and other alkaline solutions. It occurs in a massive form of granular structure, white and rather soft, and also in the form of crystals mostly transparent and without colour, but sometimes softly coloured grey, green, blue, or yellow. Anglesite contributes something to the world's supply of lead, but it nowhere occurs in

sufficient quantities to be used by itself as a source of that metal. It gets its name from having been originally discovered in Anglesey (1832) *See* Lead

Anglican Chant. Derivative of the Plain Song or Gregorian Chant. Its distinguishing features are (1) definite accents and note values: and (2) harmony. A single chant has two sections, of three and four bars respectively; a double chant is of the form and length of two single chants *See* Gregorian Chant.

ANGLICANISM : HISTORY & PRINCIPLES

The Very Rev. S. C. Carpenter, D.D., Dean of Exeter

This article deals with the development of Anglicanism as a broad principle of religious belief and practice both in England and in other countries. For details of its organization in England, see Church of England

Anglicanism is properly a temper of mind, a spirit, a thing which cannot be counted, weighed, or measured. Nevertheless, spirit in this world always takes to itself form. Accordingly, the nature of Anglicanism can be diagnosed from the history of the Church of England, and, since the Reformation, of that larger body, the Anglican Communion.

Anglicanism has existed for a long time, and has continued to flourish in the face of considerable difficulties. The difficulty at first was the pressure exercised by Rome. The difficulty since the Reformation has been the pressure of the State.

The story begins with the conversion of the English in the seventh century. That came from two quarters, from Rome and from the North West. Early English Christianity was a very fine thing. It tamed a very rough and barbarous people, it bred some great saints, and it was missionary-hearted. Moreover, it united the nation. There was one church of the English while there were still seven English kings, and there were English church synods before there was an English parliament. The weakness of the Church of England at that time was that it was isolated, especially the Northern half of it.

The Norman conquest, hard as it was for Englishmen to bear, had the salutary effect of "continentalising" the Church of England afresh. William I refused to do homage to the Pope for his kingdom, but he brought in much of the culture of the Continent. At the same time he gave the Church a considerable measure of independence by creating ecclesiastical courts side by side with

his own secular courts. Thomas Becket, taking advantage of this, stood out as a champion of the rights of the clergy against Henry II, but he was felt by the common people to be their champion too. Fifty years later, the Great Charter, which the barons, headed by the archbishop, wrung out of King John, threw the Church once more into the arms of the Papacy, but that was only because there was at that time nothing else.

From the beginning of the 13th century, especially under the weaker kings, like Henry III and Henry VI, the papal power in England increased. The stronger monarchs, like Edward I and Edward III, resisted the process. Statutes were passed forbidding appeals to Rome from the King's Court and papal nominations to English benefices. And all the time everybody protested against papal financial exactions. That was where the shoe pinched every foot. The fact is that the Church of England, remaining in communion with the Pope, and for centuries not dreaming that anything else was possible, had all the time a character of its own. It developed a good deal of the sort of thing which in the French Church was afterwards called Gallicanism. In England it was Anglicanism.

The Reformation was, among other things, an upspringing of nationalism. It was, of course, much else besides. There were theological and ecclesiastical discontents which had been brewing for centuries. The actual course of events was largely engineered by monarchs, but not even Tudor monarchs could act effectively except where there was some public

opinion to support them. There was a general desire for simplification in belief and practice, and an eagerness to use the New Learning and the English Bible. Continuity was taken for granted. No one supposed for a moment that a new church was being created, and there is no vestige of a date at which it could be alleged that this was done. Care was in fact taken that the old Bible, the old creeds, the old sacraments, should continue to be used, and that the episcopal succession should be maintained. But what chiefly happened was that the Church of England rose up and said: "We will have our own form of the Christian religion." The Reformation took a long time. It began under Henry VIII, and it ended with the Book of Common Prayer in 1662.

Non-Jurors and Nonconformists

The Book of Common Prayer represents the victory of the Church and King party over the Puritans. The Prayer Book system never had a chance to take root everywhere. It assumed that there would be small parishes, and that all the parishioners would be baptized, confirmed, and communicants. This did not happen. The Puritans went out, and non-conformity, in the modern sense, began. A little later nine bishops, including five of the famous seven who had resisted the tyranny of James II, about 400 priests, and with them a number of the laity, felt that they could not suddenly transfer their sworn allegiance from King James to King William. They were the non-jurors. They were not Jacobites. They made no attempt to restore the Stuarts. But they refused the new oath, and were accordingly deprived and went out into private life. Their departure was a loss to the Church. Later still "the people called Methodists" gradually drifted away from the Church, and with the Industrial Revolution and the development of large urban populations, a generation grew up of whom many knew nothing of either church or chapel. Thus the Prayer Book did not obtain the universal acceptance its compilers expected.

From 1688, except for a brief period under Queen Anne, it was the policy of the government to ensure that the bishops and other State-appointed clergymen were of sound Whig principles, and in the 18th century the Church, with her Convocations forbidden to transact any business, and her leaders all cut to a State pattern, sank into inertia.

Then came four great revivals, the Evangelical movement, which was a recovery of personal religion, the Oxford or Catholic movement, which was a reassertion of the corporate idea of the Church, the liberal movement, which taught people to think about their religion, and a movement, of which Maurice and Kingsley were among the leaders, which emphasised the social implications of belief in Christ. The Church of England has been able to absorb these movements to such an extent that every Anglican in the world today is affected for the better by all four of them.

Anglicanism Overseas

The Anglican Communion is something very much larger than the Church of England. Anglicanism since the Reformation has existed in Scotland, in Ireland, and in Wales, as well as in England. In these countries it is now "disestablished." That fact, of course, makes no difference whatever to its spiritual *ethos*.

Elsewhere it has grown to very large dimensions. The earliest English missionaries, like Boniface in Germany, had no thought of planting anything specifically English. But the Elizabethan explorers, like Raleigh in Virginia, planted a part of the Anglican Communion, with the English Prayer Book, and from that grew up what is called the Protestant Episcopal Church of America. During the 18th century the American colonists were, by the obstinate action of the home government, without bishops; but in 1784 Samuel Seabury was consecrated at Aberdeen to be bishop of Connecticut, and there are now more than 100 bishops of the American Church. The American Church is, of course, completely self-governing, as are the Churches of the Dominions (Canada, Australia, New Zealand, South Africa, and, rather less completely, India), but it is their pride and pleasure to send their bishops every ten years to the Lambeth Conference, which sits under the presidency of the archbishop of Canterbury.

The Churches of the Dominions were all at one time "established" and were in fact legally parts of the Church of England. When Bishop Selwyn of New Zealand held a perfectly innocent synod of his few clergy, grave fears were entertained that he was contravening a statute of Henry VIII! All this has passed completely away. It proves that Anglicanism is independent of State establish-

ment. In England the Church happens to be established—or, more correctly, the State has an ecclesiastical connexion—a condition of affairs which is an advantage to the nation and a burden to the Church. Overseas there is no State connexion.

There are also large numbers of missionary dioceses. The work of the Society for the Propagation of the Gospel, the Church Missionary Society, the Universities Mission to Central Africa, and other agencies has planted the Church in all parts of the world. The missionary dioceses are not yet self-supporting, either in workers or in finance, but they are being more and more staffed by native-born clergy and teachers, and they are all developing a character of their own. The policy of the missionary dioceses is not to import into the new country all the traditional furniture of home Anglicanism, but to plant the four essential things, the Bible, the Creed, the sacraments, and the ministry, and to promote the growth of the new Church on natural and native lines. The architecture, the music, the parochial organization of a Church where Indian Christians worship should all be as completely Indian as their language.

The Anglican Principle

The life of Anglicanism overseas has hitherto been affected by the fact that the Anglicans are often of English origin. Even in the U.S.A. a large number of the Anglicans are those whose forebears came from England. But everywhere Anglicanism is resting less and less on accidents of this kind, and more and more on principle. It is a fatal mistake for the traveller to Canada, the U.S.A., or Scotland to speak of the "English" Church. It may in fact include a few English people who have gone to live in the country in question, but it is not the "English" Church. "Anglican" is a proper term, because that signifies a principle.

What is the principle? What is the spirit that indwells in this body? Its classical exposition is to be found in the pages of the Elizabethan Richard Hooker. Living at a time when the old medieval text-books had been laid aside, and in some quarters were being replaced by a Calvinism which was coming from Geneva, he began again at the beginning, and worked out what may be called an Anglican interpretation of Christianity. It was neither Papal

nor Puritan. It was, in fact, a new experiment in religion.

There were at the time of the Reformation two quite simple things that could be done. It was possible to pursue the old paths and to dismiss the reformers as rebels against divinely sanctioned authority. It was possible also to fling tradition to the winds and start afresh. These two courses were simple and straightforward. They were adopted in the main at Rome and at Geneva. Rome went on being papal, and Calvinism was a new church.

The Church of England adopted a policy which its enemies call compromise and its friends call comprehensiveness. It remained faithful to what it conceived to be the fundamental things, and it tried to be open-eyed towards new knowledge, to be both Catholic and Reformed.

The result is that Anglicanism, both at home and overseas, has always had a more ragged margin than is observable elsewhere. There are eager spirits who say: "Let us be definite." Others, however (and this is the characteristically Anglican position), say: "We are a part of Western Christendom, and of the whole Catholic Church, East and West. We are also Reformed. Let us therefore work for the reunion of Christendom all round. And in the meantime let us be realists. Let us remember that there are many English people who are friendly to the Christian cause, but have not yet come all the way. Let us try to meet them where they stand. Let us use the ordered beauty of our liturgy. Let us proclaim the highest possible ideal for all who are able to receive it. For those who are not yet ready, let us provide whatever they will take—street-preaching, parochial visiting, Christian Evidences in Hyde Park on Sunday afternoon, the parish magazine, schools, music, drama, the films, broadcasting, volumes of philosophy, journalism, tracts, lectures, Padres' Hours—anything that will bring men and women one step nearer God." That is Anglicanism.

ANGLING: FISHING WITH ROD AND LINE

Walter M. Gallichan, Author of *The Complete Fisherman*

General information concerning angling—what it is and how it is carried on—is given here, also some particulars of the more notable branches into which the sport is divided. See also articles on Salmon Fishing, Trout Fishing, Fishing Rod; etc.

Angling, from the A.S. *angel*, a hook, is the art of catching fish with rod, line, and hook, more particularly that branch of fishing which requires delicate manipulation of an artificial or natural bait. The term is specially used to denote the capture of fish as a sport and a means of recreation rather than as a commercial undertaking. Angling was doubtless practised with rude methods by primitive man all over the world, generally in order to obtain food, and it was certainly known to the ancient Egyptians, Greeks, and Romans.

Angling as a sport has several branches. The capture of salmon, sea trout, and river, or brown, trout with the artificial fly is considered the highest form of the art of fishing. General fish or "coarse fish," as distinguished from the "game fish" of the salmon family, are taken by bait-fishing in mid-water or on the bottom, and in the case of pike by spinning or trolling a natural or artificial lure. The principal fish now included under the category of "general," and frequenting rivers, lakes, or ponds, are pike, perch, carp, bream, tench, rudd, roach, chub, eels, and gudgeon. Barbel are only found in flowing water, and dace do not thrive, as a rule, in lakes. Chub occasionally resort to still water, but they prefer streams.

MODERN ANGLING METHODS. Pike are caught by spinning and live-baiting. The first mode is considered the more "sporting," provided that the bait is cast from the rod, and not trailed or trolled behind a moving boat.

Varieties of Artificial Baits

Skill in casting a spinning bait requires much practice. The newest reels are constructed with a free running mechanism, which enables the fisherman to cast from the reel itself by a swinging movement of the rod. These reels are of various makes, and are provided with checks, which are applied when the fish is hooked. The least expensive are the Nottingham wooden reels, fitted with optional checks and line guards. Among the reliable chonite and aluminium spinning reels are the Allcock-Aerial, the Coxon, the Britannia, and the Schooling.

The spinning baits employed in pike fishing are numerous. One of the oldest, but still popular, is

the spoon-bait of various sizes. A modified form is known as Geen's phantom spoon. Among the newest artificial baits are the Spiral, the Perfect, the Water-Witch, the Wagtail, and the Chase-Mc. Some anglers use silk or rubber baits, resembling small fish, and of these there are several varieties. Light celluloid spinners are preferred by some, and the Devon minnows or Kill-Devils are popular. Pike rods are usually from 9½ ft. to 12 ft. in length. A rod of 10 ft. is useful for general pike fishing; the best kinds are made of split cane, or whole cane with lancewood or greenheart tops. The Jardine and the Ideal are useful combination rods for live-baiting or spinning. A light rod, in two joints, is the Perfect, obtainable in two lengths, 7½ ft. or 9½ ft.

Angling for Pike and Roach

Pike lines should be fairly strong. The length should be not less than 70 yds. Traces of gut, with revolving swivels attached, must be used in spinning. For live-baiting, a single hook thrust through the lips of a small fish (dace, roach, or gudgeon) must be used, or the triangle hooks known as "snap-tackle." A length of gut of moderate stoutness, with a weight at the bottom, and fitted with a single large hook, is called a paternoster, and this is a useful tackle for pike fishing in weedy waters. With a running live-bait the snap-tackle is mostly in use, and the bait is kept about mid-water by a large cork float.

Pike are predatory fish, and will seize any kind of small prey. In spinning, a natural bait, mounted on a proper trace and hooks, is generally more alluring than an artificial bait. Live-baits must be kept fresh and lively in a bait-can. An ordinary live-bait is a dace or gudgeon of about 5 ins. or 6 ins. in length. The season for pike is from the end of September to the end of February.

Roach fishing is a very popular pastime. Most town anglers are chiefly roach specialists, and the methods of angling are becoming finer and more subtle. Some fishermen use a roach pole, a long rod made of bamboo in several joints, and angle with very fine tackle, a small hook, and bread paste, gentles, or soaked wheat as bait. Another way is Nottingham fishing, in which a 10-ft. or

12-ft. rod is used with a running line, a fine cast, and a goose quill or porcupine float. By this mode a long swim can be fished by paying out the line from the reel as the float sails down with the current. Roach feed on or near the bottom, and before fishing the depth must be ascertained by a plummet. In most waters roach may be drawn to a feeding place by a ground-bait of soaked bran, a mixture of bran and bread, stewed wheat or barley, or brewer's grains. A few handfuls should be thrown into likely places some hours before fishing.

Bream, Chub, Perch, etc.

Roach will take a red worm or the tail of a lobworm, when the river is discoloured. Some anglers prefer gentles as a summer bait and worms in winter. A very popular bait at present is a small cube of bread-crust. Roach occasionally grow to 3 lb. in weight, but a fish of half that weight is esteemed. In many lakes and streams the average weight is $\frac{1}{2}$ lb.

Carp, which are shy feeders, mostly frequent old ponds. They attain the weight of 20 lb. in some waters, and are frequently taken up to 10 lb. The tackle for carp must be stouter than that for roach fishing. Among the chief baits are bread paste sweetened with honey, gentles, and lobworms.

Tench feed on the bottom, and may be caught in some rivers of a sluggish character, in canals, and in ponds. Their feeding habits are uncertain, but they may be drawn into a shoal by the liberal use of worms as ground-bait.

Bream grow to about 10 lb., and specimens of 7 lb. are not uncommon. They are caught in the same manner as roach, but a rather larger hook is used, and the bait should touch, or trail upon, the bed of the river. Ground-baiting is necessary—and this may be stewed wheat, boiled rice, or a mixture of both. Bream feed most freely in the height of summer.

Chub may be enticed with a fly on, or just below, the surface, or with gentles, worms, cherries, blackberries, boiled shrimps, or cheese paste. These fish will take a live cockchafer, beetle, or blue-bottle, if presented to them without the shadow of the angler falling on the water. Fishing for chub with Nottingham tackle in the winter often gives good sport. A little ground-bait may be cast now and again into the swims.

Dace will take an artificial fly in the summer months, and in winter they often feed on gentles or small worms. Fine roach tackle should be used for this fishing.

Barbel have been captured up to 15 lb. They resort to sharp streams, or deep holes near weirs, and are only taken at certain times, and after liberal ground-baiting. The usual manner of angling is with a leger, i.e. a yard of gut with a worm-hook attached. Above the knot of the reel line is a bored bullet, which sinks to the bottom. A bite is indicated by a jerk of the line.

Perch afford good sport in both summer and winter. They frequent weedy waters, the roots of trees, and the clay banks of rivers. They may be enticed with a live minnow on a paternoster or float tackle, or with worms, and occasionally with small spinning baits. They are sometimes voracious during a thaw. Worms may be used as ground-bait in either rivers or lakes.

Rudd are not very generally distributed, but they abound in eastern England, and in some pools in the south and Midlands. The methods of angling are the same as for roach. Rudd are most lively in warm months, when they often rise to the fly.

Gudgeon are voracious little fish, which take red worms freely in the summer months. The bait should touch the bottom.

The General Fisherman's Outfit

The outfit for the general fisherman consists of a pike rod, a bottom rod, landing net, reels, two lines, one stout and one finer, hooks of various sizes, gut casts, and two or three floats.

SALMON FISHING. The acme of salmon angling is with the artificial fly. In some rivers, and at different seasons, spinning is more profitable, and in certain conditions bait-fishing may be permissible. As most sportsmen prefer to catch salmon with the fly, every beginner should master the art of casting. The rod is grasped with the left hand below the reel and the right hand above it. The angler should face slightly downstream, and advance the right foot. In casting, the fly should be thrown backwards and overhead, but not high in the air, and when the line is well extended, a swing forward must be given to the rod and the fly directed as towards an imaginary object on the water. The cast must be made cleanly and without lashing the water violently with the line. When the cast is made the fly will sink, and it must be allowed to float down the stream under water. During its course some slight jerks must be given to the rod to keep the fly "lively," and the line should be kept as straight as

possible from the point of the rod. Only practice will enable the novice to avoid a bagging line. In quiet pools and in lochs, a sharper motion of the fly in the water is necessary. The Spey cast, practised in strongly flowing rivers, is performed by bringing back the rod in a vertical position and inclining it slightly to the right or left before casting. In this cast the line must not be extended behind the fisherman, but should be allowed to form a loop, which strikes the water before the fly.

Points in Salmon Fishing

The chief points are accuracy in placing the fly wherever a salmon is likely to be lying, and careful working of the fly with a straight line whenever possible. As a rule salmon hook themselves, but it is always advisable to put an immediate strain on the fish when it has taken the fly. Playing a lively salmon is often active exercise, especially in swift and rocky rivers. The fisherman should endeavour to turn the salmon's head downstream or across the stream, and not allow the fish to fight up water. The angler must on no account give any slack line to his fish, but he must avoid a too severe strain until the salmon is wearied. When the fish is beaten it should be drawn to the bank and secured with a quick, accurate stroke of the gaff, the rod being changed to the left hand. Spinning for salmon requires skill in casting and working the bait: trolling from a moving boat, with sixty yards of line extended, is a much simpler, though less sportsmanlike, method. The spinning bait must not be pulled too swiftly through the water. It should be drawn in slow jerks, and the rod may be inclined first to the right and then to the left in bringing back the bait. In streams the bait is cast down or across stream, and drawn against the current. Natural as well as artificial baits may be used. Other baits are the prawn, upon tackle made for the purpose, and the lobworm, which is usually kept slightly moving in the water. In many preserved waters fly-fishing only is permitted.

Salmon frequent the deeper pools of rivers, and the deeper currents, though they are sometimes caught in the shallows during a flood. The habits of the salmon vary in different waters, and in some rivers the fly is not always a sure lure, though the fish may be abundant. When the rivers are low the salmon remain in hiding during the daylight, only venturing out after sunset. After a flood in the river salmon may be expected in due season

(which varies) to ascend the rivers from the sea. The best sport is usually experienced when the river is clearing after a flood.

The rod is an important weapon in salmon fishing. Rods vary in length from 12 ft. to 18 ft., and are made of split cane throughout, or greenheart, and in some cases hickory and greenheart. A built cane salmon rod of good workmanship will last for years with care. The rod should be adapted to the strength of the fisherman. A long cast may be made with a 12-ft. rod, but some anglers prefer a rod of 16 ft. for big rivers. The greenheart rods are considerably heavier than those made of split cane. Reels that will serve for either fly-fishing or spinning have greatly improved in the last fifty years. They are made of aluminium, instead of the heavier brass or gun-metal, and their action is more perfect. The reel should hold at least 100 yds. of good dressed line, which may be tapered for fly-fishing. With a heavy rod a heavy line is necessary, but some split cane rods will throw a light line. For spinning, undressed flax or silk lines are preferred by many anglers. Lines for fly-fishing are of silk, dressed with a preparation to resist water. Some of these lines

soleskun phantom, or a "clipper," and a spoon-bait is often effective in lochs and discoloured rivers.

In some rivers the salmon fisherman will enjoy the best sport by wading to the lurking places of the fish. The wading outfit consists of rubber trousers, with thick socks over the feet, a pair of canvas or leather brogues studded with nails, and a short mackintosh. A steel gaff in a short handle is required for landing.

The best salmon rivers of the British Isles are in Scotland and Ireland. The Tweed, Annan, Deveron, Findhorn, Tay, Dee, Naver, and Inver are among the famous Scottish waters; in Ireland the Shannon, Erne, Bann, and Mourne. Well-known Welsh rivers are the Dee, Usk, Conway, Severn,

streams of the West and North of Ireland. Sea trout have been taken about 3 ft. in length. Fish of from 3 lb. to 5 lb. are very lusty and strong, and a sea trout of less weight is a great fighter when hooked on ordinary trout tackle. A single-handed fly-rod may be employed for sea trout. If they average a pound, fine casts are strong enough. Bright flies are in favour among sea trout anglers, and small salmon or loch flies are sometimes attached to the cast. In fine water, in summer time, small flies are best. Sea trout are variable in their feeding habits. Generally speaking, the best fishing is after a spate in the river, when the fish are fresh from the sea or estuary. The fly is worked in fishing for sea trout. Spinning often accounts for heavy baskets; large catches are made in many rivers by worm-fishing, or fly-fishing at night.

Trout fishing with the artificial fly is an art that excels all others in the sport of angling. Fly-fishing is now very popular, and its practitioners are constantly developing its tactics in order to cope with the "educated" trout of clear streams. The easiest form of fly-fishing is with a wet or sunk fly in a rough mountain brook, well stocked with free-rising fish.

Angling. Successive positions of the rod in casting for trout with a fly. Top: The beginning of the cast. Left: The fly nearing the water. Right: The end of the cast

have a breaking strain of 42 lb. dead weight, and are used for big salmon in powerful rivers.

The list of salmon flies is very large. General favourites are the Durham Ranger, Jock Scott, Wilkinson, Dusty Miller, Butcher, Silver Grey, Popham, and the Doctor. There are also special patterns tied for certain rivers. The cast for salmon fishing is made of the finest quality gut. For heavy salmon twisted gut is sometimes essential. Casts and traces for spinning should be of the finest quality. The Hercules casts can be recommended. Artificial spinning baits may be the same as those used in pike fishing. Usually salmon will take a large silver or gilt Devon minnow, a

Glaslyn, Teifi, and Towy. Favourite English rivers are the Wye, Avon (Hampshire), Eden, Dart, and Tavy. Most of the salmon fishing in the British Islands is privately owned, but lengths can be rented, and there are hotel waters on some good rivers.

SEA TROUT FISHING. The sea trout is of the salmon family, and is a migratory fish that comes into fresh water to spawn. In Ireland these fish are called white trout, in Devonshire peel, in Wales sewin, and in Scotland sea trout and herling. They afford capital sport in several rivers, notably the Devon and Cornwall streams, the Dovey and Conway in Wales, the Deveron, Findhorn, and several lochs in Scotland, and many

In the first stage the beginner should cast a short line, not longer than twice the length of the rod. The rod is grasped above the reel, and the thumb should extend along the butt. Too much wrist action must be avoided, and the cast should be made with the whole of the forearm. The line must fall lightly on the water, upstream if practicable, and the rod must be raised vertically, as the fly floats down towards the angler. The chief haunts of trout are near the ends of pools, where the current is succeeded by a broken stream or "run," in the swift shallows, and off the edge of the tumbling water. When a breeze is blowing, the pools may be fished with advantage. In the

height of summer trout lie in the quickly flowing water, and in a long drought they resort to the deeper pools.

Two or three flies may be used in wet-fly fishing. These are attached to a fine gut cast about 3 yds. long. They should be about 18 ins. apart. The fly on the point is usually called the "tail-fly," those above are the "droppers." The upper dropper should just skim the surface of the water. When a swirl or rings are seen in the immediate vicinity of the flies, it is an indication of a "rise," and the fisherman should promptly twitch the rod upwards, i.e. "strike," to drive in the hook.

Lake fishing is practised from a boat or from the shores. In boat fishing it is usual to drift with the wind, and make shortish casts with the breeze, or lateral casts from the bows or stern. Lake trout chiefly frequent the shallow water, the bays, the outlets of streams, and weedy corners. A slow, jerking motion should be given to the fly in loch fishing. Unless the water is ruffled by a breeze, fly-fishing in still water is rarely successful. Windy days, with subdued sunlight, are often propitious.

Methods of Dry-Fly Fishing

Having practised the wet-fly method for a few weeks, the novice may essay the more complicated science of the dry fly. Only one floating fly is attached to the cast, which should be delicately tapered. The fly is touched with paraffin to cause it to float. There are two ways of dry-fly fishing—watching the rise, and casting into all likely places. On Southern rivers, experts usually "fish the rise." The angler closely scans 50 yds. or so of the stream, until he sees a trout take a natural fly. He then stalks within casting distance, sometimes crawling and kneeling, and presents the fly deftly just above the rising fish. On no account must the shadow of the fisherman fall upon the spot where the trout are rising. Success depends greatly upon careful stalking, especially in clear waters with a moderate flow. When the floating fly falls lightly on the stream, no movement must be imparted to it, but it should sail down with the current, without the slightest "drag" of the cast. Avoidance of drag can be learnt only by practice. The fly must be tied with erect wings, resembling the natural insect.

Among artificial flies, the following are useful for wet-fly fishing: March Brown, Blue Dun, Wick-

ham's Fancy, Alder, Mayfly, and Iron Blue. Some may be "hackled," i.e. wingless and "buzzy," and others winged. Any of them will take trout by the wet-fly or dry-fly method if used at the proper season. The Alder kills in summer, and the Iron Blue on dull, windy days. Standard lake flies are: Teal and Black, Teal and Orange, Grouse and Claret, Mallard and Yellow, Heckam Peckham, and Woodcock and Red.

Trout can be taken with minnow on a suitable trace, artificial spinning baits, and small quill minnow. The natural minnow is used chiefly in summer and autumn. Fishing with a worm upstream, in low, bright water, may avail in summer when the fly is refused. The bait must be dropped into all likely places near rocks and under banks.

ANGLING IN SALT WATER. The newer methods are with rod, reel, and line, and finer casts than formerly. Sea rods are from 6½ ft. to 10 ft. long, fitted with line pulleys and large rings. The equipment includes reels holding 100 yds. of line, leads for sinking bait, hooks, gut casts, fine wire traces, artificial baits, and a gaff.

Rocky shores afford the best rod-fishing, but the feeding grounds of fish may be over a mile from the coast. Bass, pollack, and congers frequent rocks; flat fish are found in sandy bays. Fly-fishing for bass may be enjoyed in British estuaries and bays during summer. A salmon rod and flies may be used for bass and pollack. The principal sea-baits are lugworms, shrimps, mussels, crabs, fish offal, and various shell-fish. Sand eels are good bait for bass. Cod may be taken close to the shore with lugworm or crab bait.

Wanless, 1944; *The Complete Fly Fisherman*, T. Gordon, 1949.

Anglo-Egyptian Sudan. Territory in N.E. Africa. It is a condominium administered by a governor-general appointed by Egypt upon British recommendation. Bounded N. by the 22nd parallel of N. lat. beyond which lies Egypt; W. by French Equatorial Africa; S. by Belgian Congo and Uganda; E. by Abyssinia and the Red Sea; the territory covers 967,500 sq. m., including most of the Nile valley. About 1,650 m. from N. to S., it is up to 1,000 m. from E. to W. Divided into nine provs.—Bahrel-Ghazal, Equatoria, Upper Nile (the S. provs.); Blue Nile, Darfur, Kassala, Khartum, Kordofan, Northern (the N. provs.)—each under a governor, it has an est. pop. of 7,547,500, all black except 41,720. Omdurman, old dervish capital, has 117,650 inhabitants; Khartum, the present capital, 61,800; Port Sudan, 47,000. In the N. dwell Arabised Muslims; elsewhere Nilotic and negro tribes.

Forests near the Blue Nile yield fibres and tanning material; mahogany and acacia grow in the S. This country is the main source of gum arabic. Egyptian cotton thrives, also the long-staple American type. Dates, nuts, millet, beans, senna leaves, are the chief edible products; salt pans supply the whole country; gold is mined at Gabait.

Joint administration began in 1899. In 1948 a legislative assembly and executive council were inaugurated, first elections favouring the Independence party. Discussions from 1946 revealed that while many Egyptians wanted permanent union with the Sudan, the British supported Sudanese self-determination. Egypt put the question before the U.N., which recommended no action, 1947.

Anglo-French Union Proposal. Offer made by British government on the eve of France's capitulation to Germany in 1940. On June 17 it was announced in London that the government had offered to conclude an Act of Union between the two countries. The draft declaration had been communicated to the French government on June 16. Britain and France were no longer to be two nations but one Franco-British Union, with joint organizations for defence, foreign, financial, and economic policies. Every French citizen was to enjoy British citizenship, and vice-versa.

During the war there would be a single war cabinet and the two parliaments were to be formally associated. Churchill, the British prime minister, was on the point of leaving for France to discuss this declaration with Reynaud, the French premier, when it became known that Reynaud had been replaced by Pétain.

On April 25, 1945, Mr. Churchill stated that the offer to France would not be renewed.

Anglo-Iranian Oil Company.

Large British industrial undertaking, whose major interests lie in Iran (Persia). In 1901 the Persian government granted to W. K. D'Arcy, a British subject, a concession for the exploration and exploitation of petroleum. The concession was for a period of 60 years and, amongst other things, conferred upon the holder the exclusive right to work all deposits of petroleum throughout Iran, except in the five northern provinces of Azerbaijan, Gilan, Mazandaran, Astrabad, and Khorassan. Prospecting first began at a point near Qasr-i-Shirin in the N.W. part of the country, but was later transferred to the Bakhtiari foothills, some 70 m. N.E. of Ahwaz. Here, at Masjid-i-Sulaiman petroleum wells were drilled which yielded oil of a quality and quantity that led to the formation of this company in 1909, for the purpose of acquiring and developing the D'Arcy concession. In 1914 the British government was empowered by parliament to take ordinary shares in the company to the extent of £2,000,000 (2,000,000 £1 shares at par), and this holding has since been increased until in 1945 it amounted to a total of £11,250,000 of the ordinary stock of the company; the British government also held £1,000 8 per cent preference stock. On April 29, 1933, the D'Arcy concession was replaced by a new concession, which came into force a month

later. The new concession covered an area of 100,000 square miles and was for a period of 60 years, ending Dec. 31, 1993.

In addition to the original oilfield at Masjid-i-Sulaiman further oilfields have been discovered to the S.E. of the first field. All these areas are connected by pipelines to the refinery at Abadan, which is also the headquarters in Iran of the company. The distance by pipeline from Masjid-i-Sulaiman to Abadan is 142 miles, and from Gach Saran 167 miles. The refinery at Abadan is the largest in the world under a single control, with a max. capacity for processing approx. 17 million tons of crude oil per year.

In June, 1934, the Anglo-Iranian Oil Co. formed a small subsidiary company named the Kermanshah Petroleum Co., Ltd., to operate in the province of Kermanshah. The oilfield in this area is adjacent to the Iran-Iraq frontier in the vicinity of Qasr-i-Shirin, and is connected to a small refinery near the town of Kermanshah, some 81 miles E. of the frontier on the road to Tehran. Products from this refinery are utilised solely to meet local demands in N.W. Iran.

In 1935 the original name, Anglo-Persian Oil Co., Ltd., was formally changed to Anglo-Iranian Oil Co., Ltd., in deference to the wishes of the Iranian government, whose desire it was that the word Iran should be universally introduced in place of the more familiar word Persia.

Anglo-Saxon.

Language of a N. part of Germany, brought into England by Angles, Saxons, and Jutes and there modified; also name applied to those peoples between the times, roughly, of Alfred and the Norman Conquest. While applied to the English race, wherever found, to denote their descent from the Angles and Saxons, the modern tendency is to substitute the word British so as to include Celtic elements

Anglo-Saxon Antiquities. The material remains of early England. The more pretentious dwellings and some churches, e.g. Greenstead, Essex, were of sawn timber, while the peasantry continued to use wattle- and -daub. Dressed masonry was introduced in the 7th century by Gaulish craftsmen. The industrial arts are illustrated mainly from pagan grave-mounds, wherein the fully dressed bodies were interred with their grave-goods, sometimes with traces of the animal sacrifices of primitive Teutondom. Out of 323 Anglo-Saxon cemeteries enumerated by G. Baldwin Brown, 65 bear evidences of cremation.

The national weapon was the leaf-shaped spear, fitted by a split socket—the Danish being unsplit—to an ironshod shaft 6 ft. long. Barbed javelins (*angon*) were commoner in Kent. The Frankish sword-knife (*scramasax*) was sometimes damascened with runes; the battle-axe was rare. The two-edged sword was borne by nobles and thanes, the hilt being often patterned with interlacings, gems, and silver. The wood or wicker shield was round or ovoid, with an iron boss (*umbo*), sometimes gilded.

The most characteristic ornament was the brooch, of which eight types are distinguished. Other articles of dress and the toilet are girdle-hangers, combs, buckles, bronze tweezers, and—more rarely—hairpins and earrings. Metal-bound wood buckets (*situla*) apparently held grave-food; primitive magic survived in crystal balls and amulets. Native pottery was well developed; round-based glass vases, with spiral threads, were, like the amber and glass beads, mostly importations. Silverwork is represented by the Trewiddle chalice and the S. Cuthbert Altar, Durham. Goldsmiths' inlay work, under ultimate Scythian influence, won European fame. Besides the Alfred Jewel (*q.v.*) outstanding examples are the 7th century Wilton pendant and the Ethelwulf ring. Consult Anglo-Saxon Art to A.D. 900, T. D. Kendrick, 1938; Anglo-Saxon England, F. M. Stenton, 1943.

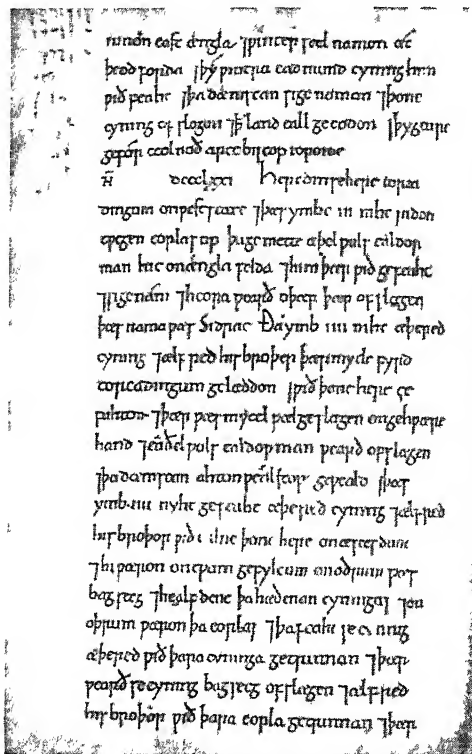

E. G. Harmer

Anglo-Saxon Chronicle, THE.

Name given to a narrative which relates the history of England from the birth of Christ to 1154. It is written in Anglo-Saxon prose, the information being arranged chronologically and without any embellishments or graces of style.

Anglo-Egyptian Sudan. See text in page 448

Anglo-Saxon Chronicle Reduced facsimile of a page of this early history of England from an 11th century MS
Cottonian MSS British Museum

The following is typical of the shorter entries, "821. Herein was Ceolwulf deprived of his kingdom." The dates are not always accurate, and some of the matter is obviously legendary, but there is no reason to doubt the genuine character of the bulk of the contents.

The compilation of the Chronicle was probably begun in the time of Alfred the Great just before 900, and possibly at his instigation. Its early part was taken from Bede's History, from oral traditions, and from other sources and is of little value. Scanty at first, it is much fuller for the 7th and succeeding centuries, and for the 8th and 9th especially is a valuable source of knowledge.

In reality there are several chronicles, and in the seven existing MSS four distinct narratives have been distinguished. The theory is that Alfred had a chronicle compiled at Winchester. Several copies of this were made, and these were sent to various monasteries, where the monks continued the story. This accounts for the differences, additions being made from local knowledge. For instance, one chronicle probably compiled at Ripon, contains some extra information about

Northumbrian, and others about Mercian, affairs. Three of the chronicles end about the time of the Norman Conquest, the fourth the Peterborough, takes the story down to 1154. There are several good translations, including one by J. Ingram (Everyman Library). See Anglo-Saxon Literature.

Two distinct churches were thus in process of organization, and to unite them the synod of Whitby was held in 664. The decision taken here, after a heated debate, was that Roman practices should be adopted and this brought the church in England into close relation with Rome. Theodore, who became archbishop of Canterbury in 668, built on this foundation. He reorganized the church, held a synod of the whole, and drew up rules for its government. Henceforward there was only development. The early dioceses were usually continuous with the little Anglo-Saxon kingdoms, and the bishops among the chief counsellors of the kings. There was an archbishop at York, and for a time one at Lichfield, but it was not until long after 1066 that Canter-

bury was definitely recognized as having precedence over York. See Church of England.

Anglo-Saxon Law. Very little is known of Anglo-Saxon law probably for the reason that in Anglo-Saxon times there was no centralized administration of justice. The law was not, as it became after the Norman Conquest, administered mainly by the king's judges, but by local courts or moots, the principal of which was the shire moot, afterwards called the county court. There were also the hundred moot, for the hundred, the burgh moot, for the burgh, the tithing moot, for the tithing, and from these something like an appeal lay to the shire moot, which consisted of the freemen of the county. The shire moot was a lay body, presided over by the earl, the bishop, and the alderman, of whom none was a lawyer, it was, in fact, more like a parliament than a law court as now understood. There seems to have been a right of appeal in case of injustice to the king and the witenagemot, or national council.

For the most part, in ordinary affairs, Anglo-Saxon law was local and customary, not national and rigid. A few facts are known. The land tenure of Anglo-Saxon England was allodial, not feudal; that is to say, the land was owned by its possessor, not held of a lord and finally of the king, as it is even now in theory. The landowner was under the *trinoda necessitas* or threefold obligation of maintaining roads, repairing bridges and defending the country.

Criminal law and practice were primitive. For certain crimes of personal violence there was a tariff. If the assaulting party destroyed a man's eye he must pay so much, for a hand so much—more for the right hand than for the left. In the case of theft, if the thief could not be found, the whole hundred where the larceny was committed must make good the value of the stolen property. When a person accused denied his guilt, he might clear himself either by the ordeal or by the oath of "lawful men," 12 men who were neither serfs nor outlaws.

There was a curious kind of cross-swearing. The accuser brought up as many people as he could muster, who swore that they believed the accused to be guilty. The accused then produced, if he could, an equal number who swore that they believed him innocent. If he could not, he seems to have been adjudged guilty. But it was not a mere trial of numerical strength, for the oath of an earl, for

example, was equal to that of a number of corals. No evidence seems to have been given.

Trial by ordeal, abolished by a decree of the Lateran Council in 1215, was even more curious. The accused could demand the ordeal, which had many forms, including the hot iron. A variation of this was to walk with bare feet over red-hot ploughshares. Another was to plunge the arm into a cauldron of boiling water and bring out a stone from the bottom. Women were excused the hot iron and hot water, but were generally tied up and thrown into a pond. A woman who sank was innocent.

Outlawry was a favourite Saxon punishment. It was inflicted either as a sentence after an offence proven, or on a person who refused to stand his trial. An interval was allowed the man to escape beyond the jurisdiction, after which he might lawfully be killed by anyone who found him.

Bibliography. English Law, vol. i, Pollock and Maitland; Anglo-Saxon Wills, D. Whitelock, 1930; Anglo-Saxon Charters, ed. A. G. Robertson, 1939.

Anglo-Saxon Literature. Term used to denote the literature of the English people which was produced from about the 7th to the 11th century. Though the tendency among scholars is to deal with Anglo-Saxon literature under the somewhat indefinite name of Early English, the older title is the more convenient, as being better indicative of a special historical period.

The earliest, or that which is generally accepted as the earliest, work in this literature is the epic Beowulf. This poem is so closely connected with the Teutonic invaders that it is only the circumstance of its having been, as it is believed, written in Northumbria that makes it English. Students of this poem are in disagreement as to whether it is a story of some legendary hero of the Continent, or whether it can be claimed to be an English story with an English setting. It is certainly akin in character to the old German Lay of Hildebrand, of which only a fragment has come down. Yet the Anglo-Saxon literary period has characteristics which mark it off very definitely from that out of which it grew, and also from another form which was developing among the Norse peoples. The large part of Beowulf which has been preserved, along with fragments of other poems—Waldherc, Fight at Finnesburh, Battle of Maldon, etc.

—show a command of vigorous narrative and free use of rhetoric that places them in a far higher literary category than any other comparable primitive literature.

Following on the heroic narrative poetry referred to there is also a remarkable body of religious poetry, much of which is associated more especially with the names of Caedmon and Cynewulf, including renderings, some of them peculiarly fine, of Bible stories, e.g. Genesis, Exodus, Andreas, Judith, etc. Then, too, there are interesting examples of shorter poems, e.g. Widsith, The Seafarer, and a goodly if on the whole less remarkable body of prose, including The Anglo-Saxon Chronicle and the series of translations made by King Alfred. De Quincey has declared that the writers of the Chronicle had at command a vocabulary of only 600 to 800 words. See Anglo-Saxon Chronicle; Andreas; Beowulf; Caedmon, Cynewulf; English Literature; Exeter Book; Vercelli Book, etc.

Earle, 1884; English Writers, vols. i and ii, H. Morley, 1888; Anglo-Saxon Dictionary, J. Bosworth, new ed., 1882-98; Anglo-Saxon Poetic Records, Ed. G. P. Knapp, 1932; Anglo-Saxon Poetry, G. Bone, 1943.

Angmering-on-Sea. Modern coastal resort of Sussex, England, 5 m. W. of Worthing. The parent village of the same name lies in

land; here the remains of a Roman villa were discovered.

Angola (Bantu, *Ngola*), or PORTUGUESE WEST AFRICA. Largest colony of Portugal. It is bounded N.E. by the Belgian Congo, S.E. by Rhodesia, S. by the territory of South-West Africa, W. by the Atlantic Ocean. A small detached enclave, Cabinda, lies to the N. between the Congo and French Equatorial Africa. Situated wholly in the tropics, and, save for Cabinda, south of the Congo river, Angola has over 1,000 miles of coast, and is otherwise mainly a plateau, rising by terraced hills to about 2,000 ft. in the N., over 6,000 ft. in the S., and reaching 7,349 ft. in Loviti, towards the centre. This plateau forms the watershed between the Congo and Zambezi systems. It gives rise to the Kwango, flowing N. to the Congo; the Kwanza and Kunene, issuing into the Atlantic; and the Kubango, flowing E. The climate has well-defined seasons, drought from June to Oct. (winter), rains from Nov. to April.

Cultivation of sugar, cotton, rice, maize, palm oil, rubber, coffee, sisal, tobacco, and tropical fruits is undertaken by native labour. The grass uplands, almost free of tsetse fly, are suitable for stock raising, and a liberal land policy has encouraged holdings of all sizes. Wax and a few equatorial woods like ebony and mahogany are produced. Diamonds and salt are mined, and iron is worked by native blacksmiths; coal, copper, gold, silver, and sulphur await exploitation. Exports to Europe include coffee, maize, diamonds, sugar, wax, and coconuts.

Angola was discovered and explored between 1482-5 by Diogo Camo, and was soon developed under treaty rights with native kings. It has been held continually by the Portuguese except for an occupation by Dutch artisans, 1641-48. Loanda, or São Paulo de Loanda, the capital, was founded in 1575. Huambo, 266 m. from the coast, was in 1927 designated the future capital, to

Angola. Map of the Portuguese colony also called Portuguese West Africa founded in 1575

be known as Nova Lisboa. Lobitos is perhaps the finest harbour in Africa. Other ports are Ambriz and Mossamedes. Lubango and Malange are growing railroad towns. The country is ruled by a governor-general and organized into 14 administrative districts among five provinces. The area is 481,351 sq. m. and the pop. in 1940 was 3,738,010, of whom 44,083 were Europeans and a large majority of the rest Bantu Negroes.

Primary education is available in 73 schools, secondary in two. Ecclesiastically Angola is a diocese of the Roman Catholic church in the province of Lisbon. Missionaries attend to much of the native instruction. There are 1,442 miles of rly., including a line from Benguela E. across the whole country to the Belgian Congo, and routes from Loanda to Malange and Mossamedes to Lubango. Good motor roads total 23,350 miles.

Bibliography. Through Angola, J. C. B. Statham, 1922; Angolan Sketches, T. A. Barns, 1928; Angola, the Land of the Blacksmith Prince, J. T. Tucker, 1933.

Angoniland. A plateau of E. central Africa. It lies to the S.W. of Lake Nyasa, has a mean elevation of 4,000 ft., and is inhabited by the Angoni, who were formerly members of the Zulu confederation. Central Angoniland forms a district in the Nyasaland Protectorate. Area 5,884 sq. m.

Angora. Former name of the present capital of Turkey, as well as of the vilayet of which it is the chief town, and the river on which it stands, each of which is now called Ankara (*q.v.*).

Angora Goat (*Capra angorensis*). Long-haired breed of Asiatic goat, named after Angora in Asia Minor. Angora wool is produced from the goats. This is used for making light, warm shawls, chiefly at Grenoble, France. See Mohair.

Angora Rabbit. The only long-tailed variety of rabbit. Believed to have originated in Asia Minor and Persia, it was brought to Great Britain as an exhibition pet about 1850. White is the most popular colour. A fine specimen should weigh about 6 lb., and have a fleecy coat over the whole body, short and erect ears with hanging tufts at their tips, deep bright pink eyes, straight and heavily woolly legs and tail. The commercial side of the keeping of Angoras was much developed between the two Great Wars. An average rabbit may yield $\frac{1}{2}$ lb. of wool a year, and first quality

British wool has been priced at 30s. a lb.

Angostura Bark. The bark of small trees (*Galipea officinalis* and *Cusparia febrifuga*), natives of tropical America, and included in the order Rutaceae. It yields a stimulant tonic, which has been used in place of cinchona in treating fever. The tonic known as Angostura Bitters is an essence containing angostura bark together with various aromatics.

Angoulême. City of France. The capital of the department of Charente, it stands on a hill between the Charente and its tributary, the Anguienne, is 83 m. N. by E. of Bordeaux on the rly. to Poitiers, and is at the head of the navigation of the river. It is the seat of a bishop and has an important wine trade, and paper and other manufactures. The cathedral of S. Pierre, erected in the 11th and 12th centuries, has been altered considerably. Surrounded by boulevards, which occupy the site of the old fortifications, the hôtel de ville, now a museum, is an imposing building. Angoulême is an old city and its counts were persons of importance in French history at a very early date. Later their lands passed to the crown; members of the royal family long bore the title of duke of Angoulême (*see below*). Pop. 36,699.

Angoulême, LOUIS ANTOINE, DUKE OF (1775-1844). French prince and soldier. The eldest son of Charles Philippe, count of Artois, later Charles X of France, he was born at Versailles, Aug. 6, 1775. He left France at the outbreak of the Revolution and after some military service lived in exile. In 1799 he married his cousin Maria Theresa, daughter of Louis XVI. During the Hundred Days he unsuccessfully opposed Napoleon, and in 1823 was in command of the French expedition in Spain. He joined his father in exile, signing an abdication of the throne in 1830, and died at Görz, June 3, 1844.

Angoxa or **ANGOSTA.** A coast district and small town on the Angoxa river, Portuguese E. Africa. Known also as Angoche and by the Portuguese as Antonio Ennes, the seaport, 60 m. S. of Mozambique, is accessible by small steamers and has a trade in copra and ground-nuts. Part of the district, the coast line of which is 90 m. long, was leased to a British company as a rubber plantation. Its products include coir, cocoa, sesame oil, and ivory.

Angra do Heroísmo. Fortified seaport and the chief town of

the Azores. It stands on the S. coast of Terceira Island, and exports wine, cereals, and fruit. The name is Portuguese for Bay of Heroism. Pop. 11,000.

Angra Pequena. Harbour in South-West Africa, now known as Lüderitz Bay (*q.v.*).

Angriff, DER (German, The Attack). Daily Berlin evening newspaper of the National Socialist Party. Created by Josef Goebbels (*q.v.*), 1928, originally appearing twice weekly, it soon became the first Nazi daily of the German capital, with a circulation of over 100,000. It established Goebbels as a propagandist, though he ceased to edit the paper officially when the Nazis came to power in 1933. But he remained its undisputed master and used it to serve his own political ends until Feb., 1945, when the end of its publication was announced.

Ångström, ANDERS JONAS (1814-74). Swedish physicist. Born Aug. 13, 1814, he was educated at Upsala university and in due course became keeper of the observatory and professor of physics. His life was devoted to the study of heat, magnetism, and spectroscopy, and in all three he made large additions to scientific knowledge. The unit used to measure the wavelength of light was named Ångström in his honour. He died at Uppsala, June 21, 1874.

His son, Knut Johann Ångström (1857-1910), also became famous as a physicist and as the inventor of many scientific instruments.

Ångström Unit. Unit of measurement of wavelengths of electromagnetic radiations, including light and radio-active waves. Abbreviated Å.u., 1 unit equals 10^{-8} cm., or one-hundred-millionth part of a centimetre. The spectrum of light from the infra-red to the ultra-violet ranges from about 8,000 Å.u. to 1,000 Å.u. The frequency of vibration of each of the colour rays on this scale is directly related to its measurement in Ångström units and is therefore directly comparable. Red light, for instance, has a wavelength of 6,500 Å.u. with a corresponding frequency of 464 billion vibrations per second. The gamma rays of radium are $\cdot 015$ to $\cdot 15$ Å.u., and, at the other end of the radiation spectrum, wireless waves range from 3 mm. or 30 million Å.u. upwards. There is also an international Ångström unit. See Light; Spectrum.

Anguilla. One of the Leeward Islands, British West Indies. Among the northernmost of the Lesser Antilles, it has an area of 34 sq. m. and produces cotton, horses, cattle, sheep, goats, salt, and phosphates. Pop. 5,175, chiefly negroes.

Angul. District of Orissa, India. With the exception of the hilly S. part, the district is flat, and has an area of 1,681 sq. m. Coal and iron are mined. Once a tributary state of Orissa, it was confiscated in 1847. Pop. 199,000.

Angular Motion. Term used in dynamics. Any displacement of a body may be produced by moving the body forward or by rotating it about a certain axis through the centre of figure of the body, or by a combination of these two motions. Thus a fly-wheel moves about its hub, but it is clear that the movement of a particle at the end of one of the spokes is not at the same rate as that of a particle near the hub. The movement or velocity of rotation of the fly-wheel as a whole is therefore measured, either by the number of turns made in a given time, or by the speed of a particle at a unit distance from the hub. This speed is called the angular velocity; the term angular motion is derived from it.

Angus. Eastern maritime county of Scotland, bounded N. by Aberdeenshire and Kincardineshire, W. by Perthshire, S. by the Firth of Tay. It was known as Forfarshire from the 16th century until 1928, when the old name, derived perhaps from a legendary chief or from a hill near Aberlemno, was revived. Of the 873 sq. m. of Angus, about one third is highland country, Glas Maol in the Grampians reaching 3,502 ft. The varied surface of the co. falls into four main divisions: the Braes in the N.W., scored by the famous glens Esk, Prosen, Clova, and Isla; the Howe, or Strathmore, in the centre, one of the most fertile plains in Scotland; the Sidlaw Hills which continue into Perthshire in the S.W.; and the coastal strip on which stand the ports of Dundee, Arbroath, and Montrose. The longest rivers are the North and South Esk and the Isla; there are a few inconsiderable lochs. Incheape Rock (*q.v.*) belongs to the county.

Agriculture is the chief industry, with oats the main crop; wheat is grown in Strathmore. Sheep and cattle, pigs, and Clydesdale horses are raised. Jute and flax manufacture, bleaching, confec-

Angus. Map of the east coast county of Scotland formerly known as Forfarshire. The Braes of Angus form part of the great range of the Grampians

tionery, distilling, and shipbuilding are the activities of Dundee. Sea fishing thrives along the entire coast. Angus joins with Kincardineshire to elect two M.P.s, while Dundee has its own two. The est. pop. is 279,500. Forfar (11,062) is the county town, but Dundee (181,800) is much the biggest. Inland places include Brechin, Kirriemuir, Frickheim, and Newtyle. Carnoustie is noted for golf. Antiquities include castle ruins at Edzell and Melgund, towers at Affleck and Brechin, and the fort of Inverquhar. Glamis castle is the home of the Strathmore family, from which came Queen Elizabeth, consort of George VI. Kirriemuir was the birthplace of Sir James Barrie (*q.v.*), who made it famous in literature under the name of Thrums. Evidence abounds of Pictish and Roman occupation.

At Dundee was born in 1465 Hector Boece (*q.v.*), and 80 years later, at Baldovie, the educational reformer, Andrew Melville. Angus poets include James Tytler, of Brechin, who edited the second and third editions of the *Encyclopaedia Britannica*.

Angus is the title of an earldom now held by the dukes of Hamilton; also a common Christian name in Scotland.

Anhalt. Former state of central Germany. A principality from

the 13th century, it joined the German empire as a duchy in 1871, renounced allegiance after the First Great War, and became a state of the German republic, July 18, 1919. On both sides of the Elbe, it was surrounded by provinces of Prussia. Dessau was the capital and largest town. The area was 888 sq. m.; pop. 436,000.

Anhalt ceased to be a state and was incorporated in the Reich, 1934. The area is agricultural and yields wheat, vegetables, hops, and tobacco. It has extensive forests in which deer are found, and fish are plentiful in the rivers. Lignite, salt, potash, and silver occur. After the Second Great War, the area was allotted as part of the Russian zone of occupation in Germany.

Anhui or **Nganwhi.** Province of China. It lies to the W. of the coast prov. of Kiangsu, of which it was formerly a part, and is traversed by the Yang-tse-kiang. Area, 87,929 sq. m.; pop. 22,705,000. The part of Anhui lying N. of the Yang-tse-kiang is watered by the Hwaiko and its tributaries, and is a fertile plain, constituting the principal rice-producing area of China, with Wuhu as one of the four most important rice-marketing centres in the country. Other products include tea, paper, and timber. Hwaining, formerly Anking, is the capital.

Anhydrides (Greek *an-*, not; *hydōr*, water). Oxides which react with water to form acids, or are obtained from acids by withdrawing water. Acid anhydrides are the acid radicals remaining after abstracting water from the acid. Sulphuric acid (H_2SO_4), with water (H_2O) abstracted, leaves sulphuric anhydride (SO_3). Similarly, the anhydride of an organic body is the substance obtained from it by the elimination of water. *See* Acid.

Anhydrite. Natural anhydrous sulphate of calcium. It occurs like gypsum in beds and nodules, usually in association with red sediments and salt-deposits, such as those of the Trias, which indicate arid climatic conditions. Formerly little used, anhydrite now enters into the manufacture of sulphate of ammonia for use as a fertiliser.

Anhydrous. Term applied to a substance with no water in it. A crystal with no water of crystallisation is said to be anhydrous.

Sulphate of calcium exists naturally in an anhydrous form as anhydrite, the variety containing water being gypsum or selenite. *See* Crystallisation.

Ani. Ruined city, in the 10th century the capital of the Bagratide kings of Armenia. It is in

the Turkish vilayet of Kars, about 25 m. S.E. of Kars. It was destroyed by Seljuks in 1063.

Ani, Papyrus or. Finest extant example, 78 ft. long, of the Egyptian Book of the Dead. Made in honour of a Theban scribe Ani about 1500 B.C., its magnificently coloured vignettes, now in the British Museum, depict the ceremonial at an Egyptian funeral. A papyrus in Cairo Museum contains the paternal precepts of another scribe Ani of about 600 B.C. *See* Book of the Dead.

Anie, Pic d'. A peak of the Pyrenees in France. It is a sacred mt. of the Basques, 8,215 ft. high.

Aniline (Arab. *annil*, indigo) ($\text{C}_6\text{H}_5\text{NH}_2$). Colourless oily liquid used as the starting point in the manufacture of a series of aniline dyes. It was discovered by Unverdorben of Erfurt in 1826 among the products obtained by the distillation of indigo, and named by him *krystallin*. Runge in 1834 obtained it from coal-tar oil, and named it *kyanol* on account of the azure-blue colour it gives with bleaching powder. Fritzsche in 1840 obtained an oil by distilling indigo with caustic soda, which he designated *aniline*. Hofmann examined these three products and found them identical. He proposed to call the chemical

phenylamine, but amidobenzene was adopted as the scientific name. Perkin in 1856 first obtained mauve from aniline, and this laid the foundation of the aniline colour industry, which has now reached enormous proportions. Aniline is made by the reduction of nitrobenzene with iron and hydrochloric acid, or by the action of ammonia on chlorobenzene. The three qualities of aniline made are pure aniline oil, aniline for red, and toluidine. By boiling aniline with glacial acetic acid, the product acetanilide or antifebrin, used in the treatment of headache, is obtained. Aniline combines with acids to form well-crystallisable salts, one of these, the hydrochloride, being prepared on a large scale and known commercially as aniline salt ($\text{C}_6\text{H}_5\text{NH}_2\text{HCl}$). It is used by calico printers for aniline black. Some of the aniline or coal-tar dyes are employed in medicine. *See* Dyes.

Animal (Latin, living being). Scientific name for all living creatures except plants. The popular restriction of the name to mammals as distinguished from birds, fishes, etc., is erroneous.

A living creature may be defined as an organism which exhibits five forms of activity—movement, sensation, nutrition, growth, and

Ani. Portions of the magnificent papyrus made in honour of the Theban scribe Ani about 1500 B.C. This papyrus is the finest known example of the Egyptian Book of the Dead. The upper part shows a funeral procession, and the lower the weighing of the soul before the judgement seat. The original is in the British Museum

reproduction. It moves by its own impulse, not as the mere vehicle of some force or impulse from without. It possesses the power of sensation, or irritability in the widest sense of the word, and responds by contraction or otherwise to the impact of external objects or forces. It feeds, or takes in nutriment, which is assimilated and becomes part of its own tissues, to repair a waste that is continually going on as the result of activity. It grows by this process of assimilation of food, and it possesses organs of reproduction.

The world of animate or living matter is divided into two great kingdoms, the animal and the vegetable, the former the subject of zoology, and the latter of botany. Animals and plants are alike in fundamental structure, and may be said to form two divergent branches of the one tree of life. Both transform nutriment by a process of digestion into tissue; but while plants assimilate the nitrogen and carbonic oxide in the air and build up their tissues by absorbing mineral salts from the soil, animals can assimilate these chemical elements and compounds only after they have been transformed into organic compounds by the plants. In other words, plants are the great food producers and animals are the consumers, an equilibrium being maintained by their joint action.

Grouping of Animals

Animals are grouped according to anatomical structure. A porpoise looks like a fish, but on examination is found to be altogether different. It has the internal structure of a land animal, breathes with lungs, is warm-blooded, and suckles its young. It is therefore a mammal and not a fish. The eel looks like a snake, but its anatomy proves it to be a fish. The bat flies like a bird; the platypus lays eggs like a bird; yet their internal structure shows them to be mammals. The same principle applies when we come to the minor divisions of the animal kingdom. Two animals that look alike may be separated by some important point of internal structure. Conversely, animals of very different outward appearance may be almost identical in internal structure.

The classification of animals begins with the grouping of individuals into species, species into genera, genera into families, and these again into orders, classes, and phyla—divisions of increasing importance and size.

The domestic dog may be taken by way of illustration, and in tracing its classification one may conveniently start with the phylum and work down to the species. Being a backboneed animal, it belongs to the phylum *chordata*: the fact that it suckles its young places it in the class of *mammalia*. Mammals with sharp, recurved claws, powerful tearing teeth or canines, and cutting teeth well adapted to a flesh diet, form the order *carnivora*. This is divided into a number of families, such as cats, dogs, weasels, and bears. Taking one of these families, the dogs or *Canidae*, we find that there are four genera. In the first of these, the genus *Canis*, there are between thirty and forty different species, of which the domesticated dog is one. It is therefore known zoologically as *Canis familiaris*, the first being the generic name and the second the specific.

The animal kingdom is divided primarily into three unequal sub-kingdoms: *Protozoa*, *Parazoa*, and *Metazoa*, comprising between them ten great phyla. The first and second sub-kingdoms each consist of a single phylum, the *Protozoa* and *Porifera*, respectively animalcules and sponges; while the third sub-kingdom contains all animals more highly organized than sponges. The first and second sub-kingdoms and the majority of phyla constituting the third, *viz.* phyla containing animal types like worms, crabs, spiders, scorpions, insects, shell-fish, cuttlefish, starfish, and sea-urchins, are *Invertebrata*. The remaining animal types of the *Metazoa* sub-kingdom, *viz.* fishes, amphibians, reptiles, birds, and mammals,

are *Vertebrata*, or, more correctly, *Chordata*.

It is clear that the term phylum does not possess equal significance throughout the animal kingdom, for the backboneed animals constituting the single phylum *Chordata* are of supreme importance. The ten great phyla are as follows:

1. *Protozoa* (animalcules). Comprises the simplest and lowliest form of animal life and includes many disease-producing blood parasites such as *Plasmodium*, the organism of malaria.

2. *Porifera* (sponges).

3. *Coelenterata* (jelly-fish, corals, sea-anemones).

4. *Platyhelminthes* (flat worms). Most members of this group are unsegmented parasites, tapeworms and flukes, chiefly notable as sources of disease.

5. *Nematoda* (round worms). Chiefly parasites of economic and medical importance, such as the tropical guinea worm.

6. *Annelida* (ringed worms). Includes a vast number of marine worms, as well as earthworms and leeches.

7. *Arthropoda* (jointed-limbed animals). Includes crabs, scorpions, and spiders, centipedes, millipedes, and insects. This phylum has by far the greatest number of species, as well as most numerous individuals.

8. *Mollusca* (shell-fish and cuttlefish).

9. *Echinodermata* (starfish and sea-urchins).

10. *Chordata* (backboneed). The highest animals are included here. They range from the *Balanoglossus* (acorn-worm), a small creature found in the sea, and the sea-squirt, through fishes, amphibians, reptiles, and birds, up to mammals. These last consist of several groups, of which one, the *Eutheria*, is divided into sixteen orders. At the head of these sixteen are the *Primates*, consisting of men and anthropoid apes.

ANIMAL: EMPLOYMENT IN WAR-TIME

Craven Hill, F.Z.S

An account of the many valuable ways in which the special powers and instincts of animals have been used by mankind in the waging of war, particularly during the two Great Wars of the 20th century

From the earliest times man has used the lower animals to help him in warfare. The numbers pressed into service increased with each large-scale conflict and culminated in the two Great Wars of this century when, in one military sphere or another, it is computed that at least 30,000,000 were employed. They included horses, dogs, elephants, camels, sea-lions, monkeys, ferrets, pigeons, white mice, and spiders.

During the Second Great War the number of "dumb" creatures employed was probably smaller

than in the First, for with modern warfare becoming more and more a contest of machines, the openings available to animals became more restricted. An obvious example is the war horse, now virtually out of business, the cavalry regiments having become to a large extent mechanised.

There are, however, still important rôles for the camel, the elephant, the white mouse, and even the spider to play. A flourishing camel corps attached to the Egyptian army is proof of the continued efficacy of an

VERTEBRATES shown in the upper portion to the left are birds—parrot and golden cranes, centre and right, mammals—lion, elephant, and chimpanzee; below them, reptiles and amphibians—crocodile and (round the tree) python, tortoise, turtle, lizard, toad, and frog; in the water are fish—salmon and lamprey, and in the corner sea-squirt

The INVERTEBRATES which are shown in the lower portion are, on the left, crab, snail, earthworms, spider, and brittle star-fish, with below the latter, common star-fish and sea-urchin, in the water are floating jelly-fish; while on the rock to the right is an octopus, with below it coral, four different kinds of sea-anemone and two sponge-

ANIMAL-WORSHIP: FIGURES AND MUMMIES FROM ANCIENT EGYPTIAN TOMBS

Animal. This pigeon, released from a crashed plane Dec., 1943, struggled clear of the oily sea, flew 120 miles to its loft, and thus caused an R.A.F. bomber crew to be saved. It received the P.D.S.A. medal

animal unrivalled for hauling or carrying rations, petrol, water, and ammunition between base areas where manoeuvrability is more important than speed. In India, and on the Burmese frontier, the elephant, now long withdrawn from the front-line service which his kind rendered to Hannibal, is today often used in rear areas for the transport of guns in difficult places, and for the drawing of timber and other heavy war material over country where no other animal or machine could go.

In both wars large numbers of white mice were kept in submarines, not only as mascots for the crews, but as never-failing indicators of air pressure and oxygen supply. The spider plays its part [in the optical industries of both Great Britain and the U.S.A., to spin silk for cross hairs on lenses, for surveying instruments, and for use in gun and bomb sights. Its silken strands are far finer than the finest line that could be etched on a lens by a diamond.

Sea-lions as Detectors

Sea-lions "served" for a brief period during the First Great War. On the suggestion of a young naval officer several were lent to the British government by zoos and circuses for special training, with a view to the detection of the presence of U-boats in home waters. The animals were put through a course of tuition on Lake Bala in N. Wales, where an attempt was made to teach them to break surface and bark vociferously on detecting underwater vibrations. Two or three specimens which passed the test were subsequently taken to the English Channel and the North Sea for service; but

they showed a tendency to chase the shoals of fish which had multiplied during the war. In 1917 the scheme was superseded by the hydrophone.

More efficient service was rendered in the First Great War by the ferret, which rounded up the rats that infested trenches and dug-outs of the Western front. Large numbers of ferrets were exported to the Continent expressly for this purpose, one Ashford (Kent) dealer sending out no fewer than 500.

Monkeys did much to help in meeting the menace of poison gas. Hundreds were commandeered for use along humanitarian lines in government laboratories, where their reactions to noxious gases proved of special value to those engaged on research. The animal most commonly employed was the Indian rhesus macaque, and at the end of the war the government were left with several hundred of these animals on their hands. Most of them found sanctuary in the London zoo.

In both wars pre-eminent service was rendered by pigeons and dogs, chiefly in the sphere of life-saving. During the First Great War over 100,000 pigeons were used by Great Britain. The total employed during the Second Great War, thanks to the large reserves bred by the National Pigeon Service, reached nearly a million, and most of them saw front line service. In 1942 almost 500,000 pigeons were being used in operational work by the R.A.F. alone, and nearly 2,000 went out each day with planes, usually two birds to each plane.

During a single eight-month period in 1942, 320 messages, a few of them S O S calls, were dispatched from aircraft by R.A.F. pigeons. Of these, no fewer than 307 were successfully delivered.

Operating from their mobile pigeon lofts (or, if used in planes, from wicker or metal containers), carrying vital maps, films, or dispatches in cylinders attached to their legs or backs, the pigeons conveyed messages innumerable. The speed at which the birds fly—often, with a tail wind to assist them, not far short of a mile a minute—resulted in the saving of countless human lives.

The Verdun Pigeon

Perhaps the most notable achievement of a pigeon in war was that of Cher-ami, a hen pigeon who saved the French from a German defeat at Verdun during the First Great War. Subjected to heavy fire and poison gas, and with their lines of communication broken, the beleaguered garrison sent out a message for help by the only bird left to them. Cher-ami set out amid gas and gunfire, reached her base, and within an hour relief was on the way. Cher-ami recovered from her wounds, and was returned in 1919 to the U.S.A., whence she had come. She lived only a short time there, but her body was mounted and placed in the Smithsonian Institute, Washington, D.C., where it still is today.

Notable pigeons of the Second Great War are the one that saved an entire bomber crew, brought down in the North Sea, and Percy, the pigeon hero of the Battle of

Animal. British war dogs hunting mines laid by the enemy in France, 1944. They proved almost as successful as any mechanical mine-detecting apparatus

Britain, who faced machine-gun bullets, cannon shell, and *flak*, to carry a vital message for the Army, an achievement which earned him a medal. Pigeons flying back to the U.K. from Holland in 1944-45 carried details of rocket-bomb sites. As a counter-measure the Germans employed falcons, but their success was negligible.

Great Work of Dogs

The nature of the war-time services rendered by dogs has undergone striking changes. Ancient Egyptian wall writing, probably dating as far back as 4000 B.C., depicts savage dogs straining on leashes held in the hands of Egyptian warriors and leaping on enemy soldiers. In Iraq, old Assyrian temple walls show bas-reliefs of battle dogs in action. Attila the Hun used a drove of huge dogs to stand as sentries around his camp, to guard him against any approaching foe; and Pliny refers to squadrons of dogs that fought in the ranks beside the Colephonians of Asia Minor against their Ionian enemies.

Since then dogs have seen service in almost every large-scale war. Between 1914 and 1918 they were most often employed as scouts and messengers. In the Second Great War they were trained mainly to guard aircraft works and other vital centres of production. But a certain number saw service in the front line, e.g. those used by Allied forces in France after D-day to locate buried mines, and the "anti-tank" dogs used by Russian troops on the Kalinin front.

Alsations. The animals used by the Civil Defence, London Region (the only area in the country in which rescue dogs were officially used), totalled 18, 15 being Alsations. The exceptions were a border collie, a Labrador, and a Boxer.

The dogs, all about 3 or 4 years of age, were obtained from the public and trained in London. When schooled in their work they were sent to four depots (Chelsea, Lewisham, Hendon, Loughton), where they operated in pairs, each pair under its own trainer.

On orders from Group H.Q. they were taken to flying-bomb and rocket incidents involving substantial demolition of houses, and there, by their behaviour, quickly indicated to their trainers whether any human victims still lay buried beneath the debris.

The dogs located not only living victims but also dead persons. If a living victim lay buried, the animals would show every sign of impatience to reach him, and the rescue work was accordingly maintained until the casualty was released. If the victim were dead the dog would indicate this fact, known to him apparently by some sixth sense, by remaining steadfastly at the scene. One Alsatian bitch alone located 21 living people. It is estimated that the rescue dogs altogether were instrumental in saving the lives of over 45 living casualties, and in locating 480 dead. The animals answered 192 call-outs between Oct., 1944, and March, 1945.

The intuition possessed by some of these hardworking animals was often quite uncanny. In one

These, working in groups of 50, were trained to carry bombs to enemy tanks, and did in fact obtain many knock-outs. But casualties among them became so high that their use was abandoned. In Oct., 1944, another entirely new and most significant opening was found for canine service, that of assisting the rescue services operating at bomb incidents. The rescue trait is deeply ingrained in most dogs, particularly

incident involving the complete demolition of a butcher's shop, the dogs refused to be put off the scent by the stocks of meat which lay buried, and successfully guided the rescue services to the injured butcher himself.

The notable services rendered to man by his so-called "dumb" friends are not forgotten. After the First Great War monuments to the animals were erected in most European countries, some of them quite imposing. Those erected in Great Britain include the Scottish national war memorial at Edinburgh Castle, which has, both carved in stone and represented in glass, a pageant of animals, in which are represented horses, mules, donkeys, dogs, camels, oxen, elephants, and reindeer (2,000 reindeer served in Archangel in 1918-19, with Lapps as drivers), pigeons, and mice—even canaries, which had proved invaluable to sappers in their task of tunnelling underground.

Animal Intelligence. Chimpanzees give remarkable evidence of a reasoning intelligence. 1. One fits a stick into a hollow cane to make a rod long enough to reach an objective. 2. Another has piled up boxes for the same purpose
From "Mentality of Apes,"
by Prof. W. Köhler

ANIMAL INTELLIGENCE AND INSTINCT

R. I. Pocock, F.R.S., Supt., Zoological Gardens, London, 1904-23

The reading of this discussion of an interesting subject should be supplemented by reference to the articles on Ant; Dog; Horse; and other insects and animals that display intelligence of any kind

Intelligence has been defined as "quickness of mental apprehension": and this is perhaps the meaning most commonly attached to the word. In animals it is usually measured by aptitude for learning under training or by readiness in finding out things for themselves. In reality, intelligent behaviour is manifested by the originality of the actions concerned, and by the individuality displayed in dealing with novel conditions. This conception of intelligence serves to distinguish it from instinct.

But the study of the subject is beset with difficulties. That rapidity of response to tuition is an untrustworthy criterion of intelligence is illustrated by domestic cats, which, contrary to prevalent opinion, are probably as intelligent as dogs. The comparative difficulty in training cats is

ing, which have been inherited almost unchanged from a wolf-like ancestor, may be cited. Similarly, when deer and antelopes learn to push back the sliding doors of their sheds, we call their behaviour intelligent. But the action has its basis in the instinct of these animals to use the horns or muzzle to brush aside natural obstacles like branches. A more complex example of instinct-adaptation is illustrated by the story of a cat which habitually gained admission to a house by pulling a bell with its paw. But cats of all kinds instinctively use their paws for a variety of purposes, such as cleaning the face, playing with prey, reaching food, and so forth: and although we cannot know how far the animal in question understood the sequence of events connecting the pulling of

selected specimens of different kinds, Prof. Watson completely failed to teach them to use a crooked stick to secure grapes hung out of reach of their hands, or to push or pull bananas from a glass pipe fixed to the floor of the cage. The reputation for high intelligence enjoyed by monkeys and apes seems to be due in a great measure to their likeness to human beings in structure and behaviour, and to the comparative ease with which, owing to their possession of hands, they can be taught to perform essentially human actions. There is certainly much to be learnt about the mental processes of these animals; but it does not yet appear that they can be placed definitely on a higher intellectual plane than dogs or elephants.

Stories of the intelligence of these two groups of animals may be found in all books dealing with the subject. One instance attesting the intelligence of elephants may here be told. In the Zoological Gardens, in London, the elephants have found out that the way to obtain a piece of food that has fallen within the hand-rail beyond the reach of their trunks is to blow it back beneath the rail to the person who dropped it. This behaviour seems to show intelligence of a tolerably high order. A low order of animal intelligence is attested by the story of the pike which took three months to learn to abstain from charging a glass partition separating him in an aquarium from some small fishes which he wished to eat at the time, but which at the end of that period and thereafter he refrained from attacking, despite the removal of the partition.

Animal Magnetism. Name which was formerly given to hypnotism under the impression that its phenomena were due to magnetic influence proceeding from the operator to the subject. It has no connexion with the electrical phenomena which often occur in the living organism. See Hypnotism.

Animal Power. Standard of work which certain animals can perform. Many tests have been made to establish the amount of power which animals of various kinds can exert for considerable periods. Watt estimated that a horse of average strength could do work equivalent to raising 33,000 lb. one foot per minute (33,000 foot-pounds). In practice this is too high for a ten hour working day, 22,000 ft.-lb. being about an average, but the figure of 33,000 has been adopted as the standard

Animal Power. Sketch illustrating the comparative pulling power of man and certain animals. While a man can pull .8 to 1.166 lb. for each pound of his own weight, an elephant pulls only .729 lb. for each pound of its own weight; thus, relatively, a man is stronger than an elephant

doubtless due, not to stupidity, but to independence of character or unadaptability of temperament. It is not always easy, moreover, to decide whether behaviour is dictated by instinct or intelligence. The cunning of wolves in avoiding traps is generally, and possibly rightly, assigned to intelligence, on the tacit assumption that snares are too recent an invention to be regarded as a part of the natural surroundings of these animals. But since wolves have been trapped by mankind for thousands of years, it may be that their caution is, at all events partly, instinctive, for instincts may be perfectly or imperfectly developed.

Again, many alleged intelligent actions of domesticated or captive animals, living under conditions providing factors foreign to their natural mode of life, are either the direct outcome, or slight modifications, of simple instincts. The wariness displayed by elephants when testing the strength of a bridge, and the attitudes of sporting dogs, called setting and point-

ing the bell with the opening of the door, it was probably only to a very limited extent.

Quite commonly animals have gained a fictitious reputation for a comparatively high standard of intelligence owing to misinterpretation of their behaviour. Under natural conditions the lives of many vertebrate animals depend upon their rapidity of response to the slightest movement or sound. They are, therefore, exceedingly quick at detecting and acting upon signs from their trainer which are likely to pass unnoticed by on-lookers. In that innate faculty probably lies the explanation of the alleged spelling and counting capabilities of horses and dogs. When the required letter or number is touched, a slight, possibly unconscious gesture of the showman may serve to apprise the animal that the correct selection has been made.

Carefully conducted experiments have also thrown doubts upon the reputed high intelligence of monkeys. After hundreds of trials with

horse-power by which engines are rated. Comparisons between elephants, horses, camels, and men, as regards their tractive power, carried out under scientific conditions at Barnum and Bailey's circus in New York, showed that for every pound of its own weight an elephant pulled .729 lb.; a horse, .822 to 1.172 lb.; a camel, .764 lb.; a man, .8 to 1.166 lb. These figures relate, however, only to short periods of maximum effort.

An ox is considered to have $\frac{2}{3}$ the strength of a horse; a mule about $\frac{1}{2}$; a man $\frac{1}{3}$ to $\frac{1}{4}$. Proportionately to weight, strength tends to increase with decrease of size. Small animals, such as weasels and rats, also birds and fish, are enormously strong for their weight. Insects again display even more extraordinary power. A flea is able

Animal-worship. Old Egyptian figures showing a king making an offering to the sacred bull, Apis. Above: Snake-worship in India

to jump 500 times its own height, and an ant carries several times its own weight with the greatest ease. See Horse Power

Animal-worship. Term loosely denoting a complex range of ritual cults which have their roots in animism and their survivals in folklore. The assumption of identical qualities in the human and the animal soul, fortified by the primitive belief in transmigration, led to a uniform treatment of the dead. Hence emerged in one direction the various forms of ancestor-worship, and in another those of animal-worship. At first a whole species may have been revered or feared; in process of time individuals were chosen for their rarity, as the Siamese white elephant, or expressly

reared under conditions of sanctity, as the Egyptian Apis. It is possible that animal-worship may be the primary origin of animal domestication.

Functionally, beast-cults are related to the chief material concerns of their worshippers. The nomad hunters of N. Asia reverence the bear, many American Indians the deer. The pastoral races of the ancient Nile valley and of Aryan India paid divine honours to the cow. Dangerous animals are propitiated in the case of the leopard (W. Africa), lion (Bantu Africa), tiger (S E. Asia), hawk (N. Borneo). A potent motive for the reverential cult of animals

Animal-worship. The sacred cow of Benares, and other protected animals, by a statue of one of the sacred beasts

Drawing by F. Maiana

is their supposed kinship with men as tribal ancestors in the communion of the totem. The eagle-hawk and crow are not only phratry or tribal names in many Australian tribes, but are the subjects of a copious mythology. Under polytheistic forms animal-worship reaches its most systematic development in Hinduism. See Totemism; consult also Herbert Spencer's Essays, Vol. III, Origin of Animal-worship; Lang's Magic and Religion, 1901; Farnell's Evolution of Religion, 1905.

Animé. Resin which exudes from the bark of *Hymenaea courbaril*, a huge tree of tropical S. America. It is used in perfumery and in making plasters, and is supposed to take its name from its power of attracting living creatures.

Animism (Latin *anima*, soul). Belief in spiritual beings, which is the philosophic groundwork of all primitive culture. It should be distinguished from animatism, which attributes to natural objects and phenomena personal will-power, apart from a separate soul. It may be argued that man laid the foundations of an explanation of nature by subconsciously regarding the moving objects around him—wind, river—as possessing a volition like his own, and thus as

being alive. Later on he would draw from the observed facts of dreams and of unconsciousness, visible breath and ill-health, reflected images in water and shadows, the notion of a spirit-self—it might be more than one—separable from the body. This recognition of the human soul and its extension to all other sensible objects are the material of what E. B. Tylor, taking over the term from G. E. Stahl, who used it of vitalism, called animism.

By the side of the belief in human personality there emerged another, not necessarily as an inference—the belief in an after-life of the soul, for a time at least. The spirit or breath of the dead became a ghost, the shadow of the dead a shade. That this was perceived by early palaeolithic man in Europe is attested by the careful interment of the dead, and the provision of choice amulets and tools for their ghostly service. From this point animism as an effort of the mind began to influence the emotional life. While, therefore, the primitive religions may not be the direct offspring of animism, they arose at any rate in an animistic atmosphere. The lines of development follow a threefold path, deducible from the foregoing. (1) The soul's after-life suggested the cult or tendence of the dead, which became the worship of disembodied spirits credited with objective powers. (2) The contemplation of the power manifest in phenomena resulted, not necessarily later in time, in nature-worship. (3) The conception of bodiless spirits led to devices for their propitiation, which widened into spirit-worship.

-To the savage mind a spirit may be a thing of mystery, but not an abstraction, as when the natives of Danger Island, in the Indian Ocean, employ rope nooses as traps for errant souls. Moreover, not all spirits are traceable to a material home, while many are conceived as able to enter at will different kinds of bodies, human, animal, or inanimate. They are thus often creatures of the imagination rather than objective ghosts, and by association of ideas are regarded as controllable by the principle of similarity. Out of the one grew the primitive belief in transmigration; out of the other, sympathetic magic. This brought about the separation of a special class of men, often exercising psychic powers more or less consciously, who as medicine-men or witch-doctors practise the arts which culminate in shamanism. So also

the individual attitude towards a subservient spirit or tutelary genius diverged in Africa into fetishism, and in Australia and Polynesia is illustrated by ideas connoted respectively by the *chunnga* and *mana* (*q.v.*).

Through these primal beliefs runs the idea of communion with a friendly, or at least a placable, unseen world. Some have held that a still more primitive movement of the mind was instigated by fear. When all was well, human nature may in all ages, as to-day, have been content with the unthinking acceptance of the material life; when calamity befell such thoughts began to emerge as led to propitiation by sacrifice. This involves the consideration how far the "god-idea" may have arisen independently of the "spirit-idea." While it cannot be asserted that the conception of a Supreme Being is

Anise. The star anise from which much of the oil used in medicine and for flavouring is obtained

inherent in all savage minds, some interesting conclusions are deducible from the aboriginal beliefs of the Australians, Bushmen, and Fuegians, who represent at the southern extremities of the continental masses the still lingering relics of earliest man. We are on surer ground when considering the clear distinction made in early ages between good and evil spirits. The effort to avert the malevolence of malignant spirits as the producers of disease, either through demon-possession or hostile witchcraft, led to exorcism.

There is little, if any, moral element in animism. The belief that the after-life is determined by the ethical acts of the present belongs to a higher stage. Among animistic peoples ethics is essentially obedience to tribal law. It was after religion had come to exert a more peremptory hold on the attitude of the individual

soul that to customary law it added sanctions based upon the fear of subsequent retribution, or the expectation of ultimate reward. The great non-Christian theisms have offered the world lofty philosophies, but their votaries still for the most part maintain in time of calamity their primal animism. Thus while Australia and Polynesia, Melanesia and non-Moslem Africa may be classed in general terms as animistic, the mongoloid peoples of Eastern Asia maintain ancestor-worship as their operative religion. Even Hinduism itself, polytheistic though it be in form, is at heart a highly systematised animism. See Anthropology; Spiritualism.

Bibliography. Golden Bough, J. G. Frazer, 1890; Origin and growth of the Conception of God, E. Goblet d'Alviella, 1892; Myth, Ritual and Religion, A. Lang, new ed., 1899; Threshold of Religion, R. R. Marett, 2nd ed. rev. 1914.

Anio. River of central Italy. A tributary of the Tiber, which it enters 2 m. above Rome, it rises in the Herminian Hills, flows W. past Tivoli, where it forms famous falls, and has a length of about 70 m. Known also as the Teverone, or Little Tiber, and Aniene, it supplied ancient Rome with water by two aqueducts.

Anion (Gr. *ana*, up; *ion*, going). Name applied by Faraday to the product of electro-chemical decomposition which appears at the anode or positive pole of the battery. That which appears at the cathode or negative pole is called the cation. See Electrolisis.

Anise (*Pimpinella Anisum*). Perennial herb belonging to the widespread family Umbelliferae. Anise is a native of Greece and other parts of S. Europe. It has leaves cut into lobed or toothed leaflets, and minute white flowers; as with all umbelliferous plants, the little fruits are pierced with tubes filled with an aromatic essential oil. The fruits, the aniseed of commerce, are used as a flavouring in confectionery, and the oil extracted is used in medicine as a remedy for flatulence and dyspepsia. Much of the commercial oil of anise is obtained from the fruits of star anise (*Illicium verum*), an evergreen shrub of the order Magnoliaceae and a native of China and Japan.

Anjengo. Village in the state of Travancore, India. On the coast, 78 m. N.W. of Cape Comorin, it was one of the earlier English settlements in India, being occupied by the East India Company in 1684. Although enclosed within the state of Travancore, it was a British settlement until 1947.

Anjidiv OR ANJADIVA. An island off the W. coast of India, forming a dependency of the Portuguese settlement of Goa. It is 1 m. long, and was the first piece of territory in what is now the Bombay Province to fall into Portuguese hands.

Anjou. Old province of France. It lay around its capital, Angers, on the Maine, a tributary of the Loire, and came into existence in the 7th or 8th century. In the 10th century it was ruled over by Fulk, founder of the warlike family of the counts of Anjou. One of these counts, a later Fulk, carried on a war with Henry I of England, but in 1129 Henry's daughter Matilda married Fulk's son Geoffrey, first of the Plantagenets.

Henry II of England was the son of this marriage, and he was in turn count of Anjou. His son John lost Anjou about 1203, when it was seized by Philip Augustus of France, and henceforward it belonged to his successors, except when, during the reigns of Henry V and Henry VI, it was again an English possession. It was finally recovered by France about 1444.

In 1360 the count was made a duke, and in the 15th century Anjou had a period of glory under Duke René. In 1584 Anjou passed under the direct rule of the kings of France. It was included for a time with Orléannais, but in the 17th century was a separate province. Since the Revolution it has formed the department of Maine-et-Loire and part of the departments of Indre-et-Loire, Mayenne, and Sarthe. See France: History.

Ankara. Capital of the Turkish republic. In the vilayet of the same name, it stands on the left bank of the Enguru Su, 215 m. E.S.E. of Uskudar by the Anatolian Rly. Before becoming the capital on Oct. 13, 1923, it was generally known in Europe as Angora. It was a sleepy provincial town in a barren and malarial plain when Kemal Atatürk (*q.v.*) decided to move the centre of administration from Istanbul to a place strategically safer. Ankara is somewhat inaccessible, though there are rly. services to Kayseri, Erzincan, and into Armenia, and air routes to Cairo, Istanbul, and beyond.

Rebuilt almost entirely since its change of status, Ankara has been called the most expensive city in the world. The practical and severe modernity of the many embassies, government buildings, and residences shows the hand of German architects and engineers who were called in to help to construct a typically European capital. Yenishehr, the modern part of the city, has broad boulevards and spacious parks, as well as factories, mills, power stations, and drainage and sewage systems. The old quarter is interesting historically, with remains of Roman and Byzantine occupation. A large bronze equestrian statue of Kemal stands overlooking both the old and the new districts. Ankara is the second largest city of Turkey: pop. (1945) 227,505. The industries include agriculture, goat breeding, and cloth working. Wool, mohair, grain, honey, and fruit are exported. There is a permanent exhibition in which Turkish products are displayed.

Captured at different times by Persians, Arabs, Seljuk Turks, and

Ankara. The capital of Turkey, inaugurated by Kemal Atatürk, is an interesting example of modern large-scale city building. 1. The railway station. 2. The bazaar, a survival of the oriental element of what was formerly a quiet provincial town. 3. Government buildings seen across one of the new boulevards

Latin Crusaders, the city fell to the Ottoman Turks in 1360. Tamerlane the Tartar defeated and imprisoned the sultan Bayazid near here in 1402, but Mohammed I recovered the place in 1415, since when it has remained Turkish. In 1832 it was momentarily seized by Egyptians under Ibrahim Pasha. The Turkish nationalist movement chose it for headquarters in April, 1920. Shocks were felt here during the great earthquake to the E., Dec. 27-28, 1939, and it was here that relief measures were organized.

Anker. Old Dutch measure of liquid capacity. Formerly used in England, when it contained ten gallons of wine, it is still used in S. Africa, equalling 7½ gallons.

Anker. Old Dutch liquid measure

Anker-Larsen, JOHANNES (b. 1874). Danish novelist and dramatist. Born at Lange-lund, Sept. 18, 1874, he became a student of theology and law, but was attracted by the stage and worked his way as an actor for eight years, eventually holding the post of stage director in various theatres. With this career he combined journalism and a considerable output of plays and novels. He won the Gyldendal prize for literature with his *De Visers Sten* (The Philosopher's Stone) in 1923. Other translated works include *Martha and Mary*, *With the Door Open*, and *A Stranger in Paradise*.

Ankh. Ancient Egyptian symbol resembling a loop surmounting a T. From its use at coffin ends under the 1st dynasty, it is now recognized as having originated as a sandal-string. As its name resembled that of life it became the symbol of life, and as such is depicted in later ages in the hands of gods. By local association it became among the early Coptic Christians the sign of the cross.

Ankh

Anklam. Town of Pomerania, Germany. It stands on the Peene, 5 m. from the Baltic and 52 m. by rly. N.W. of Stettin. It has a military academy, some ship ping trade, and shipbuilding, linen woollen, and sugar industries. An old town, it has a church dating from the 12th century. Formerly an important fortress, it belonged to the Hanseatic League and later to Sweden, passing to Prussia in 1720. Pop. 14,789.

Ankle. A hinge joint of the human body, scientifically known as ginglymus. The articulation takes place between the two bones of the leg, the tibia and fibula.

Ankle. An indication of the way in which its bones connect the foot with the leg

which are firmly united at their lower ends by ligaments, and the upper surface of the astragalus or ankle bone. It is a joint of very great strength owing to the ligaments which surround it and the close interlocking of the bony surfaces, the ends of the leg bones being prolonged down on each side to form a hollow resembling a mortice into which the astragalus fits.

Injuries of the ankle are sprain, dislocation, and fracture of the bones forming the joint. Sprain is usually due to twisting or wrenching the foot in a fall or "stepping over," and is accompanied by pain and swelling of the joint and sometimes discoloration of the skin if the blood-vessels have been injured. The treatment is to apply cooling lotions for a few days while the symptoms are acute and to keep the foot at rest, but as soon as the pain and swelling have sufficiently subsided gentle massage should be begun and movements of the joint made in order to prevent adhesions being formed and permanent stiffness resulting. Dislocation of the ankle joint is frequently associated with fracture of the lower ends of the bones of the leg owing to the close interlocking of the various bones. Fracture is particularly likely to occur with lateral dislocations. Backward dislocation of the astragalus usually results from a fall on the feet while running or jumping, or sudden violence applied to the leg while the foot is fixed, and may be associated with fracture of both bones of the leg. Dislocation forwards is very uncommon. Fracture dislocation of the ankle necessitates skilled surgical treatment.

Disease of the ankle is most frequently tuberculous, a pulpy swelling gradually involving the whole region of the joint, with impairment and eventually loss of movement of the foot. The treatment is to give the joint complete rest for a prolonged period either by the application of splints or, and often preferably, by encasing it in plaster of Paris, simultaneously taking measures to build up the general constitution of the patient. Surgical treatment may be adopted in appropriate cases. See *Anatomy: Man*.

Ankleswar. Town of Bombay prov., India. It is 5 m. by rly. S. of Broach and has cotton and paper mills.

Anklet. A ring worn upon the ankle as a bracelet is on the wrist. It is specially in favour with the

Anklet. 1. Of brass, worn by women of Torres Straits islands. 2. Of seed pods, worn by S. African natives

British Museum

peoples of Asia, Polynesia, and Africa. Anklets are made of metals, glass, and also of textiles and woven grasses. Asiatic dancing girls often have small bells attached to their anklets, while some African tribes wear anklets of spiky grasses as a protection from snakes. See *Charm*.

Ankober. Town of Abyssinia. The former capital of Shoa, it stands 8,700 ft. high on the E. slope of the Shoa plateau, and is 90 m. N.E. of Addis Ababa. It is now a hut village on the trade route. Pop. 2,000.

Ankylosis. Partial or complete fixation of a joint resulting from inflammation following disease or

Anklet. Foot of an Indian princess, illustrating use of anklets

injury. The new tissue which is formed and unites the bones may be either fibrous or bony. Where only a small amount of fibrous tissue has been formed, the condition may be improved by massage, exercises, or breaking down the adhesions by forcible extension of the joint under an anaesthetic. Severe cases may require a surgical operation. *See* Ankle.

Ankylostomiasis (Gr. *ankylos*, hooked; *stoma*, mouth). Disease, characterised by progressive anaemia, due to a parasite which occurs in two forms, the *Ankylostoma duodenale* and the *Necator americanus*. Of the two forms the former is not limited to the Old World and the latter is said to be commoner in India than in the New World.

The parasite is a worm, the male being about 7 to 11 millimetres in length and the female about 10 to 18 millimetres. The American form is shorter and thinner.

The disease is widespread in tropical and sub-tropical countries, e.g. Egypt, South America, Central America, southern parts of N. America, China, Japan, Italy, and parts of Australia. The fertilised eggs pass out from the bowel and incubate in the moist soil. Early in their larval development the parasites become infective and regain entrance to humans through the skin, moving about the body by regular channels until they reach the intestine, where they develop to maturity. Two sets of symptoms are present in hookworm infestation: by the larvae (itching or burning at the points of skin penetration, or sickness); and by the adult parasite (varying degrees of anaemia).

Treatment is of a dual character: to expel the worms and to restore the blood level to normal. Large doses of iron and a well-balanced diet are essential, while anthelmintic drugs such as thymol, carbon tetrachloride, tetrachloroethylene, or hexylresorcinol may be employed.

Anna (Hindustani, *ana*). Coin of India and Pakistan, the sixteenth part of a rupee. It is about equivalent to a penny, and is divided into four pice, or 12 pies. The British in India also used the word to denote a fraction. *See* Rupee.

Anna. Left, Pakistan (obverse); right, Indian (reverse).

Annaberg. Town of Saxony. In the Erzgebirge, near the frontier of Bohemia and 18 m. by rly. S.S.E. of Chemnitz, it has manufactures of lace and trimmings, industries introduced by Barbara Uttmann and extended by refugees from the Netherlands. In the 16th century it was an important mining centre, but the mines are almost worked out. Its 16th century church, S. Anne's, has interesting sculptures. There are monuments to Luther and Barbara Uttmann. The town was founded in 1496.

Anna Christie. Play by Eugene O'Neill (*q.v.*). Written 1920 and produced at the Vanderbilt Theatre, New York, 1921, and at the Strand Theatre, London, 1923, this strong human drama, which won the Pulitzer prize in 1922, concerns four characters, of whom the chief, Anna herself, is a waterfront prostitute. The others are her father, a Swedish-American sea-captain; a drab whom he keeps on his coal barge; and an Irish stoker. Pauline Lord appeared in the name part in the New York and London productions. Anna Christie was also adapted in two film versions. The first (silent) was made in 1924, with Blanche Sweet as the heroine. The second, 1930, was notable for providing Greta Garbo's first part in a talking film. She played Anna, with Wallace Beery as the father.

Anna Comnena (1083–1148). Earliest female historian. Born at Constantinople, Dec. 1, 1083, daughter of the emperor Alexius I Comnenus, she was wife of the Byzantine historian, Nicephorus Bryennius. Before her father's death she vainly endeavoured to get the succession altered in favour of Bryennius. In 1118, when her brother John succeeded, she intrigued to depose him. The conspiracy was detected, her property was confiscated, and Anna fled to a convent, devoting the rest of her life to writing the *Alexiad*. This prolix work, in fifteen books, undertaken as a continuation of the work of Bryennius, is more of a panegyric of her father than a serious contribution to history. The first two books contain a sketch of the period from 1069 to the opening of her father's reign.

Anna Comnena is one of the chief representatives of the Byzantine purists, whose object it was to reintroduce the style of the ancient classical authors, such as Xenophon and Thucydides. Her sympathies were strongly with the Eastern church and, like her father, she regarded with suspicion the ad-

vance of the Crusaders. Sir Walter Scott made use of the *Alexiad* in his romance *Count Robert of Paris*.

Anna Karénina. A Russian novel by Leo Tolstoy. It was published in 1873–6, and is a powerful story of the tragedy of the conflict between passion and duty; of marriage without love (Anna and Karénin) and love without marriage (Anna and Vronsky). The development of the tragedy of the brilliant, passionate Anna is the central theme of the story. In Levine we have largely an autobiographical study of the author himself. The work has many English translations (R. S. Townsend, 1912; C. Garnett, 1912; Louise and Aylmer Maude, 1918), and several dramatic versions have appeared, including that produced by Lydia Yavorska at the Ambassadors Theatre, London, 1913, in which she played the title-part. Film versions appeared 1935 (with Greta Garbo) and 1948 (with Vivien Leigh).

Annales, LES. Popular French illustrated weekly review of politics and literature. It was founded in Paris in 1883, and under the direction of Adolphe Brisson, the dramatic critic, helped by his wife, daughter of Francisque Sarcy, it numbered some of the best contemporary writers among its contributors. It was published regularly until June, 1940.

Annals (Lat. *annalis*, yearly). Name given to historical and other works in which information is arranged chronologically. From very early times, records of events in Roman history were kept by the priests, especially the pontifex maximus, but their destruction at the sack and burning of Rome, 390 B.C., seriously impairs the credibility of the accounts given of events previous to that date. The earliest prose writer of Roman history proper as distinguished from annals or chronicles was Fabius Pictor (3rd century), who wrote in Greek. From that time historical works became more elaborate and artistic, but the name annals was still used, notably in the *Annales* of Tacitus. With the decadence of Roman literature historical writing degenerated, and the annalistic form revived.

This Roman tradition was carried with the Latin language into the monasteries of medieval Europe and the monkish histories were arranged in annalistic form. The annals of some of the monasteries, Corvey and St. Gall, for instance, are useful as sources for the history of their time. *See* Chronicles.

Annam. Part of the republic of Vietnam (*q.v.*), along the central littoral of Indo-China. Extending for 750 m. along the China Sea, with a mean breadth of 93 m. and an area of 56,973 sq. m., it adjoins Tongking on the N., Laos and Cambodia on the W., and Cochinchina on the S.W.

POPULATION. The earliest inhabitants, long-headed Indonesians, are represented by the primitive Kha, M \ddot{o} i, and Muong, now upland dwellers. The kindred Cham, who, under Hindu and afterwards Muslim culture, maintained during eleven centuries the Champa power, now form a remnant in Binh-thuan and Khanh-hoa valleys. The Giao-chi, immigrant from Tibet, have become by fusion the now dominant Annamese. The population of 6,211,228 is in the main Annamese, the rest being mostly Kha, with Tai, Cham, some Chinese, Minh-huong—offspring of Chinese fathers and Annamese mothers—and a few Europeans. The official Confucianism, besides Chinese Buddhism and Taoism, is subordinated to ancestor-worship, with a substratum of spirit-worship. The primitive peoples are animist.

PHYSICAL FEATURES. A longitudinal backbone extends between the Mekong valley and the sea. The W. boundary of Annam approximates to the mountain crest, except in the S., where a detour takes in the upper waters of two Mekong affluents, the Sebangkhan and Donnat. Averaging 2,150 ft. high, with occasional peaks up to 8,350 ft., this forest-clad ridge is ramparted along its eastern base by foot-hills 15 m. to 30 m. broad, sinking into a cultivable coastal plain 12 m. to 50 m. broad. Two rivers, the Songma and Song-ka, have formed very densely populated rice-deltas. The other streams, short and unnavigable, send down in winter silt-laden torrents, which have formed dunes and lagoons, especially along the ironbound coast down to Tourane. Indurated limestone beds have been hollowed into extensive caves, either by sea action, as at Tourane, or by river action, as at Bo-kinh, in Kwang-binh. The climate is governed by the winds. The N.E. trades from Oct. to May are attended by a temperature from 59° to 75° F., and a heavy rainfall, mostly from Sept. to Dec. The S.W. monsoon, discharging its moisture in Cambodia and Laos, causes a dry season, with a June-Aug. temperature from 86° to 95°.

INDUSTRIES. There are three economic regions. The N. region,

based on Hai-fong in Tongking, shares the rice-growing and mining activity of that protectorate. The central region, based on Tourane, is unsuited for rice, which is imported, but produces millet and other cereals. The S. or Cham region, based on Saigon in Cochinchina, depends on agriculture, silk, timber, and coast-fishing. Other products are sugar, cotton, maize, bamboo, ground-nut, oilseeds, tobacco, and spices. In 1944 there were nearly a million head of cattle. Coal is mined near Tourane, magnetic iron-ore in Ngean, and there is some native smelting, and the output of gold and other metals is developing. There are salt works in N., Central, and S. Annam.

The mandarin road from Tongking into Cochinchina passes through the capitals of the coastal

provinces; in Annam this road frequently degenerates into a mere track. But there are 2,093 m. of rly., including a coast line from the Chinese border in the N. to Mytho in the S., through Hanoi, Hué, and Saigon, and a transverse line E. to N.W. from Hai-fong to Yunnanfu in China. Hué (*q.v.*), the capital, has a pop. of 13,056.

HISTORY. After many centuries of Chinese domination a native monarchy, established in 968, gradually overcame the Champa power and attained final independence from China in 1428. French intervention, begun in 1787, led in 1884 to formal suzerainty, and until 1945 Annam remained a native monarchy under French control. The emperor Bao-Dai, who succeeded in 1926, resided at Hué, and was aided

Annam, Vietnam, Indo-China. 1. Native carrying balanced baskets over their shoulders. 2. Native costumes. 3. Women going to market by boat. 4. Poling a river boat. 5. A woman of the interior. 6. Native with filed teeth

by a comat or privy council of seven ministers. The French resident-superior presided over the protectorate council, which was composed of departmental officials and members of the comat. A chamber of representatives of the people was established in 1926.

After the Franco-German armistice of June, 1940, the Vichy government appointed a new governor of Indo-China who, with Vichy approval, agreed to the "temporary occupation" by the Japanese of strategic points in Indo-China in July, 1941, remaining, however, in nominal control until Japan recognized Annam's independence in March, 1945, renaming the country Vietnam three months later. A strong nationalist movement developed, and Annam was a part of the republic of Vietnam recognized by France in March, 1946. The events leading up to this recognition are described under Indo-China. See also Saigon; Vietnam.

Annamese. Indigenous people forming five-sixths of the population of Vietnam, Indo-China. Short, ungainly, tawny, flat-faced, small-nosed, round-headed, they are lowland dwellers, subsisting mainly on rice, fish, and poultry. Both sexes wear silk or cotton trousers and tunics, with the hair coiled into top-knots surmounted by turbans or palm-leaf hats. They blacken the teeth by betel-chewing and varnish, are industrious, independent, and inveterate gamblers. Their dialects and script are of early Chinese derivation.

Annan. A river of Dumfriesshire, Scotland. It rises close to the sources of the Clyde and the Tweed, and flows S. for about 50 m. to the Solway Firth. It has good salmon and trout fishing.

Annan. Royal burgh and seaport of Dumfriesshire, Scotland.

Annan arms

It is pleasantly situated on the Annan, $1\frac{1}{2}$ m. from its mouth in the Solway Firth, and 17 m. E.S.E. of Dumfries by railway. It is an old burgh with historic associations. Industries include the manufacture of rolled breakfast oats and of boilers. The town owns salmon fishings in the Solway Firth. There is a small harbour regularly used by the Solway fishing fleet and small coastal vessels. Edward Irving was a native and Carlyle a schoolboy here. Annan

was frequently involved in the Scottish wars and Border disturbances. During the First Great War the town housed many of the workers at the great Gretna arsenal, and during the Second Great War many workers at ordnance factories in the neighbourhood. The sale of liquor in Annan is under government control, an experiment introduced during the earlier war. Pop. 4,323.

Annapdale. Central division of Dumfriesshire, Scotland. Consisting of the valley of the Annan, 30 m. long and about 16 m. broad, it anciently formed part of Strathclyde and later of Valentia. Near the source of the river is a hollow known as the Devil's Beef-tub or Beef-stand, with steep wooded sides, which figures in Scott's Redgauntlet.

Annapolis. City and capital of Maryland, U.S.A. It stands on the S. bank of Severn river, 2 m. from Chesapeake Bay, and 26 m. S. by E. of Baltimore by the Maryland Electric Rly. It contains the U.S. Naval Academy, St. John's College, and other state, civic, and educational institutions, and has a wireless station. Founded in 1649 as Providence, it received the name Annapolis in honour of Queen Anne. Its chief industry is oyster canning. Pop. 13,069.

Annapolis Royal. Town in the county of Annapolis, Nova Scotia, at the mouth of the Annapolis river, on the Bay of Fundy, at the head of deep water navigation and on the C.P. rly., 120 m. W. of Halifax and 60 m. S.E. of St. John. Chief industries: milling, lumbering, fruit houses, apple orchards, fishing, and shipbuilding. The town contains five churches, public schools academy, library, court house, town hall, theatre, general hospital, nursing home, and three hotels. It is surrounded by a district famous for its apples; a million barrels are produced annually. The town was founded in 1604, was originally the capital of the prov., and is the oldest European settlement in America N. of Florida. Fort Anne, the oldest fortification in N. America, is situated at Annapolis, and, with its historic museum, attracts thousands of tourists every summer. Captured in 1710, it became formally

Annan, Dumfriesshire, Scotland. View of the High Street, looking to the west

British in 1713. It is also known popularly as "the Evangeline country," after Longfellow's poem.

Annas. Biblical character. In the Gospels of Luke and John he is referred to as holding the office of high priest, apparently jointly with his son-in-law Caiaphas; and into his hands Jesus was delivered upon His arrest.

Annates (Lat. *annus*, a year). Ecclesiastical term for the first year's revenue of any clerical benefice. In England this was paid to the pope until 1534, when it was claimed by the king. It was transferred to the Church of England by Queen Anne in 1703. By the First Fruits and Tenths Measure, 1926, annates were, with a very few exceptions, abolished. See Queen Anne's Bounty.

Anatto or **ARNOTTO.** Yellowish-red colouring matter derived from the fruit capsules of *Bixa orellana*, a S. American plant. Produced in Brazil and Cayenne, annatto contains a colouring matter known as bixin. As a dye for fabrics annatto is boiled with potashes. It is much employed as a colouring for cheese and butter, and because of the solubility of the colouring matter in oil it is largely used to impart a rich colour to the oil in which fish is fried.

Anne. Feminine Christian name. A variant of the ancient Hebrew name Hannah, meaning grace, it was used in France and England for both males and females. Anna was another form; in the 7th century there was a king of the East Angles named Anna. After a time, except to a slight extent in France, its use was confined to females, and the form Annie became popular in England and Scotland. Other variants are Ann and the diminutive Annette.

Anne. Saint and mother of the Virgin Mary. According to tradition, she was a native of Nazareth and the wife of S. Joachim. She is regarded as the patron saint of

S. Anne with the Holy Family and S. John, from a famous painting by Raphael
Valla Borghese, Rome

married women. Though held in high honour in the Middle Ages, her festival (July 25) was not generally observed in the Church until 1584. It is retained in the calendar of the Church of England.

Anne (1665-1714). Queen of Great Britain and Ireland. The younger daughter of James II by his first wife, Anne Hyde, daughter of the earl of Clarendon, she was born in London, Feb. 6, 1665. Her childhood passed quietly, its most important incident being the beginning of the friendship between the princess and Sarah Jennings, afterwards duchess of Marlborough, who for long were Mrs. Morley and Mrs. Freeman to each other.

In July, 1683, Anne was married to Prince George of Denmark (1653-1708), and after five years of quiet domestic life came the upheaval of 1688. When William of Orange landed in England she deserted her father and went over to the side of her Dutch brother-in-law, this step being due partly to her friend, then Mrs. Churchill, and partly, no doubt, to zeal for the

Protestant faith. Moreover, the establishment of the Protestant succession to the throne, whereby Anne's half-brother, known later as the Old Pretender, was excluded, made possible, if not probable, her own succession; by the Declaration of Right she was recognized as the next ruler in case William and Mary left no children. During the early part of William's reign Anne was in disgrace, a fact largely due to her friendship for the Churchills, but she obstinately refused to dismiss her favourite lady. Soon after Mary's death in 1694, however, she was reconciled with William and resumed her place in court circles.

In March, 1702, William III died, and Anne became queen, almost her first act being to provide lavishly for her husband, Prince George, and her friends the Marlboroughs. In the war of the Spanish Succession the arms of Britain under the leadership of Marlborough won brilliant victories, the fruits of which were gathered when the treaty of

Utrecht was signed in 1713. In 1707, while the war was in progress, England and Scotland were united, and in domestic politics the present system of party government, directed by a cabinet, the members of which all profess the same political creed, was inaugurated. The literary splendours of the reign earned for it the title of the Augustan Age of English literature, and it is adorned with the names of Addison, Pope, Swift, and Defoe.

Although a woman of few attainments and no talents, afflicted by constant illness and harassed by domestic troubles, Anne made a good queen. Only in ecclesiastical matters did she show any strong opinions, and her devotion to the Church of England was proved by her support of Dr. Sacheverell and the restoration to its funds of the first fruits of every benefice, still known as Queen Anne's Bounty. Her preference for the Tories, largely due to this cause, was shown by her rejoicing openly when a Tory ministry was formed in 1710.

In 1707 came one of the great events of her life, her estrangement from the duchess of Marlborough. The chief cause of the quarrel was undoubtedly the influence which Mrs. Masham, a relative of the duchess and a servant of old standing, was acquiring with Anne; henceforth she and not Mrs. Freeman was the favourite and counsellor of royalty.

In spite of her personal leaning towards the restoration of the

ANNE

Anne, Queen of Great Britain, from a painting by Sir Godfrey Kneller

Anne, Queen of Great Britain and Ireland. "The view of the charity-children in the Strand, upon the VII of July, MDCCXIII, being the day appointed by her late Majesty Queen Anne for a public thanksgiving for the peace (of Utrecht), when both Houses of Parliament made a solemn procession to the cathedral of S. Paul."

From a print of 1715

Stuarts, Anne had recognized, tacitly at all events, the succession of the elector of Hanover, when she died at Kensington, Aug 1, 1714. She was buried in Henry VII's Chapel in Westminster Abbey. She had borne seventeen children, but only one, William, duke of Gloucester, survived infancy, and he died when only ten years old. Anne's private life was exemplary, and in her narrow way she showed a sincere desire to do her duty to the country. *Consult* Life, M. R. Hopkinson, 1934.

Anne of BOHEMIA (1366-94). Queen of Richard II of England. The eldest daughter of the emperor Charles IV, she was born at Prague, May 11, 1366, and in 1382 married Richard II. In 1392 she mediated between the king and the citizens of London, who had refused Richard a loan of £1,000. She died of plague at Sheen, June 7, 1394, and was buried in Westminster Abbey.

Anne (1456-85). Queen consort of Richard III of England. She was a daughter of Richard Nevill, earl of Warwick, and was born at Warwick Castle, June 11, 1456. In 1470 she was betrothed to Edward, prince of Wales, son of Henry VI, and after his death at the battle of Tewkesbury was married in 1474 to

Richard, duke of Gloucester, who became king in 1483. She died March 16, 1485.

Anne of CLEVES (1515-57). The fourth queen of Henry VIII of England. Born Sept. 22, 1515, daughter of John, duke of Cleves, she was married to Henry, Jan. 6, 1540. Neither attracted by her person, nor willing to seem in alliance with the Protestants of Germany, Henry obtained an annulment of the union from Parliament on July 9 of the same year. Anne was pensioned on the understanding that she should not leave the kingdom. Surviving Henry and Edward VI, she died at Chelsea, July 16, 1557, and was buried in Westminster Abbey.

Anne of DENMARK (1574-1619). Queen of James I of Great Britain. She was born in Jutland, Dec. 12, 1574, the daughter of Frederick, king of Denmark and Norway. In 1589 James, then king of Scotland, sailed to Norway, and the marriage with Anne, already contracted by proxy, was celebrated at Opslo, now known as Oslo. They resided in Scotland until the death of Elizabeth, and in 1603 Anne was crowned with James as queen consort at Windsor. She was very extravagant, and exercised little influence in state affairs.

The Catholics in Scotland and England were encouraged by her coquetting with Rome, but their hopes were disappointed. Of her five children only two survived, Elizabeth, queen of Bohemia, and Charles I. She died March 2, 1619.

Anne of AUSTRIA (1601-66). Queen of Louis XIII of France. The daughter of Philip III of Spain, she married Louis in 1615. The union was unhappy, largely owing to Cardinal Richelieu's hostility to Austria; and Louis' repugnance to his wife had not been lessened by the folly of George Villiers, the 1st duke of Buckingham, who openly made love to Anne at Amiens. When Louis died in 1643, Anne became regent, and made Cardinal Mazarin her minister. She became greatly attached to Mazarin, whom she is believed by some to have married, and after his death lived in retirement at the convent of Val de Grace. Of her two sons, Louis became king as Louis XIV. She died Jan. 20, 1666.

Bibliography Mems. on Anne of Austria and her Court, Mme. de Motteville, Eng. trans. K. P. Wormeley, 1902; *Married Life of Anne of Austria*, M. W. Freer, rev. ed., 1912; *Anne of Austria*, M. Buchanan, 1937.

1. Anne, queen of Richard III of England. 2. Anne of Cleves, fourth queen of Henry VIII of England (Holbein, Louvre). 3. Anne, queen of James I of Great Britain (Van Somer, Nat. Port. Gallery). 4. Anne, queen of Louis XIII of France

Anne Ivanovna (1693–1740). Empress of Russia. The younger daughter of Ivan V, she was married to the duke of Courland in 1710.

Anne Ivanovna,
Empress of Russia

Widowed in 1711, she governed the duchy until 1730, when, on the death of Peter II, she accepted the Russian throne. Once recognized as autocrat in March, 1730, she abolished the council and kept the government in the hands of foreigners, chief among whom was her favourite Biren. On her deathbed she appointed Biren regent for her great-nephew, later known as Ivan VI.

Anne Leopoldovna or Carolovna (1718–46). Regent of Russia. The daughter of Charles Leopold, duke of Mecklenburg-Schwerin, she was also niece of the empress Anne Ivanovna, who early adopted her. In 1739 she married Anton Ulrich, duke of Brunswick-Wolfenbützel. Her son, born in 1740, was adopted by the Empress, on whose death in 1740 he became tsar as Ivan VI. Biren, the actual ruler of Russia, was then displaced by a conspiracy and Anne was proclaimed regent in his place, taking the title of grand-duchess. In Dec., 1741, she was deprived of the regency by a bloodless revolution, which deposed Ivan and made Elizabeth, daughter of Peter the Great, empress. She died in exile.

Anne (1477–1514). Duchess of Brittany. Daughter of Francis II, duke of Brittany (then almost an independent state), she succeeded him on his death in 1488. Unable to secure her hand by peaceful means, Charles VIII of France sent an army into Brittany, whereupon Anne was married by proxy to Maximilian of Austria, but the marriage was never consummated. She later married Charles VIII, and, after his death in 1498, his successor Louis XII.

Anne, duchess of
Brittany

Annealing (A.S. *anelan*, to burn). Process applied to various materials, chiefly metals and ceramics, including glass, in order either to remove internal stresses

set up during the processes of manufacture, to remove or reduce the hardening effect of plastic working such as rolling or drawing, or to remove, in some cases locally, the effect of previous heat-treatment such as tempering (in the case of steel) or age-hardening (in the case of light alloys). It involves heating the material to a sufficiently high temperature to cause internal recrystallisation or reorientation of the crystal boundaries, and is usually followed by slow cooling. With most pure metals, particularly copper and aluminum, slow cooling is not essential, but with glass it is absolutely essential; and very large articles such as searchlight mirrors and telescope lenses require weeks or even months to cool at a carefully controlled rate.

Annealing finds its widest application in the metal industry. Most structural metal products are annealed at some stage in their manufacture. Structural castings, particularly those required to maintain dimensional stability, are usually annealed after final machining to remove internal stresses set up by uneven cooling from the molten state, even when they are subsequently subjected to some other form of heat treatment to improve the mechanical properties. Wrought metals, e.g. sheet, tube, wire, sections and forgings, must in general be annealed at one or more stages in their production from the cast ingot, in order to remove the hardening effect of the rolling, drawing, or forging, and to render them capable of further working without cracking or splitting.

Where additional forming operations are to be carried out on the wrought material, such as the pressing or deep-drawing of sheet into utensils, or the bending or pressing of strip or sections into structural elements, annealed or partly annealed starting material is employed.

In general, particularly in the case of relatively pure metals, fully annealed material has the minimum hardness, as measured by the indentation or scratch tests, the minimum strength as measured by the tensile break test, and the maximum ductility as measured by the extension on break. Some alloys, including most of the heat-treated light alloys, are in the fully annealed condition immediately after the initial heating and quenching and can be subjected to forming operations while in this condition

before the final age-hardening or precipitation process. To anneal metals in part, by heating to moderate temperatures, is not usually feasible, as the results are rather uncertain. Where partly annealed sheet is required, e.g. for deep drawing in dies, it is usual to anneal fully and then subject the material to a moderate amount of further work. Such material is known as quarter-hard or half-hard, as the case may be.

Freeman Horn

Anne Boleyn (1507–36). Queen of Henry VIII. Younger daughter of Sir Thomas Boleyn, created earl of Wiltshire, Anne was taken to court in early life. There the

Anne Boleyn. This drawing by Holbein portrays the queen who went to her death at the age of twenty-nine as a woman of serenity and dignity
Windsor Castle

king became enamoured of her, but found she was not to be won except by marriage. For this and other reasons he resolved to rid himself of Catherine of Aragon, and throughout the proceedings for her divorce treated Anne quite openly as his future queen. In Nov., 1532, or Jan., 1533, when he had finally decided what course to adopt with regard to Catherine, he was privately married to Anne; as soon as Cranmer had pronounced his former marriage null the ceremony was performed publicly. In Sept., 1533, Anne's daughter Elizabeth, later Queen Elizabeth, was born.

Henry, however, soon tired of his new queen. Her conduct was by no means discreet; she failed to give him the son he desired, and Jane Seymour had attracted his attention. A case against the marriage was brought in the ecclesiastical court, and Cranmer pronounced it void. At the same time Anne was tried for treason

before a special court, her alleged offence being not merely adultery but incest. Her condemnation was a foregone conclusion, although it is doubtful whether there was any truth in these charges and she was beheaded on Tower Green, May 19 1536. See Henry VIII., *consult* also History of England, J. A. Froude 1836-70 Lives, P. Friedmann 1884 and P. Sergeant, 1934

Annecy. Town of France. The capital of the department of Haute Savoie, it is an important railway junction at the NW end of Lake Annecy, 24 m by rly NE of Aix les Bains. It has a castle, cathedral, episcopal palace, and library and manufactures linen paper, and hats. It became French in 1860, before which time it was part of Savoy. A centre of the French resistance movement during the Second Great War, Annecy was liberated by the Maquis Aug. 20, 1944. Pop. 15,620. Nearly 1,460 ft above sea level, Lake Annecy is 9 m long and 2 m broad. The river carries its waters to the Rhône.

Annelida (Lat. *annellus*, little ring). Fossil forms, mostly marine worm-like organisms. They have a tubular covering of calcium carbonate, chitin, or cemented sand grains. *Serpula* and *Spirorbis* are the most common genera. The former makes its appearance in rocks of the Silurian formation and is living at the present day, but the coiled form, *Spirorbis*, although appearing somewhat earlier, reached its maximum in Carboniferous times, when it helped in forming thin beds of limestone. See Fossils.

Annelids. Term applied by Cuvier to a group of segmented worms. Earth worms, lob worms

Annelids. The lug-worm or lob-worm found in the sand of the seashore.

and leeches are included and all have the body divided into a series of rings or segments.

Anne of Geierstein; OR THE MAIDEN OF THE MIST. Romance of the closing days of Charles the Bold, by Sir Walter Scott. Published in May, 1829, it deals with the continental adventures of two Lancastrian exiles, the earl of Oxford and his son Sir Arthur

de Vere, the wars of the duke of Burgundy with the Swiss, and the dynastic intrigues of Margaret of Anjou at the court of her father Rene, and introduces the secret society of the Holy Vehm. The heroine, Anne, who marries Sir Arthur de Vere, is a daughter of Count Albert of Geierstein, who joins the army of Lorraine, his dead body being found near that of his enemy, Charles the Bold on the field of Nancy.

Annexation (Latin *ad* to, *nectere*, to bind). In international law the assumption by a state of

third verse and also composed the music.

Anning, MARY (1799-1847). English naturalist. Born at Lyme Regis May, 1799, she was the daughter of a cabinet maker whose hobby was the collecting of fossils from the neighbouring cliffs. As a child she accompanied her father on his expeditions and after his death continued the pursuit making a small income by selling her specimens. In 1811 she discovered the first complete ichthyosaurus. With the aid of local workmen the 30 ft

Annecy, France. Showing the castle, the canal and Pont de Thiou and the quays from which passengers embark on the lake steamers.

sovereignty over territory not previously within its dominions. In olden days this was called conquest. The term annexation carries with it the meaning that the acquiring state takes over the territory acquired without regard to the wishes of the people of that territory. Modern instances are the annexation by Germany of Austria in 1938 and of Czechoslovakia in 1939 and the annexation of Albania by Italy in 1939. See International Law.

Annie Laurie. Eighteenth century Scottish song by William Douglas. Annie Laurie was a real person, who lived from 1682 to 1764. The daughter of Sir Robert Laurie, 1st bart., of Maxwellton House, Dumfriesshire, she married Alexander Ferguson of Craigdarroch in 1717. William Douglas, of England, Kirkcudbright, was her rejected suitor, who afterwards made a runaway match with Betty Clark, of Glenboig, Galloway. The words of his song were first printed by C. K. Sharpe, in 1824, they were remodelled in 1835 by Lady John Scott (1810-1900), who added a

skeleton was dug out of the block in which it was embedded. For years it was thought to be that of a crocodile, but its true identity was in due course established and it was removed to the South Kensington museum. Later she discovered a skeleton of the plesiosaurus, and in 1828 the remains of a pterodactyl. She received a small government grant, but was little honoured in her native town, where she died March 19, 1847.

Anniston. City of Alabama, U.S.A., the co. seat of Calhoun county. A health resort on the slope of the Blue Mts., it is 63 m. ENE of Birmingham by the Southern rly. Founded in 1873 by an iron company, it has now a number of manufactures, mainly connected with the coal and iron found around it, and is a centre of the cotton trade. Pop. 25,523.

Anniviers, VAL D' (Ger. Livschthal). Mt. glen of Switzerland, in the Rhône valley. It runs N and S in canton Valais from Sierre to the Dent Blanche, and contains the villages and resorts of S. Luc, Aver, Chandolin, and Zinal.

ANNO OR HANNO (d 1075) A German saint and ecclesiastic. He was made archbishop of Cologne in 1036. In 1062 he was entrusted with the education of the young emperor Henry IV and was made regent of the empire. He reformed all the monasteries in his diocese. He died at Cologne, Dec 4, 1075, and was canonised shortly afterwards.

Annobon. Small island in the Gulf of Guinea, belonging to Spain. It is 110 m S W of St Thomas, is 4 m long by 2 m broad, and has an area of under 7 sq m. The chief town is San Antonio de Praia, and the roadstead is visited by ships for water and provisions. Annobon was discovered by the Portuguese on New Year's Day 1471. Pop 1,400, mainly negroes.

Anno Domini. In the year of our Lord, a Latin phrase abbreviated A D. It is used for the chronology of the Christian era, the previous time being described as B C — i.e. before Christ. See Calendar.

Annonay. Town of France, in the department of Ardeche. It is 50 m S of Lyons on the riv to Bordaunx, at the junction of two small rivers, the Cance and the Dôme. It has manufactures of gloves and paper. Pop 16,661.

Annual Register. A British yearly review of public events at home and abroad, begun by Robert Dodsley in 1758. For many years Edmund Burke was the principal contributor. A rival publication was begun by Rivingtons in 1791, and the two were combined in 1824. Since 1890 the work has been published by Longmans. Dr Kippis was first editor of *The New Annual Register*, which ran from 1780 to 1825 inclusive; Sir Walter Scott edited *The Edinburgh Annual Register*, 1808–27, and Arthur Aikin *The Annual Review*, 1802–8.

Annals. Books of verse, tales, essays, and engravings, mainly intended for gifts at Christmas, the New Year, and on birthdays. They were very popular in the third and fourth decades of the 19th century, the fashion being set by Rudolph Ackermann's *Forget Me-Not*, 1823–47, and followed by *Friendship's Offering*, *Literary Souvenir*, *Amulet*, *Keepsake* etc. The term is often applied to annual reference books.

Annals. Varieties of plants which, raised from seed, blossom and die within a year. For large gardens of permanent establishment annuals are not greatly in demand, but in small town and suburban gardens, where the tenants are often migratory, they are most useful, as they offer what may be termed a quick result garden.

There are two divisions of annuals, hardy and half hardy, the genera and species of which embrace many thousands. Hardy annuals, if sown in the open ground in the spring flower in the summer, and die in the autumn of the same year. Half hardy annuals require to be started in heat, that is, sown in boxes in a heated greenhouse, hotbed or frame, and transplanted in the open air when all danger of late frosts is over. Half hardy annuals may also be sown in the open ground late in May or early in June, but the results are rarely so satisfactory, and the period of blooming is retarded.

Annuals should be well soaked when watering. They are not deep rooting subjects, and a mere surface damping sends the roots upward in search of moisture, with the result that the following day's sun plays havoc with them. To obtain the fullest results with annual flowers a succession of seed should be sown at intervals of a fortnight or three weeks. Popular garden annuals include China aster, candytuft, clarkia, godetia, larkspur, love in a mist, margold, nasturtium, sweet sultan, sweet pea, tobacco plant, and Virginian stock. Consult *Annals R. Hay*, 1937.

Annunciation From D. G. Rossetti's painting, *Ecce Ancilla Domini!* See p 472
National Gallery, London

Annunciation. From the painting by the great Spanish artist Murillo
Wallace Collection, London

Annuity (Latin *annus*, year). Periodical payment made for a limited time and carrying with it the repayment of capital by regular instalments. The time during which an annuity is payable may be either a fixed term of years, or the duration of one or more lives. The word is sometimes used for a pension, as when the king grants an annuity to a retiring judge, or Parliament votes one to a member of the royal family. Deferred annuities are annuities purchased, often by instalments, but not payable until the purchaser or his nominee has reached a certain age. Annuities are in most cases purchased from either the Government (through the National Debt Office, the Post Office Savings Bank, and Trustee Savings Banks), or from insurance companies. The cost of annuities is calculated by skilled actuaries. Every £100

will purchase a certain annual income, varying according to the age and sex of the intending annuitant. Annuities on the lives of women cost more than those on the lives of men because the calculations of the actuaries show that women tend to have a better chance of longevity than men. The purchasers of annuities are usually persons who, having no particular desire to conserve their capital, wish to obtain a higher rate of interest for their money during their lifetime. Annuities are also bought by executors and trustees to carry out bequests of testators.

Since 1808 the British Government has sold terminable annuities, chiefly as a means to repay part of the National Debt. The purchaser of one of these hands over to the Treasury a certain sum of money. With it Consols or some other public security is bought and

cancelled, while to the annuitant the Government pays a certain sum every year until death, when the liability is ended.

The idea of annuities is an old one, but the cost was first worked out on a scientific basis in Holland in the 17th century. By a converse process an annuity can be commuted or sold for a lump sum of money. Rates for transactions of this kind are also worked out in minute detail by actuaries. For instance, a man of 54 wishing to obtain money for his annuity of £100 would receive something like £1,100, because, according to actuarial calculation, it is worth eleven years' purchase.

The following statement shows the approximate yield per cent on capital sunk in the purchase of annuities through the Post Office Savings Bank on single lives at a few selected ages:

Age last birthday at time of purchase	When the average price of Consols is £80 or between £80 and £83.		Males		Females

Annulet (Lat. *annulus*, a ring). Architectural term for the fillets at the base of the Doric capital. In

Annulet in architecture, the fillets of a Doric capital

heraldry, as a mark of cadency, the word denotes the fifth son and his descendants.

Annunciation (Lat. *annunciare*, to announce). Literally, the act of making known or announcing anything officially or publicly. The

Feast of the Annunciation was appointed by the Church to commemorate the day on which the angel Gabriel announced to the Virgin Mary that she should bring forth a son and should call His name Jesus (Luke 1). The day, the observance of which dates from the 7th century, has always been observed in the Western Church on March 25, except in Milan, and for a time in Spain, when the Council of Toledo (656) changed the date to Dec. 18 so that it should not occur in Lent. The original date was restored in Spain when Dec. 18 became the Feast of the Expectation of the Blessed Virgin. In the Church of England calendar the title is the Annunciation of the Virgin Mary; in the table of Lessons proper for holy days, Annunciation of Our Lady—hence Lady Day. The subject of the Annunciation has inspired some famous paintings. The name is given to several orders. See Incarnation; Lady Day.

Annunziata, ORDER OF THE. An Italian order dating from 1362. It was founded by Amadeus VI, count of Savoy, as the Order of the Collar and his successor, Amadeus VII adopted the motto *Fert* (literally he brings), possibly an allusion to the relief of Rhodes by Amadeus V—*Fortitudo ejus Rhodum tenuit*, his bravery kept Rhodes—although no certain explanation can be given. It was remodelled in 1518, was taken over by Sardinia, which was ruled by the counts of Savoy, in 1869, and became Italian when the kings of Sardinia became kings of Italy. The badge is a representation of the Annunciation, surrounded by knots: the ribbon is blue.

Annunzio, GABRIELE D' (1863-1938). Italian author and imperialist. He was born at Pescara. March 12, 1863, of Dalmatian extraction, and studied at Rome university. A lyric poet from boyhood, he achieved fame with *Canto Nuovo*, 1882, and followed it with a succession of poems, short stories, and novels. The brilliance and beauty of his descriptive passages led some to hail him as the greatest of modern Italian writers, while many attacked him as a perverter of public morals. *Il Trionfo della Morte* (The Triumph of Death), 1894; *Le Vergini delle*

Rocce (The Virgins of the Rocks), 1896; and *La Città Morta* (The Dead City), 1898, were translated into English. A scandal broke out over *Il Fuoco* in 1900, as a result of the cruel treatment therein of the actress Eleonora Duse (*q.v.*), with whom he had had a love affair: and all his books were placed on the papal index. With *Laudi del Cielo, del Mare, della Terra e degli Eroi*, he was nevertheless hailed as a great national poet; and in 1928 his works were published under royal patronage.

In the first Great War d'Annunzio served in the Italian cavalry, infantry, navy, and finally with great gallantry as an airman, losing an eye. Appearing after the armistice as an imperialist and crusader, a mixture of Garibaldi and Byron, he declared that the peace conference was betraying Italy. In Sept., 1919, he led a raid on Fiume, which was being awarded to Yugoslavia; he occupied it and ruled for over a year as a Renaissance despot until forcibly ejected by the Italian government. Reconciled to Mussolini in 1923, he was next year created prince of Montenevoso. His later years were devoted to autobiography, aviation, and motoring. He married in 1883 the Duchessa Maria Gallese, but was notorious for amours. He died March 1, 1938.

Bibliography. Gabriele d'Annunzio, the Warrior Bard, G. Griffin, 1935; D'Annunzio, A Portrait, F. Nardelli and A. Livingston 1931.

Ann Veronica. Novel by H. G. Wells. Published 1909, it was one of the earliest in the author's series of sociological novels and the first of them to deal at length with the relationship of the sexes. The spirited frankness (in relation to the conventions of the time) with which the adventures of the heroine, Ann Veronica Stanley, were treated caused offence in some quarters, and the work was banned from several public libraries. The book, though not one of the author's best, long survived such treatment.

Ann Vickers. Novel by Sinclair Lewis. In contradistinction to the author's earlier masterpieces, *Main Street* and *Babbitt* (*q.v.*), where the emphasis is masculine, Ann Vickers, published in 1933, stresses the feminine point of view. The heroine is a social worker, dedicating herself to settlement work and prison reform. The book achieved a popular success in America and Great Britain.

Anointing. Ceremonial use of consecrated oil or ointment. The practice is often referred to in the Bible, *e.g.* Gen. 28 and 35. Ex. 29 and 30; 1 Sam. 10 and 15; 2 Kings 9; Matt. 6; Luke 4; James 5. The custom prevailed in the early Christian church of anointing at baptism, confirmation (chrisma), in time of sickness, and at ordination, and is still so retained in the Roman Catholic church. In the Anglican church anointing at ordination ceased in 1549; at baptism and the visitation of the sick in 1552; and at confirmation in 1662; and is retained only at a coronation of the sovereign. See Extreme Unction.

Anolis. Genus of lizards, also known as American chameleons. They are common in the W. Indies and neighbouring mainland, their native name in the Antilles being anoli. They are small, slender, and active, have large dewlaps and very brittle tails, and some can change colour. See Lizard.

Anomalistic Year (Gr. *an-*, not; *homalos*, even). The time of the earth's yearly movement round the sun reckoned from perihelion to perihelion. The earth moves with a different speed in its orbit at different times of the year, moving most swiftly at perihelion when nearest to the sun, and most slowly at aphelion when farthest away from it. The anomalistic year is, owing to the precession of the equinoxes, longer than the true or tropical year by about 25 min. The anomalistic month is, in an analogous way, referred to the return of the moon to perigee, that is, to her nearest approach to the earth.

Anomaly. Term used in English law. Where some suggested doctrine stands in contradiction to general legal principles it is anomalous; and this fact furnishes a powerful argument to show that it is not good law. Nevertheless, there are many legal anomalies. The word is also used where there are exceptional cases in which the general rules of law do not operate satisfactorily. Thus the ministry of Labour was given power to make orders for the purpose of removing anomalies arising in the operation of the Unemployment Insurance Acts, *e.g.* where persons were employed for part only of the year on seasonal work.

Anorthite. A silicate of calcium and aluminium, and an important member of the group of plagioclase feldspars. Like all the soda-lime feldspars, it crystallises in forms belonging to the triclinic

Gabriele d'Annunzio

system. It is a prime constituent of basalt and other igneous rocks. It also occurs as a product of thermal metamorphism of calcareous rocks, particularly brilliant small crystals being found in many of the blocks of calcareous rock ejected from the crater of Vesuvius.

Anorthoclase (Gr. *an-*, not, *orthos*, straight, *klasis*, fracture). Felspar similar to orthoclase, but with soda replacing potash in its composition. It may be regarded as an intimate mixture of the two feldspars, orthoclase and albite, as is suggested by its micro-structure. It is a constituent of many alkaline igneous rocks, more especially those allied to the nepheline-syenites.

Ansa (Lat. *ansa*, handle). The name given by early astronomers to Saturn's rings. The planet was supposed to resemble a vase, and the name was applied from the appearance of the appendages in certain positions of Saturn.

Ansaldo, GIOVANNI (b. 1895). Italian journalist and political writer. Born at Genoa, he was first known as leader-writer for the Genoa socialist paper *Il Lavoro*. But after being imprisoned by the fascist government for insulting the army, he became an ardent fascist, and from 1938 acquired notoriety as editor of Count Ciano's paper, *Il Telegrafo*, of Livorno, and was called "Mussolini's mouth-piece." On Italy's capitulation to the Allies, Sept., 1943, he ceased to be a prominent figure.

Ansbach or **ANSBACH**. Town of Bavaria, Germany. It stands on the Rezat, 27 m. by rly. S.W. of Nuremberg, has brewing, iron-founding and other industries, and trades in agricultural produce. As the residence of the margraves of Ansbach, it was a place of some importance; their palace, erected 1713-23 and now used for public offices, stands in a large park. Ansbach has several fine ancient churches and a good museum. The little principality of which it was the capital was long ruled by a branch of the Hohenzollern family, who obtained it in 1362 and called themselves margraves. It was sold to Prussia in 1791 and transferred to Bavaria in 1806. Pop. 21,923.

Ansbach, taken by Gen. Patch's U.S. 7th army, April 19, 1945, lay in the U.S. zone of occupation after the German surrender.

Anschluss (Ger., joining). Word used by German propagandists to describe the plan for union of Austria with Germany. This union was forbidden (save by the consent of the League of Nations)

in 1919 by the Treaty of St. Germain; but, after long agitation, and some support in Austria for the idea of the Anschluss Hitler sent his troops into Austria on March 11, 1938. The next day the Austrian government promulgated a law whereby the federal state of Austria was dissolved and Austria was declared a land of the German Reich, with the same status as Prussia, Bavaria, etc.

Ansell, JOHN (1874-1948). An English musician. Born in London, March 26, 1874, he studied at the Guildhall school of music, and was musical director at various London theatres from 1907 onwards, with an interval from 1926 to 1930 with the B.B.C. He composed comic operas, including *Violette*, 1918, and orchestral pieces of which the overture *Plymouth Hoe* is best known. He died Dec. 14, 1948.

Anselm (1033-1109). English saint, archbishop, and theologian. Born at Aosta, he entered in 1060

S. Anselm's seal
British Museum

the Benedictine abbey at Bec, and in 1078 was made abbot. On the death of Lanfranc, archbishop of Canterbury, in 1089 William Rufus appropriated the revenues of the see until 1093, when he appointed Anselm archbishop.

The king and Anselm were soon in collision. In 1094 William called upon the archbishop for a contribution to his war against Robert of Normandy, but he rejected the amount offered as insufficient. Anselm distributed his money and declined to make another offer. Anselm proposed to go to Pope Urban to obtain the archbishop's pallium. William asserted that neither pope nor antipope was to be recognized without his own authority. Anselm denied that the question was an open one and was supported by the barons. Though the Church denied that ecclesiastical appointments and lands were subject to the secular authority, William continued to extort money from the churchmen and called upon Anselm to furnish men for his Welsh war. When the bishop left England, the king again seized the revenues of Canterbury.

William was succeeded in 1100 by his brother Henry I, who at once sought a reconciliation with the exiled archbishop. Eventually, in 1105 a compromise was reached.

The insignia of ecclesiastical offices were to be bestowed only by spiritual authority; in return the prelates and abbots were to do homage for their temporalities. With the ratification of this settlement Anselm finally returned to England in 1107. He died April 21, 1109, and was canonised in 1494.

Anselm was the great theologian of his day, and is accounted one of the founders of medieval scholasticism by virtue of his endeavour to reconcile faith and reason. The most notable of his theological works is *Cur Deus Homo*, an exposition of the doctrine of the Incarnation.

Angarius or **ANSCHAR** (801-865). A French saint and prelate, often styled the Apostle of the North. A native of Picardy, he became a monk at Corvei. In 826 he was sent to preach the Gospel to the Danes. After two years' work in Denmark he went to Sweden and three years later was appointed archbishop of Hamburg. Returning to Scandinavia in 854, he founded churches in Slesvig and Sweden. Made the first archbishop of Bremen in 847, he built hospitals, ransomed captives, and endeavoured to mitigate the slave trade. He was the author of a *Life of S. Willehad* and a collection of prayers called *Pimenta*.

Anson, GEORGE ANSON, BARON (1697-1762). A British admiral. Born April 23, 1697, at Shugborough, Staffordshire, he entered the navy in 1712, became a captain 1724, and in 1739 on the outbreak of the war with Spain, was given command of a squadron of six ships in the Pacific. The expedition, which set out on Sept. 18, 1740, was ill-equipped and ill-manned, ships were lost off Cape Horn, and Anson's flagship,

Baron Anson of Soberton, British admiral

After Sir Joshua Reynolds

the Centurion, alone survived, returning by the Cape of Good Hope and reaching Portsmouth June 15, 1744, thus circumnavigating the globe. Spanish treasure to the value of £500,000 was a tangible result. Created rear-admiral of the blue in 1744, Anson's next triumph was the defeat of the French fleet off Cape Finisterre, May 3, 1747, in recognition of which he was raised to the peerage. He was first lord of the Admiralty from 1751, with a short interval, until his death at Moor Park, Herts. June 6, 1762.

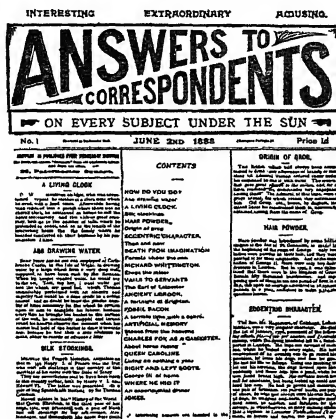

The many successes of the British navy were in great measure due to Anson's home administration. He was also responsible for the organization of the marines in their present form, and his reconstruction of the articles of war lasted until 1865. The well-known Voyage Round the World, edited by Anson's chaplain, Richard Walter, is still a popular work.

Anstey, F. Pen-name of Thomas Anstey Guthrie (1856-1934), British humorist and playwright. Born at Kensington, Aug. 8, 1856, and educated at Trinity Hall, Cambridge, he was called to the bar, but abandoned law for authorship. He made a name with *Vice Versa*, *A Lesson for Fathers*. 1882, following this with other humorous fantasies such as *The Giant's Robe*, 1883. *The Tinted Venus*, 1885: and *The Brass Bottle*, 1900. Much of his best work appeared in *Punch* after he had joined the regular staff of that periodical in 1895. *e.g.* *Voces Populi*, *Baboo Jabberjee*, *B.A.*, and *The Man from Blankley's*. The last-named enjoyed a vogue as a stage farce, as did stage versions of *Vice Versa* and *The Brass Bottle*. Guthrie died March 10, 1934, and an autobiography, *A Long Retrospect*, was published in 1936.

Anstruther. Original and still most widely used name of a harbour and fishing town of Fife, Scotland, the official name being the Royal Burgh of Killyrenny, Anstruther Easter, and Anstruther Wester, these burghs having been united 1929. It stands on the firth of Forth, 9 m. S.S.E. of St. Andrews and 19 m. E. of Thornton Junc. by L.N.E.R. It has a fine harbour, is the centre of the Fife fisheries, and engages in ship-building, fish-curing, and the manufacture of oilskin goods.

Answers. Weekly periodical started in 1888 by Alfred Harmsworth, later Viscount Northcliffe. As Answers to Correspondents it

appeared first on June 2, 1888, and soon attained an immense circulation. Competitions of various kinds, some of them with huge prizes attached, have appeared in its pages, and its contributors have included Thomas Hardy, J. K. Jerome, Sir A. Conan Doyle, John Strange Winter, and Sir Max

Answers. Reduced facsimile of front page of the first number of the popular weekly journal, issued June 2, 1888

Pemberton. It was the first of the papers issued by the firm which became later the largest publishers of the kind in the world—the Amalgamated Press (*q.v.*).

Ant. Group of insects belonging to the order Hymenoptera (membrane-winged), which includes the bees and wasps. They are distinguished by having the first segment of the abdomen reduced in size to a mere stalk to which the rest of the abdomen is attached. The stalk bears a hump or tubercle (sometimes two) on its upper surface which is not found in other Hymenoptera. The queen and males have wings, but the workers, who constitute the bulk of each ant community, are wingless. About 2,000 species are known, and they occur in nearly all parts of the world except the frozen regions.

Ants are regarded as the most intelligent of all insects, and the economy of their communities is even more highly developed than that of the hive bee. It is held by many naturalists that, among all the creatures they have studied, in the ant instinct reaches its highest level. There is, in fact, scarcely any form of mental activity, apart from abstract reasoning, that does not suggest itself in the proceedings of this insect. Indeed, Lord Avebury went so far as to say of the ants generally, that their mental powers differ not so

much in kind as in degree from those of men. Most remarkable in the ant is its power of memory. If an ant is taken from a nest, kept in captivity for several months, and then returned to the nest in company with a stranger, the latter will at once be killed and the former admitted into the home with every sign of recognition and pleasure. A colony of ants that have found a desirable cupboard, however far from their nest, during the summer, will come straight back to it after hibernation, showing that the fact of its existence and the route by which to reach it have both been remembered. Numerous experiments made by Lord Avebury and other investigators clearly establish the fact that ants are able to communicate with and impart information to one another. An ant that finds a scrap of food too large to carry away will hurry back to the nest and return with assistance. If one ant finds a large heap of food and another a small one, the former will bring a much more numerous company of assistants than the latter.

The practice of slave-keeping prevails among certain species. Raids are made on the nests of weaker species and, after battle, the pupae are carried off to the nest of the robbers, and the young ants reared and kept as workers for the community. One species of ant depends entirely upon slave labour for the work of the nest, and does nothing except occasionally carry out a slave raid on its weaker neighbours. The statement that ants keep cows is, in a sense, perfectly true. Ants are fond of feeding upon honeydew, a secretion of the aphides or plant lice, and commonly climb the stems of plants to obtain it. Certain species construct tunnels over the aphides or build walls of earth around them to prevent their escape. They convey the eggs of aphides, to their nests, carefully tend the young, and in all ways show themselves accomplished cow-keepers. Other insects, such as small beetles, are also kept by ants in their nests, and carefully fed. It is improbable that the ants keep them as mere pets, so it is assumed that they serve some purpose which observers have so far failed to establish.

Ants are of three castes, queens, males, and workers, the last being neuters or sterile females. So far as is known, caste is determined by the conditions under which the larvae are reared. At certain seasons the young queens and

Ant. 1. Female wood ant, before shedding her wings in the nuptial flight. 2. Winged male wood ant. 3. Slave raid by large red ants on the nest of a small black species with the object of carrying off the cocoons. 4. Wingless queen. 5. Typical worker, an imperfectly developed female. 6. Nest of wood ants, showing how cocoons are transported in the mandibles of a 'nurse' worker. 7. Black ants taking the body of a queen which has died outside back to the nest.

Photos 1-5, 7, H. Bastin; 6, Rev. S. N. Sedgwick.

the males take a nuptial flight. On their return the queens lose their wings and settle down to egg-laying. There are often several queens in a single nest, and individual queens have been known to live and continue laying eggs for fifteen years.

The eggs are carried about by the workers from one part of the nest to another according to the temperature, and undergo a continual process of licking. They hatch in about sixteen days in warm weather, and the young larvae are fed with half-digested food and cleaned by the workers. In due course they turn into pupae, usually but not always wrapped in white silken cocoons, forming the so-called ants' eggs. After some days they emerge as perfect insects, are carefully cleaned by the nurse ants, and then go about the work of the community. The nest consists of a series of passages and chambers constructed sometimes in the ground, sometimes in masses of fallen leaves and wood debris, or in the trunks of old trees. In the tropics the nests are often of great size and of most elaborate construction. A large community will often construct several nests in close proximity.

Ants will eat almost any kind of animal or vegetable matter of a nutritious character, sweet things being much preferred. The British species do not lay up a store for the winter, though this is done by some in hotter climates. During the winter they remain dormant.

Certain species of ants can sting, but all possess a poison bag charged with formic acid as a protection against enemies. In some species this poison is conveyed by the bite, while in others it can be ejected to a distance of two feet or more. A handkerchief lightly brushed over a colony of common wood ants will be found to be charged with acid.

In the tropics ants are so numerous, so pugnacious, and so destructive that they become a serious pest. The insects of the tropics that are commonly known as "white ants" do not, however, belong to the same order (Hymenoptera) as the true ants, but to a separate order known as Isoptera, comprehensively called termites and termite is the proper designation of an insect of this family.

To a certain extent ants are beneficial as scavengers, and sometimes serve a useful purpose in fertilising flowers. When they find

their way into houses, as they are fond of doing, they often become a source of annoyance and are usually difficult to expel. Powdered borax sprinkled about their haunts will discourage them, and they are said to dislike the odour of powdered cloves. When a cupboard is infested by them, a little turpentine injected into the crevices, or powdered camphor sprinkled about, will often get rid of them. See *Insects*; *Termites*; *consult* *Ants*, W. M. Wheeler, 1910; *The Ant*, E. Step, 1924; *British Ants*, H. Donisthorpe, 1927; *Guests of British Ants*, H. Donisthorpe, 1927. *Ants*, J. Huxley, 1935.

Antacid. Term occasionally used in medicine for a substance which neutralises acidity. The drug most frequently employed for this purpose is sodium bicarbonate, in doses of from 5 to 30 grains. It should be taken about half an hour after a meal, and is appropriate in those cases where pain is felt some hours after a meal and is associated with gaseous eructations. Less harmful antacids include aluminium hydroxide and magnesium trisilicate. Other magnesium preparations are also widely used.

Antaeus. In Greek mythology a Libyan giant, son of Poseidon and Gē (the earth). A mighty wrestler, a fall to the ground only brought him fresh strength from his mother earth. He was conquered by Hercules, who held him up in his arms out of reach of the earth and squeezed him to death.

Antalcidas (4th century B.C.). Spartan diplomatist and naval commander. The blockading of the Athenian fleet by Antalcidas compelled the Athenians to accept the terms known as the Peace of Antalcidas (387).

Antalya. Vilayet of Turkey, formerly known as Adalia (*q.v.*)

Antananarivo OR TANANARIVO (French *Tananarive*). Capital of Madagascar. Situated on a hill

its 14,000 m. of coastline are not completely known, and more than three-quarters of the inland area of 5,000,000 sq. m. have not been traversed by man. Graham Land is the land region farthest (1,750 m.) from the South Pole and also the nearest to one of the other continents, being less than 700 m. from South America. Exactly on the other side of Antarctica the long stretch of explored coast near Wilkes Land lies just beyond the Antarctic Circle, 1,600 odd miles from the Pole; Wilkes Land is about 1,700 m. from Tasmania. East of the Graham Land peninsula is the Weddell Sea, one of the great indentations into the outline of the continent; the other great bay is Ross Sea, fringed by

in King Edward Land, some 150 m. S.E. of the Bay of Whales. Inland of the mts., round the Pole itself, is a plateau where the overlying ice sheet is between 1,000 ft. and 2,000 ft. in thickness, and its surface is some 10,000 ft. above sea level. The extent of this plateau has still to be determined; it is not probable that it connects with King Edward Land. On the inland ice, slight depressions, in which move ice streams or false glaciers, have been discovered, and any explorer who approaches the Pole, as Shackleton intended, from a base on the Weddell Sea might be severely handicapped by the ice streams and mt. ranges which are known to exist between the Pole and the Weddell Sea.

Mt. Erebus on Ross Island, 13,000 ft., is an active volcano. the direction and shape of the clouds above the crater are a guide to the weather conditions in McMurdo Sound. Due S. the mts. which fringe the Beardmore Glacier rise to heights between 13,000 and 15,000 ft., and consist largely of a carboniferous formation in which seven seams of coal were detected in 1908. Most explorers in Antarctica have met blizzards of terrific intensity, and it is one of the tragedies of the South that so many have been detained for days together in camp by these fierce storms, unhappily in the case of Scott with serious loss of life. The continent contains the South Magnetic Pole, lying in Wilkes Land. The large Emperor penguin and the smaller penguins are familiar denizens of Ross Island.

Future work in determining the geography of the continent will depend upon pure scientific research on the one hand and on the other on commercial enterprise in an attempt to exploit the known coal deposits and to discover other deposits of minerals that may prove of commercial advantage. See Antarctic Exploration.

Antananarivo. The capital of Madagascar is a pleasant city with many modern thoroughfares such as the Avenue Fallières seen above

4,750 ft. above sea level, it is in the central plateau of the island, about 100 m. from the E. coast. Here are the administrative offices, Anglican and Roman Catholic cathedrals, numerous churches, the royal palaces, schools (including a school of native medicine), and colleges. It has several industrial establishments, including a meat-preserving factory, and is connected by rly. with Tamatave, the chief seaport. Pop. 126,515, including 7,376 Europeans.

British troops under the command of Gen. Platt entered Antananarivo on Sept. 23, 1942, four months after the occupation of Diego Suarez. The Vichy govt authorities offered only slight resistance, and on the occupation of the capital Gen. Platt declared Madagascar to be temporarily under British military jurisdiction.

Antarctica. The circumpolar continent of the South. This, the sixth of the great land masses of the world, is only slightly explored:

the Ross Ice Barrier, 840 m. from the Pole; at the N.W. corner of Ross Sea are the Balleny Islands, some 1,400 m. from the S. of New Zealand.

The coast consists chiefly of ice which changes in outline with the winds, currents, etc. This false coast forms, *e.g.* in the Ross Ice Barrier, cliffs which reach a height of 150 ft. The permanent land edge may be some miles behind the ice edge; the floating Ross Barrier, for instance, is fed by the glaciers some 400 to 500 m. from the open Ross Sea. Only about 4,000 m. are rock coast. Less than 10 m. from the land edge mts. frequently rise, as in South Victoria Land, to 13,000-15,000 ft., or 2,000-9,000 ft. above

the ice cap: these contain the true glaciers. Elsewhere the land rises less rapidly. Lt. Shirase, *e.g.*, attained a height of only 1,000 ft.

Antarctic and Arctic circles, showing how the sun's rays reach them in midsummer and midwinter

Antarctic Circle. Parallel of latitude drawn $23\frac{1}{2}^{\circ}$ (approximately) from the South Pole, *i.e.* in latitude $66\frac{1}{2}^{\circ}$ S.

ANTARCTIC EXPLORATION: 1773-1937

Admiral Lord Mountevans, K.C.B., D.S.O.

This account of the various Antarctic expeditions is by Captain Scott's successor as leader of the expedition of 1910-12. See also the articles on the various lands and seas of the Antarctic regions and those on Amundsen, Byrd, Scott, Shackleton, and other explorers

Exploration in the Antarctic may be said to date from Jan. 17, 1773, when Captain James Cook was the first man to cross the Antarctic Circle, in long. 38° E.; the farthest S. he then reached was $67^{\circ} 15'$ S. in long. $39^{\circ} 35'$ E. In the following Dec. he reached $67^{\circ} 31'$ S., and on Jan. 30, 1774, the ice prevented him from proceeding further S. than $71^{\circ} 10'$ S. in long. $106^{\circ} 54'$ W. The next great step forward occurred in 1819, when William Smith discovered what are now called the South Shetland Islands. In 1821 Bellingshausen, a Russian, discovered Peter I Island and Alexander I Land.

James Clark Ross in command of the Erebus and of a British Antarctic expedition; Commander F. R. M. Crozier was appointed to the Terror, the second ship of the expedition. In Jan., 1841, the two ships broke through the Antarctic ice pack and found open sea, and sailed onwards straight towards the S. magnetic pole, until stopped by land at Cape Adare with Mt. Sabine (10,000 ft.) in the distance. Ross discovered the Admiralty Mts., Possession Island, Coulman Island, Mt. Melbourne, Franklin Island, and finally the volcanic mts. Erebus and Terror, and Cape Crozier. East of the latter Ross

sailed along the edge of the Great Ice Barrier; he had made the first voyage beyond 75° S., and his name is attached to the great Antarctic bay which he discovered. The extent of South Victoria Land was first suggested by his discoveries. In each of the following seasons attempts were made by Ross to reach the high latitudes, the best effort being $71^{\circ} 30'$ S. in the Weddell Sea in March, 1843. For thirty years after this no great progress was made.

On Dec. 21, 1872, the Challenger expedition sailed for the S., and on Feb. 16, 1874, the Challenger was the first steam vessel to cross the Antarctic Circle. No land discoveries were made, but the examination of the sea floor showed the presence of fragments of glaciated gneiss, granite, quartzite, etc., indicating the existence of the ice-bound continent of Antarctica.

King Oscar II Land was discovered by Larsen in 1893, his ship, the Jason, being the second steamer to cross the Antarctic Circle. In 1897 the Belgica sailed from Antwerp, under Adrien de Gerlache, with a company which included Roald Amundsen, Dr. Cook, and Henryk Arctowski; the ship was gripped by the ice in March, 1898, at $71^{\circ} 30'$ S., and for the first time an exploration party spent the winter in the Antarctic. Borchgrevink led the Southern Cross expedition in 1898, and a party of ten wintered near Cape Adare on the mainland, while the ship went back to New Zealand; in 1900 the party were taken on board and the Southern Cross explored part of the Great Ice Barrier.

In 1901 R. F. Scott sailed in the Discovery and landed a party at

James Weddell, a Scotsman, reached $74^{\circ} 15'$ S. in 1823, in the great bay to which his name has been given. Enderby Land was seen in 1831 by Biscoe, a captain in the service of the Enderby Brothers; the next year Biscoe discovered Adelaide Island, the Biscoe Islands, and Graham Land. John Balleny was sent southwards by the same merchants and discovered the islands which bear his name in 1839. A French sailor, D'Urville, made Adélie Land in 1840, and in the same year Wilkes, of the U.S. Navy, sailed along the coast of Wilkes Land. Although later explorers have found open sea in some parts of the area where he claimed to have found land, yet his discovery went a considerable way towards developing the idea that there was a continuous land mass to the S. of Australia.

In 1839 the Admiralty placed

Antarctic Exploration. Scott's expedition, 1910-12. The crew of the Terra Nova in their cabin. Above: Members of the Amundsen expedition proving themselves at the South Pole, Dec., 1911

the foot of Mt. Terror on Ross Island on Jan. 22, 1902. The ship, before taking up her winter quarters, followed the Great Ice Barrier eastward and discovered King Edward VII Land. Winter was passed in McMurdo Sound, and next spring sledge journeys were made S. over the Barrier Ice. Scott led one party, which discovered Mt. Markham and reached $82^{\circ} 17' \text{ S.}$, 370 m. from the ship, without being able to gain land to the S. or to set foot on the great S. extension of South Victoria Land, visible to the W. of the Great Ice Barrier. The Discovery could not be freed from the ice during the summer, stores were obtained from the relief ship, the Morning, and a second winter came on. The next spring Scott led an expedition due W. over South

Antarctic Exploration. Captain Scott (left) and his companions discover the tent left at the South Pole by Amundsen, who had reached it 32 days earlier

Antarctic Exploration. Captain Scott's vessel, the Terra Nova, amid the polar ice

Victoria Land and penetrated 300 m. from the ship. The Discovery was set free from the ice, and with the relief ships Morning and Terra Nova left the Ross Sea.

Drygalski sailed in the Gauss in 1901 from Hamburg, discovered Kaiser Wilhelm II Land, and wintered in the neighbourhood of the Gaussberg. Otto Nordenskiöld, in the Antarctic, reached King Oscar II Land, where he wintered. W. S. Bruce sailed in the Scotia in 1902 from the Clyde, wintered at Laurie Island, and in 1904, after refitting at Buenos Aires, the Scotia reached $74^{\circ} 1' \text{ S.}$ at Coats Land on the shores of Weddell Sea. Mossman remained for meteorological work until 1905 on Laurie Island at the station which had been established there. Charcot, in the Français, made explorations in Palmer Archipelago in 1903-4-5.

On New Year's Day, 1908, Shackleton, who had been with Scott on his famous sledge journey

over the Barrier Ice, left New Zealand in the Nimrod, and wintered near Cape Royds, the Nimrod returning to New Zealand. Mt. Erebus was ascended in March. He set out polewards over the Barrier Ice in Oct., climbed the Beardmore Glacier in Dec., and reached $88^{\circ} 21' \text{ S.}$ on King Edward VII Plateau on Jan. 9, 1909, an advance on the previous farthest S. of some 420 m. A second sledge party, led by David, pushed N., ascended the plateau near Mt. Bellingshausen, and discovered the South Magnetic Pole in $72^{\circ} 25' \text{ S.}$, $155^{\circ} 16' \text{ E.}$, at an elevation of 7,260 ft., on Jan. 16, 1909. Charcot made a second Antarctic voyage in the Pourquoi-Pas? and explored Bellingshausen Sea in 1909-10. Charcot Land appears on the map to define his discoveries.

Roald Amundsen left Norway on the Fram in Aug., 1910, and reached the Bay of Whales on the edge of the Great Ice Barrier on Jan. 14, 1911; winter quarters were established, and the ship went back to Buenos Aires. The dash for the Pole began on Oct. 20. The inner edge of the Barrier Ice was reached on Nov. 17, at 85° S. , the Axel Heiberg glacier was climbed, and the Pole was reached on Dec. 16, 1911.

Scott left London on the Terra Nova on June 1, 1910, winter quarters being prepared in Jan., 1911, on Ross Island. Sledge parties set out S. in Oct., and on Jan. 4 Scott and four companions, Wilson, Bowers, Oates, and Evans, went onwards from lat. $87^{\circ} 35' \text{ S.}$ and reached the Pole on Jan. 18, 1912. On the journey back Evans

Antarctic Exploration. Sir Ernest Shackleton's ship, the Endurance, closely beset by the floating ice and drifting northwards in 1915

From "South," by Sir Ernest Shackleton. London: William Heinemann

and John Rymill (Great Britain) revolutionised the whole nature of Antarctic exploration. Great hopes were raised at the beginning of aeroplane flights in the Antarctic that fresh features would be noticed and photographic surveys used to chart mountain chains and tablelands, and, in fact, many inaccessible parts of the South Polar continent. These hopes were certainly realized.

Wilkins found a practicable landing-ground for aircraft on the shores of the great land-locked harbour of Deception Island. On Dec. 20, 1928, he flew south on the meridian of 61° W. across Graham Land to 64° S., and after ascending to 8,200 ft. was able to observe the mts., capes, and islands charted by the Scandinavians, Larsen and Nordenskjöld. He flew across the Antarctic Circle, and on to 71° 20' S., 64° 15' W., taking important photographs.

The following summer season Wilkins pursued his explorations by air from the Discovery Committee's ship William Scoresby. On Dec. 29, 1929, he flew from the edge of the pack-ice at 68° S., 75° W., over the Bellingshausen Sea down to Charcot Is., beyond 70° S. His final flight took him over pack-ice and bergs to 73° S.

Byrd's Expeditions

Richard E. Byrd had already gained a store of flying knowledge in the Arctic before he set out on his magnificent and costly South Polar enterprise. Money was no object; Byrd's two expeditionary ships *City of New York* and *Eleanor Bolling* alone cost the expedition nearly 300,000 dollars when fitted out and equipped. Byrd in his journal quotes the headlines of a contemporary newspaper: Million dollar expedition has magnificent equipment—costliest on record. By his results the expenditure was justified.

Establishing a base on the Great Ice Barrier, in the Bay of Whales, Jan., 1929, the *City of New York* landed the advance party with dogs, stores, and equipment. The *Bolling* came alongside three weeks later, and landed a Ford 3-engined aeroplane and three smaller machines. A landing ground was made, and Little America, Byrd's first-class base, was constructed. A base-laying flight was undertaken, and enough petrol and lubricating oil (with food, etc., for two months) placed in a depot on the Barrier at the foot of the Axel Heiberg Glacier, Queen Maud Range, to fly 500 m. home over the Barrier.

Ten important flights were made. The first extensive flight was to the E., Jan. 27, 1929, when Byrd, flying over King Edward VII Land, S. of Scott's Alexander Range, discovered a new range between 78° 14' S., 153° 15' W., and 77° 35' S., 153° 5' W., which he named Rockefeller Mts.

A second flight in the same direction was made on Feb. 18, and a further range was discovered E. of 150° W., running S.E. This range formed a boundary of some high land still farther E., which Byrd named Marie Byrd Land. This new land was again flown over and photographed for survey purposes. On March 7 Prof. Larry Gould flew to the Rockefeller Mts., landed in 78° 9' S., 154° 27' W., and camped for 15 days for a geological survey.

Various sledge journeys were undertaken after the winter, including one made by the geological party from the Axel Heiberg Glacier base, for the establishment of W/T communications and weather reports, upon which the success of the Polar flight was so largely to depend.

The flight to depot stores and fuel at the Barrier base was made on Nov. 18, 1929. New mountains were seen, and named Bob Range. Byrd, after experiencing the most hazardous adventures imaginable, gained excellent experience, which was to help him immensely in the Polar flight itself. This he undertook on Nov. 28 and 29. Accompanied by Balchen, June, and McKinley, he reached the plateau by way of Liv Glacier. Flying on S. he circled the S. Pole and returned to the Barrier by the Axel Heiberg Glacier. Valuable photographs were taken on this journey.

On Dec. 5 another important flight to the E. of King Edward's Land as far as the 145° meridian resulted in the discovery of a range of mountains running N. and S. in 144°. This was followed from 75° to 77½° S. It was the N. extension of the Marie Byrd Mountains, and showed that the coast trended N.E., then after a slight bend turned S.

Byrd's airmen made two further flights, surveying the Bay of Whales from the air, and Gould's party completed their sledging expedition to Queen Maud Mts. and climbed 6,500 ft. up Mt. Nansen. This remarkable expedition left for New Zealand and home in Feb., 1930.

Byrd returned to the Antarctic in 1933 to complete his work, using the *Bear* of Oakland and the

Jacob Ruppert. Echo sounding from the *Bear* showed depths of over 4,000 metres in 75° 20' S., 148° 15' W. Byrd had with him 55 men in what must now be called the village of Little America, where electric light and power, a broadcasting plant, tractors, aeroplanes, dog-teams, repair shops, a library and science hall, a dairy with three cows and a young bull-calf, and a mess hall seating 28 men, were to be found together with a variety of other structures and underground habitations. There was even a U.S. post office.

Tractor sledge parties established a depot 100 m. to the S. covering 50 m. a day, this being ten times as much as Scott's motor sledges could do.

A hut was erected 120 m. S. of Little America and furnished with supplies to enable one man to live through the winter. Byrd himself took on this duty, attending to the observations throughout this dark period. The minimum temperature experienced was 80° below zero. Byrd was in W/T communication with the base throughout his stay. When, in late winter, his messages became terse and irregular, a relief party set out to succour him. Arriving on Aug. 11, after a difficult journey, they found Byrd to be very weak and ill through poisoning from the fumes of his kerosene stove. For six weeks he had been too ill to prepare food, and he actually lived mainly in his sleeping bag in a half-frozen state, existing on the contents of tins stored under his bunk. Eventually he improved the ventilation, reduced the fumes, and made efficient use of his stove, after which his condition improved. During the whole of his stay until the arrival of the relief party he had managed to complete the meteorological and auroral observations. He was flown to the base Oct. 13, 1934.

Sledge journeys explored Marie Byrd Land and the Queen Maud Mts., using mainly dogs and tractors. The Queen Maud Range party were supported a month after their departure by a party in a Condor biplane. The party camped 182 nautical m. from the Pole, and discovered numerous new mountains and glaciers as well as beds of coal. Air flights made between Nov. 15 and 25 dispelled Byrd's belief that a transcontinental strait divided the Antarctic into two land-masses.

NORWEGIAN EXPEDITION, 1933-1934. Capt. Røiser-Larsen, who

Antarctic Exploration. The vast white south polar regions have an impressive beauty all their own. Here in the foreground are seen glacier and moraine, backed by towering cliffs, a high icy plateau, and mountains up to 15,000 ft.

Photo, Frank Debenham

ater commanded the Royal Norwegian Air Force in Great Britain during the Second Great War, set out in 1933 to explore the sector of the Antarctic between Enderby Land and Coates Land (longitude 50° E.— 30° W.). Enderby Land was sighted on Feb. 8, 1934, across an immense icefield, but two attempts to reach the land were frustrated by ice.

Riiser-Larsen used the Norwegian ships Thorshavn and Thorshammer, then engaged in whaling. He also worked from whale-catchers, which from their handiness and light draught made it possible for him to land 50 dogs and 100 cases of equipment on the ice, to the E. of Princess Ragnhild Land. But during establishment of the base, the ice broke up, and dogs and gear became isolated on small floes. On March 8 the situation had become so grave with the complete break-up of the ice that a wireless message was broadcast, and the whaler *Glove 5* rescued the party from an iceberg on Mar. 11. Without dogs or equipment it was impossible to continue the expedition.

CHRISTENSEN'S CRUISE, 1933-1934. Although the object of the Norwegian Lars Christensen's

cruise in the whaling factory ship Thorshavn was to inspect the whaling ships of his company, he carried out a good deal of exploratory work, including meteorological, hydrographical and geographical exploration. A *Cirrus-Avian* seaplane was carried, and two short flights were made in latitude 65° S. and longitude 66° E. A new line of coast was sighted stretching W. for 150 m., and named after Princess Astrid. Christensen completed the circumnavigation of the Antarctic continent, and reached lat. $71^{\circ} 44'$ S., long. $134^{\circ} 11'$ E. in the part of the Ross Sea which was at that time practically unexplored.

His cruise lasted 70 days, and during the latter part a new bank, named Sars Bank, was discovered S. of Cape Horn.

ELLSWORTH EXPEDITION, 1934-1935. The plan of the American, Lincoln Ellsworth, was to fly across the Antarctic from Weddell Sea to Ross Sea. Using a low-wing Northrop monoplane, he followed the east coast of Graham Land for 500 m., across a mountain range reaching to 12,000 ft. (the Eternity Range), then an even higher range, which he named the Sentinel Mts. A further chain was seen on the S.

horizon 100 m. away. Low visibility compelled him to land his machine after a flight lasting nearly 14 hours. Camp was made in $79^{\circ} 12'$ S., $104^{\circ} 10'$ W. at a height of 6,400 ft., on a plateau named after Ellsworth's flight companion, Hollick-Kenyon.

The two fliers took off again on Nov. 27, but were again forced down and remained in camp for three days. Starting at midnight, in improving weather conditions, they flew on for nearly an hour, but a severe blizzard forced them to land a third time and remain another three days in camp. On Dec. 4 another start was made, but poor visibility forced them to land in latitude $70^{\circ} 17'$ S., $153^{\circ} 16'$ W. On Dec. 5 they took off again, and flew over the plateau until within a few miles of Little America, their destination. Fuel ran out, and they made their last landing. After four days in camp they dragged a home-made sledge on to the abandoned huts of the Byrd expedition, where they arrived Dec. 15, to be rescued ultimately by *Discovery II*.

This magnificent flight of 2,340 m. was not only productive of topographical results, but set a new standard for Polar aviation,

in that four successful landings were made on the way for the purpose of fixing positions and avoiding bad weather.

BRITISH GRAHAM LAND EXPEDITION, 1934-1937. John Rymill, with the motor schooner *Penola*, worked in a previously unvisited part of Antarctica, and made two major discoveries: (1) that Graham Land is part of the Antarctic continent, not an archipelago as was previously believed; (2) that a great channel running approximately N. and S. separates Graham Land from Alexander Land. Rymill named this King George VI Sound. His little expedition carried a small aeroplane. With ship, sledge, and plane, its 16 members explored a great part of Antarctica and Sub-Antarctica between latitudes 63° and 73° S., and longitudes 55° and 75° W.

The charting of Antarctica was continued during the years of the Second Great War and after by representatives of the U.K., U.S.A., Norway, and Argentina. See N.V.

Antarctic Ocean. Name conveniently applied to the waters of the Atlantic, Pacific, and Indian Oceans which girdle the Antarctic continent. It is also frequently called the Southern Ocean. The arbitrary northern limit of the ocean is lat. 60° S., where it merges with the Southern Ocean. The chief seas of the Antarctic Ocean are the Weddell Sea, between Graham Land and Coats Land; and the Ross Sea, between South Victoria Land and King Edward VII Land. The name Bellingshausen Sea is used for the waters to the W. of Graham Land and N. of Charcot Land. Except in the vicinity of Graham Land there are few islands in the ocean; the chief groups are the South Shetlands, South Orkneys, and South Sandwich Is., N. of the Weddell Sea, and the Balleny Islands, N. of Victoria Land.

The Antarctic is the shallowest of all the oceans, the depths

averaging 2,000 fathoms or less. One of the few deeps over 3,000 fathoms is the Ross deep in the Biscoe Sea, the area of which has been greatly restricted by the researches of the Scotia. A submarine ridge, probably under 1,000 fathoms in depth, connects Graham Land with South America via the South Orkneys, the South Sandwich Is., and South Georgia. There are less certain indications of a submarine ridge between Victoria Land and Tasmania. Evidence is lacking of former land connexions between Antarctica and S. Africa, but that part of the Antarctic Ocean has been even less adequately explored than others. The bottom deposits are mainly blue mud of terrigenous origin carried seaward by glaciers from Antarctica, and towards the northern limits of the ocean a band of varying width of diatom ooze, derived from the siliceous tests of the chief organisms of the surface waters. Surface water temperatures are under 40° F. throughout the year, and frequently fall to 28° F. Bottom temperatures range about 31° F.

In winter the whole ocean is frozen or blocked with pack-ice: in summer the pack is loose, but invests most of the coasts. The salinity is low owing to the influx of fresh water from the wastage of icebergs and to the slight evaporation. The proportion of dissolved nitrogen and oxygen is high. Density, owing to the low temperatures, is relatively high. Near the continent there is a narrow zone of westerly current; this is turned northwards by the E. coast of Graham Land, and ultimately flows eastward. Surface organisms are mainly diatom and other lowly plants. In shallow water there is a wealth of invertebrate life; seaweeds are numerous. Fish are abundant, and various species of whales are found, source of a profitable industry. No trade routes touch the Antarctic Ocean, which is visited only by whalers and exploring vessels. See map p. 480.

Antares (Greek *anti*, compared with; *Arēs*, Mars). Giant red star at the heart of the Scorpion. known also as Alpha Scorpii. It is a double star of which the primary star, or sun, is of the first magnitude. It is one of the few stars of which the diameter can be directly measured by means of the stellar interferometer (*q.v.*). Its radius is 450 times that of the sun. See Scorpion.

Anteater. Popular name given to any of a number of almost unrelated animals united only by their common habit of eating ants or other insects. In all of them the teeth are reduced or absent, and because of this the name Edentata was used to denote most of them collectively. The group thus set up is a false one, and the use of the word should be discontinued. In Australia the spiny anteater (*Echidna*) is a relative of the duck-billed platypus, with which it makes up the group called the monotremes. These mammals

Anteater. One of the great anteaters, *Myrmecophaga jubata*, of S. America

lay eggs. Superficially *Echidna* resembles a hedgehog, but in detail it is very different. In Asia, and extending into Africa, is the scaly anteater, or pangolin (*Manis*), which looks like an animated fir-cone. Confined to Africa is the Cape anteater, or ant-bear, called in Dutch the aardvark (*Orycteropus*). It resembles a pig with a long tongue.

In S. America there is a group of animals fairly closely related to each other though remote from those already mentioned. They are sometimes called the hairy anteaters. They all have long thin tongues, and because of this the group is called the Vermilingua. The largest of them, about four feet long, is the great anteater (*Myrmecophaga*), found in tropical S. America. It is grey and brown in colour, with a bushy tail. It has powerful digging claws turned inwards, on which it walks awkwardly. The lesser anteater, or tamandua, is about half the size of the great, and has a tail like that of a rat. The two-toed, or pygmy anteater, about 6 ins long, lives in trees like a sloth, in the hottest parts of S. America. It is reddish in colour, with a prehensile tail. It eats the contents of the nests of insects built in trees, whereas most anteaters dig for food.

Antecedent (Latin *antecedens*, going before). In logic (1) that part of a conditional proposition on which the other depends (if A is, B is); (2) the first part of an enthymeme. The latter is a

syllogism containing two propositions: "I think, therefore I exist," where the major premise "all that thinks, exists" is omitted.

Antelope. A large group of mammals of the family Bovidae. The term is generally applied to all ruminants that cannot well be described as cattle, sheep, or goats. Most antelopes are graceful and deer-like, bearing horns which are usually long, cylindrical, more or less ringed, and more solid than those of oxen, sheep, or goats. Antelopes usually have glands beneath the eyes, which never occur in cattle and goats.

All the numerous species of antelope are confined to the Old World, the so-called prong-horn antelope of America belonging to a separate family. Most are natives of Africa, but a few are found in Syria, Arabia, India, and Tibet. In Europe they are represented by the chamois of the Alps, but it is a matter of dispute whether this animal should be included in the group. In size they range from the hartebeest, which stands about 5 ft. high at the withers, to the little duikers, some of which are no larger than a rabbit with long legs.

Antennae (Latin *antenna*, sail-yard). The horn-like feelers on the head of insects, crustaceans, and

Antelope. *Cobus defassa*, a species which is native to Africa
Photo, Gamber Bolton, F.Z.S.

certain other animals. Insects have only a single pair of antennae, but in crustaceans, such as the crab and lobster, the number is usually more. They are frequently of elaborate structure, as in some moths and gnats, and great care is taken to keep them clean.

In the larval stage of certain crustaceans the antennae are used as swimming organs, but in adults and in insects they evidently perform sensory functions. Lobsters and crabs feel their way and possibly discover their food by their means, while ants appear to recognize one another and possibly communicate by means of these

organs. Two ants when meeting usually touch each other's antennae, which, it is thought, perform olfactory functions.

Antequera. Town of Spain, in Malaga province. Called Antiquaria by the Romans, it is 28 m. N.N.W. of Malaga, on the Algeciras-Granada Rly., and has a Moorish castle, remains of the city wall, and an arch built partly of Roman masonry in 1595. It trades in wine, oil, and fruit, and manufactures woollens, paper, leather, sugar, and soap. Near the town, which was taken from the Moors in 1410, is one of the largest grave-mounds in Spain. Pop. 31,950.

Anthelion (Greek *anti*, against; *helios*, sun). Concentric rings, halo, or colourless mock sun, seen round the shadow of an observer, who, standing with his back to the sun, is gazing upon a moist surface, such as a cloud, fog, or dewy grass. The phenomenon is produced by diffraction of light, and is observed when the moist surface has the same angular altitude as the sun.

Anthelmintic (Gr. *anti*, against; *helmins*, worm). Medical term for a remedy which destroys or expels intestinal worms. Those preparations which destroy the parasites are known as vermicides, and those which expel them are

Antennae. Feelers of various insects (some highly magnified). 1. Antennae of the blow-fly. 2. Whip-like antennae of the hornet. 3. The long antenna of the North European timberman beetle. 4. Antennae of the male cockchafer. 5. Antenna of the silkworm moth. 6. Antenna of a butterfly. 7. Antennae of the male gnat. 8. Antenna of the male emperor moth. 9. Whip-like antennae of a worker wood ant. Great care is taken by insects to keep the antennae clean

called vermifuges (Lat. *vermis*, worm; *caedere*, to kill, and *fugare*, to put to flight).

Anthem (Greek *anti*, against, *phōnē*, sound or voice). Vocal music with sacred words, with or without accompaniment. In the Church of England its place is after the third collect of Morning or Evening Prayer. The early English anthems were contrapuntal in character, and their form grew out of the motet. In the first half of the 17th century solos began to be introduced, and were used with greater freedom later, together with duets, trios, and quartets, and free accompaniments were added for organ and other instruments by Humfrey, Purcell, and other composers of the post-Restoration period. Modern anthems are very free as to form; and they range from the calibre of a simple part-song to the dimensions of a sacred cantata. See National Anthems.

Anthology (Gr. *anthos*, flower, *legein*, to select). Collection of selected poems or prose extracts. The oldest collection is that generally known as the Greek Anthology. The first Greek Anthology was formed in the 1st century B.C. by Meleager; in the 10th century A.D. Constantine Cephalas made the great collection that has come down to us. In the 14th century a Byzantine monk, Maximus Planudes, expurgated and rearranged the Anthology, and his version was printed at Florence in 1494, and remained the only one known until Salmassius discovered the original text of Cephalas at Heidelberg early in the 17th century.

This great find, containing selections from 300 Greek poets, was removed to the Vatican Library after the Thirty Years' War, and to Paris after Napoleon's successes in Italy, but was returned to Rome in 1816. It was published by R. F. P. Brunck, 1772-6, and by F. C. W. Jacobs, 1794-1814, and has become the text drawn upon by all translators. There have been several translations into English of selections from the Greek Anthology. Latin anthologies, more or less on the Greek plan, were first compiled in the 16th century by Scaliger, 1573, and Pithoeus, 1590; one by A. Riese, 1869-70, contains nearly 1,000 poems. There are anthologies in many Oriental languages.

Anthologies of English poetry and prose are innumerable. A pioneer and classic volume was The Golden Treasury, compiled by F. T. Palgrave with Tennyson's

help in 1861 and expanded several times. Sir A. T. Quiller-Couch's Oxford Book of English Verse, 1900, was the first of a series of Oxford Books devoted to different periods and subjects, such as 16th century verse, Christian verse, or ballads. Robert Bridges' The Spirit of Man (verse and prose), 1916, was paralleled by Sir Bruce Richmond's The Pattern of Freedom, 1940. The Week-End Book, 1923, was typical of lighter anthologies. Van Doren's Anthology of World Poetry appeared in 1929. In 1934 Martin Armstrong and Rose Macaulay edited respectively collections of verse and prose on The Major Pleasures of Life and The Minor Pleasures of Life.

Plays, essays, letters, and short stories have also been collected and a modern feature has been the development of the specialised anthology devoted to a particular period (e.g. the best plays or short stories of a given year). The B.B.C. has adopted the term anthology for a short reading of miscellaneous verse or prose.

Anthony of PADUA (1195-1231). Franciscan saint and preacher. He was born at Lisbon of a noble family, and entered the Order of Friars Minor (Franciscans) at the age of 25, after he had been for 10 years an Augustinian monk, the greater part of that time being spent in prayer and study. He was appointed by S. Francis to instruct the order in theology, but he was chiefly famous as a preacher in S. France. He died at Vercelli, near Padua, June 13, 1231, and was canonised by Gregory IX in 1232. In the spirit of S. Francis, Anthony was the friend of all animals, not disdaining to preach to them on occasion. His help is popularly invoked for the recovery of lost goods, and his festival is kept in the Roman Catholic church on June 13. The great church of Sant' Antonio at Padua contains his tomb.

Anthony of THEBES (c. 251-356). Christian saint and hermit, generally known as S. Anthony the Great. Born at Koma in Upper Egypt of Christian parents, at an early age he devoted himself to a religious life. He sold his property, gave the proceeds to the poor, and retired to a remote part of the Nile valley, where he lived as a hermit until 305. By this time his fame had spread, and many wished to live under his guidance. He therefore established the first Christian monastery near Memphis, which ultimately comprised about 15,000 monks.

The community of S. Anthony included a number of hermitages, the monks living in solitude in scattered cells, but observing certain rules in common, and owing obedience to the superior. In extreme old age S. Anthony travelled to Alexandria to oppose the Arians, but returned to his hermitage to die. S. Anthony's temptations in the desert, the subject of more than one famous picture, and of a novel by Flaubert, have no foundation in history. The main facts of his life are derived from the writings of S. Athanasius. See Monasticism.

Anthony, C. L. Pseudonym used until 1935 by the British playwright Dodie Smith (q.v.).

Anthony Adverse. Historical novel by the American author Hervey Allen (q.v.), published 1933. It is a long romantic story of the life and loves of a founding, told with a wealth of accurate period detail and vividly depicted backgrounds changing from Europe under Bonaparte, first to the W. Indies, then to the slave-trading coast of W. Africa, and finally to the southern states of America in the early 19th century. It was filmed in 1936, with Fredric March in the name part.

Anthophyllite (Greek *anthos*, flower; *phyllon*, leaf). Member of the amphibole group of minerals. It is a non-aluminous magnesium silicate containing some iron. A more highly ferruginous variety containing alumina is known as gedrite. It differs from the other amphiboles in possessing orthorhombic symmetry, thus corresponding to hypersthene among the orthorhombic pyroxenes. It occurs only in metamorphic rocks, especially in those of Greenland.

Authorism (Gr. *anti*, against; *horos*, definition). In logic and rhetoric, a counter definition, one differing from and counter to that which has already been put forward. See Logic.

Anthozoa (Gr. *anthos*, flower; *zōon*, animal). A large class of marine organisms including corals and sea-anemones. See Coral Sea-anemone.

Anthracene (Gr. *anthrax*, coal). Solid hydrocarbon obtained from coal-tar, symbol $C_{14}H_{10}$. In distilling tar various products are obtained according to the temperature. Between 570° F. and 680° F. heavy oils come over, known as anthracene oil, which deposits crude anthracene on cooling. This is afterwards purified by pressure, solution in hot benzene, and crystallisation. Anthracene is em-

ployed for the manufacture of alizarin, which on this account is known as anthracene red.

Anthracite. Non-bituminous variety of coal containing a high percentage of carbon. Anthracite burns slowly with very little smoke or flame, and throws out great heat. The average composition is: fixed carbon, 80-90 p.c.; volatiles, 5-7 p.c.; ash, 3-8 p.c.; sulphur, 1-2 p.c. The calorific value is about 12,600-15,000 B.Th.U. per lb.; the density is 50 lb. per cubic foot. In commercial classification, anthracite is coal which contains less than 10 p.c. volatiles. "Anthracitic coal"—sometimes called semi-anthracite—contains 10-16 p.c. volatiles. Anthracite is found in great quantity in S. Wales, in Pennsylvania, and in Canada. See Coal.

Anthraquinone. Substance occurring in the form of yellow needles, symbol $C_{14}H_8O_2$. It is prepared by dissolving anthracene in glacial acetic acid and adding chromic anhydride to the hot solution. On adding water the anthraquinone formed is precipitated and further purified by sublimation. It is used in the manufacture of derivatives, mainly dyestuffs and intermediates, such as alizarin.

Anthrax (Greek *anthrax*, coal, carbuncle). Disease which affects mainly sheep and cattle, but also at times human beings. It is a widely distributed, specific, infectious disease caused by the presence of the *Bacillus anthracis* in the blood. The carnivora, especially the dog, are relatively immune from the disease.

In cattle, cases of anthrax usually occur singly. The disease is extremely rapid, death occurring in a few hours, with rapid decomposition, although cases of recovery are recorded. The temperature rises to a high point;

there is progressive weakness, with difficulty of breathing; and blood escapes from the external orifices. After death the spleen is found to be very much enlarged, hence the disease is sometimes termed splenic apoplexy in cattle. In Great Britain horses and sheep are rarely affected, the disease being more common in pigs.

Symptoms of Human Infection

Human beings usually become infected with anthrax as the result of their occupation, e.g. skinning and dressing carcasses, carrying hides, or manipulating wool. The symptoms in human beings vary with the way in which the infecting organisms find an entrance to the body. When infection is through a cut or injury on an exposed surface, such as the hands, arms, or face, the result is the formation of a malignant pustule somewhat resembling an angry carbuncle. The tissues in the immediate neighbourhood become congested, and then inflammation may spread to the lymphatic glands, with development of fever and signs of general illness. Sometimes the symptoms go no further and the pustule gradually heals, but more frequently the patient grows worse and dies from a generalised form of blood poisoning.

Among woolsorters and workers in hair, infection is more often due to inhaling the bacilli, the effect of which is to produce a rapid rise of temperature, pain in the chest, hurried breathing and cough and bronchitis. Extreme prostration follows, and death may occur within twenty-four hours. Infection may also occur through the stomach or intestines, from eating the flesh or drinking the milk of diseased animals. Bleeding from the mucous membranes may follow, and death occurs with symptoms of intense poisoning.

Treatment of malignant pustule consists of measures to prevent a general infection; the pustule is kept clean, but incision is not recommended. Large doses of anti-anthrax serum are given, sometimes in conjunction with arsenical compounds. It has also been shown that the bacillus of anthrax is sensitive to penicillin.

Prevention of the disease is exceedingly important, since infection is most often due to germs on pasture. The body of an animal which has died from anthrax should not be dragged over a field, but buried promptly, unopened, in a deep pit surrounded by quick-

lime; all straw and material known to have been in contact with the animal must be burned: yards should be thoroughly cleaned, and stalls and byres limewashed. Men who have handled the carcass must thoroughly disinfect their hands, and clothes soiled with blood, etc., must be steamed or boiled.

In Britain a case of anthrax occurring in a factory or workshop must be notified to the Home Office under the Factories Act, 1937. The Anthrax Prevention Act, 1919, prevents the importation into the U.K., either absolutely or except at specified ports and subject to conditions, of any goods infected or likely to be infected with anthrax. Persons who contracted anthrax while engaged in handling wool, hair, bristles, hides, or skins were entitled to compensation under the Workmen's Compensation Acts, anthrax being a scheduled disease under these Acts.

Anthropogeography (Gr. *anthrōpos*, man; *geographia*, geography). The study of physical environment as a factor in the history of mankind. It is thus complementary to the factors of race or ethnology and social environment or cultural anthropology. The convenience of the term, first introduced by Friedrich Ratzel in 1882, was recognized by the Royal Geographical Society.

More comprehensive than political or economic geography, which are special aspects of it, anthropogeography is concerned with the terrestrial influences underlying human migration in all ages and the variation of man's physical and mental characters. With the aid of physiography it studies differences of stature, pigmentation, muscular energy, viability, capacity for progress, and mental retardation. Not merely descriptive, it seeks to establish the principles that caused early man to cling to river-valleys, to pass from primeval hunting to pastoral nomadism upon the wide grasslands of temperate Eurasia, to develop the arts of life in the settled agriculture and primitive navigation of the Mediterranean basin, and to emerge from these nurseries of civilization to an adolescence of world-conquest through the medium of ocean travel. It accounts for the isolation of archaic types of head-form, culture, and speech in remote mountain fastnesses or distant islands. It discusses such social institutions as polyandry and infanticide in relation to food scarcity, and discerns

Anthozoa. 1. *Montipora* (coral).
2. *Coenopissammia Willeyi* (coral).
3. *Viduata* (sea-anemone). 4. *Actinobola Dianthus* (sea-anemone).
5. *Miniata* (sea-anemone)

the reason for terrace cultivation in restricted areas. It follows the path of trade along the roads of economic exchange predestined by the natural form of the land. See Anthropology; Ethnology.

Anthropoid Apes (*Anthropomorpha*). Those animals that come nearest to man in form and structure, and are included in the same natural order (Primates). They are without tails, have a single curve to the backbone, and the breast bone (*sternum*) is broad and flat as in man. The fore-limbs end in hands that are larger than the feet; and the thumb and great toe are both set at an angle to the other digits, and are opposable to them. The skull develops great bony ridges, to which are attached the powerful muscles that operate the jaws. The muzzle projects considerably, and the teeth agree in number and arrangement with those of man, but the canines attain a large size, especially in the male.

Unlike the monkeys, anthropoid apes have no cheek pouches. They can stand in a semi-erect atti-

tude, and when in this position the superior length of the arms causes the hands to reach below the knees—in the oranges as low as the ankles. On the ground they advance on all fours and on the doubled hand, only standing up to defend themselves. They live among the leafy branches of trees, feeding upon fruit and leaves, and building temporary platforms or nests of boughs and leaves on which to sleep. The group includes the gibbons (*Hyllobates*), the oranges (*Pithecius*), and the chimpanzies and gorillas (*Troglodytes*). They are natives of the Old World—Africa, Asia, and the islands of the E. Indies. See Monkey; Primates.

Anthropological Institute, ROYAL. A British learned society. It is a union of the Ethnological Society of London, founded 1843, and the Anthropological Society, founded 1863. They were amalgamated in 1870 and given the royal title in 1907. The offices are at 21, Bedford Square, London, W.C., where there is a library for the use of fellows (F.R.A.I.).

ANTHROPOLOGY: THE STUDY OF MAN

E. G. Harmer, Writer on Archaeology

This article deals with the growth of man's activities in what are called prehistoric times. The companion article on Man should be referred to for the development or evolution of man himself. See also Bronze Age; Family; Society; Totemism, etc.

The term anthropology (Greek *anthropos*, man; *logos*, science) was used by Otto Casmann, 1594–5, to denote the mutual relationship of human physiology and human psychology, and it bore that meaning until it acquired a wider one under the impulse given by the appearance of Darwin's *Origin of Species* in 1859.

Anthropology still recognizes, although in a different form, the duality involved in the earliest use of the word. Accordingly its two main divisions are (1) physical, the "natural history" of the human animal; (2) cultural, the study of civilization. These terms are to be preferred, because of their precision, to somatology, a name given to it by Bentham, or sociology, which was used by Herbert Spencer and Comte.

PHYSICAL ANTHROPOLOGY. The student begins by considering the place occupied by man in the animal kingdom. The comparative zoologist points out the similarity of man's physical structure to that of the anthropoid or man-like Primates, and endeavours to trace the course of human evolution.

The oldest fossil bones for which any human characters have been claimed are those of *Sivapithecus indicus*, discovered by Dr. Guy

Pilgrim in 1915 in a zone corresponding to the Middle Miocene of Europe. That in so remote a geological epoch tropical forests may have harboured erect arboreal anthropoids is not in dispute. This is not to say, however, that they had advanced beyond the quadrumanous stage, with all four limbs used as prehensile hands. The earliest known form in which the lower limbs were adapted for walking on the ground is the Java ape-man, *Pithecanthropus erectus*, of the Pliocene age. To that age, therefore, the origin of two-handed, two-footed man is, on our present evidence, to be attributed. That there were Miocene precursors is a necessary inference, but they were probably essentially pre-human.

The substantial period of time implied in these processes is the affair of geology, and still matter for inquiry, but it is sufficient to say that the totality of human history is in any event measurable in myriads of years.

ORIGIN AND DISTRIBUTION OF RACES. Exact methods of measuring the human body elicit more or less constant characters in mankind when grouped into races. But no ethnic classification yet devised completely accounts for

the facts. The primary races developed their distinctive characters in wide isolated "areas of characterisation" in a remote past. Since that time racial intermingling has been active, although new racial types are not necessarily due more to admixture than to environment. The study of racial origins, and of the distribution of mankind over the globe is the task of ethnology.

UNITY OF THE SPECIES. Of primary interest is the question, do all modern types of man descend from a single ancestral form, or did two or more branches from the anthropoid stem lead to the independent development of the main ethnic stocks? A two-fold ancestry was urged in 1909 by Professor Klaatsch, who derived Neanderthal man from an African stem whence the gorilla also sprang, and Aurignacian man from an Asiatic stem which also yielded the orang-utan. The suggestion met with disfavour, and the monogenist theory holds the field so far as modern man is concerned.

One Human Species

Existing races have never passed beyond the stage of inherited "breeds" or zoological "varieties." There is to-day but one human species, known as *Homo sapiens* (Lat., man the knowing). The biological test is conclusive—any interracial union produces fertile offspring. All breeds, however, are not equally educable, because mental culture is conditioned by brain development. The repugnance of the highest races for mating with the lowest is based upon a reasoned psychology. The consideration of this and cognate themes belongs to Eugenics.

CULTURAL ANTHROPOLOGY: MATERIAL FOR STUDY. The anthropologist as such puts forward no explanation of the problems of life, mind, and soul. They are, in part, the affair of psychology. His task is limited to observing their manifestations in human culture. In the absolute sense uncultured man would not be man at all. The cultural history of mankind begins at the same moment as the physical. Like the physical, the cultural might be studied with reference to its origin and antiquity, its racial distribution, and its witness to the unity of the human mind.

Man may be said to have become differentiated from the brute creation—with its unthinking subservience to environment—when first brain and hand began to react upon each other. His erect posture was inherited from arboreal precursors; when he descended to the ground and walked

firmly upon the earth, the hands were released for manual uses, and man the tool-maker began. Hence all culture has sprung. This is the main preoccupation of anthropology, because culture in all its forms belongs to man alone. The work of man's hands is embodied in technology and the arts, including the technological fossils revealed by archaeology. His social institutions, having their visible expression in customs, pertain to social anthropology.

FOOD QUEST. At the ultimate base of human action lies the quest for food. That primeval man limited his dietary to fruits and roots cannot be proved by direct evidence. When, however, he began to hunt—on land and water—for animal food, he called in the aid of sticks and stones. Amid the profusion of a tropical jungle there was lacking the incentive to community of action, from which society originated. This was to come when man was confronted by the problems that beset his path as he began to go about the world. Thus by following the herds of food-animals in their daily and seasonal wanderings—which ultimately led him to Europe—he embarked upon a nomadic life that endowed him with new powers of intelligence and resource. This factor of the physical environment is the concern of anthropogeography, the study of geographic control.

FAMILY LIFE. In that primeval age which we might call pre-archaeologic family life was already foreshadowed. The theory of a primal promiscuity of intercourse does not accord with the implications of arboreal life, not to speak of anthropoid usage. The restrictions entailed upon childbearing by considerations of food and shelter fostered maternal care. There was correspondingly imposed an ever-increasing need for the physical and mental nurture which we call education.

Birth of Speech

The modification of the ape-like jaw proceeded side by side with the introduction of tools in connexion with food, and with the need for eating sparingly and often, due to the position of the abdomen upon a bipedal support. This made it possible for the organs connected with the mouth to utter articulate sounds. Under the guiding intelligence of the brain these came to possess a fixed communicable meaning, and so gave birth to speech, aided—not necessarily preceded—by gesture. The priceless gift of language was not only a social but also a mental endowment, because it furnished man with the means

of logical thought. The comparison of language-forms belongs to philology, which comes within the purview of ethnology in connexion with physical evidence of racial relationships. Language, however, is not in itself a criterion of race. Any babe may learn any language, and be ignorant of its parental speech. Language is not heritable.

USEFUL ARTS. When prehistoric archaeology reveals the oldest extant relics of man's handiwork it offers the first tangible evidence of cultural progress. The record is imperfect, because only those objects remain whose material has withstood the ravages of time. Man embarked upon his career as a tool-maker by employing for the fabrication of his implements not only wood and stone, but also bone and shell.

Discovery of Fire-Making

During the Stone Age, if not before, he acquired the power of producing fire, one of the mightiest events in his history. In that age, too, his inventiveness was displayed in such forms as the spear, the detachable harpoon, the poisoned arrow. He introduced personal adornment as a social no less than a magical device. In tropical lands clothing may have been, at first a contrivance for attaching to the person the tool equipment. The protective use of leaves and skins, out of which modesty arose, was also an early institution. When the forest was exchanged, as in palaeolithic Europe, for river valleys and open plains, the camp stations were but seasonal and transient. There is, however, pictorial evidence for the early invention both of the hut and of the tent.

DOMESTICATION. Towards the close of the older Stone Age some progress was made in turning to account the animal herds amid which man lived. This may have been at first the unforeseen and unintended result of the segregation of selected animals for religious purposes. The dog may have domesticated itself by living in companionship with man under conditions of mutual toleration and helpfulness. The taming of other animals for flesh, milk, and locomotion slowly followed. It was because this task was accomplished mainly in the Eurasian grasslands that their peoples were able to impose their wills upon the hunting communities of W. Europe.

The human family was now able to enter upon a settled existence, and permanent homesteads arose. Around these the women collected their household stuff and their stores of edible grasses and roots. Experience gradually showed that

the cereal and fruit supply could be ensured and increased by planting. The domestication of plants meant also the domestication of human life. It turned the hunter into a farmer, and for the first time man had leisure for reflection.

Many Inventions

A vigorous crop of inventions now sprang up, in an age that witnessed the adolescence of culture. The word culture itself denotes in Latin the tillage of the soil. The grinding of corn introduced the staff of life. The digging-stick, still used in Australia, became in tropical Africa the hoe, and in Europe the plough, which in its turn led to the wheeled cart. The use of natural objects (shells, nuts, gourds) for utensils was followed by the invention of basketry, which developed in two directions. From the plaiting of bark and rushes it advanced to weaving. The encasement of the basket in clay for cooking food was one of the contrivances that gave rise to pottery. Lastly, the discovery of the art of smelting and metal-working ushered in the modern world.

The practice of pasturage and agriculture brought in its train a new order of social ideas. It led to food-storage, the parent of capital. The tribal areas of the hunter (Australians, Eskimo) developed into communal, and that into private, property in land, the outcome of which was inheritance, individualism, and eventually kingship. Land cultivation, too, involved land measurement, the occupation of river valleys meant irrigation, and this demanded water engineering, while the rise of seafaring gave birth to navigation. Along these paths knowledge travelled to its ultimate goal in geometry, mechanics, and astronomy.

It is by such steps as these—animal- and plant-taming, the byre and the barn, inheritance, leisure, invention, ordered knowledge—with their wealth of meaning for the intellectual life, that the unfolding of culture is to be traced. Invention, the child of necessity, was the mother of civilization.

ARTS OF EXPRESSION. Reference has been made to the early place held in human society by personal ornament. The use of masks in palaeolithic dancing suggests a magico-religious origin. Out of the forms of art—dancing, music, drama, picture, ornament—devised for ceremonial uses, grew the arts of pleasure. Primitive music has not yet been adequately studied, but much attention has been given to the pictorial and decorative elements in the lower cultures.

The table illustrates the improvements of the weapons made in successive periods and the changing types of human beings, as these have been such, remains as have been discovered. The periods covered by this plan bring the story of man to the Azilian time, which is regarded as the Age was merging in the Neolithic Age—the age of polished stone weapons, of cromlech and stone circle builders and pile dwellers.

ANTHROPOLOGY **TABLE ILLUSTRATING CHARACTERISTICS OF THE EARLY EPOCHS IN THE GROWTH OF PREHISTORIC MAN**

Anthropology. Prehistoric man, as he is believed to have been from the evidence of the remains found at Galley Hill, near Northfleet, Kent

Drawing by A. Forester

When these arts were employed as a means of record and communication, they led to such inventions as picture-writing and such collateral devices as drum-language, wampum, and the quipu.

DISPERSAL OF CULTURE. To the ethnographer belongs the systematic description of the cultures of races and tribes one by one, and the collection and study of the objects and customs wherein their arts and institutions find expression. Analogies drawn from living savage peoples are of service in following out the unfolding of civilization. Nowhere, however, does man live to-day on the cultural horizon of palaeolithic Europe, unchanged and unchanging. The lowest races possess the same long ancestral history as ourselves. They have not developed to the same extent, or in the same way, because of the factors in life and environment that make for permanence rather than progress.

The modern savage may be primitive; he is not primeval.

Dissemination of Ideas

In this connexion the question arises, how far are human inventions of single or multiple origin? For this line of research their geographical distribution is an important guide. Constant as racial migration has been, cultural drift—the dissemination of ideas—has been equally potent. Even a single migrant may exercise profound cultural influence upon a distant people. It is in this direction that the anthropologist looks when seeking to explain such problems as the resemblances between the civilizations of Mexico and Peru and that of the Nile valley. While contact may thus lead to new outbursts of art and custom, prolonged isolation tends to stagnation and eventual decay.

SOCIAL INSTITUTIONS. Man is the child of his social no less than of his material environment. Even

in the food quest every act is governed by his obligations to tribal customs and his attitude towards the unseen. The primary social group is sometimes defined as a food-group. It is more than this, because of the factor of sex. The family—whether it developed early into some form of group-marriage or not—is the foundation of the tribe. Its implications may be followed under such related themes as Brotherhood, Caste, Consanguinity, Endogamy, Exogamy, Kinship, Phratry, Totem. The story is profoundly affected by the problems of mother-right and patriarchal rule.

History Illustrated in Weapons

These manifold institutions are traceable in action under such aspects as Betrothal Customs, Couvade, Marriage Customs and Wedding Rites. Light is thrown upon them also by Birth Customs, Naming Customs, Infanticide, and the group of usages pertaining to childhood and adolescence summarised under Circumcision, Mutilation Customs, Tattooing, Toys. These lead up to the higher education of savage life which is expressed in Initiation Customs. External relationships are implied in the developments of Cannibalism, Exophagy, Head-hunting, Scalping. The history of war is illustrated in weapons, and is closely bound up with the institution of slavery. The forms of customary law, modified by ceremonial law, developed into the law and justice of the civilized state. So, too, anthropology has its interest in, and makes its contribution to, the history of commerce and economics, medicine and surgery, politics and statecraft, ethics and moral science.

THE SUPERNATURAL. In the presence of death the emotional life finds itself brought most closely into contact with the supernatural. It is of profound significance that the oldest human interments attest the recognition of a life beyond the grave. On the material side this theme may be studied in such articles as Barrow, Cinerary Urns, Mummy, Pyramid, Stone Monuments. The institutions themselves are dealt with under Burial and Death Customs, Mourning Customs, Cremation, Urn-Burial, Funeral Rites.

The framework of all primitive culture is that belief in spiritual beings which is called animism, and—in association with animatism—is an explanation of nature no less than of the supernatural. This attitude of the primitive mind finds expression in such forms as Ancestor-, Nature-, Spirit-worship; Mana, Taboo; Fetishism,

Medicine-men, Shamanism ; Exorcism ; Human Sacrifice, Foundation Sacrifices ; and Magic.

In one direction these studies lead on to further developments such as Astrology ; Creation Legends, Deluge Legends, Folk-lore, Mythology. In the other they stand on the threshold of man's recognition of God enshrined in the world's great religions, and crowned by the supreme faith of Christendom.

NATIONAL RECOGNITION. Apart from its outstanding interest as the study that coordinates all human learning, anthropology is of immense importance in the practical life of the British Empire. There are chairs of social anthropology in Oxford and Liverpool, of ethnology in Cambridge and London. The Natural History Museum at South Kensington contains a small and inadequate department of physical anthropology. The British Museum possesses at Bloomsbury, besides its prehistoric collections, an ethnographical gallery which urgently needs expansion before the opportunity for its completion is irrevocably gone. The Hunterian Museum in the Royal College of Surgeons, London, was unfortunately two-thirds destroyed in the Second Great War.

Anthropometry (Gr. *anthropos*, man ; *metron*, measure). Measurement of the human body. In modern research it is a branch of biometrics, which embraces the measurement of mental as well as physical characters. Measurements derived from every part of the bony skeleton are utilised by anatomists for comparison with similar data of the anthropoid apes in elucidating the physical evolution of mankind.

Anthropometric methods are employed by ethnologists for the comparison and classification of races. The principal instrument employed is called an anthropometer. Thus racial stature varies

Anti-Aircraft. Part of a battery of 4·5-inch A.A. guns which helped to defend London against enemy bombers in the Second Great War

from about 5 ft. 10½ ins. among the male Patagonians to 4 ft. 1 in. among the male Akka. Subordinate to this character is limb-length, and in some cases the stature of prehistoric man has been deduced from his fossil thigh-bones. Other measurable criteria are hair-colour, hair-texture, and skin-colour.

But the most important branch of this science is the measurement of the head and its organs, especially the skull. This includes: the relation of head-length to head breadth and the classification of races into long-heads, medium-heads, and short- or round-heads ; the projection of the upper jaw ; the shape of the nose ; eye-colour ; the form of the ear, the chin, the teeth. In regard to the capacity of the brain-cavity, it is now realized that large skulls are consistent with low mental development.

In 1883 the French government adopted Alphonse Bertillon's system of measurements for the identification of criminals. But

this "criminal anthropometry" has been generally abandoned in favour of the finger-print system. See Finger Print

Anthropomorphism (Greek, *anthropos*, man ; *morphē*, form). Term used for the ascription to God of a human form and qualities. Anthropomorphism represents a definite stage in the evolution of religion. In the earlier phases of religious thought, the gods were construed in terms of the natural world, and the great forces of nature, e.g. the sun, the moon, the winds, the rainstorm, etc., were deified. This worship is sometimes called the zoomorphic stage.

It was a great advance when, owing to the influence of Babylonia, Egypt, and especially Greece, the gods were humanised and interpreted in terms of man's personality. The gods of ancient Greece represent anthropomorphism in its most pronounced form. They are men and women "writ large" and endowed with human passions

and qualities on a grander scale. The Iliad of Homer may be described as the Bible of anthropomorphism. But though anthropomorphism is an intermediate stage in the development of religion, it is never its final goal. Even in Greece itself it was superseded by a far nobler conception of God, in the philosophy of Plato. It is not surprising, therefore, that we find anthropomorphic elements in the O.T., which speaks of God as sitting, standing, walking, seeing, hearing, and speaking, and alludes to His eyes, ears, and feet. Such statements must be regarded as a survival of a primitive type of faith, and we must not forget the great protests against anthropomorphism in Psalm 50 ("Thou thoughtest that I was altogether such an one as thyself") and Isaiah 40.

In its crudest forms anthropomorphism merits all the criticism which has been brought against it. "The lions," says Xenocrates, "if they could have pictured a God would have fashioned him like a lion, the horses like a horse, the oxen like an ox." "If a circle could think," writes Spinoza, "its God would take the form of a glorified circle." The case against anthropomorphism goes too far when Theodore Parker forbids us to say God "thinks" and Matthew Arnold will not allow us to hold that He either "thinks or loves." The dehumanisation of God in some forms of modern philosophy is, indeed, a recoil to the other extreme. There is a true as well as a false form of anthropomorphism. If man was created in the image of God, there must, necessarily, be points of contact and resemblance between the nature of God and the nature of man; and if this is granted, some form of anthropomorphism is inevitable. See God : Religion.

Anthrophophagi (Gr. *anthrōpos*, man; *phagein*, to eat). Tribes of man-eaters described by Pliny and others as dwelling N.E. of the Caspian. Of nomadic habit, they observed the custom of eating the flesh of aged parents. This honorific form of cannibalism, designed to preserve the ancestral soul from decay, survived in Eastern Asia until recent times.

Anti. Tribe of South American Indian forest dwellers E. of the Andes in S. Peru. They and the Chunchos are a warlike outpost of the Guiana Arawak. The Incas established them in Antisuyu. Of fine physique, they wear woven ponchos, are skilled in metal work, and practise simple agriculture.

ANTI-AIRCRAFT COMMAND, 1939-45

Gen. Sir Frederick Pile, G.C.B., D.S.O.

The G.O.C.-in-C. of Anti-Aircraft Command throughout the Second Great War here records the growth of his Command and the notable part it played in the defence of Great Britain. See also Air Defence; Balloon Defence; Barrage Balloon; Bofors Gun; Bren Gun; Flying Bomb, etc

Anti-Aircraft Command, a unit of the British army, was formed on April 1, 1939, and then consisted of five divisions. Lt.-Gen. A. Brooke, afterwards

Badge of the
A.A. Command

F.-M. Lord Alanbrooke, was appointed C.-in-C. At that date none of the divisions was up to strength, although, thanks to the Militia

Act, recruits were rapidly being enrolled. Two more divisions were in process of being formed. The seven divisions were scheduled to cover the defence of the whole of the United Kingdom, including Orkney and Shetland. In July, 1939, General Brooke handed over to General Pile, who remained G.O.C.-in-C. till the end of the war in Europe.

In the previous year, at the time of the Munich crisis (*q.v.*), the A.A. defences of the country, which then consisted of two divisions, went into action in preparation for the defence of London. At the time the Second Great War broke out, in Sept., 1939, the Command was equipped with 695 guns of all calibres and 2,700 searchlights. The guns were mostly of the old 3-in. type, equipped with Vickers predictor and No. 2 height-finder. The troops were Territorials—very keen men, but suffering from a very limited amount of training and shortage of equipment. The winter of 1939-40 was spent by both gun and searchlight crews in training. The searchlight crews, who were equipped with the 90-c.m. lamp and sound locator, were exercised nightly, but there was a shortage of aircraft for co-operation and a good deal of their work had to be make-believe. Serious air attacks on Great Britain were not made until July, 1940, when the Germans began their attempt to wear down the morale of the British people by sending over nightly about 70 planes directed against centres of industry. (See Air Raids).

During Aug. and Sept., 1940, A.A. guns destroyed 253 enemy planes by day. The actual rounds per "bird" were somewhat fewer than the theoretical

figures which had been worked out by the scientists, so that it may fairly be assumed that the training had reached a high standard by this time.

After Sept. 7, when London was very heavily attacked both by day and by night, it became clear that the enemy's main attack was to be directed on the capital. At that time A.A. Command had approximately 1,000 guns and 3,000 searchlights deployed all over the country, London being defended by 92 heavy guns and 34 light guns. After Sept. 7 guns from all over Great Britain were hurried to London; and on Sept. 11 Londoners rejoiced to hear the tremendous barrage which greeted the German raiders. The technique of engaging the unseen target was still in its infancy. Radar equipment was not designed for such a purpose, and the shooting on that night of Sept. 11 can hardly be described as accurate; but it certainly had a deterrent effect on the enemy, as well as a most heartening effect on Londoners.

During the winter of 1940-41 the night battles continued, at first directed on London and later on all the main centres in the country. New gunnery techniques were devised, and, as new radar equipment became available, shooting improved greatly. In the first six months of the night "blitz" over 80 p.c. of all planes destroyed at night were shot down by A.A. guns, fighters and balloons sharing the remainder between them.

The searchlights were still equipped with sound locators. As the enemy appreciated the danger from the night fighter and the searchlight, he flew higher and higher until it became almost impossible for a searchlight to illuminate the plane. All sorts of new equipment were devised for improving the accuracy of the searchlight. This equipment first of all depended on sound, but later used radar technique, and finally the searchlights became so accurate that it was difficult for any plane to fly through a searchlight belt without being picked up. Searchlights played a tremendously important part in the night defence of the country. At their peak nearly 7,000 were deployed, forming a carpet all over Great Britain, except for the mountainous regions. As man-power became more and more limited, the searchlights were reduced in numbers and eventually were deployed in two comparatively narrow belts—one in the S. of England and one running through the eastern counties. By this time, however, the heavy raids on England had ceased.

The man-power shortage also affected the guns, and led to the introduction first of women and later Home Guard in batteries.

Eventually there were 200 mixed batteries. The number of A.T.S. employed reached 74,000, and Home Guard 142,000.

Early in the war scientists were appointed to the Command H.Q. From small beginnings the numbers grew, until eventually the operation research group had representatives on almost every battery site, and a large staff continually dealt with the new problems arising from new enemy tactics and from the new equipment which was being rapidly produced. The success of the Command was perhaps more due to this band of scientists than to any one other factor.

Radar was gradually applied to the control of both heavy and light guns, as well as to that of searchlights, and achieved a high degree of accuracy. The guns themselves developed both in size and in velocity. The 3.7-in. gun was the main heavy A.A. armament during the war, but it was reinforced by a high velocity 3.7-in. and by 4.5-in. and 5.25-in. guns, while the light A.A. consisted of the 40-mm. Bofors and several types of 20-mm. gun. In addition, rocket batteries were deployed for defence of all the main cities to the number of over 1,000 twin rocket projectors.

The Germans' "tip and run" raids on S.E. coast towns were carried out at very low altitudes, and were thus difficult to stop, as radar was not designed to pick up low-flying aircraft. However, after some weeks of intensive effort, special radar was produced and the guns began to take heavy toll of the low-flying air-

craft, eventually bringing that type of attack to a standstill.

The next phase of the German attack came with the advent of the flying bomb in June, 1944. Plans had already been prepared for deploying guns, balloons, and aircraft in three zones S.E. of London and S.E. of Bristol; but as the attack was only on London, the Bristol deployment was not proceeded with. It was soon evident that the deployment was not satisfactory. The gun zone and the fighter zone interfered with each other; neither arm had a fair chance of getting at the enemy. So it was decided to move the gun belt to the coast. The fighters patrolled out to sea, and were also ready to pounce on any flying bombs that passed through the gun zone. This new deployment at once began to give results, although much work had to be done and new equipment improvised before real success came.

Before the end of August the guns were shooting down regularly between 70 p.c. and 80 p.c. of all the flying bombs that entered their zone.

Over 1,500 A.A. guns of all sorts and nearly 500 rockets, together with 800 searchlights, had been specially deployed. The heavy guns were far the most successful in shooting down flying bombs, blowing up more than 50 p.c. in the air. These guns were all equipped with electric predictors and the very latest type of radar, and every possible manual operation was eliminated in favour of automatic control.

When the Pas-de-Calais area was overrun by Allied troops, there

Anti-Aircraft. Rockets being fired from a multiple-barrelled A.A. weapon on a mobile mounting. When the projectile is fired, its passage to the target is punctuated by a series of secondary explosions as the successive charges ignite

Photo, British Official. Crown copyright reserved

was a lull for a few weeks in the flying bomb attacks. However, in the autumn of 1944, flying bombs, now launched from aircraft, were once more directed against London. These bombs were launched off the E. coast, and once more a great deployment of guns took place, stretching all the way from Yarmouth to the mouth of the Thames. The success against these flying bombs was even greater than on the S. coast. On many occasions 100 p.c. of the targets were destroyed, and for days on end no single bomb of the many launched got through to London.

Before the end of the flying bomb attack the Germans started discharging rockets at London. Meetings were at once held at A.A. Command to explore possible ways of dealing with this new menace, and various schemes were suggested. Immense difficulties were met in attempting to predict the exact path of the rockets, but eventually specially devised radar situated on the E. coast was successful in locating a large proportion of them. However, the war ended before any theory could be finally put to the test.

Anti-Aircraft Ships. Introduced by the Royal Navy in 1935, when cruisers of the Curlew class were converted to provide floating A.A. batteries to accompany the Fleet at sea. The main armament of 6-in. guns was replaced by ten 4-in. semi-automatic A.A. guns each firing 15 rounds of H.E. shell per min.; four multiple machine-guns; and eight Lewis guns. The 4-in. guns were linked by a system of predictor fire-control. To provide protection for merchant convoys old destroyers were rearmoured with eight dual-purpose 4-in. guns, mounted in twin turrets, and a subsidiary armament of multiple pom-poms and machine-guns.

During the Second Great War the British Admiralty laid down new vessels specifically designed as A.A. ships. Displacing 1,200 tons, each ship had a speed of 20 knots and armament of eight dual-purpose 4.5-in. guns and a battery of multiple pom-poms and Orlicons. Other navies adopted the A.A. ship, but many, e.g. German *flak* ships, were converted trawlers restricted to coastal duties.

Anti-Aircraft Weapons. Passive anti-aircraft weapons comprise mines suspended from balloons, balloon barrages, and parachute and cable units. Active weapons comprise rockets and

heavy and light guns. In the Second Great War the three British types of heavy A.A. guns were the 4.5-in., the 3.7-in. and the 3-in. The 4.5-in. was mounted on a permanent concrete emplacement. Its range was 45,000 ft. and it fired nine 55-lb. shells per min. The 3.7-in. was a mobile gun, 10 tons, which could be sited quickly; with a range of 40,000 ft., it discharged twelve 30-lb. shells per min. The 3-in. A.A. gun, highly mobile, was a naval weapon converted to A.A. purposes. It fired 20 rounds per minute, to a range of 20,000 ft.

Light A.A. guns included the Bofors, Hispano, multiple Pom-pom, Orlikon, Vickers, Browning, Lewis, and Bren (*see* entries under all these headings; *also* Machine-gun). Such guns were usually sited individually in pits or on towers or buildings to form a defensive ring. A heavy A.A. gun site might have had eight 4.5-in. guns, spaced at intervals of a few yards, but the normal plan was a four-gun site run by a half-battery in two sections (two guns each). Passive weapons and light guns protected specific targets. Heavy A.A. guns kept up a barrage to hold attacking aircraft at altitude. *See* Ammunition; Rocket Weapons.

Anti-Atlas. Mountain plateau of S.W. Morocco. Its average elevation is about 10,000 ft. The Wadi Draa is parallel to the S. face, which drops abruptly to the Saharan lowland; the W. end is Cape Nun. The plateau is separated from the Great Atlas by a depression of which the sea end forms the shore of Agadir Bay.

Antibes. Seaport of France. In the department of Alpes-Maritimes, it is 13 m. by rly. S.W. of Nice, and was once a fortified town. Its chief industries are fishing and the making of perfumes from flowers specially cultivated in the neighbourhood. The ancient Antipolis, it is supposed to have been founded by Greeks from Marseilles in the 4th century B.C., and was later a Roman settlement. Under German control from Nov., 1942, it was liberated by U.S. troops Aug. 24, 1944. Pop. 23,574.

Antibiotic. Substance, produced by a living organism during growth, which has an inhibitory or lethal effect on micro-organisms. *See* Penicillin.

Antichlor. Name applied to the chemicals used to remove the last traces of chlorine from fibres or paper pulp bleached with chlorine obtained from chlorinated lime or bleaching powder.

and if even a small amount of free chlorine remains, the material will slowly rot. Sodium hyposulphite or "hypo" ($\text{Na}_2\text{S}_2\text{O}_3$) is most used as an antichlor, the fibres or pulp being immersed in the solution and afterwards washed. Antichlor has been rendered largely unnecessary by improved methods.

Antichrist (Gr. *anti*, against or in place of: *Christos*, Christ). Term used in the N.T. (1 John 2 and 4: and 2 John) to denote one who originally denies that Jesus is Christ and, teaching falsehood, claims to teach the truth. S. John, while speaking of several Antichrists, refers in especial to a single person, and assumes that the early Christians were aware that Antichrist should come. S. Paul had already (2 Thess. 2) spoken of the "man of sin" who should precede the day of the Lord, and this man of sin is identified with S. John's Antichrist. Allusion to the coming of Antichrist may also be found in the Gospels (Matt. 24; Mark 13; Luke 21). References in Revelation (11 and 13) to the beast are held by many commentators also to refer to Antichrist. (*See* Apocalyptic Number.)

The early Latin fathers and many later commentators decided that S. Paul held Antichrist to be the main obstacle to the setting up of Christ's Kingdom on earth; that S. Paul meant by Antichrist a particular Roman emperor—e.g. Caligula or Nero—is a later interpretation not found before the 17th century. At the Reformation the papacy, not the person of the pope, was identified with Antichrist by Luther, Calvin, and Zwingli, and also by Cranmer, Latimer, Ridley, and other Protestant apologists. As late as 1861 Lutherans maintained that the papacy became Antichrist A.D. 607, when Pope Boniface III was entitled Head of All the Churches. *See* Greek Testament Prolegomena to Thess., H. Alford, 1849-61; Discussions and Arguments on Various Subjects, chap. 2, J. H. Newman, 1872; Antichrist, W. Bousset Eng. trans., 1896; The Protestant Idea of Antichrist, in Essays Critical and Historical, J. H. Newman, repr. 1901.

Anticipation (Lat. *ante*, before; *capere*, to take). English legal term. By the common law of England a married woman, called in Norman-French *feme covert*, could have no property apart from her husband. The Court of Chancery, however, allowed property of all sorts to be given to a trustee, to be paid and applied by him to a

married woman, or for her benefit, outside the husband's control. A common way of so benefiting a married woman is to give in trust the income of property for her life. In such a case the woman may, and often does, sell the income for a lump sum down, and if she squanders the lump sum she is left without means, thus defeating the intention of the person who gave her the income.

In the reign of George III, a remedy for this defect was devised. By this a marriage settlement was prepared, giving the wife the income of the trust fund for life *without power of anticipation*. Thus she could not mortgage or charge it in advance, or sell it or get rid of it in any way beforehand. A creditor could not levy execution on it. The device became generally adopted. By the Law Reform (Married Women and Tortfeasors) Act, 1935, it became impossible to impose this restraint on anticipation by any instrument executed after Jan., 1936, in so far as the instrument attached to the enjoyment of any property by a woman any restriction upon anticipation which could not have been attached to the enjoyment of that property by a man.

Anti-climax (Gr. *anti*, against; *climax*, ladder). Device in literary composition or rhetoric whereby emphasis of expression, conveying ever-increasing intensity, suddenly drops to an unexpectedly weak conclusion. For unintentional anti-climax see Bathos.

Anticline (Greek *anti*, against; *klinein*, to lean). Convex fold in stratified deposits, due to lateral

Anticline. Diagram illustrating the two forms

pressure on a portion of the earth's crust. The fold may be symmetrical or otherwise. If it has a cylindrical form it may be referred to a directional line known as its axis; if asymmetric, to a plane known as an axial plane. The rocks on each side and involved in the folding constitute the limbs of the fold. See Syncline.

Anti-Comintern Pact. Agreement directed against the Comintern, the Communist International

operating from Moscow. It was concluded Nov. 25, 1936, between Nazi Germany and Japan, and Italy joined it on Nov. 6, 1937. The original signatories undertook to inform each other of the activities of the Communist International, to consult each other on the necessary protective measures and to carry out such measures in close cooperation. Other countries "whose permanent peace was menaced by the seditious work of the Communist International" were invited to join; and in 1939 Manchukuo, Hungary, and Spain accepted the invitation. After the signing of the Nazi-Soviet agreement of Aug. 23, 1939, the pact was in abeyance, for its ideological basis had been removed, but after the German invasion of Russia, June 22, 1941, it was revived, and Nazi-dominated governments of Europe—Denmark, Finland, Slovakia, Croatia, Rumania, and Bulgaria—as well as the Japanese puppet government in Nanking, signified their adherence. See Axis; Comintern.

Anticosti. Island of Canada. Situated in the Gulf of St. Lawrence, it belongs to Quebec province, is 122 m. long by 30 m. broad, and has an area of 2,600 sq. m. The N. coast has limestone cliffs, the S. is low and dangerous. The island was acquired in 1895 by M. Menier, a Frenchman, who stocked it with wild animals.

Anticyclone. A meteorological term for type of pressure distribution in which the isobars form closed curves, as a rule roughly circular or oval in shape. Atmospheric pressure is highest at the centre and diminishes towards the margins, so that the movement of air is in a direction opposite to that in a cyclone. Towards the centre of the system the air is usually very still, but nearer the margins the winds—which are rarely more than light, since the pressure differences are not great, and therefore do not give such steep gradients as in cyclones—blow outwards in a clockwise direction in conformity with Buys-Ballot's law (*q.v.*). Anticyclones are generally regarded as bringers of fine or fair weather, and are marked as a rule by absence of rain, though in a land area surrounded by sea, *e.g.* the British Isles, drizzle is not uncommon, and appreciable rain may fall on and near the coasts. There are seasonal characteristics to be noted in British anticyclones: the almost cloudless type predominates in spring and summer, and

the overcast or foggy type in late autumn and winter.

In the first the diurnal range of temperature is considerable, while in the second it is usually small. In general the hot deserts are anticyclonic regions. In the N. hemisphere in summer an anticyclone centres near the Azores and intermittently spreads as far as S. England; in winter the Siberian anticyclone is accompanied by intense cold and the fringe of it sometimes reaches England. In the S. hemisphere anticyclones move steadily from W. to E. between the trade winds and the "brave west winds." See Meteorology; Weather.

Anticyra. Name of three towns in ancient Greece. One was in Thessaly on the Malian Gulf, another (mod. Aspra Spitia, white houses) was in Phocis, on the Corinthian Gulf. Both were famous for hellebore, supposed to be a remedy for lunacy and melancholia; hence a person suspected of insanity was told *Naviga Anticyram*, sail to Anticyra. The third Anticyra was in Locris.

Antietam. River of the U.S.A. It rises in the Allegheny Mts. in Pennsylvania, and flows S. through Maryland to the Potomac. It was the scene of a battle, Sept. 16-17, 1862, during the Civil War.

Antifreeze. Substance added to liquid to prevent its freezing. It is largely used in motor-car radiators to avoid damage by frost during winter months. Many substances have been suggested for this purpose, among the most satisfactory being alcohol, glycerin, and ethylene glycol. All these are miscible with water in all proportions, and the addition of any one of them to water considerably lowers its freezing point. The following figures show the percentage by volume of glycerin and ethylene glycol required to give protection from freezing at stated temperatures: *glycerin*, 32 p.c., +10° F.; 40 p.c., 0° F.; 47 p.c., -10° F.; 53 p.c., -20° F.; 57 p.c., -30° F.; *Ethylene glycol*, 25 p.c., +10° F.; 33 p.c., 0° F.; 39 p.c., -10° F.; 45 p.c., -20° F.; 50 p.c., -30° F.

Anti-friction Metals. Name given to various soft metals, usually alloys of copper, antimony, lead, etc., used for engine bearings, to lessen friction. If the bearings in which axles or shafts revolve are too hard, the shaft or axle may be worn away; if too soft, they may be squeezed out or torn by the revolving axle; if their surface in contact with the shaft is

unsuitable, excessive friction will be set up with consequent loss of power and excessive wear. Hence it is the aim of inventors and designers to provide a metal for bearings which, while not too hard, shall be hard enough to resist any pressure likely to fall upon it, and shall present a surface to the axle or shaft which will not tend to cling too closely to the latter, and shall hold the lubricant used rather than permit it to be squeezed out. Many such metals are now in use.

The first successful alloy of this class and the one most generally known is Babbitt metal (*q.v.*). Other such alloys include Parsons' Metal, Richards' White Metal, Delta White Metal, and Anti-Attrition Metal, while the class is also known by the term White Metal. One great advantage possessed by most of these alloys is that they admit of being poured while molten directly round the shaft or axle, thus saving much time and labour in machining.

Antigonē. In Greek legend, the daughter of Oedipus, king of Thebes. When her father, blinded by his own hand, had to leave Thebes, Antigone was his faithful companion until his death at Colonus. For her disobedience in burying the corpse of her brother Polyneices, which had been forbidden by Creon, king of Thebes, Antigone was immured in an underground cave, where she hanged herself. Antigone's tragic story is the subject of the Antigone of Sophocles, and she figures in plays by Aeschylus and Euripides.

Antigonus (c. 380-301 B.C.). General of Alexander the Great. On the death of Alexander in 323 the provinces of Greater Phrygia, Lycia, and Pamphylia were assigned to him, and after the death of Antipater in 319 he planned to make himself master of Asia. This led to a series of wars against the other generals of Alexander, and though by 306 Antigonus felt sufficiently sure of his position to assume the title of king of Asia, he was defeated and slain at the battle of Ipsus in Phrygia five years later.

Antigua. Island of the British W. Indies. It has an area of 108 sq. m. and is, with Barbuda and Redonda, one of the four presidencies of the Leeward Islands. It has a rugged and irregular coast, fertile soil, and several good anchorages, the best being English Harbour and St. John, the capital. It is an episcopal see and the seat of government of the Leeward Islands, and it produces salt,

cotton, pineapples, molasses, and rum. Discovered by Columbus in 1493, it was settled in 1632 by the British, by whom it was finally acquired in 1667. In 1940, a site near Parham Harbour was leased to the U.S.A. for 99 years for the construction of a U.S. naval base. Pop., with dependencies, 41,024.

Antigua. The former capital of Guatemala, 15 m. W.S.W. by road from Guatemala City. It stands at 5,000 ft. at the foot of three volcanoes rising to 13,000 ft. In 1773 almost every building but the cathedral was destroyed by an earthquake. Pop. 22,839.

Anti-Jacobin, THE. Weekly newspaper, published for a few months in 1797-8. Its main object was to ridicule the democratic opinions of Fox and other Whigs. William Gifford was its editor, and its most brilliant contributor was George Canning.

Anti-Lebanon OR **ANTI-LIBANUS.** A mt. range of Syria. Lying E. of, and fairly parallel with, the Lebanon range, between Homs and Damascus, it is traversed by a branch rly. from the latter city to Beirut. The Anti-Lebanon extends about 90 m. and rises to a height of 9,166 ft. in Mt. Hermon.

Antilles. Name applied to the West Indies exclusive of the Bahama Islands. The Antilles are divided into two groups—Lesser and Greater—the former including Antigua, Barbados, Barbuda, Dominica, Grenada, Guadeloupe, Martinique, St. Lucia, St. Vincent, Tobago, and Trinidad, and the latter consisting of Cuba, Haiti and the Dominican Republic, Jamaica, Puerto Rico, and smaller islands. The Lesser Antilles are subdivided into the Leeward and Windward groups. *See* West Indies.

Antiochus. In Greek legend, son of the venerable Nestor. He accompanied his father to the siege of Troy, where he was killed by Memnon or by Hector.

Antilogarithm. In mathematics, the number which results when a base (usually 10) is raised to the power represented by a given logarithm. Thus, in the statement $10^{.30103} = 2$, .30103 is the logarithm of 2 and 2 is the antilogarithm of .30103. It is usual

Antigua, British West Indies. The main street of St. John, the capital of the island

not to calculate antilogarithms for oneself but to consult tables.

Antimony (symbol Sb, Latin *stibium*). Metal having a bluish-silvery colour and a flaky crystalline structure, showing beautiful facets on fracture. It is a chemical element. Atomic weight 121.76; specific gravity 6.72-6.86; and melting point 1,166° F. (630° C.). It volatilises at a white heat, but in a current of hydrogen distils readily. In a stream of oxygen or on ignited charcoal in air it burns with a brilliant white light, giving off copious fumes which settle in a fine dust (antimony trioxide), commonly described as "flowers of antimony." The metal does not rust or tarnish except slightly in air, but if exposed while in a state of fusion it quickly oxidises.

It dissolves in strong hydrochloric acid and in concentrated sulphuric acid. Nitric acid, even if very dilute, also dissolves it.

The extraction of the metal from its principal ores is simple, but usually involves several processes. Crude metal may be obtained in the first instance by a process of liquation, and the product refined in one of several ways into "regulus," which is the standard antimony of commerce. The old English method of obtaining the metal direct from stibnite consisted in smelting the ore with an alkaline flux (salt cake) and scrap iron in crucibles. When molten, the contents of the crucible were run into conical moulds which gave when cool an impure antimony, a regulus, and a slag of sulphide of iron. The process is still in use. The regulus so obtained, as also regulus prepared in other ways, is refined by heating in crucibles with soda, common salt, and a certain amount of pure antimonial ore. The iron, which is usually the chief impurity, and other foreign metals present are oxidised and scorified, the

resulting product being nearly pure antimony, containing 99.6 of the metal and known as "star" antimony from the fact that the surface of the ingots or slabs when cool are beautifully figured with stars.

The methods of extraction used in France, formerly the chief producer of antimony, and also where the ores contain appreciable quantities of arsenic, are more elaborate, and various furnaces are used.

The principal uses of antimony in the arts are in the preparation of alloys, particularly Britannia metal, type metal, pewter, and anti-friction metals. Its peculiar value in the making of type metal lies in the hardness which it imparts and the fact that it expands slightly on cooling and thus makes a very sharp and clearly defined cast. Its value for domestic articles lies in its hardness and its resistance to corrosion or tarnishing. Alloys, e.g. hard lead, are used in lead pipes, in the manufacture of shrapnel and shot, for battery plates, siphon taps, cable covering, and toys.

Antimony is widely distributed in nature, ores occurring in about 16 countries. China is the world's largest supplier, producing 17,000 tons in 1936. Other production figures for that year (in tons) were: U.S.A., 9,000; Mexico, 7,000; Bolivia, 6,000; Yugoslavia, 2,000; Czechoslovakia, 1,000; Algeria, 1,000; Peru, 1,000.

Antimony Compounds. Three oxides of antimony, the trioxide (Sb_2O_3), the tetroxide (Sb_2O_4), and the pentoxide (Sb_2O_5), are known. Antimony trioxide is found native, but is usually prepared by boiling powdered antimony sulphide with hydrochloric and nitric acids until free from sulphuretted hydrogen, pouring the liquid into a large volume of water, and washing the precipitate until it is free from acid. From it is prepared tartar emetic, used in medicine and as a mordant in dyeing and calico printing. The two chlorides of antimony are the trichloride (SbCl_3) and the pentachloride (SbCl_5).

Antimony trichloride is prepared by dissolving the sulphide in strong hydrochloric acid and evaporating the liquid to dryness. The pasty mass obtained is known as butter of antimony, a name first applied to it by Basil Valentine. In concentrated solution, butter of antimony is used in veterinary medicine as a caustic, and also for browning rifle barrels. When this solution of antimony trichloride is poured into water, a white precipitate of basic chloride is obtained, which as Powder of Algaroth was much employed in medicine towards the

end of the 16th century by a Veronese physician named Algarothus. Of the two sulphides of antimony, antimony trisulphide (Sb_2S_3) is found in nature as antimony ore, and somewhat resembles graphite in physical properties. As kohl, this native form has been used in the East from time immemorial for colouring the eyebrows and skin. It can also be prepared as a red powder by passing sulphuretted hydrogen into a solution of an antimony salt. This form is for vulcanising rubber, in making fireworks, and as an ingredient in match-head composition.

Kermes mineral or Carthusian powder, formerly of high repute as a febrifuge, is, from its method of preparation, a mixture of antimony trisulphide and trioxide. Antimony cinnabar, used in painting, is an oxisulphide. Schlippe's salt, employed in photography, is made by warming antimony trisulphide with a strong solution of sodium sulphide. Antimony pentasulphide (Sb_2S_5) or golden sulphide of antimony, made by boiling the trisulphide with sulphur and caustic potash, filtering, and precipitating with an acid, was formerly a favourite medicine. The organic compounds of antimony are of considerable importance in medicine as anthelmintics and in the treatment of acute diseases. The symptoms of acute and chronic antimony poisoning are similar to those caused by arsenic.

Antimony Ores. The chief ore of antimony is stibnite or antimonite, which is a sulphide of the metal. It also occurs in numerous associations with other metals—arsenic, lead, copper, iron, nickel, silver, and zinc. Stibnite is lead grey in colour, builds blade-like crystals, occurs in veins deposited from alkaline solutions, and is usually associated with quartz. It is found in China, Japan, Bohemia, Mexico, Corsica, America, and to a limited extent in Cornwall. The First Great War, by increasing demand and cutting off Continental supplies, stimulated production in other regions, and the metal is now being worked in California, Nevada, Alaska, Mexico, Bolivia, Algeria, France, Italy, Spain, Canada, Germany, Hungary, and the Transvaal.

Antinomianism (Gr. *anti*, in place of; *nomos* law). Term first employed by Luther against Johannes Agricola, to express the doctrine that Christians being saved by faith alone are bound by no obligation to keep the law of God. An exaggerated view of S. Paul's teaching on justification by faith (Romans), and a reaction

from Judaism, the tendency to antinomianism is found in early Gnostic sects and in later mystics. It was fiercely maintained in Germany in the 16th century, and as fiercely opposed by Luther, and was rife in England at the time of the Commonwealth.

The controversy was concerned with belief only, without reference to conduct, but from time to time, and especially in the case of the Anabaptists, antinomianism was pleaded in extenuation of the grosser excesses, the argument being that since man is saved by his mental attitude, i.e. by his acceptance of the atonement of Christ, it is irrelevant what is done by the body. The doctrine was formally condemned by the Council of Trent, by Luther, and by the leading divines of the Church of England and Nonconformity. Its vitality is still seen in numerous societies formed to concentrate on thought and ignore rules of conduct and the external practices of religion. The real antithesis of antinomianism is formalism, which, again ignoring conduct, would practically confine Christianity to the observances of ecclesiastical laws. See Anabaptists.

Antinomy (Gr. *anti*, against; *nomos*, law). Kant's term for a system of two contradictory propositions, each to all appearances equally valid. Thus, either of the propositions, "the world has a beginning in time and is limited as to space," "the world has neither beginning nor limits," can be equally defended. See Logic.

Antinous (d. A.D. 132). Favourite of the Roman emperor Hadrian. He was born at Claudiopolis, in Bithynia, and drowned himself in the Nile at Bessa. To signify his grief and perpetuate his memory, Hadrian enrolled Antinous among

Antinous, favourite of the Roman emperor Hadrian

Vatican, Rome

the gods, built temples and erected statues in his honour, of which a bust in the Vatican and a statue in the Capitoline museum are examples. Antinous also appears on coins and gems, and his name was given to a constellation.

Antioch or **ANTAKYA**. Town of Turkey, in the vilayet of Hatay. It is on the left bank of the Orontes, about 60 m. W. of Aleppo. Founded by Seleucus Nicator in 300 B.C. in memory of his father Antiochus, for a time it rivalled Rome in greatness. Called Antioch the Beautiful, it lay in a fertile plain 14 m. from the sea, and at its zenith had a population of 500,000. It played a leading part in the early days of

Antiochus. Name borne by thirteen Macedonian kings of Syria of the house of the Seleucidae (*q.v.*). Nearly every king of the dynasty was named either Antiochus or Seleucus.

Antiope. In Greek mythology, mother by Zeus of the twins Amphion and Zethus. She afterwards married Lycus, king of Thebes, but the machinations of Dirce, his former wife, set her husband against her, and Antiope was cruelly treated. When her sons reached manhood and learned of the persecution of their mother, they killed Lycus and Dirce.

Antioquia. Department of Colombia. It contains branches of the Cordilleras and is watered by the Cauca Magdalena and other

are anti-parallel to A B and A C when the angle A C B equals the angle A X Y. See Geometry.

Antiparos or **OILAROS**. Island in the Aegean Sea, one of the Cyclades. It is near Paros, hence the name, is 8 m. long by about 3 m. broad, and has a famous stalactite cavern.

Antipater (d. 319 B.C.). General of Philip of Macedon and of Alexander the Great. When the latter embarked on his Persian campaigns he left Antipater behind as regent, in which capacity he put down a Spartan revolt at Megalopolis in 331. After Alexander's death he shared the government of Macedonia with his son-in-law Craterus, but the change inspired the Greeks with the hope of regaining their freedom. For a time Antipater was hard pressed, but eventually he decisively defeated the combined Greek forces at Crannon (322). After the murder of Perdiccas (321), he was declared regent of the empire at Tripuradeisus in Syria. He died in Macedonia.

Antipathy (Gr. *anti*, against; *patos*, feeling). The opposite of sympathy, an instinctive, unreasoning aversion to persons or things, physical or psychological. In the first case it is natural, depending upon the peculiar structure of our senses; in the second it is acquired, in most cases the result of the association of ideas. Certain persons cannot endure the smell of certain flowers; Erasmus became ill if he smelt fish. Many women and even men are alarmed at the sight of a mouse; Lord Roberts had a great aversion to cats. The dog has a natural antipathy to the wolf and the cat, the bull and the turkey to the colour red.

Antiphilus. A Greek painter. Born in Egypt, he flourished about 330 B.C. Crossing to Macedonia, he lived at the capital, Pella, and is said to have painted the portraits of Philip and Alexander the Great. He later returned to Egypt, where he enjoyed the favour of Ptolemy I. He was jealous of his rival Apelles, against whom he made a discreditable accusation. Ptolemy, having discovered that the charge was false, is said to have presented Apelles with 100 talents (£20,000) and to have given him Antiphilus as a slave.

Antiphon (480-411 B.C.). One of the ten Attic orators. Born at Rhamnus in Attica, he conducted a school of rhetoric which Thucydides the historian is said to have attended. Of his fifteen extant speeches the majority were composed as models for pupils, the remainder for use by clients

Antioch, Turkey, on the Orontes, about sixty miles west of Aleppo. Known as Antioch the Beautiful, it once rivalled Rome in its greatness

Christianity, and here the followers of Christ were first called Christians (Acts xi, 26). Its bishops were patriarchs of the first rank, and for long it was the centre of missionary enterprise. Captured and destroyed by the Persians in A.D. 538, it was rebuilt by Justinian, and conquered by the Saracens c. 638, from which time its decline dated. It prospered again under the Christians from 1098 to 1268, when it was taken by the Egyptian Bibars and gradually decayed. The modern town is a place of slight importance, trading in grain, silk, tobacco, and cotton. French Syria ceded it to Turkey by treaty, June 23, 1939. Pop. 28,000.

Antioch. Ancient city of Pisidia. Founded, like Antioch in Syria, by Seleucus Nicator in memory of his father Antiochus, it was a free city under the Romans. It was colonised under Augustus and received the name of Caesarea. The place, which was visited by S. Paul, is mentioned in Acts 13 and 14. Its site is about 200 m. E. of Izmir.

streams; its area is 25,419 sq. m. To the N. it extends to the Gulf of Darien. The mts. are forest-clad and rich in gold, silver, platinum, iron, coal, galena, and rock salt. The agricultural produce includes rubber, maize, coffee, timber, cotton, sugar-cane, and tobacco. The capital is Medellin.

Anti-parallel. Term used in geometry. It denotes the figures created when lines cross others in such a way as to produce equal angles in a figure, but on contrary sides to what would have been the case had the crossed lines been

parallel. Thus in the figure A X B C Y the lines X Y and B C

in the law courts. Antiphon enjoyed a great reputation as orator, but his only known public speech is his own defence when arraigned after the fall of The Four Hundred. Despite his eloquence, he was condemned and executed. *Consult* Attic Orators, R. C. Jebb. 1876.

Antiphonal (Gr. *anti*, opposite; *phōnē*, voice). Music in which effects of response are used. Officiant and choir, soloists and choir, or a divided choir, may be employed with this object. Antiphonal singing is heard in the chanting of the Psalms in the Roman Catholic and Anglican Churches, where alternate verses or half-verses are allotted to opposite sides of the choir.

Antipodes (Gr. *anti*, against; *podes*, feet). Geographical term meaning directly opposite each

Antipodes. Map indicating the antipodal relation of London and W. Europe to New Zealand

other. Points are antipodal to each other when they are at opposite ends of a straight line joining the points and also passing through the centre of the earth. Thus one point is as far N. of the equator as the other is S., while each is separated from the other by 180° of longitude. Although the longitude of New Zealand is roughly that of a land antipodal to the British Isles, the S. of Britain is some 1,100 m. farther from the equator than the N. of New Zealand.

Antipodes Islands. Group of uninhabited rocky isles in the S. Pacific. They belong to, and are about 480 m. S.E. of, New Zealand.

Antipope. Pope set up in opposition to the canonically elected pontiff. The Roman Catholic Church recognizes an unbroken series of true popes; any opposition popes for whom that title is claimed are accounted antipopes.

Felix, in the 4th century, is often wrongly called the first anti-

pope. He was intruded during the exile of Liberius, but was canonised as a saint. The last was Felix V, Amadeus of Savoy, who was elected by the Council of Basel in the 15th century, in opposition to Eugenius IV. On the death of Eugenius Nicholas V was elected, and during his pontificate Felix resigned his claim. The Great Schism began in 1378 with the election of the antipope Clement VII in opposition to Urban VI. Clement's successor bore the name of Benedict XIII. In 1409 the Council of Pisa declared the deposition of both Benedict and the opposition pope Gregory XII, but neither would resign, and after a short interval John XXIII was appointed. The contest between the three popes was settled at the Council of Constance, which elected Martin V in 1417. *See* Papacy.

Antipyrin. Antipyretic and analgesic drug introduced into medicine in 1884. A white crystalline powder, chemically a phenylpyrazolone derivative, it is also known as phenazone.

Antiquaries, SOCIETY OF. An English learned society. It was reconstituted in 1717, in succession to an earlier association (1572-1604), and granted a royal charter in 1751. It ranks in age and dignity next to the Royal Society, and its president is an official trustee of the British Museum. The offices are at Burlington House, London, W. Its library is rich in examples of early printing, heraldry, pageantry, and numismatics, and is available for fellows (F.S.A.). Its publications are *Archaeologia*, since 1770; and *Proceedings*, since 1849.

Antiquaries, SOCIETY OF. A Scottish learned society, founded in Edinburgh in 1780. The fellows at once began the formation of a museum, primarily to illustrate Scottish history. In 1856 this was presented to the public, and has been since maintained as the National Museum of Antiquities of Scotland. The fellows are described as F.S.A.Scot.

Antiquary, THE. Third of the Waverley Novels and Scott's own favourite. It was published in May, 1816. "There is assuredly," writes Lockhart, "no one of all Scott's works on which more of his own early associations have left their image." The book gives a picture of life in Forfarshire (Angus) in the last decade of the 18th century, and is notable for some of the most effective of Scott's creations—Jonathan Oldbuck, the bachelor antiquary; Edie Ochiltree, the garrulous but shrewd old gaberlunzie man; the

gloomy Glenallans, the tragic Mucklebackits, and others.

Antique. Term used in art schools for what was once the students' earliest introduction to figure work. Drawing from the antique implied the making of accurate and painstakingly finished studies from the plaster cast of some famous piece of Greek sculpture, e.g. the Discobolus, the Belvedere Torso, the Ilissus, the Venus of Milo. The practice has been virtually abandoned in favour of drawing from the living model.

The word is also used for a piece of furniture or an objet d'art of which the chief value and interest lie in its age.

Antirrhinum OR SNAPDRAGON. *Antirrhinum majus* is a perennial herb of the family Scrophulariaceae, a native of Europe. The variable leaves are more or less lance-shaped. The tubular flowers are purplish-red and closed by the compression of the rounded upper lip. Garden antirrhinums are cultivated forms, and white, yellow, crimson, or variegated

Antirrhinum. Fine blooms of the variety known as Royal Rose

in colour. The only native British species, *A. orontium*, is found mainly in cornfields.

Antisana. Volcanic peak of the Andes in Ecuador. It is 35 m. S.E. of Quito, and is 19,335 ft. high. On its slopes is one of the highest inhabited villages in the world, Tambo de Antisana, 12,400 ft. high. The volcano is extinct.

Anti-Semitism. Modern term for that open hostility to the Jews which has existed in varying degree in every country where they have been found since the 4th century A.D. The word Semite is commonly regarded in Europe as equivalent to Jew, the only Semitic

people who have found a permanent home in Europe being the Jews. While the question of religion had some relation to the hostility to the Jew in the earlier Middle Ages, the basis of anti-semitism has been in the main economic and social; in its modern form it is political, economic, and, most of all, racial.

The argument of the anti-semiter is that the Jew, being always of alien race, cannot be absorbed into national life, and that, since he naturally puts the welfare of his own race before that of the country of his adoption, he should be excluded from all share in the government of that country. The answer of the Jew to this contention is that he has always proved himself a loyal, law-abiding, and industrious citizen in whatever land he has settled, and that the international character of his community does not conflict with national duty. Anti-semitic outbreaks in Eastern Europe were largely the result of the indebtedness of the people to the Jewish moneylenders, the latter having acquired a hold on the land of the peasants as security for loans.

As an organized political movement anti-semitism dates from the latter half of the 19th century. In Germany, France, Austria, and Holland it was directed to excluding the Jew from political rights. In Russia, Rumania, and Poland it was displayed in violent attacks upon his person and property. In 1873, during a time of German financial crisis, a Hamburg journalist, Wilhelm Marr, published a pamphlet called *The Victory of Judaism Over Germanism*, which became the basis of an organized anti-semitic movement, attracting a considerable strength of clerical and conservative support. It died down some years later after certain scandals in which the leaders were involved. Many potential supporters were also horrified by events in Russia, where extensive savage pogroms took place in 1881, hundreds of Jews being robbed and murdered. Almost simultaneously anti-

semitic outbreaks occurred in Austria and Hungary. In France the movement reached its height in the trial and conviction of Alfred Dreyfus (*q.v.*).

After the Russian revolution of 1917 many people professed to see in the new Bolshevik government a Jewish conspiracy to overthrow Christian civilization. The work, *Protocols of the Leaders of Zion*, purported to be the minutes of a

Anti-semitism. Jewish husband and wife wearing the yellow Star of Judah which was enforced in Germany in the Second Great War

secret conference of leading Jews at which a plan of world domination was drawn up. This was exposed as a forgery in 1921, but Nazi Germans later accepted its authenticity as justification for their own crimes.

Anti-semitism had returned to Europe with renewed violence on the rise of Hitler to power in 1933. Hitler was a lifelong Jew-hater, suspecting and fearing Jewish influence everywhere. Under his regime Jews in Germany, of every walk of life, were penalised as a non-Aryan race by the so-called Nuremberg laws. They were deprived of the protection of the law; their means of livelihood were removed; their property was confiscated; they were sent to concentration camps, hunted into exile, or murdered. In Streicher's paper, *Der Stürmer*, they were constantly assailed with brutal indecency. Hitler admitted many times that he aimed at the physical extermination of the Jewish race.

The Second Great War gave him every chance for further repressive measures. Jews in Germany were denied ration cards; they were excluded from all means of public transport and centres of public recreation. They were obliged to wear a yellow badge as a mark of recognition. Jews were forcibly

removed from central and western Europe to eastern Europe, where they were crowded into ghettos. The same measures were applied in countries in Nazi occupation or under Nazi influence. In Poland, particularly, Jews were massacred wholesale. In April, 1943, about 40,000 Jews in the Warsaw ghetto resisted a German attack. Thousands were killed and the survivors were deported to an unknown fate. Hundreds of thousands of Jews were exported as slaves from France with the tacit consent of Pétain and Laval.

It has been computed that upward of 5,000,000 Jews were exterminated by the Nazis, in crematoriums and asphyxiation halls, by machine-gunning, clubbing, and mass drownings. At Maidanek, in Poland, 18,000 were killed in a single day, Nov. 3, 1943, to the music of brass bands.

In Poland anti-semitism has always been present to some degree, and even after the Second Great War the Jews were subjected to persecution; though they enjoyed equal rights of citizenship and the government was doing its utmost to eradicate anti-semitism. In the Balkans, Nazi propaganda in Rumania caused a smouldering anti-semitic feeling to burst into flame. There were murders, riots, and the same kind of anti-Jewish legislation as the Nazis had introduced elsewhere.

Neither in Great Britain nor in the U.S.A. has anti-semitism obtained any considerable influence, though the British fascists led by Sir Oswald Mosley in the years immediately before the Second Great War made attacks on Jews in the poorer quarters of London and other cities. *See also* Jews.

Antiseptics (Gr. *anti*, against; *septikos*, putrefying). Substances which destroy bacteria or arrest their growth. Pasteur proved that putrefaction and fermentation are always due to bacteria or related micro-organisms, as are also those diseases termed infectious. When antiseptic agencies actually kill the bacteria, sterilisation or bactericidal action is said to occur. Antiseptic properties are exhibited in a variety of ways, *e.g.* the inhibitory effect exerted on many bacteria by the fluid constituents of the blood, to which in part must be ascribed the resistance to infection manifested by the living body. Many chemicals such as strong acids or alkalis, *e.g.* quicklime, kill bacteria; and concentrated salt solution has the property of

preventing bacterial growth, hence its use in pickling meat, etc. The term antiseptic, however, is usually restricted to definite chemical compounds which act in high dilutions. Among physical agencies heat and certain radiations are very effective, *e.g.* light rays, especially in the ultra-violet region of the spectrum. Antiseptics produce physical or chemical changes in the organisms which are incompatible with their life-processes, but the exact mechanism of these effects is still obscure. To obtain efficient action the antiseptic must have access to the bacteria in a watery medium; thus organisms encased in oily matter are protected, unless the antiseptic can form emulsions with fats, hence the value of detergent preparations. Also, the antiseptic must be used in adequate concentration and must remain in contact with the bacteria for a sufficient time. Again, organic matter if present must be allowed for; since it combines with most antiseptics, a greater amount of the latter will be required.

Relative Lethal Properties

Antiseptics differ widely in their potency as measured by the dilution in which they are effective, and also as regards the rate at which they kill bacteria. Thus carbolic acid, Lister's original antiseptic, is comparatively weak, and it is necessary to use $\frac{2}{3}$ or 5 p.c. solutions; mercuric chloride under similar conditions is employed in a strength of 1 in 1,000 or 1 in 2,000. These substances kill organisms rapidly, whereas some extremely powerful antiseptics, *e.g.* proflavine and other aminoacridines, act relatively slowly, *i.e.* are at first only inhibitory (bacteriostatic) and finally lethal. All organisms are not equally susceptible to a given antiseptic. Solutions of hypochlorites (bleaching powder) are exceedingly rapid, powerful bactericides when other organic matter is absent, hence their use for rendering supplies of drinking water safe.

It is of practical importance that heat, particularly when moist, is highly destructive, momentary exposure to boiling water killing the majority of bacteria, *e.g.* tubercle bacilli. When sterilising a fluid, however, care must be taken that the whole material actually reaches the lethal temperature. When dry, many organisms will withstand brief exposure to temperatures over 100°C .; on the other hand, in the

absence of moisture bacterial multiplication is inhibited, and some bacteria are killed by ordinary conditions of drying. The process of pasteurising depends on the fact that exposure of aqueous fluids, *e.g.* milk, to lower temperatures— 162°F . for at least 15 seconds or 145°F . for 30 minutes—kills any pathogenic bacteria which may be present and also greatly increases keeping properties by destroying most of the organisms which cause souring and putrefaction. Beer and light wines can be treated similarly. The process of "canning" of foodstuffs depends on sterilisation at higher temperatures, with exclusion of air from the containers. Certain species of bacteria can produce resistant forms, known as spores, which require prolonged boiling for their destruction, *e.g.* at least 5 to 10 minutes for the spores of anthrax, tetanus, and gas gangrene bacilli, or many hours in the case of certain others, such as the hay bacillus. Spores are also resistant to chemical antiseptics; but are killed rapidly by moist steam under pressure, *e.g.* in less than 30 minutes at 115°C . Temperatures at or below 32°F . inhibit the multiplication of bacteria, hence the method of preserving meat and other food by chilling; but cold is not lethal, organisms being found to survive exposure even to liquid hydrogen.

Varieties and Specific Uses

The general employment of antiseptics in surgery dates from the discovery by Lord Lister that Pasteur's work on putrefaction applies also to sepsis in wounds, *i.e.* a wound will heal without the occurrence of suppuration provided that it is not contaminated with virulent bacteria. By ensuring that the patient's skin is properly cleansed and that everything which comes into contact with the site of operation has been sterilised, a surgical wound will usually heal aseptically. Virulent organisms may be conveyed by the air in contaminated dust, but this is not usually an important source of wound infections. The applicability of different antiseptics depends on the particular purpose for which they are to be employed. For sterilising surgical dressings, and infected materials, moist steam, phenolic compounds, mercuric chloride, or hypochlorites are widely used, and for surgical cat-gut watery solution of iodine or hydrogen peroxide. For application to the skin

alcohol (70 p.c. of absolute) and alcoholic solutions of certain organic dyes (brilliant green, crystal violet, and aminoacridines) are suitable. For disinfection of the air in rooms, wards, etc., the following are recommended—ultra-violet radiation, propylene glycol as vapour, or a fine spray (aerosol) of hypochlorite solution.

Science of Chemotherapy

An entirely different problem is the attempt to destroy micro-organisms in an infected body without damaging the living tissues in which they are embedded. This branch of treatment is called chemotherapy. It presents greater difficulties than that of sterilising dead materials. Most antiseptics are comparatively ineffective or actually harmful in the living body, because they combine with the tissues and body-fluids, and so are neutralised before reaching the organisms and also because they are active tissue-poisons, like phenol or mercuric chloride. Thus for introduction into infected wounds where a local action on bacteria is desired, *i.e.* surface antiseptic effect, useful substances are those which are relatively non-poisonous, and which are not inactivated by blood serum, *e.g.* the aminoacridines (proflavine, monacrine, etc.), sulphonamides, and penicillin, or a mixture of these. Neutral hypochlorite solutions (eusol, Dakin's solution) and the chloramines have the property of becoming transformed into harmless compounds in the tissues, so that they can safely be frequently renewed. It is still more difficult to act on bacteria in the blood stream or to reach infected sites in the tissues by systematic administration of drugs. When administered in this way the sulphonamides and penicillin are effective against many pathogenic bacteria including those usually responsible for septic infections. In the case of chemotherapeutic agents it is probable that the destruction of the micro-organisms in the body is usually due to the cooperated action of the drug with the defensive mechanisms of the living tissues.

C. K. Browning, M.D., F.R.S.

Bibliography. Disinfection and Disinfectants, S. Rideal, 2nd ed., 1898; Handbook on Antiseptics, H. D. Dakin and E. K. Dunham, 1917; The Extra Pharmacopoeia, W. Martindale, 22nd ed., 1941-43.

Anti-Slavery Movement. Agitation and organization to abolish slavery. It was conducted in two distinct stages—(1) the stopping

of the slave trade, and (2) the abolition of slavery itself.

In 1772 a legal decision was given that a slave could not be owned while in England. An Act stopping the English slave trade was passed March 25, 1807, and the imposition of heavy penalties on offenders in 1811 finally suppressed it. Denmark had abolished the trade in 1792. The U.S.A. in 1794 prohibited trade in slaves with foreign countries, and in 1807 stopped all importation of slaves. The attack on the trade had been led in England by Thomas Clarkson, William Wilberforce, and Zachary Macaulay. The Emancipation Act, passed by the British Parliament Aug. 7, 1833, was a measure that came gradually into operation so as to release all slaves in the British Empire by 1840. The end, however, arrived two years earlier through the voluntary release of the slaves, who had proved intractable during the transition period.

Slavery was extinguished in the French colonies in 1848, by Holland in 1863, and in the U.S.A. in Dec., 1865, following the Civil War. The northern states of the Republic had emancipated their slaves, for whose services there was no demand, during the period of the English agitation before 1840, but many were sold into the southern states, where the cotton industry required much cheap labour. Seeing their economic prosperity threatened by the anti-slavery movement, the southern states claimed the right to secede. See Slavery; Slave Trade; consult also History of the Abolition of the African Slave Trade, T. Clarkson, 1808; History of Slavery and Serfdom, J. K. Ingram, 1895; Slavery, Lady Simon, 1929.

Anti-Slavery Society, BRITISH AND FOREIGN. Society founded in 1839, soon after the abolition of slavery in the British Empire. Its objects were described as the universal extinction of slavery and the slave trade, and the protection of freed slaves in British possessions. It watches native conditions in the British Colonies: strives to improve those in lands for which Great Britain has treaty obligations, such as the Belgian Congo, and also in places, such as the Putumayo region, where British capital is employed; and cooperates with societies in other civilized lands which have similar objects. It has a parliamentary committee and publishes a quarterly journal, The Anti-Slavery Reporter and Aborigines'

Friend. In 1909 the society was amalgamated with the Aborigines Protection Society under the name of the Anti-Slavery and Aborigines Protection Society. The offices are at 49, Denison House, Vauxhall Bridge Road, London, S.W.

Antispast (Greek *antispasēn*, to draw in the opposite direction). In prosody, a four-syllabled foot consisting of an iambus and a trochee, $\sim - \sim -$, i.e. a short and a long syllable followed by a long and a short syllable.

Antisthenes (c. 440-370 B.C.). Founder of the Cynic school of

Antisthenes,
Greek philosopher

Greek philosophy. Born at Athens, originally a pupil of the rhetorician Gorgias, he became a follower of Socrates, after whose death (399) he founded a school in the Cynosarges gymnasium. He chiefly devoted himself to the ethical side of his master's teaching, and held that virtue consisted in doing without all but the barest necessities of life and in the avoidance of evil; that the man who wanted little was most like the gods who wanted nothing. He conscientiously practised what he preached, but the doctrines and manner of life of the extremists among his followers degenerated into absurdity.

Antistrophe (Gr. *antistrephein*, to turn to the opposite side). In Greek chorus and dance, that part of an ode which was sung as the chorus returned from left to right after singing the strophe as they moved from right to left. It is also the stanza of a choral song which alternates with the strophe; and, in rhetoric, the figure of retortion, or turning back of a sentence to a word or idea previously employed in it.

Anti-Tank Weapons. For a description and discussion of the various methods of defence employed against tanks—e.g. anti-tank gun and rifle, P.I.A.T. projector, "sticky bomb"—see under Tank.

Anti-Taurus. A mt. range in Asia Minor, the exact nature and extent of which are doubtful. It is generally regarded as being the range which begins near Mt. Argeus, 12,565 ft., and extends for over 200 m. in a N.E. direction.

Antithesis (Gr. *anti*, against; *thesis*, placing). In rhetoric, a sharp contrast or opposition between sentence and sentence, or

sentiment and sentiment. It is used much in the forming of maxims or moral sayings, as in Seneca's "If you regulate your desires according to the standard of nature, you will never be poor; if according to the standard of opinion, you will never be rich." Macaulay's writings are full of antitheses, e.g.: "He had covertly shot at Cromwell, he now openly aimed at the Queen."

Antitoxin (Gr. *anti*, against; *toxikon*, poison for smearing arrows). Medical term for a substance which has the power of neutralising the action of a bacterial poison or toxin. It consists of the serum obtained from the blood of a living animal which has been rendered immune from the disease to be cured, or prevented, by injections of the toxin of that disease. Antitoxin has been used successfully in the treatment or prevention of diphtheria, lockjaw, scarlet fever, typhoid fever, etc. In botany the term is used of a secretion in plants which secures them from injury by microbes.

Anti-Trade Winds. Surface winds which blow over the oceans in latitudes higher than 40°. Because the air currents are moving from low to higher latitudes the rotation of the earth gives them a westerly component, so that in the northern hemisphere these winds are in general S.W. winds, and are frequently called the Westerlies; in the southern hemisphere they vary in direction from W. to N.W., and are called the Brave West Winds, or, incorrectly, the Roaring Forties. The Westerlies vary in speed from about 16 m. per hour in the summer to more than 25 m. in the winter; the Brave West Winds usually exceed 20 m.

Because these winds are oceanic, warm moist air moves towards the westerly shores of the continents and causes rains, which are usually heaviest in the autumn and winter, on the coastal areas which lie in their path. Ireland is rainier than England; British Columbia has a considerable rainfall; the west coastlands of South Island, New Zealand, and of Tasmania are very rainy. The area covered by these winds varies slightly with the seasons; during the winter months the winds are nearer the equator, with the result that the rains on the coasts reach comparatively low latitudes only during the winter. Thus California, the W. Mediterranean countries, Chile, the district round Cape Town, and the S. coastal lands of Australia experience cool wet winters and hot

dry summers; i.e. they have "winter rains."

By their comparative steadiness these winds affect the navigation of sailing vessels; they interfere seriously with the "wind-jammers" which sail from the Atlantic to the Pacific round Cape Horn, and cause sailing vessels making the trip round the world to go round the Cape of Good Hope and E round Cape Horn. The first air voyages across the Atlantic were made from W. to E. with their assistance, and the airways of the future will depend to some degree upon the effect which the anti-trade winds have been proved to have on airships and aeroplanes. In any case these winds cause the air navigator considerable trouble by the varying amount of drift they produce. They make signal stations a necessity along the W coasts, especially for night flying.

Antium. One of the oldest cities and ports of Latium, the modern Anzio. It stood 33 m. S.E. of Rome, and was a stronghold of the Volscians and the haunt of pirates. Conquered by Rome, 468 B.C., it revolted, and was finally subdued in 338. Antium became a favourite Roman watering-place, and numerous remains of villas and art treasures have been found, e.g. the Apollo Belvedere and the Borghese Gladiator, and the only pre-Julian Roman calendar. Here the emperors Caligula and Nero were born. See Anzio, Porto d'.

Anti-Vaccination Movement. Agitation to bring about the repeal or the modification of the Vaccination Acts; in other words, to abolish compulsory vaccination. In England Acts passed in 1851, 1867, and 1871 made vaccination compulsory, while Scotland and Ireland were similarly treated. This legislation gave birth to the movement, which, after 1867, and especially in Leicester and other Midland towns, attained large proportions, many parents being prosecuted for failing to comply.

In 1898 an Act relieved parents who declared they had a conscientious objection to vaccination from the necessity of having their children vaccinated. A declaration of belief in the injuriousness of vaccination was substituted in 1907. In 1910 the board of education ceased to enforce their previous vaccination requirements on teachers and trainees. From 1923 post-office employees were no longer subject to obligatory vaccination. The National Health Act, 1946, abolished compulsory vaccination. The National Anti-

Antler. Stages of development in the antlers of a full-grown male wapiti, from the beginning (immediately after the shedding of the old antlers) to the completion of the new growth five months later

Photos, H. Irving

Vaccination League, however, continued its propaganda in the U.K. Its offices are at 25, Denison House, Vauxhall Bridge Road, London, S.W. In most other countries there is strong opposition to vaccination, especially in Canada, Australia, and the U.S.A. See Vaccination.

Antivari. Italian name of a town and harbour of Yugoslavia, described under its Yugoslav name, Bar.

Antivenins. Antitoxins prepared from the blood of animals immunised against snake bite and used to neutralise the effect of the venom in persons bitten by snakes. Scorpion antivenin is also available. See Snake Bite.

Anti-Vivisection Movement. Agitation which aims at the abolition of the practice of vivisection. It began about 1876, when the Act still regulating the practice in the United Kingdom was passed

and the National Anti-Vivisection Society was founded by Lord Shaftesbury, Lord Coleridge, and others. The central argument of its supporters is that vivisection involves torture, and as such should not be permitted in any civilized country. The society's work is to watch the operation of the Act of 1876 and to inform public opinion on the subject. It presented its case to the Royal Commission on Vivisection, 1906-8, and has attempted unsuccessfully to pass through Parliament a bill making the use of anaesthetics and stricter regulations obligatory in experiments. Its offices are at 92, Victoria Street, London, S.W. See Vivisection.

Antler (Lat. *ante*, before; *oculus*, eye). Outgrowth from the frontal bone of the deer, usually in the male sex only. Antlers are shed and renewed annually. They spring

from a stalk or pedicle on the skull, the point of junction forming a bony ring or burr. During the period of growth, usually from April to Aug. in British deer, the antlers are covered with hairy skin called the velvet, which is well supplied with blood vessels and hot to the touch. When the antlers are fully developed, the supply of blood is cut off. The skin then dries up and is rubbed off against the branches of trees. As the deer reaches maturity the number of tines or branches on the antlers commonly increases and indicates the approximate age of the animal. Antlers are used by the males for offensive purposes during the breeding season, when furious fights take place. When the antlers are shed the stags become inoffensive.

Antlia Pneumatica. One of the southern circumpolar constellations named by Lacaille. Its name, meaning The Air Pump, is entirely inappropriate.

Ant-Lion snaring its prey. In circle, antlion in its larval stage: and, above, the perfect insect of a species which hunts instead of trapping its prey

Ant-Lion (*Myrmeleon*). Larval form of a neuropterous insect, common to temperate and tropical regions, so called from its habit of ambushing its prey. After making a conical pit in the loose sand, it buries itself at the bottom with only its head showing. When some passing insect, such as an

Antlers. Annual development of the antlers of the male fallow deer, from the unbranched horn of its second year to the many-tined one of its tenth. Above: Similar development of the antlers of the red deer

ant, slips over the edge of the pit, the ant-lion throws sand at it to hasten its fall, and then seizes it. After sucking the juices of its prey, the ant-lion hurls the body out of the pit. The ant-lion passes through its pupal stage in the sand beneath its pit, which is about 2 ins. deep and 3 ins. wide at the top, and the perfect insect resembles a dragon-fly.

Antofagasta. Largest prov. of Chile. It has an area of 47,502

sq. m. It is rich in silver, copper, saltpetre, and other minerals. The desert of Atacama covers the province. Known as Atacama until 1879, it was then captured from Bolivia and finally ceded to Chile in 1885. Pop. 145,147.

Antofagasta. Seaport of Chile. It is the capital of Antofagasta province. It is connected by rly. with Oruro and La Paz, being the

terminus of the Antofagasta and Bolivia Rly. Ships lie in the roadstead and discharge by means of lighters. Much of the trade of Bolivia passes through this port, which is the commercial centre for an extensive mining district. It is a wireless station. Pop. 51,107.

Antoine, ANDRÉ (1851-1943). French theatrical manager and dramatic critic. In 1887 he founded the Théâtre Libre, Paris, renowned for a dramatic realism inspired by the contemporary naturalistic novel.

Antommarchi, FRANCESCO (c. 1780-1838). A French physician, medical attendant on Napoleon during his captivity on St. Helena. He was born in Corsica, and Napoleon bequeathed him £4,000. His *Les Derniers Moments de Napoléon* was published in Paris in 1823.

Antofagasta, commercial centre of the great Chilean nitrate industry. The Plaza Colon is on the left, and the Calle Prat on the right

He acted as director of military hospitals in Warsaw during the Polish revolution and died in Cuba, April 3, 1838.

Antonescu, Ion (1882-1946). Rumanian dictator. Born in Transylvania, June, 2, 1882, he saw service with the Rumanian army in the First Great War, being promoted to colonel. Later he was chief of the general staff and war minister. In 1940 he was imprisoned for his opposition to the cession of Bessarabia to the U.S.S.R., but was released by King Carol and appointed prime minister. Supported by the Iron Guard, the Rumanian fascist organization, his first act was to demand Carol's abdication. He thereupon assumed the powers of dictator, and on Sept. 14, 1940, proclaimed Rumania a totalitarian state. In Nov., 1940, he signed Rumania's adherence to the Axis. It was on his order that the Rumanian army in 1941 joined with the Nazis to invade Russia. On Aug. 23, 1944, following the Rumanian defeat, he was arrested, along with his government, by order of King Michael. In May, 1946, the Rumanian peoples' court found him guilty of war crimes, and he was executed June 1.

Antonine Column. Memorial column erected in Rome in honour of the emperor Antoninus Pius. The shaft, about 50 ft. high, has been destroyed, but the decorated marble pedestal is preserved in

Antonine Column in the Piazza Colonna, Rome

Antonine's Wall. Map showing the line of this Roman rampart from the Forth to the Clyde, and the positions of some of its forts

the Vatican. Another Antonine Column commemorated the victory of the emperor Marcus Aurelius Antoninus over the Marcomanni (176), and was set up by his son and successor Commodus. It is in the Piazza Colonna.

Antonines, AGE OF THE Period in the history of the Roman Empire covered by the rule of the emperors Antoninus Pius (A.D. 138-161) and Marcus Aurelius Antoninus (A.D. 161-180). An era of peace and general prosperity, it came to be regarded as the Golden Age of the empire.

Antonine's Wall. A Roman rampart, 36 m. long, between the

Forth and the Clyde. Erected by Lollius Urbicus in A.D. 140-1, it became the northernmost outpost of Roman Britain. Mainly of turf, flanked by a ditch, it was protected by from 10 to 20 forts, some of which, e.g. Camelton and Barrhill, mark the site of Agricola's temporary works of about A.D. 80. The stone-ramparted Castle Cary is well preserved. A sculptured legionary tablet, dedicated to Antoninus, was found at Bridgeness and is now in the National Museum, Edinburgh. The wall was known in early Scottish history as Grim's Dyke and transformed by later legend into Graham's Dyke.

Antonine's Wall, between the Forth and Clyde. 1. Section through the wall disclosing the stone foundation. 2. Exposed foundation showing opening for drainage. 3. View of the wall at Fergusson Moor

Antoninus Pius (A.D. 86–161). Roman emperor, 138–161. Born Sept. 19, 86, he held with credit

Antoninus Pius,
Roman Emperor
British Museum

several administrative posts and enjoyed the friendship of Hadrian, who adopted him and designated him his successor. The name Pius refers to his affectionate regard for the memory of his patron. During the reign of Antoninus the only serious military operations were those carried on in Britain, where his name remains associated with a military wall constructed between the Forth and the Clyde. Under Antoninus the principles of equity, fortified by the prevailing Stoic philosophy, were more widely introduced into the Roman system of law, and the harsh code which governed the relations between freemen and slaves was considerably mitigated. The provinces were well governed, the arts and sciences encouraged, salaries paid to professors of philosophy and rhetoric, and persecutions of the Christians checked. Antoninus died March 7, 161.

Antonio. Character in Shakespeare's comedy, *The Merchant of Venice*. The plot hinges on his generosity in borrowing money for his friend Bassanio from Shylock the Jew, on condition that, if the money be not repaid at the appointed time, he shall forfeit a pound of his flesh.

Antonio (1531–95). The prior of Crato and pretender to the Portuguese throne. He was a natural son of Louis, duke of Beja, second son of Emanuel I of Portugal, and was unsupported by the nobles or the populace in his claim to the throne. In 1581 he was defeated at Alcantara by Philip II of Spain, and fled to Paris with the crown jewels, among which was the famous Indian diamond known as the Sancy diamond. After making an attempt on the Azores in 1582, and accompanying a futile English expedition against Portugal in 1589, the prior returned to Paris, where he died. He received the wealthy priory of Crato in youth, but was never ordained.

Antonio, ANTONELLO D' (c. 1414–93). A Venetian painter, called Antonello da Messina. He was born at Messina, and after study in Rome and Naples went to Bruges to learn from Jan van Eyck the new method of painting in oils.

He settled in Venice, where he died. He introduced oil painting among the Italians, and happily blended the somewhat hard manner of the Flemish school with the softness and suavity of the Italian. His *S. Jerome in his Study*, in the National Gallery, London, is perhaps his masterpiece, and the *Portrait of a Young Patrician*, at Venice, is also remarkable.

Antonius, MARCUS (c. 83–30 B.C.). Roman statesman and soldier, commonly referred to as Mark Antony. He was of patrician birth and related through his mother to Julius Caesar. In spite of reckless dissipation, his brilliance and daring were recognized by Julius, of whom he became the whole-hearted partisan and by whom he was rapidly advanced. He commanded the left wing of the army of Julius which overthrew Pompey at Pharsalus in 48 B.C. In 44, just before the murder of the dictator, Antony was named his colleague in the consulship. After the murder, the conspirators did not realize how dangerous he was, and he soon took up arms at the head of the Caesarian party. He sought the alliance of Julius's adopted son Octavian, and for a time the future rivals made common cause. They compelled their own appointment, with a subordinate colleague Lepidus, as triumvirs for the restoration of the commonwealth; in effect they were a commission with unlimited authority. Butchering by a proscription their personal enemies, including Cicero, they turned their arms against Brutus and Cassius and the republicans, who were crushed at Philippi, Oct., 42.

The victors, practically ignoring Lepidus, now divided the Roman world, Octavian taking the west and Antony the east. Within two years there was a serious breach, but war was averted by temporary reconciliation. Antony became enslaved by the fascination of the Egyptian queen Cleopatra. But the partition of the Roman world was intolerable to both Octavian and Antony, and in 31 they joined battle for mastery. The victory fell to Octavian's fleet, under the command of Agrippa, in the sea-fight off Actium, Sept. 2; and Antony fled back to Egypt with Cleopatra. He had become incapable of sustained effort, and on the arrival of Octavian next year he put an end to his own life, an example immediately followed by Cleopatra; which secured the complete predominance of Octavian in the Roman empire.

Antony's character is admirably portrayed in Shakespeare's two plays, *Julius Caesar* and *Antony and Cleopatra*; and Dryden's *All for Love* dramatizes his relations with the Egyptian queen. See *Augustus*; *Caesar*; *Cleopatra*.

The grandfather of Marcus Antonius bore the same name and was a lawyer and orator (143–87 B.C.). He distinguished himself against the pirates of Cilicia, of which he was governor in 103. He was consul in 99 and censor in 97. A supporter of Sulla and the aristocratic party, he was put to death by Marius. Cicero ranked him as an orator with the greatest of Greece.

Antonomasia (Greek *anti*, instead; *onomazein*, to name). Use of a descriptive epithet in place of a proper name. Examples are "His Grace of Canterbury" for the archbishop, "the honourable member for ——" instead of the name of the M.P. referred to, "the swan of Avon" for Shakespeare, or "the inspired tinker" for Bunyan.

Antony and Cleopatra. Tragedy by Shakespeare. Antony had met Cleopatra when he was triumvir with Octavius and Lepidus. For her he neglects his first wife, Fulvia, and his second wife, Octavia, sister of Octavius. He quarrels with his brother-in-law for expelling Lepidus from the triumvirate, is defeated by him at the naval battle of Actium, and then, deserted by his friend Enobarbus (Ahenobarbus), after witnessing the surrender of the Egyptian fleet and receiving a false report of Cleopatra's death, falls upon his sword and dies in her arms. Cleopatra, to avoid gracing Caesar's triumph, kills herself by applying asps to her arm and breast.

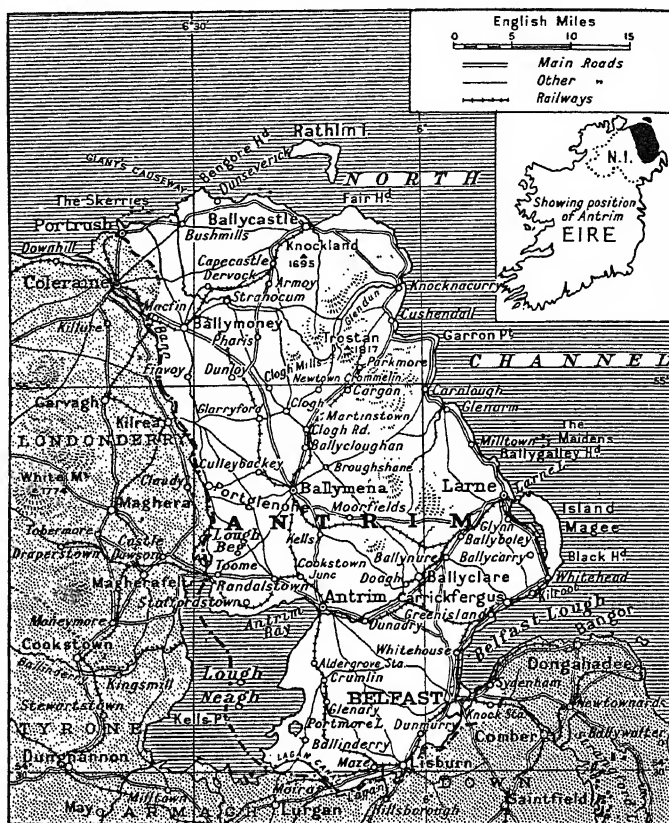

The play was licensed May 20, 1608; first printed in the 1623 folio; and is based upon North's version of Plutarch's *Life of Antony*, much of the text of which is incorporated. Preceded by *Julius Caesar* and followed by *Coriolanus*, it forms the second of the poet's Roman trilogy. There are five acts; the action, with intervals, extends over 12 days, and is quick to the verge of breathlessness. It begins and ends in Alexandria, the scene shifting meanwhile between Rome, Messina, near Misenum, a place in Syria, Athens, and Actium. It contains 2,761 lines of blank verse and 42 pentametric rhymes, as well as passages in prose. Dryden's first drama in blank verse, *All for Love*, or *The World Well Lost*, 1678, was based on this tragedy.

Antonym (Gr. *anti*, against; *onyma*, name). Word bearing the opposite meaning to that of another word. It is peculiarly effective in the statement of a contrast, e.g. A bliss in proof, and prov'd, a very woe (Shakespeare, sonnet 129), where woe is the antonym of bliss. An antonym is thus the converse of a synonym (*q.v.*). Many dictionaries of synonyms and antonyms have been compiled.

Antraignes, EMMANUEL HENRI LOUIS ALEXANDRE DE LAUNAY, COUNT D' (c. 1755-1812). French political agent. After several years of travel he went to Paris, where in 1788 he published his revolutionary Memoir on the States-General. At the outbreak of the Revolution he was elected deputy, but quickly changed his opinions. In 1790 he left France and intrigued on behalf of the Bourbons at the European courts. In 1803 he was sent by Alexander of Russia to Dresden, but was dismissed for writing an anti-Bonapartist pamphlet. He settled in London, and is said to have divulged to Great Britain the secret articles of the treaty of Tilsit. He and his wife were murdered near London, July 22, 1812, by an Italian servant. He encouraged the two Montgolfier (*q.v.*) brothers in their early experiments in aeronautics.

Antrim. North-east maritime and most populous co. of Northern Ireland. Its greatest length is 65 m., greatest breadth 30 m., coastline 90 m., and land area 1,098 sq. m. Rathlin Island and the Skerries, off the N. coast, and the Maiden rocks with two lighthouses, off the E. coast, form part of the co. The chief rivers are the Bann and Lagan, and Lough Neagh is the largest lake. The surface is hilly in the N. and E., and attains its highest alt. in Trostan Mt. (1,817 ft.); much of the interior is bogland. On the north coast is the Giant's Causeway (*q.v.*), a remarkable example of columnar basalt formations.

The centre of the linen industry, Antrim has also cotton and woollen manufactures, while oats, potatoes, flax, and cereals are grown in considerable quantities. Good rock salt is obtained near Carrickfergus, iron ore, limestone, and coal are worked, and salmon fishing and distilling engaged in. Belfast, the metropolis, Lisburn, Carrickfergus, Ballymena, Ballymoney, Larne, Antrim, and Portrush are the principal towns. Apart from Belfast, Antrim returns 2 M.P.s to

Antrim, the most populous county of Northern Ireland. It is on the N.E. coast, and in its most northerly part is the Giant's Causeway

Westminster, 7 to the N. Ireland parliament. Pop. excluding Belfast, 213,024. That nearly half are Presbyterians is in large measure due to colonisation from England and Scotland under James I.

Antrim. Market town of Antrim, N. Ireland. It is 22 m. by rly. N.W. of Belfast, near the N.E.

Antrim. One of Ireland's mysterious ancient round towers is found near Antrim. It is 95 ft. high

shore of Lough Neagh. Linen, paper, and woollen goods are made. Near are Antrim Castle, Shane's Castle, and a well-preserved round tower. Market days, Tues. and Thurs. Pop. 1,979.

Antrycide. Synthetic drug developed as a prophylactic against trypanosomiasis, the cattle disease caused by the tsetse fly. See N.V.

Antsirane. Coast town and free port of Madagascar, on Diégo Suarez Bay. Founded in 1885, it is the chief French naval station in the Indian Ocean. On May 5, 1942, British troops, having landed near Antsirane, were held up by Vichy French forces 5 m. S.W., but after the arrival of reinforcements the town was carried by assault May 6, Royal Marines having landed in the defenders' rear. Pop. 15,277. See Madagascar.

Antung. One of China's nine N.E. provinces. It is bordered on the E. by the state of Korea, and is served by the Antung-Mukden rly. As the southern Changpai Mts. are within its borders, the prov. is an important

timber centre. Wheat, kaoliang, and soya beans flourish in the lowlands. Area 43,250 sq. m. Pop. 5,340,000. The capital is the old treaty port of Antung on the Yalu river. Pop. est. 10,000.

Antwerp. Second city and most important port of Belgium, one of the great ports of the world. On the right bank of the

Antwerp arms

Schelde, 55 m. from the sea and 27 m. by rly. N. of Brussels, it is the capital of the province of the same name, and has an estimated pop. of 254,057. Although it has manufactures of cloth, cotton, and silk goods, as well as diamond cutting and other industries, it is chiefly famous as a centre of import and export. While a great tidal river available for ships of the largest tonnage flows past its quays, it is situated two degrees E. of Paris, and is the Continental Atlantic seaport nearest to the heart of Europe. An extensive canal system makes it the great port for the industries of the Rhine and of Belgium itself.

HISTORY. The name (French *Anvers*, Flem. *Antwerpen*) is derived from the practice of punishing pirates or smugglers by cutting off their right hands and throwing them into the Schelde, enforced by Brabo, a semi-mythical governor in the early Frank period. The place appears as *Andhunerbo*—plunging the hand—in A.D. 511. This disposes of Motley's attempt to derive it from "an'twerp," on the wharf. The arms of Antwerp, even in the 9th century, show two severed hands and a castle.

In its early days, Antwerp was a stronghold or barrier fortress against the raids of piratical invaders. It was attacked several times by the Normans; in 836 they captured and burnt the town. It recovered, and in the next century was made into a marquisate to protect the German frontier from attacks by the counts of Flanders. In the 12th century it joined the Hanseatic League, thus beginning its rôle as a commercial rather than political metropolis. For three centuries it was subordinate to Bruges, which had free access to the ocean by the Zwyn, an arm of the sea navigable by the largest ships of the period. This channel began to be sand-locked early in the 15th century, and the comple-

tion of the process, which undermined the prosperity of Bruges, was followed by the transfer of the foreign guilds in 1490 to Antwerp. From that year it was the most important commercial city in Europe. A thousand foreign merchants occupied as many separate houses, and among the most famous of them was Sir Thomas Gresham. These houses were divided among the seven nations, English, French, Spaniards, Italians, Portuguese, Germans, and the Danes and the Hansa counted together. The population exceeded 200,000, and about 500 ships entered or left the port daily in the year. Spices, sugar, silk and gold embroideries, wine and grain were imported in great quantities, and highly valued Flemish carpets, textiles, and gold and silver articles were sent to India, Arabia, and Persia.

Then Antwerp became involved in the wars of religion in the 16th century, and her fortunes declined with those of Spain. The duke of Alva built the first modern citadel on the site of the margrave's castle, but he forgot to pay his men regularly, and they mutinied. The soldiers sought to pay themselves by plundering the citizens. The Spanish Fury of Nov., 1576 raged for three days, when 6,000 citizens were massacred. Then followed a great exodus of the people. A second blow was inflicted in 1585 by Parma, when, on capturing the city, he ordered that all who adhered to Protestantism should leave within a specified period. Thirty thousand emigrated. The United Provinces imposed their terms on Spain.

and closed the Schelde to Antwerp, thus making sure of the pre-eminence of their own ports.

During the 17th and 18th centuries Antwerp sank into complete insignificance, and it was said that one-third of its inhabitants lived on charity. At the end of the 18th century the French Republicans freed the river; but it was not until 1831-32, when England and France forbade the Dutch blockade and kept navigation open, that Belgium recovered the use of her own river for commerce. The First Great War revealed that the Dutch clung to their putative sovereignty, held under the treaty of Munster (1648). Their government closed the river in the face of the Allies to their troops and armaments.

For the Siege of Antwerp in Sept., 1914, almost at the outset of the First Great War, see Antwerp, Siege of. The city remained in German occupation from Oct., 1914, until Nov., 1918.

Description of City

In respect of public buildings, monuments of antiquity, broad boulevards, and residential mansions, Antwerp is not surpassed by any other city in Belgium. The old enceinte was removed in 1859 to give place to the new boulevards which form a crescent round the eastern side of the city, and two large suburbs were then incorporated. A famous street is the Place de Meir, which contains the royal residence, used, however, only on rare occasions. Here also stood the house of Rubens.

The most famous of the old buildings is the magnificent cathedral of Notre Dame, begun

in 1352 but not completed until 1518, the choir being added about 1550. The tower with its spire is 470 ft. high. The cathedral, in its beautiful design, has been compared to point lace. It contains some old glass, a fine pulpit, and masterpieces of Rubens. In the church of S. Jacques, completed in the 15th century, is the chapel of the Rubens family, and his painting of his family in

Antwerp. Plan of the main part of this Belgian city

Antwerp. 1. The square of the Hôtel de Ville, looking across the Schelde. 2. The Cathedral. 3. Place de Meir, showing the Boeventoren skyscraper. 4. The Steen (part of the old castle, now a museum) with the quays

an allegorical form, including himself in the guise of S. George.

The Guild Houses, the Hôtel de Ville, and the Plantin Museum all date from the 16th century. The last named was the residence and workshop of the great printers, Plantin and Moretus, and was sold to the city in 1876. The Steen on the quay represents the old castle. It has undergone a modern restoration, but the dungeons are at latest of the 10th century.

Among modern buildings may be named the Royal Museum, the Flemish Opera House, the Law Courts, and the National Bank. The museum, 1879-90, has a superb collection of paintings by the old masters, including many of the early Flemish school, and some 500 works by modern painters. Thoroughly modern in equipment are the quays which extend for 5 m along the right bank of

the river. The Zoological Gardens rank among Europe's best.

By 1939, 158 shipping lines (about 2,000 ships) used the port regularly, and about 80 others maintained less regular services. One quarter of the ships entering the port were British. In 1905 a scheme of improvements to cost nearly £10,000,000 was sanctioned. Further extensions and improvements were made shortly after the First Great War, and by 1940 there were 26½ m. of dock frontage, and 3½ m. of riverside quays. In the harbour area alone there were 500 m. of railway track.

Antwerp: 1940-45

In the Second Great War Antwerp fell into German hands on May 18, 1940, without having played any direct part in the defence of Belgium.

While the city was in German occupation little information came

out. In the summer of 1940 the enemy concentrated in the port and estuary numbers of barges and similar craft for the projected invasion of Britain. These vessels were repeatedly bombed by the R.A.F., and during the ensuing years of the war there were frequent attacks by Allied aircraft on military objectives in the neighbourhood. After the Allied landings in Normandy during June, 1944, and the subsequent operations that led to the reconquest of France and Belgium, the city and port of Antwerp became a major objective as a potential supply base for the Allied invasion of Germany.

Though Antwerp was liberated from the Germans on Sept. 5, 1944, the port could not be brought into use until enemy forces occupying the islands of the estuary had been expelled, and Allied control estab-

lished over the mouth of the Schelde. By the middle of November this had been accomplished, and the great port was captured almost intact. (See Walcheren.) A fortnight later Antwerp began again to receive ocean-going ships, and soon became one of the chief supply bases for the Allies.

Up to that time the damage inflicted on the city had mainly consisted of destruction by German artillery fire in the port district and the suburb of Merxom. The Boeventoren skyscraper was also damaged. Two tunnels under the Schelde were rendered unusable by the Germans before they left. But between Oct., 1944, and March, 1945, Antwerp became a principal target for German V-bombs, 700 of which fell in the area. Half the total number of houses in Antwerp were destroyed, while 5,000 people were killed and 21,000 wounded. The object of these attacks was the destruction of the port to prevent Allied supplies going through. British troops of the Pioneer Corps and the No. 1 Overseas column of British Civil Defence were in action in Antwerp throughout the period.

Antwerp, SIEGE OF, 1914. This was one of the most significant operations of the first autumn of the First Great War because of its bearing on the "race to the Channel ports." It was begun by the German General von Beseler with 125,000 men on Sept. 27, 1914. The forts guarding Antwerp were shown at once to be powerless against the huge German guns, and the Belgians prepared to evacuate the city, but to defend Termonde and the country W. of the Schelde, so as to keep a line of retreat open for their field army. 100,000 strong.

On Oct. 3 Mr. Winston Churchill arrived from London with a promise from Great Britain and France that, if the defence of the city could be prolonged three days, they would inform Belgium whether or not a relieving army could be sent and in what strength. In any event the British 7th division would be moved to Ghent to cover the Belgian retreat, and naval brigades and heavy guns dispatched to Antwerp to assist in protracting the resistance. Some 2,200 British marines arrived late on Oct. 3, followed by 6,000 men of the Royal Naval Division, mostly without proper equipment, on October 5-6.

Antwerp. First ship of an Atlantic war convoy to arrive in the great Belgian port after its liberation by the British in November, 1944

From Oct. 6, however, the bombardment was intensified; the Belgian field army withdrew towards Ghent; officials, refugee civilians, and troops poured out of Antwerp; and on Oct. 9 the city surrendered and was entered by the Germans. About 200 civilians had been killed, while the British losses were 37 killed, 193 wounded, 1,560 interned in neutral Holland, and 800 prisoners. Yet the movement of a British force to Antwerp had prolonged by some days the resistance of that place, and detained a large German force which otherwise might have pushed through Ypres to the sea and captured the Channel ports.

Anu. Principal and most ancient deity of Babylonian and Assyrian myths. His name is found in the earliest of transcribed inscriptions. He was the chief of the

upper triad of deities, representing heaven, while Bel or Ellil, and Ea represented the earth and the lower regions.

Anubis. Egyptian deity. The reputed son of Osiris and Nephthys, the rising and the setting sun, he was primarily a twilight god. He is represented as jackal-headed, was the sombre guardian of the

dead, and presided over embalmings. He was later identified with the Greek Hermes. Under the New Empire he watched the scales at the weighing of souls before Osiris in the under-world. See Amanti; illus. p. 455.

Anupshahr. Town in the United Provinces, India. It stands on the Ganges, 70 m. E.S.E. of Delhi, is ill-built and crowded, and is a place of pilgrimage.

Anuradhapura. Ruined city of Ceylon. It is 84 m. N. of Kandy on the rly. from Colombo. The capital of Ceylon from 437 B.C. to A.D. 750, it is famed for its ancient monuments and its Bo tree. In its grand proportions, 256 sq. m., in the number and beauty of its temples, and in population, it vied with Babylon and Nineveh. The cleared environs contain some 3,600 people.

Anvil. Commonly a block of iron having a flat steel surface upon which metals are forged or wrought by hammering, as by blacksmiths, goldsmiths, etc. The block has at one end a substantial conical projection termed a beak or horn, for use in bending operations. The anvil is provided with holes for the reception of tools, such as swages or cutters. Heavy anvils are mounted upon wooden foundation blocks; those for steam or power hammers, and for punching and other machines, are embedded to a considerable depth and supported upon piles of masonry.

Anzac. Popular designation of the troops from Australia and New Zealand who fought in the First and Second Great Wars. The word was generally supposed to have been derived from the initial

Anubis,
Egyptian deity
British Museum

letters of the words Australian (and) New Zealand Army Corps. It seems to have had an earlier origin in an Arabic word meaning "to cause to jump," being possibly suggested by the nickname Kangaroos applied to Australian troops when quartered in Egypt. The name was also given to the cove, N. of Gaba Tepe, Gallipoli, where they landed on April 25, 1915. The date is still celebrated annually as Anzac Day.

The word was officially adopted by the War Office in 1916, and so popular did it become that in Nov., 1916, an Anzac (Restriction of Trade Use) Bill was passed into law prohibiting the use of the word for trade purposes. Previously Australia had made the use of the word as a trade mark illegal.

Anzin. Town of France, in the department of Nord. On the Schelde, it has developed from a suburb of Valenciennes into a coal-mining town. During the First Great War it was in the occupation of the Germans. The largest mining company is the Compagnie d'Anzin, founded 1716. Pop. 15,300.

Anzio OR PORTO D'ANZIO. Fishing harbour and seaside resort of Italy, the ancient Antium (*q.v.*). It is 33 m. S.E. of Rome. Until the Second Great War and the battle of the Anzio beaches in Jan., 1944, its principal interest consisted in its antiquarian remains.

Anzio Beaches, BATTLE OF THE. Operations of the Second Great War. On Jan. 22, 1944, full-scale landings were made on beaches N. of the Italian port of Anzio by Anglo-U.S. forces under the protection of powerful naval and air cover. Landings were also made simultaneously at Nettuno, a small resort a few miles E.N.E. of Anzio. A strong bridgehead was effected and the Anzio port area became the centre of prolonged and bitter fighting between the British-American and German forces. The main purpose of the landings was to disrupt the German lines of communication between Rome and their strong position at Cassino opposite the main Allied 5th army, to force the Germans to withdraw in whole or in part from that position, and to break up their strong southern front, against which the 5th army had long been hammering.

Allied casualties on the first day of the landings were fewer than 100. Nettuno was captured two days later, and points were reached near the Appian Way, a few miles beyond the Pontine

Marshes. A constant stream of troops, tanks, guns, and supplies of all kinds continued to pour on to the beaches, and within a fortnight the advance from the bridgeheads threatened to engulf Littoria, Aderna, and Carroceto (Agrilia). Kesselring, commander of the German armies in Italy, waged a series of powerful counter offensives in an attempt to drive the invaders back to the sea. He reduced the Allied salient, but was unable to smash through to the coast. Anzio and Nettuno were subjected to heavy long-range shelling, and during Feb. the Germans succeeded in capturing a number of villages and important positions some 10 m. N. of Anzio harbour, Kesselring employing some 50,000 troops on the whole of the Anzio front, strongly supported by tanks and artillery. Fighting increased in intensity and casualties were heavy on both sides. In March the Germans tried to bring the entire bridgehead under constant bombardment, and six divisions faced Anzio, their purpose being to drive a wedge. This, however, they were unable to do owing to Allied superiority in tanks and planes. By April 17 the Luftwaffe had made some 270 attacks on the bridgehead, but because of heavy losses they abandoned raids at the end of that month. But German pressure on all sides of the salient remained powerful, and it was not until May 25 that patrols from the bridgehead linked up with patrols from the advancing main 5th army a few miles S.E. of the bridgehead, on the coastal highway between Terracina and Anzio. As a result, a unified Allied front stretched across Italy, 25 m. S. of Rome at its nearest point, and made the advance on Rome immediately feasible. See Italy in the Second Great War.

Anzoategui. A state of Venezuela. It is bounded N. by the Caribbean Sea, W. by Guárico, E. by Monagas, and S. by the Orinoco. Cattle-raising is the chief indus-

Aosta, Italy. The Château of Fénis, built by the Counts of Challant, between Châtellon and Aosta

try, and coffee, coal, and hides are the principal products. Barcelona is the capital. Pop. 136,573.

Aomori OR AWOMORI. Harbour of Japan, on the N. shore of Honshu island. It stands at the S.W. angle of Rikuoqu Bay, 22 m. by rly. N.E. of Hirosaki, is connected by rly. with Tokyo, and has a steamer service to Hakodate. Capital of the northernmost prefecture of Honshu, it became an open port 1906. Pop. 93,413.

Aonla. Town of the United Provinces, India, 21 m. S.W. of Bareilly. It contains the tomb of Ali Mahomed, the Rohilla chief.

Aorist (Gr. *a*, not; *horizein*, to bound). Tense of the Greek verb expressing momentary or completed action in the past, the result of which does not continue to the present time, *e.g.* I found it yesterday. In English grammars this tense is called preterite, perfect, or simply past.

Aorta (Greek *aerrein*, to raise). Main artery of the body. It originates or arises, hence the

Aorta, cross section, showing the valves

name, from the left ventricle of the heart, and having passed over the root of the left lung, descends in front of the vertebral column into the abdomen.

There it divides into the two common iliac arteries. See Anatomy.

Aosta. City of Italy, in Aosta province. The ancient Augusta Praetoria Salassorum, it stands at the confluence of the Dora Baltea with the Valpelline, 49 m. direct and 80 m. by rly. N.N.W. of Turin. Its strategic position at the junction of the routes over the Great and Little St. Bernard induced Augustus to found a military camp here in 25 B.C. Its Roman walls are well preserved, as are the Porta Praetoria and two other gates and the Arch of Augustus. It has a 14th century cathedral, the church of Sant' Orso, dating from the 5th but rebuilt in the 12th century, a 15th century priory, and ruins of a Roman theatre, amphitheatre, baths, bridges, etc. It trades in wine, leather, and cheese. The Val d'Aosta, whose inhabitants are mostly French-speaking, is noted for its pine trees, minerals, and mineral springs. Pop. 23,641.

Aosta, DUKE OF. Italian royal title. Emmanuel Philibert, duke of Aosta (1869-1931), was the eldest son of Amadeus, king of Spain 1870-73, and grandson of Victor

Emmanuel II. king of Italy. Born at Genoa, Jan. 13, 1869, he was married in 1895 in England to a Bourbon princess. In the First Great War the duke led the 3rd Italian army, and was largely responsible for the capture of Gorizia from the Austrians in Aug., 1916. He died July 4, 1931.

His elder son, Amadeo Umberto (1898-1942), cousin of King Victor Emmanuel III of Italy, was born Oct. 21, 1898.

In 1927 he married princess Anne of France, daughter of the duc de Guise, and ten years later succeeded Graziani as viceroy of

Amadeo Umberto,
2nd duke of Aosta

Abyssinia. On Italy's entry into the Second Great War in 1940, he was appointed Italian C.-in-C., East Africa. In April, 1941, he and his government fled from Addis Ababa before the British Imperial forces entered the city, and subsequently took up headquarters at Amba Alagi (*q.v.*). Having surrendered with 19,000 troops to the British on May 19, he was sent as a prisoner to Kenya, where he died in captivity, March 3, 1942. His elder brother, the duke of Spoleto (b. 1900), who succeeded to the title, married princess Irene of Greece in 1939. On May 18, 1941, he was created King Tamislav of Croatia at the instigation of Mussolini, though he never visited his kingdom, and after the fall of Mussolini in July, 1943, renounced all pretensions to the throne.

Apache. Group of N. American Indian tribes formerly occupying parts of New Mexico, Arizona, and Texas. Of Athapaskan stock, their name (Zuñi *enemy*) properly denotes their Navaho neighbours. Daring horsemen, they caused much trouble in the U.S.A. until shepherded into reservations. They number about 6,500.

The name was assumed by Paris hooligans, who became obnoxious by resorting to murder and outrage. One of the most notorious apaches was a Russian, a native of Pskov, known generally as Peter the Painter and to the police as Piatkov. Peter had been a house-painter at Marseilles. The Danse d'Apache, a portrayal of the hooligan costume and temperament, was first presented by Max Dearly and Mlle. Mistinguette at the Moulin Rouge, Paris.

Apalachee Bay. Opening on the S. coast of Florida, U.S.A., forming an arm of the Gulf of Mexico. About 90 m. across, it receives several small rivers and is a safe harbour for small vessels. Its mean depth is about 18 ft. The Apalachee river, known also as S. Mark's river, rises near the N. border of Florida and flows S. by W. into Apalachee Bay.

Apalachicola. River of Florida, U.S.A. Formed by the confluence of the Chattahoochee and Flint rivers, at the S.W. extremity of Georgia, it flows S. to the Gulf of Mexico, through the Bay of Apalachicola. Its length is 90 m., and it is navigable throughout by steamers. The city and port of Apalachicola, at its mouth, exports lumber, naval stores, and cotton, and has a monument to Dr. John Gorrie, inventor of the cold-air refrigeration process. It is on the Apalachicola Northern rly. Pop. 3,268.

Apam. Town of Mexico, in the state of Hidalgo. It stands on an elevated tableland, 57 m. by rly. N.E. of Mexico City. Maguery, or agave, from which the national drink pulque is made, is largely grown, and the town is one of the most important depots of the pulque industry.

Apanage or **APPANAGE.** This is, strictly, a portion of land or property set aside for the support of a younger son. At present the word has a somewhat wider meaning, and may be defined as a perquisite, something attached to something else; for instance, the duchy of Lancaster is an apanage of the crown of England, and Easter offerings are an apanage of a church living. It is a French word derived from the Latin, meaning literally to give bread (*panem*) and so to provide. See Primogeniture.

Aparri. Town of the Philippine Islands. It stands on the N.E. coast of Luzon, at the mouth of the Cagayan river. Though subject to earthquakes, it is the only practicable harbour on the N. coast of Luzon. Tobacco and rice are grown in the district.

Before the Japanese invasion of the Philippines in December, 1941, enemy agents prepared a landing ground at Aparri, camouflaged as a ricefield. Japanese aircraft landed on Dec. 8, and a few days later were operating against U.S. and Filipino forces defending Luzon. The town was recaptured by U.S. troops and Filipino guerrillas on June 22, 1945.

Apatin. Town in the Dunavska district of Yugoslavia. On the left

bank of the Danube, it is the last important town before the mouth of the Drave is reached. It is 12 m. by rly. S.W. of Zombor, on a loop line from that town to Gombos, where the rly. crosses the Danube. It is a farming centre on the Alföld, and the only town close to the river bank in a reach of more than 50 m.; there the land is higher and the river marshes are to the W. on the right bank. The town has the largest German colony in the district between the Danube and the Tisza. The Germans are descended from settlers sent by Maria Theresa to colonise the lands recaptured from the Turks in the 18th century.

Apatite (Greek *apatē*, deceit). Calcium fluo- or chloro-phosphate. It is an hexagonal mineral occurring chiefly as segregations from plutonic igneous rocks and in metamorphosed phosphatic limestones. The fluo-phosphate, or fluor-apatite, is usually found in pegmatites and other segregations from acid igneous rocks; the chlor-apatite is more often associated with basic rocks such as gabbros and norites. It is widely distributed in all igneous rocks as microscopic crystals and as such is occasionally met with in sedimentary rocks. Under the name of mineral-phosphate it is mined chiefly in Canada and Scandinavia, and is used as a manure. Its name is due to the fact that its appearance is deceptive, it being frequently confused with other minerals. See Rocks.

Ape. Term applied to the tailless or short-tailed anthropoid members of the order Primates, e.g. the gorilla and chimpanzee, and the Barbary ape. Until the 16th century it was the general word for a monkey.

Apeldoorn. Town of Holland, in Gelderland province. It is 26 m. by rly. E. of Amersfoort, and is served by canals. It has numerous paper-mills, whose produce goes chiefly to the East Indies, textile manufacturers, and copper foundries. The Oranje and Wilhelmine are the finest of several attractive parks. Near is Het Loo, the summer residence of the Dutch sovereigns. It was the favourite hunting-lodge of William of Orange. Pop. 71,158.

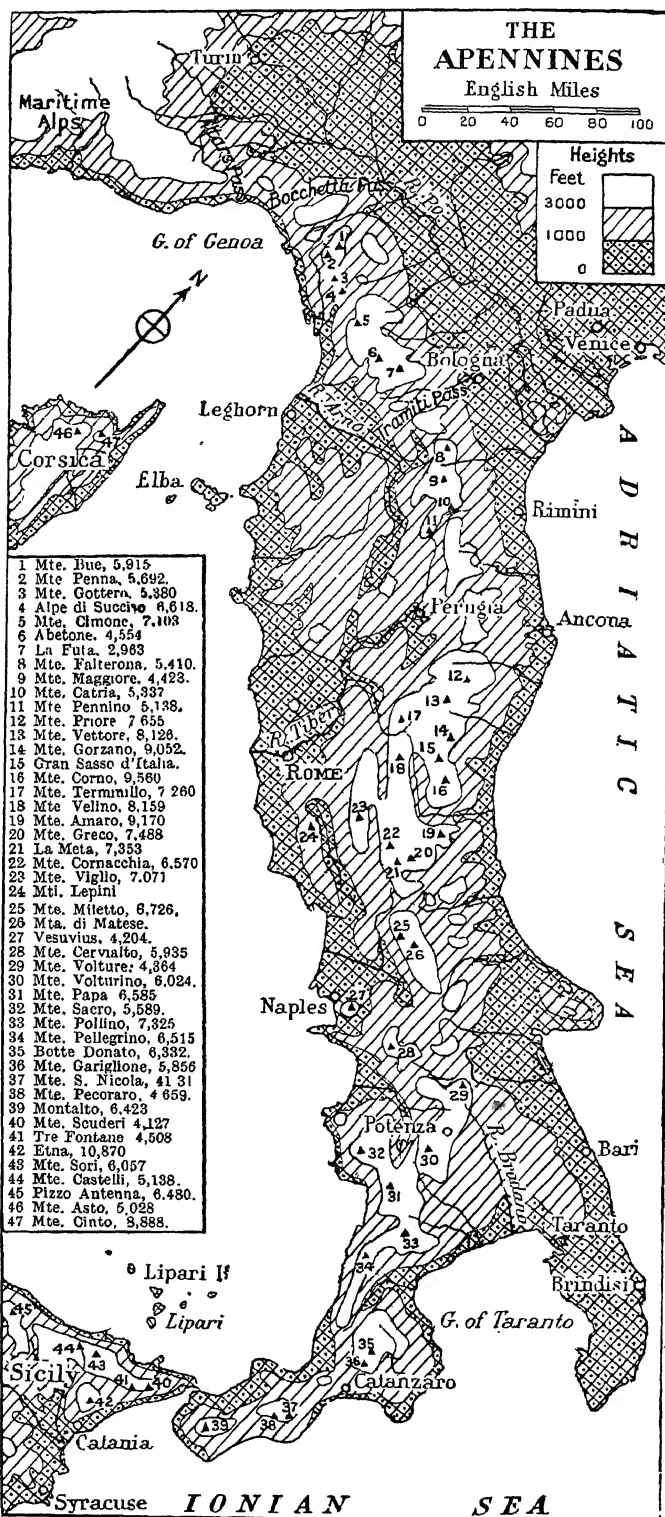

Apelles. A Greek painter. He flourished in the latter half of the 4th century B.C., and was probably born at Colophon in Ionia, in Asia Minor. The universal opinion that he was the most accomplished painter of classical times is founded

on fact. He is credited with having discovered a very thin black varnish to preserve a painting and improve its tone, something akin to the modern glazing process. He painted on panels and not on the wall. Apparently he preferred the single figure to more elaborate compositions. His portrait of Alexander the Great wielding a thunderbolt and his Venus Anadyomenē, or Venus rising from the Sea, were two of the most famous works of art in antiquity. None of his works has survived.

Apennines. Mountain range of S. Europe. The mts. traverse the entire length of Italy, reappear in Sicily, and have a length of about 800 m. Geographically divided into three sections, viz. northern, central, and southern, the Apennines start from the Maritime Alps, as they traverse the peninsula they bear various local names, e.g. Etruscan, Roman, Neapolitan, and Calabrian Apennines, and form the watershed between the Mediterranean and Adriatic Seas.

Always steep where they approach the sea, in central Italy the Apennines broaden out into parallel chains, terraces, and plateaux. They have their greatest height in Abruzzi e Molise, where the E. of the two parallel chains of the Gran Sasso d'Italia attains an alt. of 9,560 ft. in Monte Corno. Other peaks from N. to S. are Monte Cimone, 7,103 ft.; the Monti Sibillini, rising in the peak of Vettore to 8,126 ft.; Monte Terminillo, 7,260 ft., Monte Velino, 8,159 ft., Monte Amaro, 9,170 ft., Monte Pollino, 7,325 ft., and Montalto, 6,423 ft., the highest peak of Aspromonte. Among the lateral valleys formed by parallel ranges are the Florence-Pistoia, the Aterno, and the Chiana. On the W. side fairly large river-basins occur, but on the E. the streams are short and rush to the sea through precipitous valleys.

The Apennines are crossed by 13 principal passes, many being Roman roads, e.g. the Via Salaria and Pietra Mala; seven are traversed by rlys. There is no region of perpetual snow, and there are no glaciers. Generally monotonous, the great wall of mountains is often dreary and barren; poor grass and scrubby bushes cover large tracts. Much of the forest timber has been felled, and only where the mountains dip

Apennines. Monte Corno (9,560 ft.), part of the Gran Sassa d'Italia, or Great Rock of Italy, the highest part of the Apennine range

down to the sea, as in the Riviera and round the Gulf of Naples, is there rich vegetation. In the picturesque portions of the Abruzzi wolves, wild boars, and occasionally bears are found.

The Apennines lack minerals, though they contain various mineral springs. Geologically they are composed of Mesozoic and Tertiary beds, including Triassic, Jurassic, Cretaceous, Eocene, and Miocene beds, containing granite, gneiss, slate, sandstone, limestone, and marble. From Vesuvius to Etna they are subject to volcanic and seismic disturbance. Consult Six Months in the Apennines, N. McN. Stokes, 1892.

Apenrade or **AABENRAA**. Town of N. Slesvig, Denmark, 38 m. N. of Slesvig on the Apenrade Fjord. Its industries are mainly shipping, fishing, and shipbuilding, and it caters for visitors. See Slesvig.

Aperient (Lat. *aperire*, to open). Medical term for a preparation which produces gentle action of the bowels. The most familiar purgatives include cascara, castor oil, senna, and rhubarb.

Apex. Latin word meaning in general a point, specially used in connexion with the sun. The sun, with its attendant planets, is moving through the so-called fixed stars towards a point in the heavens which is called the apex of its motion. In this direction the stars (apart from their own individual motions) are apparently separating from each other owing to the sun's approach; stars in the opposite direction, towards the antapex, seem to be closing in. Around the great circle halfway between these points the apparent motion of the stars is a reflection of the solar motion. The direction of the motion can therefore be found from a study of stellar

proper motions (*q.v.*). The speed as well as the direction can be found from measurements of radial velocity (*q.v.*). Stars close to the apex tend to have radial velocities of approach, stars near the antapex seem to be moving away, while stars halfway between have on the average no systematic radial velocity at all. When the velocities peculiar to the individual stars are eliminated by averaging amongst a large number of stars, the true solar

Aphis. Specimen of the rose aphid, or green-fly, greatly magnified

motion remains. The sun is found to be moving at about 13 m. per sec. towards the apex in the constellation of Hercules at right ascension 18 hours, declination +30 degrees.

Aphasia (Gr., speechlessness). Disorder of speech due to haemorrhage into the brain from the bursting of a blood vessel or disease of the brain. In this condition the patient's muscles of speech are not affected, and he may show that he quite understands what is said to him, but he is incapable of expressing his thoughts in words. Sometimes there is merely a blurring of speech or hesitancy in utterance; in other cases words are mixed up and wrong words used; and in severe cases the patient may be completely dumb. Reading and writing are also usually

interfered with. After an attack of apoplexy resulting in aphasia, considerable power of speech may be regained as time goes on, and sometimes a good deal can be done by re-education. See Brain.

Aphelion (Gr. *apo*, from; *helios*, sun). Point in an orbit of a planet or a comet farthest from the sun.

Aphis. Name given to a large group of insects of the bug family (Hemiptera), popularly known as green-fly or plant lice. Soft-bodied, usually wingless, with prominent eyes and a suctorial beak which is kept thrust into the tissues of the plant infested by them, they spend their whole time in sucking the juices, often with disastrous effect. The surplus food is discharged as honeydew through the anus. This falls as a kind of varnish on the leaves and stem of the plant, choking its breathing pores. Ants are extremely fond of honeydew. Near the tail end of the aphis is a pair of tubes through which drops of a waxy fluid are secreted.

In spring the eggs of the aphis hatch out as females. These in a few days give birth to young ones by parthenogenesis or virgin birth. These young repeat the process when only a few days old, and so on through the season. In the late autumn males are born as well as females. These unite sexually and eggs are laid which hatch out in the spring. The only remedy for the ravages of aphides is to spray the plants with derris or nicotine, or to fumigate plants under glass. See Insects.

Aphonia (Greek *a*, not; *phonē*, voice). Loss of voice. In the majority of cases this condition is due to either hysteria or neurasthenia, the patient's organs of phonation being quite free from disease, though owing to a deficiency in will-power he is unable to produce any sound and can only speak in a whisper. Aphonia may occur in persons who are overworked, worried, or distressed, or it may be the result of sudden severe shock, either mental or physical. Rest and freedom from worry are essential in the treatment, and sometimes a sudden stimulus, such as the unexpected receipt of good news, will effect a complete cure. Aphonia due to disease or paralysis of the vocal chords in the larynx is a less frequent but much more serious condition. See Voice.

Aphorism (Greek *apo*, from; *horos*, boundary). Brief definition of a principle, artistic, moral, or scientific, in the most concise

terms, *e.g.* Life is short: art is long. Greek literature contains a number of aphorisms and Bacon's Essays abound in them.

Aphrodite. In classical mythology, goddess of love and of the fruitfulness of nature. Her Roman counterpart was Venus. According to some she was a daughter of Zeus, according to others she rose from the foam of the sea, near Cyprus; hence the name Aphrodite (Gr. *aphros*, sea-foam).

Aphrodite's husband was Hephaestus (Vulcan), but she had amours with Ares, Hermes, Dionysus, and Poseidon among

Aphrodite. Bronze head from an ancient colossal statue
British Museum

the gods, and with Adonis and Anchises among mortals. From her connexion with Ares she is also somewhat curiously regarded as a goddess of war, who takes special interest in arms and armour. By Ares she was the mother of Eros or Cupid. During the Trojan War she favoured the cause of the Trojans and constituted herself the guardian of Paris and Aeneas.

The worship of Aphrodite appears to have been of Eastern origin, introduced by the Phoenicians. It was widely diffused, its chief seats being Cyprus and Cytherea, and was frequently marked by sexual excess. Her girdle or zone was supposed to possess miraculous power to excite the passions of love: the goat, the deer, and the dove were sacred to her, and among plants the rose and the myrtle. Aphrodite is the subject of numerous works of art, among them the Venus of Milo (Melos) and the Venus de' Medici. See Adonis; Venus.

Apia. Chief town and seaport of the Samoan Islands. It is situ-

Apis, the sacred bull. Figure in relief found in the tomb of Ephto Stopte at Sakkara

ated on the N. coast, and is the capital of the former German dependency of Upolu. It is the commercial centre of the Samoan group, has an open roadstead and a high-power wireless station, and exports cocoa and copra. In 1889 a hurricane caused the loss of one American and two German warships, the British warship Calliope alone escaping. Robert Louis Stevenson, who settled at Apia in 1889, died here, Dec. 3, 1894. The town was surrendered to a New Zealand force early in the First Great War. Pop. 1,500, including 400 Europeans.

Apicius, MARCUS GAVIUS. Roman epicure. He lived under the Emperor Tiberius, 1st century A.D., and apparently spent the whole of his time and fortune in inventing and eating new and tasty dishes. Then, his money gone, he hanged himself. He is mentioned by Seneca. A book on cooking, *De Re*

Coquinaria, once attributed to him, is of much later date.

Apis. Sacred bull worshipped at Memphis throughout dynastic Egypt. Symbolising the second life of Ptah, he bore a white forehead mark upon a black hide. At death he became, like human souls, one with Osiris, and his embalmed remains were enshrined in a huge costly sarcophagus. The Sakkara mausoleum still contains twenty-four of these Apis-tombs. See Animal-worship.

Aplanatic (Gr. *a*, not; *planasthai*, to wander). Term used in optics. A beam of light reflected in a mirror or passing through a lens is subject to chromatic aberration due to unequal dispersion of the different coloured rays, and to spherical aberration due to the size of the spherical surface. An aplanatic lens is one in which both these aberrations have been corrected. See Light; Optics; Spectroscopy.

Apia, Samoa. Government House, once the home of Robert Louis Stevenson, who died here in 1894

Apnoea (Gr. *a*, not; *pnein*, to breathe). Temporary cessation of breathing produced by breathing more rapidly than physiological requirements demand.

Apocalypse (Greek, unveiling). Name given to a particular type of religious literature very popular in later Judaism and early Christianity. Of it the Book of Revelation which closes the New Testament is the best known example. Apocalyptic—the word used to denote the faith embodied in the different Apocalypses—was the lineal descendant of Hebrew prophecy, but differed from it in that its whole outlook was turned to the future. The dream of national greatness, which is one of the special themes in prophetic literature, had faded away under the disasters and defeats which the Jewish people sustained from the successive empires that attained world domination. The faith of Israel sought comfort in the thought that the way of deliverance would be found in “the day of the Lord,” when God would break into human history and set up His Kingdom by a *tour de force*.

Apocalyptic can best be understood by contrasting the Greek and Jewish conceptions of Utopia. In Greek thought, especially in Plato, Utopia is to be realized by the natural evolution of social forces. To the Jews, on the other hand, the realization of Utopia was only possible through a divine intervention. Apocalyptic first took shape in the writings of Ezekiel, and found its fullest expression, as far as the Old Testament is concerned, in the Book of Daniel. In the subsequent period between 170 B.C. and A.D. 100 many Jewish Apocalypses were written, e.g. The Book of Enoch, which contains a number of Apocalypses of varying dates, The Book of the Secrets of Enoch, The Apocalypse of Baruch, The Ascension of Isaiah, The Assumption of Moses, and The Fourth Book of Ezra. The Book of Revelation represents an attempt to Christianise the Apocalyptic movement. Other attempts of a similar nature were also made, e.g. The Apocalypse of Peter, fragments of which were discovered in 1892. This was the source from which Dante derived much of his imagery for the Paradiso and Inferno.

Apocalyptic Number. The number 666, given as that of the Beast in Rev. 13, 18. It was applied by the early Christians to rulers who seemed like Antichrist such as Caligula and Nero, the letters of whose names, written in Hebrew, total 666. Alternatively

it stood for the Roman empire. Throughout history ingenious people have fitted the number to the names of their enemies.

Apocatastasis. Greek word meaning restoration to its first condition. It is applied to the theological doctrine that all mankind shall ultimately enjoy salvation, and that even devils and those accounted lost, having been created by God, shall return to God. Derived from Platonism, it was taught by Origen, Clement of Alexandria, and S. Gregory of Nyssa. It was attacked by S. Augustine and condemned at the Council of Constantinople, A.D. 553. The belief, as revived by various modern sects, is known as Universalism. See Universalists.

Apocrypha (Greek *apokryphos*, secret). A term applied first to writings which were kept secret because they were supposed to contain truths which might be imparted only to the duly initiated. Apocryphal then came to denote certain writings connected with, and growing out of, the Old and New Testaments, but of a different character from the books generally accepted as inspired or canonical. From this to the meaning spurious or heretical the transition was easy. In common speech the Apocrypha denotes the Old Testament Apocrypha.

The Apocrypha Proper are included in the Greek (Septuagint) and Latin (Vulgate) Versions, but not in the ordinary English Bible. The Church of Rome at the Council of Trent (1546) accepted them as “sacred and canonical.” The Protestant Churches rejected them, but some of the Reformed Churches, e.g. the Church of England, use them for purposes of edification.

The books, which are in some cases Palestinian and in others Hellenistic, may be classified thus: (a) *Additions to the Old Testament*: the remainder of the Book of Esther, the Prayer of Manasseh, three additions to Daniel, viz The Song of the Three Holy Children, The History of Susanna, and the Story of Bel and the Dragon. These are of the nature of legendary history or romance. (b) *Historical Works*: I Esdras, I and II Maccabees. (c) *Didactic Works*: The Wisdom of Solomon, the Book of Sirach (Ecclesiasticus). (d) *Religious Romances*: The Book of Tobit, the Book of Judith. (e) *Apocalyptic Works*: The Book of Baruch, II Esdras. There also exist a Third Book of Maccabees (in Septuagint, but not in Vulgate) and a Fourth Book of Maccabees (in Alexandrian MS. of Septuagint, but not in Vulgate). These are

romantic in character. The periods to which these works may be assigned are as follows: c. 200–100 B.C., Sirach, Tobit, Judith, Additions to Daniel; c. 100–1 B.C., I Maccabees, II Maccabees, III Maccabees, Book of Wisdom, I Esdras, Additions to Esther; c. A.D. 1–100, Baruch, II Esdras.

The Pseudepigrapha are a similar body of literature so described by scholars because many of them were written in the names of famous persons. This class of writing has been characterised as Apocalyptic Literature. The style of writing is prophetic and allegorical or symbolic. (See Apocalypse.)

The Apocrypha connected with the New Testament are not so well known. Nor are they so well defined as a collection of writings. Most of them are very fantastic. But there are some (the First Epistle of Clement, the Teaching of the Twelve Apostles or the Didache, the Epistle of Barnabas, the Shepherd of Hermas, the Gospel and the Apocalypse of Peter) which resemble more closely New Testament writings, and in fact were used for a time as Scripture by the Church; and there are others of such value (the fragmentary Gospel according to the Hebrews and Gospel according to Peter; the Logia or Sayings of Jesus) that they may be used to supplement the Gospel account of the life of Jesus.

The First Epistle of Clement was written (probably A.D. 95–8) to the Church at Corinth in the name of the Church of Rome, and was evoked by “an unholy and detestable sedition” in the Corinthian Church. It inculcates the virtues of unity and charity. The Teaching of the Apostles deals with (1) the general moral teaching of the early Church, and (2) the institutions of the Church. It has been dated as early as A.D. 70 or 80, but may be much later. The Epistle of Barnabas, described by Origen as the “Catholic Epistle of Barnabas,” is even included among N.T. books in the Sinaitic MS. The Epistle seems to be addressed to the Church as a whole. It deals with the attitude to be adopted towards the Jewish Law, which is interpreted allegorically. It can hardly have been written by the Apostle Barnabas, and may perhaps have originated about A.D. 130. The Shepherd of Hermas is another work included in the Sinaitic MS. It contains visions, commandments, and parables, and has been called the “Pilgrim’s Progress” of the early Church. In its present form it may have originated about A.D. 140. The

Gospel according to the Hebrews contains some interesting sayings. Harnack would assign it to a date between A.D. 65 and 100. The Gospel according to Peter is heretical, written to promote Docetism, which taught that the humanity of Christ was not real, but only apparent. It is assigned by Harnack to a date between A.D. 110 and 130, but it may be later. In recent years a number of papyri containing Logia or Sayings of Jesus have come to light. Some may be genuine.

The more legendary Apocrypha include Gospels (such as the Protevangelium of James, the Gospel of the Nativity of Mary, the History of Joseph the Carpenter, the Gospel of Thomas, the Gospel of Nicodemus); Acts (of Paul and Thecla, of Thomas); Epistles (such as the correspondence between Jesus and Abgarus, the Epistle of Paul to the Laodiceans); and Apocalypses (of Paul, of Peter).

Apocynaceae (Gr. *apo*, from; *kyōn*, dog). Extensive family of twining shrubs, and a few herbs. They are natives of tropical and temperate regions in both hemispheres. Their milky sap is usually poisonous or violently purgative. The leaves are opposite or in whorls; the flowers salver-shaped or bell-shaped. The five lobes of the corolla are oblique. The family comprises more than 180 genera and 900 species, including the well-known periwinkle (*Vinca*), oleander (*Nerium*), and dogbane (*Apocynum*).

Apodeictic (Gr. *apodeiktikos*, demonstrative). Name given by Aristotle to a proposition which is demonstrated by incontestable evidence. Kant applied the term somewhat differently, to a judgment which is necessary and universal, not the result of experience. See Logic.

Apoget (Greek *apo*, from; *gē*, earth). Astronomical term with two meanings. (1) Point in the moon's orbit farthest from the earth. (2) Position in which the sun, or any other body in the solar system, is farthest from the earth.

Apollinaire, GUILLAUME (1880-1918). French poet. He was the founder of cubist poetry, a reaction against symbolism and romanticism. Alcools (1913) recorded in kaleidoscopic series his subjective impressions of the twentieth-century world. In Calligrammes (1918) he experimented in a freer selection and arrangement of words, and even in their setting, e.g. a poem on rain was printed in the form of a

downpour. He died a victim of the influenza epidemic of 1918. His work was later acclaimed by the surrealists. Consult G. Apollinaire: *Choix de Poésies*, 1945.

Apollinarianism. A heresy originating with Apollinarius, bishop of Laodicea, in the 4th century A.D. Starting with the Platonic assumption that man includes a human body (Gr. *sōma*), a human or rational soul (*psychē*), and a human mind (*nous*), it taught that in the human nature of Christ the

of soda. They are beneficial in cases of diabetes. Discovered in 1851, the spring waters average a temperature of 94° F. This and other springs in Germany and Hungary are owned by a British company, which bottles the waters and sends them nearly all over the world. The supply was interrupted by each of the Great Wars.

Apollinarius OR APOLLINARIUS (d. c. A.D. 392). Founder of the Apollinarian heresy. Son of an Alexandrian rhetorician and a friend of Athanasius, he transformed the Gospels and canonical Epistles into dialogues in imitation of Plato, defended Christianity against Porphyry, and strenuously opposed Arianism. In 362 he was made bishop of Laodicea in Syria. His opposition to Arianism, which denied the complete divinity of Christ, led him, in effect, to deny the complete humanity of Christ, hence the heresy Apollinarianism.

Apollo. One of the greater deities of ancient Greece. The son of Zeus and Leto (Latona), he was born in Delos, Artemis being his twin sister. In Homer Apollo is not identified with the sun, but in later mythology becomes the sun god. From the earliest times, however, he is the god of disease who sends pestilences among men, and is also the healing god. Power to foretell the future was attributed to Apollo in an eminent degree. There were many oracular shrines or temples of Apollo, notably the famous oracle at Delphi (*g.v.*). Probably for his gift of prophecy he was the patron deity of states, and especially of colonies, no colony being founded except after consultation with the oracle. Apollo is always represented as a tall, handsome, beardless youth, holding in his hand a bow or lyre. As the supreme type of manly beauty, he was the patron deity of athletes. He was also worshipped at Rome.

Apollo Belvedere. Statue of Apollo discovered in 1503 in the ruins of Porto d'Anzio, the ancient Antium. It was acquired by Pope Julius II, who placed it in the Belvedere gallery of the Vatican. It lacked the left hand and right forearm, both of which were restored by Giovanni Angelo Montorsoli (1507-63). The statue is supposed to be a 1st century A.D. copy of the bronze original. Illus. p. 517.

Apollo Club. Society founded by Ben Jonson about 1616 at the Devil Tavern; No. 2, Fleet Street, London. This famous inn was pulled down for the enlargement of Child's Bank in 1788. At the club's

Apollo. Ancient marble statue of the Greek god
Vatican, Rome

divine Word (Gr. *Logos*) took the place of the *nous*. It contended that to assume the complete humanity of Christ was to assume in His nature the possibility of sin and so to negative the Atonement. The heresy was condemned by the general Council of Constantinople, 381.

Apollinaris. Mineral spring of Germany, in the Rhine province. In the Ahr valley, 10 m. by rly. N.W. of Remagen, its waters are alkaline and contain carbonate

Apollo Belvedere, supposed to have been sculptured nearly two thousand years ago. See page 516
Vatican, Rome

lyric feasts there foregathered the wits of the day. A bust of Apollo and a board with the poetic Welcome are preserved at the bank. The rules, *Leges conviviales*, written in Latin by Jonson, bade the duldard, the ass, the sad-faced, and the lewd fellow keep away, and provided that "choice women" should not be excluded.

Apollo Theatre. Situated in Shaftesbury Avenue, London, this playhouse was opened Feb. 21, 1901, under the management of Henry Lowenfeld, with *The Belle of Bohemia*. Some of the greatest successes on the London stage were presented at the Apollo, including Pélissier's *Follies*, 1908; General John Regan, 1913; Hobson's *Choice*, 1916; *Idiot's Delight*, 1938.

Apollodorus (fl. c. 140 B.C.). Greek grammarian. He was a pupil of Aristarchus and the Stoic Panaetius. All his works have perished except his *Bibliotheca*, a well-arranged collection of stories connected with the mythical and heroic ages of Greece.

Apollonia. The name of numerous ancient cities. One in Illyria, near the mouth of the river Aous, was founded by emigrants from Corinth and Corcyra. Later it became a flourishing commercial town and the seat of a university at which Maecenas and the young Octavius were educated. Another, founded in Thrace by the Mile-

sians, was famed for its temple and its statue of Apollo by Calamis: this was removed to Rome by the art-patron Lucullus. Afterwards called Sozopolis, it is now known as Sozeboli. A third town, the modern Apollonia, was the harbour of Cirene, in Cyrenaica, 45 m. W. of Derna. In Gen. Auchinleck's offensive of Dec., 1941, the town was captured from the occupying Axis forces by British mobile columns. A few weeks later it fell again into the hands of Rommel's Axis forces, and in Nov., 1942, was finally liberated by the British 8th army advancing from El Alamein.

Apollonius of PERGA (c. 265-c. 200 B.C.). Greek mathematician belonging to the Alexandrian school. His systematic treatise on conic sections embodied all that was

previously known about them and immensely extended the knowledge of the ellipse, hyperbola and parabola. His books on these curves mention most of the properties found in modern text-books. He wrote also on regular solids, arithmetic, and the theory of the screw.

Apollonius of RHODES (c. 295-215 B.C.). Greek epic poet and grammarian. He was born at Alexandria, and was a pupil of Callimachus. Afterwards an enmity sprang up between the two poets, and when Apollonius read his *Argonautica* in public he found it coldly received owing to the intrigues of his rival. He then went to Rhodes, where the people received a revised version with great applause and bestowed upon him the rights of citizenship. Back in Alexandria he acquired great fame and popularity, and was appointed chief librarian by Ptolemy Euergetes. In his epic, which describes the voyage of the Argonauts in quest of the Golden Fleece, he strives to imitate the style of Homer. The poem was translated into Latin by Valerius Flaccus and Varro Atacinus.

Apollonius of TRALLES (2nd century B.C.). Greek sculptor. He is notable as having executed with the aid of his brother Tauriscus, the colossal marble group of Amphion and Zethus, known as the Farnese Bull. This group, in the National Museum, Naples, is

reputed to have been in Rome about the time of Pliny.

Apollonius of TYANA (c. 4 B.C.-A.D. 97). Greek Pythagorean philosopher. He was born at Tyana in Cappadocia, and travelled widely. In Rome he was accused of high treason against Domitian, but suddenly disappeared during his trial. He died at Ephesus while head of a Pythagorean school. Apollonius was looked upon as a magician, and wonderful tales are told of him in the story of his life by the sophist Philostratus, written in the 3rd century. His life and reputed miracles were compared with those of Christ.

Apollo. Name of an early convert to Christianity mentioned in the N.T. He was a Jew of Alexandria converted to Christianity by Aquila and Priscilla at Ephesus. Later, at Corinth, he preached the Gospel of Christ, and is mentioned by S. Paul as a fellow-worker whom faction had endeavoured to make a rival. *Consult Acts 18; 1 Cor. 1, 3, and 4.*

Apollyon. Greek term in the N.T. for the Hebrew Abaddon. It means the Destroyer (Rev. 9), and is so applied to the Devil by Bunyan in *The Pilgrim's Progress*.

Apologetics. That department of Christian theology which is entrusted with the defence of the Christian religion. Alike in theory and practice there has been infinite diversity in apologetic method, varied more in its forms than has the intellectual and literary crusade on behalf of the Christian faith. The latter has been from the start the subject of passionate contention. Not peace but a sword was the Founder's own metaphorical description of the purpose and result of His coming. He invited resistance and entailed upon His followers a legacy of struggle. An undercurrent of apologetic purpose runs through the N.T. not seldom rising to the surface. Apart from differences between leaders and parties in the swiftly growing church, missionary enterprise brought into the open the latent principles of external opposition, and by literature not less than preaching the resources of the new faith were developed.

The apologetic energies of Christianity have often resulted in the purifying of Christian faith, discipline, and practice. Dogma and piety are both indebted to the vision and experience gained by apologists through their warfare. Such questions as: What is the essence of our religion? What must be conserved at any

cost? What compromises would be disastrous? help to illuminate the path of constructive doctrine and of practical life.

In the first age Jewish, Greek, and Roman polemics were met by Clement of Alexandria, Tertullian, Origen, and Augustine. In the Middle Ages Judaism, Islam, and free-thinking philosophy were dealt with by Abélard and Aquinas. During and after the Reformation Islam and free-thought had still to be combated, as by Pascal. In the 18th century deism and scientific scepticism were met by Butler. In the 19th century attacks came on a far more comprehensive scale, but in Britain were defenders like James Martineau, Robert Flint, A. M. Fairbairn, and J. R. Illingworth, who carried the war into the very strongholds of antagonistic thought.

As the result of modern apologetic activity, a revolution has been effected in our conception of religious values. Alternatives to the Christian system have been faced. The spread of education, the diffusion of literature missionary enterprise, the encroachment of secular interests, have helped to bring about an increase in the sense of Christian and indeed religious solidarity, a weakening of sectarian animus, a growth of the power to visualise the issues raised. The battle for religion has drawn out into the open every form of spiritual activity; atheism, agnosticism, and materialism stand out as a common menace to the faiths. Apologetics accordingly has refused to hazard all upon the historicity of particular miracles, upon the inerrancy of particular Scriptures, upon an absolute differentiation between the natural and the revealed, the natural and the supernatural, the human and the Divine. Stress is laid upon continuity of faith in the unseen. Christianity is viewed as a system or ideal of life, involving the doctrine revealed by Christ but equally the life disclosed by Him and developed by His Spirit. Truth is recognized and even welcomed in rival religions. In the life and teaching of Jesus a self-commending ideal of life and thought is found, supreme in grandeur and simplicity, universal and final. *See* Christianity.

Apologia pro Vita Sua (La. Apology for his own life). Work by John Henry (afterwards Cardinal) Newman, first published in 1864. The work, provoked by a statement of Kingsley's challenging

Newman's regard for truth, is the best example of the author's prose. In it he traced the way in which he passed from the Anglican to the Roman Catholic Church, and told much of the story of the Oxford Movement (*q.v.*).

The book had an immediate success, its obvious sincerity and frankness disarming opponents and winning for its author an esteem with the British public he had not hitherto enjoyed. While the provocation has been relatively forgotten, the *Apologia* remains one of the permanently valuable autobiographies of the world. *See* Newman, John Henry.

Apologue (Gr. *apologos*, tale). Short story in which animals, trees, etc., are used as characters, from whose doings a moral is deduced. A celebrated apologue is that of the trees called upon to choose a king (Judges 9), while another, of the bee and the spider, is to be found in the early part of Swift's *Battle of the Books*. A classic example is the fable of the Belly and its Members put into the mouth of Menenius Agrippa, the patrician, in his speech to the plebeians, by Livy. The apologue closely resembles the fable, though it is generally less definitely a story; and, less closely, the parable.

Apology. Word derived from the Greek, meaning to take back speech (*logos*). In English law (Libel Act, 1843) a defendant in an action for libel may in certain cases apologise and plead the apology as a defence or in mitigation of damages. By the same Act a newspaper defendant in such an action may plead an apology and pay money into court as amends. If the plaintiff does not accept the amount so paid in, and the jury award him not more than that amount, judgement will be for the defendant with costs. Since 1934 a defendant in an action of libel or slander has been able, like defendants in other actions, to pay money into court with a denial of liability, and, in consequence, newspapers rarely avail themselves of the Libel Act. *See* Libel.

In literature the word is used to mean rather a plea for a person or thing. In this sense it is employed by Plato in his *Apology* for Socrates at his trial; by Sir Philip Sidney in his *Apologie* for Poetrie, c. 1581; by Thomas Heywood in his *Apology* for Actors, 1612; and by other writers.

Apophthegm (Gr. *apo*, forth *phthengesthai*, to speak). A terse, sententious expression of philosophic thought, *e.g.* Cowards die many

times before their deaths; the valiant never taste of death but once. *Pron.* App'-ōth-em.

Apoplexy (Greek *apo*, from; *plēssein*, to strike). Condition of sudden loss of consciousness and sensation due most frequently to the bursting of a blood-vessel in the brain. It is often referred to as an apoplectic stroke. Apoplexy is commoner in men than in women, and occurs often after the fiftieth year of life. Syphilis, alcoholism, and heavy muscular work are predisposing factors. The attack is usually without previous warning symptoms, and occurs while the patient is engaged in his ordinary occupations, though sometimes it is precipitated by extra exertion.

In a typical attack there is deep unconsciousness and the patient may fall heavily to the ground; the face may be flushed or pale or bluish; the pupils may be unequal; often the head and eyes are turned towards the damaged side of the brain. The breathing is noisy and laboured, the cheeks being puffed out during expiration and frothy saliva collecting about the mouth. The pulse is full and tense and often slow. In some cases the onset is less abrupt. In moderate attacks consciousness gradually returns, but in severe forms the condition may persist and end in death in a few hours.

Paralysis is a frequent result of an apoplectic stroke. Sometimes the whole of one side of the body is involved, a condition known as hemiplegia, in other cases only the face, arm, or leg of one side is affected. Impairment of speech with various forms of aphasia is common. With the passage of time considerable power of movement may be regained in the paralysed muscles, but complete recovery, except in mild cases, is rare.

The treatment during an attack is to keep the patient absolutely at rest with the head slightly raised. Hot bottles may be placed at the feet and an ice-bag applied to the head. In some cases venesection or blood-letting has been useful, but little can be done to relieve the paralysis. A person who has once had an attack should lead an ordered restful life, avoiding alcohol, over-eating, and severe muscular effort.

Aposiopesis (Gr. *aposiopaino*, to become silent). A rhetorical figure in which a speaker breaks off in the middle of what he is saying, impressing the imagination of the hearer by what is left unexpressed. It is often used to convey a threat.

Apostasy (Greek *apo*, away; *stasis*, standing). Term originally meaning the desertion of a military post. Its later and general application is to the complete and voluntary renunciation of the Christian faith, either in favour of another religion or of none. The persecution of the 3rd century under the Roman Empire induced a considerable apostasy, and in the Middle Ages in Spain many abandoned Christianity to become Jews and Mahomedans. The apostate always incurred heavy ecclesiastical penalties. The rejection of Christianity in favour of paganism by the emperor Julian is a most remarkable instance of apostasy.

Apostle (Gr. *apo*, from; *stellein*, to send). Term meaning "one sent forth," and so a commissioned delegate or messenger. The name is applied specially to the twelve followers selected by Jesus to be His close and constant companions and to carry on His work after His departure (*cf.* Matt. xxviii, 16-20). These were Simon, also called Peter; Andrew; James and John the sons of Zebedee; Philip, Bartholomew, Thomas, Matthew; James the son of Alphaeus; Thaddaeus; Simon the Canaanite or Zealot; and Judas Iscariot (Matt. x, 2-4; *cf.* Mark iii, 16-19; Luke vi, 14-16; Acts i, 13). Later Jesus appointed seventy others and commissioned them (Luke x, 1). These He sent forth "two and two before his face into every city and place whither he himself was about to come." According to tradition, one of them was Barnabas; and according to Origen, Andronicus and Junias may have been included in the number. In any case the title was extended for one reason or another to Barnabas (Acts xiv, 4, 14; 1 Cor. ix, 5-6). Paul applied the title to himself, and claimed by virtue of a direct revelation from Christ to himself to rank with the chosen apostles (Gal. i, 1, ii, 8; 1 Cor. i, 17, xv, 8-10, etc.). There were others, false teachers, who assumed the name to further their own ends (2 Cor. xi, 5, 13; Rev. ii, 2). In later times the term apostle has been applied to missionary founders of the Christian Church in various lands. *e.g.* S. Augustine, apostle of the English, S. Patrick of the Irish, and S. Boniface, the apostle of Germany. See Christianity.

Apostle Islands. Group of 27 isles in Lake Superior, belonging to Wisconsin, U.S.A. They produce valuable timber, possess brown sandstone quarries, and contain several Jesuit mission stations and an Indian reservation. The area is about 200 sq. m.

Apostles, THE. Oratorio by Sir Edward Elgar. Shortly after his completion of *The Dream of Gerontius* (*q.v.*) the composer planned a sequence of three oratorios to be based on the lives and works of the apostles. This trilogy was never completed. The first section, known as *The Apostles*, Parts 1 and 2, was performed under the direction of Richter on Oct. 14, 1903, at the Birmingham Festival. The words Parts 1 and 2 were omitted from later editions because the next section was separately entitled *The Kingdom* (*q.v.*). The text of *The Apostles* is taken from the Bible; the narrative follows the N.T. story from the beginning of Christ's ministry to His death, resurrection, and ascension.

Apostles' Creed (Latin *credo*, I believe). Confession of the Christian faith, stating in short articles the fundamental doctrines of Christianity. The earliest form of this creed was a profession of faith in the Holy Trinity required at baptism. In the 2nd century Irenaeus and Tertullian quoted a number of items set out in the old Roman creed; later testimony comes from Hilary, S. Augustine, and Leo the Great, and by the 7th century the Apostles' Creed in its present form was in use at Rome and in southern Gaul. The additions to the old Roman creed are Creator of heaven and earth, He descended into hell, the communion of saints, life everlasting, and the word Catholic—Holy Catholic Church superseding Holy Church.

The Apostles' Creed has been continuously retained in the baptismal service of the Catholic Church since the 7th century, and is part of the order of baptism in the Roman ritual and of the baptismal service of the Book of Common Prayer. It is also recited daily in the morning and evening offices of the Roman Breviary and the Anglican Prayer Book. The Council of Trent endorsed its authority as an essential statement of Catholic belief, and it is required to be believed in the Church of England. The tradition of the Middle Ages, dating from the 6th century, that the twelve Apostles drew up a creed and that this creed was that taught by the Fathers, is without historical foundation. The title Apostles' Creed is so given because the belief expressed is the faith of united Christendom from the days of the Apostles. *Consult* Apostles' Creed, H. B. Swete, 3rd ed., 1899; The Apostles' Creed, A. C. MacGiffert, 1902; The History of the Creeds, F. J. Badcock, 2nd ed., 1938.

Apostle Spoon. Spoon bearing on it the figure of an apostle. Such spoons were usually made in sets of thirteen, each handle terminating in the figure of an apostle except the thirteenth, which bore the figure of Christ. In the 16th century, when a child was baptized the custom was to give it one of these spoons bearing the figure

Apostle Spoon. Examples of the only known complete set, 1626

Goldsmiths' Company, London

of the child's patron saint. Old specimens are very valuable.

Apostoles. Town of Argentina, in Misiones Territory. It is on the North-Eastern Rly., 35 m. S. of its terminus at Posadas. Founded in 1638 by Jesuit missionaries, in a fertile region, it has interesting architectural remains, picturesque surroundings, and also a healthy climate.

Apostolic Acts. Works or Acts in the N.T. Apocrypha, professing to give further details concerning the lives and histories of the Apostles. Their apocryphal character is indicated by the extravagance of their narratives as compared with the general simplicity of the N.T. records. Some of the Acts are the product of a pious fantasy; others were composed in the interest of some heresy. Among the earlier of these writings are the *Acta Andreæ* (Acts of Andrew), the *Acta Thomæ* (Acts of Thomas), and the *Acta Joannis* (Acts of John). The last-named was popular among the Manicheans and certain Gnostics. There are also Acts of Peter and Paul, of Paul and Thecla, of Barnabas, of Philip, of Thaddaeus, and of others. See Apocrypha.

Apostolic Brethren. Name applied to a sect that arose in Syria and Asia Minor in the 2nd century. They denounced flesh-eating, private property, and marriage, on the ground that these things were a departure from apostolic custom. They became identified with the Manicheans. Societies bearing the name of Apostolici, and reviving the teaching of the earlier Apostolic Brethren, arose in the 12th and 13th centuries in Germany and Italy.

Apostolic Constitutions. Collection of eight books, laying down rules for the conduct of Christians, the order of services, the administration of the Sacraments, and the authority of the clergy. Ascribed

by the compilers to a Clement of Rome, they probably date from the latter half of the 3rd or the early part of the 4th century. The first six books are derived from the Didascalia of the Apostles, a lost treatise of the 3rd century, found in Syriac versions, while the seventh book is based on the Didachē of the Twelve Apostles, a 2nd century work rediscovered in 1873. The eighth book can be traced to a number of sources. The apostolic constitutions were unknown in the Western Church in the Middle Ages and were published in 1563 for the first time in Latin and Greek.

Apostolic Fathers. The name used to distinguish those disciples and contemporaries of the Apostles who wrote in the cause of Christianity. They include Clement, bishop of Rome, believed to be the Clemens referred to by S. Paul (Phil. 4), to whom two epistles are ascribed, only one of which is his; Ignatius, bishop of Antioch, seven of the twelve epistles attributed to whom are regarded as genuine; Polycarp, bishop of Smyrna, author of an epistle to the Philipians; Hermas, to whom the work known as The Shepherd of Hermas is doubtfully assigned; Barnabas, whose name is given to an anti-Jewish epistle thought to have been written by a converted Alexandrian Jew, not the companion of S. Paul; and Papias, a contemporary of Polycarp and Ignatius, whose writings exist in fragments.

Apostolic Majesty. The title borne by the emperors of Austria in their capacity as kings of Hungary. Pope Sylvester II gave it to S. Stephen, the first Christian king of that country, about 1000, and Clement XIII confirmed it when the empress Maria Theresa was "king" of Hungary. It lapsed with other royal titles in 1918.

Apostolic Succession. Name for the doctrine that the mission given to the Apostles by Christ (John 20; Matt. 27) must extend to their legitimate successors in an unbroken line until the end of the world. The Roman Catholic interpretation of this doctrine (held also by the High Anglican school) is that the method of preserving the succession and thereby preserving the Apostolic faith is through the episcopate alone; the Apostles having laid their hands on their successors, who in turn ordained other bishops. It thus follows that only those clergy ordained by bishops of the succession have the Apostolic power, the authority to celebrate the Eucharist and to give absolution to the penitent.

Protestants and Nonconformists. on the other hand, generally maintain that the succession not only does not depend on episcopal ordination, but that such a succession does not exist, the Apostolic faith having been preserved by the written word of the N.T. and legitimate successors to the Apostolic ministry raised up from time to time as S. Paul was. While Apostolic succession is to Roman Catholics, and to many members of the Church of England, a guarantee of the validity of their sacraments and the assurance of a duly commissioned ministry, neither such guarantee nor assurance is of recognized importance to Protestant Nonconformists. See Anglicanism; Roman Catholic Church.

Apostrophe (Greek *apo*, from; *strophē*, turning). A rhetorical figure. If a speaker interrupts his general discourse to address a particular individual, or sometimes a person or personification as though present, this is called an apostrophe. In the former sense Jesus apostrophised Peter (Luke 22); in the latter sense the figure is frequently employed in poetry and in impassioned prose. Thus, in Scott's Marmion (canto vi), the story is interrupted by the apostrophic "O woman, in our hours of ease."

In punctuation, an apostrophe is the mark ', used to denote the omission of a letter or figure; e.g. o'er for over, '46 for the year 1946. It is obligatory for showing the possessive case, as in the boy's, or several boys' (except in the word its); here the omission was originally of the letter e. A minor use is in forming the plural of a letter or figure, e.g. P's and Q's, all the 8's, though this is not accepted as sound by all authorities. There are still variations in practice, for whereas most would write can't for cannot, Lewis Carroll used can't, and Bernard Shaw used cant, likewise I'm and they're. In printed prose there is little excuse for can't and its like, except in quoted speech or in making use of such established phrases as "It's an ill wind," etc. The apostrophe is valuable in poetry for showing scansion; thus, winged might be two syllables, but wing'd must be one.

Apothecaries of London. WORSHIPFUL SOCIETY OF. Corporation in London, which has power to license medical practitioners and dispensers. Its charter dates from 1617, before which it was united with the Grocers' Company. Its early duties were to examine and license assistants to apothecaries,

but since 1815 it has also conducted examinations for intending medical men, who could then

Apothecaries' arms

practise in England and Wales. By the Medical Act, 1858, it can appoint a member on the General Medical Council and confer the degree of licentiate. Under the Apothecaries Act, 1907, it can grant the diploma of Licentiate in Medical Surgery—L.M.S.S.A. (London). The society is a city livery company. Consult The London Apothecaries, Their Society and Their Hall, C. Wall, 1932.

Apothecaries' Hall. In Black Friars Lane, Queen Victoria Street, London, E.C.4. It was rebuilt in 1678 after the Fire of London. The monthly examinations of candidates seeking the licence, L.M.S.S.A., are held here. The premises consist of a great hall, court room, and library, panelled in oak of the Wren period. There is some interesting stained glass, and a fine collection of furniture, plate, and pictures, the latter including two portraits of James I, founder of the Society of Apothecaries. The minutes are complete from 1617; and the library contains many ancient herbals and other valuable books. Laboratories were attached to the hall in 1671.

Apothecaries' Measure and Weight. Used in prescribing and dispensing medicines. Solids are weighed, and liquids are measured. The units are the grain, scruple, drachm, ounce, and pound for weights, though the custom is to use only the first three for prescribing; quantities of solids above the drachm are presumed to be weighed by avoirdupois weight. In apothecaries' weight a pound consists of 12 oz. of 480 grains; whereas the avoirdupois pound is equivalent to 16 oz. of 437½ grains. The units in apothecaries' measure are the minim, fluid drachm, fluid ounce, pint, and gallon. In prescribing liquids, quantities up to an ounce are measured by the apothecaries' scale; for larger quantities, imperial measure is used.

Apothecary (Greek *apothēkē*, store). One who mixes drugs. The art of mixing drugs for medicinal purposes and of prescribing and administering them is of ancient origin, and those who practised it were recognized as a distinct class as early as the 12th century. At

first they were associated in London with traders with the East in spices and drugs, known as pepperers and spicers of Cheap (Cheapside). Later they became incorporated with the grocers, but retained their special title of apothecaries and practised as such. They were the forerunners of the medical practitioners of today.

Apotheosis (Gr. *apo*, apart. *theos*, god). Elevation of human beings to the rank of gods. The practice existed among most ancient peoples—Egyptians, Assyrians, Greeks, and Romans. Among the Greeks its earliest form was the semi-deification as heroes of distinguished warriors and founders of colonies. After the 5th century B.C. full divine honours came to be bestowed upon rulers and generals even during their lifetime. In memory of Julius Caesar, divine honours were decreed him after his death with the title of *divus*. After this it became the usual custom for the ruling emperor to propose to the senate that his predecessor should be deified (*consecratio*). Empresses also could share the honour.

Appalachians. Mountain system of the E. United States. It stretches in a series of parallel ridges and valleys from Georgia to Maine, gradually approaching the Atlantic coast. The whole area has been sculptured by almost every type of destructive force, so that its geological history is complex; but in general it consists of an eastern and a western ridge, with a trough between. The western ridge—the Allegheny Mts. or Escarpment, including the Catskills at its N. end—is the eastern face of the Appalachian plateau which slopes gently down to the Mississippi valley. The eastern ridge—the Blue Ridge—rises sharply from the Atlantic coastal lowlands. Between these two ridges the Great Appalachian Valley forms a trough with a diversified floor; it varies in elevation from 400 to 2,000 ft. This general description does not apply to the north-east; the trough is continued by the valley of the Hudson river and the Lake Champlain depression, and the eastern ridge is replaced by the Shickshock, Green, and White mts.; the western ridge stops at the Mohawk river, and thus the Adirondacks resemble the Green Mts., etc., in being chiefly sculptured by glaciers. The Black Mts., which culminate in Mt. Mitchell, 6,711 ft., form the highest part of the eastern ridge.

The rivers Delaware, Susquehanna, Potomac, and James rise in the western plateau and reach the Atlantic.

Historically, the Appalachians have been of supreme importance. The Hudson-Mohawk-Champlain depression is the only easy, natural way through the barrier,

mineral resources, such as the anthracite of Pennsylvania.

Appalachian Way. Great U.S. highway nearly 1,000 m. in length running S.E. from Chicago, Illinois to the Atlantic coast at Charleston, S. Carolina, *via* the beautiful scenery of the Cumberland Mt., Clinch Mt., and Black Mt. ranges.

Apparition (Lat. *apparere*, to appear). Word meaning literally a thing seen. It is used to define (1) a ghost; (2) in pathology, a visual hallucination, as in the case of the sick or insane; (3) in astronomy, a body's first appearance after occultation.

Belief in apparitions is found in all ages and races, notably in the idea that the soul, spirit, or eidolon revisits the body or the grave of the body after death; it has received an impetus by the growth of spiritualism, clairvoyance, and experimental telepathy. Scientists assign apparitions to purely physiological causes, but, apart from the more or less traditional instances of apparitions recorded in history, the many cases in which persons in normal health have testified to seeing apparitions of departed relatives or friends, or of living persons known to have been at a distance at the time, keep the problem open. See Spiritualism; Telepathy.

Apparitor. Officer of the English ecclesiastical court whose duty it is to summon a defendant. The term is also used by some colleges and other institutions as an alternative to beadle or herald. In Rome an apparitor was the executive attendant of a magistrate.

Appassionata (Ital.). Musical term, meaning with intense feeling. Beethoven's sonata in F minor, op. 57, is known as the *Appassionata*.

Appeal, Courts or (Lat. *appellare*, to call upon). Courts of law in which, if desired, the decisions of lower courts are reviewed and, if necessary, reversed. Every modern system of administering justice provides a right of appeal, subject to certain limitations, for dissatisfied litigants.

In England there is a court of appeal manned by lords justices, in which are heard appeals from the Chancery, King's Bench, and Probate, Divorce and Admiralty Divisions of the High Court of Justice, County Courts, and certain other courts and judicial bodies, e.g. bankruptcy officials. From this court there is the right of appeal with leave to the House of Lords, which, as a court of justice, consists of peers of high legal

and this fact accounts for the localisation largely to the neighbourhood of this route of the struggle between France and England for the American colonies and of the War of American Independence. Across the barrier farther south the tortuous routes from valley to valley made communication from the coastal plain to the Ohio valley very difficult. The steady progress of the people has chiefly depended upon the construction, first, of national highways and, later, of great railways across the barrier, and upon the exploitation of the

attainments. In Scotland the inner house of the Court of Session is the court of appeal to which cases from the outer house are taken. Northern Ireland has a court of appeal on the English model. From these two there is a further and final appeal to the House of Lords. These courts deal only with civil cases, but for criminal cases England has a court of criminal appeal established in 1907; this consists of the Lord Chief Justice and some judges of the King's Bench Division. From the lower courts there is also the right of appeal. From courts of summary jurisdiction cases can go to quarter sessions, and from quarter sessions (on legal points) to a divisional court, composed of judges of the High Court. There is a like sequence in Scotland and Northern Ireland. A court of criminal appeal was established for Scotland in 1926.

Canada and Australia, being federal governments, have each a court of appeal to which cases from the provincial courts are referred: the various provinces have also their courts of appeal, though not necessarily called by that name. From the supreme courts in Canada and Australia, and also from those in South Africa, New Zealand, and other parts of the British Commonwealth, the final court of appeal is the Judicial Committee of the Privy Council; but in 1949 Canada introduced legislation to end this. The Committee is also the supreme court for ecclesiastical cases and cases under the Naval Prize Acts.

Most foreign countries have courts of appeal graded in somewhat similar fashion. The U.S.A. has a Supreme Court. France has a court of cassation for civil cases and another for criminal cases.

The principle of the appeal, although sometimes abused, is thoroughly equitable, and gives the litigant every chance of obtaining justice. In England, as a rule, appeals will only be against a decision or ruling that is wrong in law; but the Courts of Appeal will also reverse a decision where there has been a palpable mis-trial on the facts, e.g. where the verdict of a jury is "perverse," or such as no reasonable body could have given on the evidence; and the court of criminal appeal can amend a sentence or quash a verdict on the ground of judicial misdirection to the jury.

Appearance. A term used in English law. Proceedings in the High Court of Justice are begun by a writ or an originating summons,

which is served personally on the defendant or on his solicitor. The defendant, if he wishes to defend the action, must file, at the appropriate office in the High Court, a paper which says, "Enter an appearance for the above-named A.N. (defendant)," and must serve a copy on the plaintiff or his solicitor. This is the appearance.

Appellants. Name given in 1387 to Thomas, duke of Gloucester, Richard, earl of Arundel, Thomas Beauchamp, earl of Warwick, Henry, earl of Derby, afterwards King Henry IV, and Thomas Mowbray, earl of Nottingham. In a manifesto issued at Waltham on Nov. 14, 1387, they "appealed" of treason five of Richard II's friends.

Both the king's friends and his enemies collected troops; at Radcot Bridge, in Oxfordshire, the former were routed, and the appellants were masters of the land. They ruled England for over a year;

Appendix, or vermiform appendix, showing its position at the base of the caecum

they and their friends secured the great offices of state, while their foes were put to death without mercy. In May, 1389, Richard II regained control of the government, but it was not until 1397 that he felt strong enough to punish the appellants. In August they in their turn were "appealed" of treason by eight appellants—friends of the king. Gloucester was murdered in prison at Calais, Arundel and Warwick were tried and executed, while Derby fled the country, soon to return and supplant Richard on the throne. Mowbray had gone over to the king's side, and was rewarded with the title of duke of Norfolk. Consult Constitutional History, W. Stubbs, Vol. iii, 5th ed., 1903.

Appendant (Lat. *ad*, to; *pendere*, to hang). English legal term. Where a right of property, of an accessory kind, is attached to another, so as to be enjoyed with it, it is described as appendant or appurtenant. It is appendant only if it was acquired by prescription—

that is, by enjoyment from beyond the time of legal memory (Richard I). If acquired in any other way it is appurtenant. Thus, A. B., as a freehold tenant of a manor, will probably have as appendants to his freehold certain rights of common—estovers, botes, piscary. These pass with A. B.'s freehold, and are inseparable from it. See Appurtenant: Land and Land Laws.

Appendicitis. Inflammation of the vermiform appendix, a small blind prolongation of the caecum. Acute appendicitis is more common in the child; chronic appendicitis in the adult. The appendix may be infected by organisms present in the bowel or carried to it by the blood stream, bacillus coli, streptococci, and staphylococci being the commonest. Foreign bodies are an infrequent cause. The commonest of all causes is a concretion of dried faecal matter impacted in the lumen.

In acute appendicitis the onset is sudden with severe pain and possibly vomiting and collapse. The pain, especially in children, is mostly round the umbilicus, before it settles in the right side of the lower part of the abdomen. The slightly varying position of the appendix makes this pain uncertain in degree and place. Temperature and pulse-rate rise. Persistent vomiting is common. Diarrhoea may be present and may give way to constipation. Tenderness and pain are present over the right rectus muscle, which is rigid. Appendicitis is much the commonest of the acute inflammatory conditions of the abdomen in those who are under middle age. Early operation is the right treatment. The condition if left alone may recover, but the patient has a greater liability to subsequent attacks. At any stage operation is equally indicated.

In chronic appendicitis the diagnosis rests on the history of sub-acute attacks. A diseased appendix may give rise to gastric symptoms which are unrelieved by food and are made worse by fatigue. It is an important point in diagnosis that dietetic treatment is of no help. Recovery follows the removal of the appendix, but this recovery may take some time.

A purge should never be given in the presence of abdominal pain until the cause is proved not to be appendicitis. When modern surgery and asepsis are considered, danger lies not so much in removing the appendix as in leaving it possibly to become gangrenous and cause peritonitis.

Appendix (Lat. *ad*, to; *pendere*, to hang). Word used in two senses: (1) of books and official reports, to indicate additional matter. This is in the shape of documents explanatory of, or supplementary to, the ordered statement contained in the main body of the work. It is either placed at the end or issued in a separate volume or volumes, e.g. an appendix to an encyclopedia. (2) In anatomy, the vermiform appendix, a small blind prolongation of the caecum or large intestine, illustrated on p. 522. See Appendicitis.

Appenzell. Canton of N.E. Switzerland. It was made from the possessions of the abbots of St. Gall, its name coming from Latin *abbatis cella* (abbot's cell). The canton of St. Gall surrounds it. An Alpine district, its highest point is Mt. Sents, 8,210 ft. It was divided in 1597 into Inner Rhodes, chiefly populated by Roman Catholics and consisting mostly of pasture land, and Outer Rhodes, largely Protestant, densely peopled, constituting the industrial portion. The former has an area of 67 sq. m. and the latter 94 sq. m. Both use the German tongue, and each retains its primitive democratic annual assemblies. The canton has muslin and cotton industries, and is noted for its goats' whey cure. Appenzell is the capital, but Herisau is the largest town. Freed from the abbots' rule in 1405, in 1411 Appenzell obtained the protection, and in 1452 became the ally, of the Swiss Confederation, of which it received full membership in 1513. Pop. Inner Rhodes, 13,383; Outer Rhodes, 44,756.

Apperception (Latin *ad*, to; *percipere*, to perceive). In general, becoming aware of something by active, conscious thought as opposed to passive sense perception. Leibniz first introduced

the term for clear ideas as distinguished from vague perceptions; Kant insisted upon the spontaneity of the mental activity, as something not derived from experience. Herbert regarded apperception as the appropriation and elaboration of new (apperceived) ideas by older (apperceiving) ideas; mind is the resultant of the effects of the apperceiving and apperceived "masses." According to Wundt, apperception is the apprehension of an idea by attention. Comparing the act of consciousness to an internal act of vision, he distinguishes the vaguer "field" of vision from the clearly marked "point" of vision. Apperception is the entrance of an idea into the point of vision, perception its entry into the field of vision. See Metaphysics.

Apperley, CHARLES JAMES (c. 1778-1843). Writer on sport under the pseudonym of Nimrod. Born at Plasgronow, Denbighshire, and educated at Rugby, he wrote first for *The Sporting Magazine* and afterwards for *The Sporting Review*. His chief publications are: *Nimrod's Hunting Tours, 1835*; *The Chace, the Turf and the Road, 1837*; *Memoirs of the Life of the late John Mytton, Esq., 1837*; and *The Life of a Sportsman, 1842*. The first editions of these works, with illustrations (hand coloured) by Alken and other artists, are very scarce. Apperley died in Pimlico, May 19.

1843. *Consult Life and Times of "The Druid."* F. C. Lawley, 1895; *Kings of the Hunting Field*, W. W. Dixon, 1899.

Appetite (Latin *ad*, to; *petere*, to seek). Desire or relish for food. Disorders of appetite may be diminished desire for food, increased desire, and perverted appetite. Diminished appetite can be caused by absence of vitamin B. This can be replaced by taking brewer's

Appian Way. Upper, reconstruction of the road leading to Rome as laid down in 312 B.C. Lower, the Appian Way today, trees growing among the tombs which once so thickly bordered it. See p. 524

yeast. Increase of appetite is often observed in convalescence from acute illness, such as typhoid fever, after the stomach has been long inactive, and in conditions such as diabetes, where there is an abnormal drain of nutritive material from the system. Unnatural appetite can be a manifestation of mental disorder, and may occur in pregnancy. See Diet.

Appian (Gr. *Appianos*). Roman historian. Born at Alexandria, he flourished in the middle of the 2nd century A.D. He practised as an advocate in Rome and was afterwards administrator of finance in Egypt. His *Romaica* or *Roman History*, written in Greek in 24 books, of which only 11 are completely preserved, describes in sections the history of various peoples until their incorporation in the empire. The account of the civil wars of Rome is the most important and is based on authorities no longer available. The work is uncritical and inaccurate; the narrative is clear, though uninspiring. Eng. tr., H. White, new ed. 1912.

Appian Way. A highway of ancient Rome. It separated the twelfth from the second and first districts, and was begun by the censor Appius Claudius in 312 B.C. Issuing from the Appian Gate, it proceeded through Latium, Campania, Samnium, and Apulia to the port of Brundisium, the modern Brindisi. It was thus the highway to the East. Remains of tombs and other ruins are still to be seen on that part of the ancient road which still stretches from the Porta Capuana (mostly a medieval structure) for about 5 m. into the open country. The New Appian Way is an entirely modern road, running from the Porta San Giovanni almost parallel with the old one, and continuing to Naples. This was the "Route 6" of the Allied advance upon Rome in May-June, 1944.

Appin. Mountainous district of Argyllshire, Scotland. It is bounded E. by Glencoe and W. by Loch Linnhe. The highest

point is Ben Vair (3,362 ft.). Port Appin is a port of call for steamers.

Appin Murder. Name given to the murder of Colin Campbell of Glenure, May 14, 1752. Alan Breck Stewart—the Alan Breck of Stevenson's Kidnapped and Catriona—a deserter from the English army, was indicted for the murder, and James Stewart as an accomplice. Breck, against whom there was no evidence, fled to France. Stewart, though a rebel of 1715 and 1745, was on good terms with Campbell, and had been pardoned. Campbell was the factor of the confiscated estates of the Stewarts, but James Stewart had been allowed to administer the property. He was arrested for the murder, tried by a jury of Campbells at Inveraray, Sept. 21-25, 1752, and hanged. There is no reason to suppose Stewart had any knowledge of the murder, and this execution was ordered to impress the still disaffected areas. The real murderer is unknown.

APPLE: THE FRUIT AND ITS GROWTH

H. H. Thomas, Editor of Popular Gardening, 1907-47

Describing Great Britain's most widely cultivated fruit and the way it is grown. Similar articles describe the Pear, Plum, Strawberry, and other fruits. See also Cider; Fruit; Orchard, etc.

The apple is the fruit most widely cultivated in the gardens and orchards of Great Britain. A fruit census taken by the ministry of Agriculture in 1944 showed that 15,223,700 apple trees, excluding cider apples, were under cultivation in Gt. Britain; of these more than 9,000,000 were dessert varieties and over 6,000,000 were cooking apples. This total does not include the numerous trees in amateurs' gardens.

The excellent apples now available to planters are descendants of the crab; throughout many generations new varieties have been raised from seed. Some of the seedlings were raised by artificial cross-fertilisation of the blossoms of chosen varieties, others merely by saving the pips from the best apples available at the time, and sowing them. As a result of these processes, carried out during many years, hundreds of varieties of apples have been raised, though only a limited number are in general cultivation.

Much valuable work has been done in renovating neglected British orchards and in bringing the trees into a fruitful condition. Experiments by horticultural-research workers have been of the greatest help to fruit growers in providing information as to the

best stocks for the trees, in classifying apples according to whether they are self-sterile or self-fertile, and in the best methods of controlling the pests and diseases of fruit trees by the use of new types of insecticide and fungicide. These matters, together with improved methods of grading and packing, have enabled growers to keep abreast of the times and have resulted in the marketing of better produce. Home-grown apples are plentiful from August until early in the New Year, but late varieties which will keep in good condition are still needed. Large quantities of apples are imported, for the home-grown supply does not meet the demand.

The stocks on which apples are budded or grafted influence the growth of the trees and determine the period which must elapse before fruit-bearing begins. Standard trees, budded on the crab stock, are not likely to bear good crops in less than 10 years. They have a 6 ft. stem clear of branches, live to a great age, and when mature yield heavy crops. They are more suitable for orchards and large gardens than the small gardens of amateurs. The half standard, which has a clear stem of about 4 ft., is to be preferred for small gardens.

For general planting in gardens the most profitable type of tree is the bush apple; it has no main stem but consists of a number of branches which arise from near the base of the tree. It is generally budded on the broad-leaf paradise stock or Malling No. 1, comes into fruit-bearing in from 3 to 5 years, and continues profitable for an indefinite period. Trees budded on the Jaune de Metz or Malling No. IX stock are less vigorous, can be planted more closely, but are scarcely so profitable over such a long period as those on the broad-leaf paradise stock.

Although the bush-shaped tree is ideal for planting in the open garden, the various forms of trained trees are exceedingly useful, and profitable too, for setting against a wire trellis or for training over arches. The two chief types of trained apple tree are the single-stemmed cordon and the horizontal espalier which has tiers of horizontally trained branches, each tier about 12 ins. above the other. The horizontal cordon, which has a 12-in.-high stem and one branch on each side, trained in a horizontal direction, is particularly useful for planting along the sides of garden paths. Cordons with two or even three stems can be bought.

Planting Apple Trees

Apple trees must be planted at the correct distances apart if they are to have a long and profitable life. Full standards should be set at 18 ft., half-standards at 15 ft. apart. Bush-shaped trees on the broad-leaf paradise stock should be put at 12 ft., and those on the Jaune de Metz stock at 9-10 ft. from each other. Single-stemmed cordons ought to be planted at 2 ft. apart, horizontal espaliers at 12 ft. apart, and horizontal cordons at 10 ft. apart.

The best time to plant apple trees is in autumn as soon as the leaves have fallen or have changed colour preparatory to falling. November is the ideal month for the work, but planting may be carried out during mild weather in winter when the ground is not sodden, and continued until the end of March if necessary. Trees planted in early spring, however, will make less satisfactory progress the first year than others planted in autumn. Standard trees should be staked securely to prevent their being blown about in windy weather.

The ideal situation for an orchard or fruit garden is on well-drained land facing S. or S.W., but

Apple. 1. Erect growing habit of Dutch Mignon. 2. Cox's Orange Pippin, which has a more horizontal habit of growth. 3. Beauty of Kent, another distinct type. 4. Cox's Orange Pippin, considered the best dessert apple. 5. Bright red fruit of Beauty of Bath. 6. Lady Sudeley. 7. Bramley's Seedling, a late cooking apple and a good keeper. 8. Laxton's Superb

most amateurs have to make the best of the sites afforded by their plots of ground. Although clayey loam is the ideal land, apple trees will thrive in almost any soil that is manured correctly.

A mulch or soil-covering of manure or decayed vegetable material, if put on the ground round about the trees in May, will help to keep the roots moist, and that is a detail of importance. The following autumn and in the autumn of alternate years subsequently basic slag should be scattered on the soil near the trees, using 6 oz. per sq. yd. of ground. After the first year the use of sulphate of potash in spring at 2 oz. per sq. yd., and superphosphate of lime in June, applying 3 oz. per sq. yd., will prove beneficial; or a complete fruit tree fertiliser may be used in May after the blossoms have fallen.

It is not usual to prune newly planted standard, half-standard, and bush-shaped apple trees until a year or so has passed: trees planted in autumn should be pruned in Dec. of the following year. The main branches are then shortened by about two-thirds, and any side shoots are cut back to within two buds of the base.

In subsequent years the usual practice is, in summer, to prune the side shoots to within about five leaves of the base of the new growth, and in winter to cut them back again to two or three buds. The leading shoots, those at the ends of the main branches, are not pruned in summer but are shortened by half or, if weakly, by two-thirds at the winter pruning. The best period for summer pruning is from mid-July to the end of Aug.; the winter pruning may be done in Dec., Jan., or early Feb.

What is known as Lorette pruning, a system devised by a French grower of that name, now finds favour with many growers. In the modified form suited to apple trees grown in this country, it is practised by cutting down all long side shoots in summer to within a quarter-inch of the base; this in effect means cutting off the shoots altogether. The object is to force into growth those dormant buds which lie at the extreme base of the side shoots, for many of these are capable of producing blossom buds.

Lorette pruning is practised throughout the months of July and Aug. and until early Sept., for the shoots must be pruned only when they are firm and slightly woody at the base. The leading shoots, those which extend the main branches, are pruned in early spring before growth starts

by shortening them by one half or by two-thirds if not very strong.

The greatest care should be taken in making a choice of varieties for planting, for some are more reliable than others. It has been discovered that certain varieties of apple are self-fertile, *i.e.* they will set a crop of fruit even when planted alone; others are self-sterile and will not bear fruit unless their blossoms are cross-fertilised with pollen from the blossoms of other apple trees. In practice it is found best to have a mixed plantation of both dessert and cooking apples.

These are some of the best self-fertile apples. (D. denotes dessert C., cooking apples. The period in which the fruits are at their best is indicated):

Potts's Seedling (C., Aug.-Sept.).

April).

Annie Elizabeth (C., March-

May).

Cox's Orange Pippin, one of the

most delicious of all apples, is

self-sterile: it should be planted

near Worcester Pearmain and

James Grieve.

The early apples, those which ripen in Aug.-Sept., should be eaten from the tree, or stored only for a few days. Apples which are stored for use in late autumn, winter, and early spring must be left on the trees as long as possible or they will shrivel and lose flavour. Apples keep best in a cool and rather damp, frost-proof shed. The choicest fruits should be wrapped in paper before being put away. A dry airy attic is an unsuitable place for storing apples.

Apple trees are unfortunately subject to the attacks of many pests and diseases and these must be prevented or reduced to a minimum to ensure a harvest of sound fruits. The following are the measures of control generally practised. Greasebands are placed on the tree stems in Sept.; spraying with a tar-oil caustic wash is done in Dec.-Jan., or with other suitable wash, *e.g.* Thiol, in Feb.-

March; spraying with nicotine insecticide, just before the blossoms open and again as soon as they have fallen, and with lime sulphur in May and July to prevent brown rot and scab respectively. Placing bands of corrugated paper or sacking on the stems in May and taking them off and burning them in autumn will check the troublesome apple blossom weevil. The use of a brush dipped in methylated spirit or paraffin will destroy American Blight.

Bibliography. The Apple, A. E. Wilkinson, 1915; Apples and Pears, E. A. Bunyard, 1920; Handbook of Hardy Fruits, E. A. Bunyard, 1920; Commercial Apple Growing, A. H. Hoare, 1937.

Appleby. Mun. borough, market town, and co. town of Westmorland, England. It is picturesquely situated on the Eden, 30 m. S.W.

Appleby arms

of Carlisle, with good rly. services. It has town and shire halls, a grammar school founded in 1453, an old church, and a rebuilt castle with Norman keep. Appleby received charters from Henry II and other monarchs, but was incorporated on modern lines in 1885. It returned two members to Parliament from the end of the 13th century until 1832. Appleby was prominent in Roman times, was destroyed by the Scots in 1176 and 1388, aided the Royal-

at the Malvern festival on Aug. 19, 1929. It was transferred to the Queen's Theatre, London, the following month. The principal characters were played by (Sir) Cedric Hardwicke (King Magnus), Charles Carson (prime minister), and Edith Evans (Orinithia).

Appledore. Seaport of Devon, England. At the junction of the Taw and Torridge estuaries as they flow into Barnstaple Bay, it is ancient, narrow, and cobbled. There is a ferry to Instow, and interesting places within walking distance include Bideford, Northam, and Westward Ho. Ship repairing is one of the industries. Market day, Sat. Another Appledore is on the edge of Romney Marsh, Kent.

Appleton. Village of Berkshire, England, 7 m. S.W. of Oxford. On April 22, 1922, there was rung on the ten bells of the church a peal of Stedman Caters of 21,363 changes, lasting 12 hours 25 minutes, the longest peal rung in Britain by one set of men. Other feats of bell-ringing are also recorded in the church, which itself contains work of c. 1180 (Transitional).

Appleton. City of Wisconsin, U.S.A., and the co. seat of Outagamie county. Situated on the Grand Chute Rapids of the Fox river, which supply power for numerous paper, flour, woollen, and saw mills, it is 98 m. N.W. of Milwaukee, by the Chicago and N.W. rly. It has large breweries and foundries, makes chairs, spokes, hubs, etc., and is the seat of Lawrence University. Pop. 28,436.

Appleby, Westmorland. Boroughgate, the main thoroughfare, with the cloisters and the church of S. Lawrence in the background

ists in the Civil War, and was taken by the Parliamentarians after Marston Moor. Market day, Sat. Pop. 1,618.

Apple Cart, THE. Play by Bernard Shaw, described by him as a political extravaganza. First performed in Warsaw in the Polish version by Sobieniewski, it was produced by Sir Barry Jackson

Appleton, DANIEL (1785-1849). American publisher. Born at Haverhill, Mass., he was at first employed in the drapery business; then he moved to Boston, then to New York, adding the importing of books to his existing ventures. In 1834 he established the publishing firm since known as Appletons (D. Appleton-Century).

Appleton, SIR EDWARD VICTOR (b. 1892). British scientist. Born at Bradford, Sept. 6, 1892, the son of a mill worker, he was educated at Hanson School, Bradford, and St. John's, Cambridge. He became assistant demonstrator in the Cavendish laboratory, Cambridge; Wheatstone prof. of physics, London University, 1924-36; then Jacksonian prof. of natural philosophy, Cambridge, until in 1939 he was appointed secretary of the D.S.I.R. Elected F.R.S. in 1927, he gained for his researches into wireless telegraphy and later radar the 1947 Nobel prize for physics. In 1945 he became the British govt.'s chief scientific adviser, and in 1948 principal and vice-chancellor of Edinburgh University.

Appleton Layer. Ionised layer of the upper atmosphere, about 150 miles above the earth, named after Sir E. V. Appleton (v.s.). According to the prevailing theory, this layer causes the reflection of short-wave electromagnetic radiations. The longer waves, it is assumed, are similarly reflected by a lower ionised layer—Heaviside layer (q.v.)—situated at about 60 m. above the earth's surface.

Appiqué (French, applied). In architecture, any decorative feature applied to an object or structure. In decorative art generally, a piece or pattern of one material set upon the surface of another for decorative effect.

Appoggiatura (Ital. *appoggiare*, to lean). Name of an ornamental musical note preceding an

essential note. An appoggiatura takes the accent from the following note, and also an appreciable amount of its time value, viz. half of an ordinary note or two-thirds of a dotted note. The appoggiatura was originally written as a small note, without a dash through the tail (contrast this with *acciaccatura*), but today it is customary to write the exact time value in ordinary notation.

Appointment (Lat. *ad*, to; *punctum*, point). A term employed in English law. Where property is settled so as to give someone called the appointor the right to dispose of it, though the appointor is not the owner, an exercise of this right is called an appointment. For example, "I give my property to trustees, X and Y, to pay the income to my wife, A, during her life, and after her death to divide the pro-

perty amongst such of my children as she shall appoint by deed or will." This is a very common form. A's deed or will by which she exercises this power is an appointment.

Appomattox. A river of Virginia, U.S.A. It rises in Appomattox county and flows E. to the James river at City Point. About 150 m. long, it is navigable by small steamers to Petersburg, 15 m. from its mouth, and by smaller vessels to Farmville, over 100 m. up.

Appomattox Court House. Village of Virginia, U.S.A., in Appomattox county. It is 23 m. E. of Lynchburg on the Norfolk and Western rly. Here the Confederate army under Lee surrendered to Grant, April 9, 1865, thus ending the American Civil War.

Apponyi, ALBERT, COUNT (1846-1933). Hungarian statesman.

Son of Count George Apponyi, he joined the Liberal party in 1899 and was president of the Chamber of Deputies 1901-3. Leaving the Liberal party in 1903, he became leader of the new National party.

Count A. Apponyi, Hungarian statesman

He was made minister of education in 1906 in the Wekerle cabinet and again in June, 1917, in the Esterházy cabinet, and minister of public instruction in the reorganized Wekerle cabinet, Jan., 1918. He retired in Nov., 1918, but came forward in Jan., 1920, to lead the delegation to Paris to settle the peace with Hungary. Later he represented Hungary in the League of Nations. He died Feb. 7, 1933. Consult his *Memoirs*, 1935.

Apportionment (Lat. *ad*, to; *portio*, portion). English legal term, meaning the division or partition of a whole estate or interest in property into parts or portions. By law, if a reversioner of a lease assigns part of his reversion, the rent is liable to be apportioned. Thus, A makes a lease to me of land or houses at a whole rent, and it turns out that part of the property was not his, and I am evicted by the real owner; the rent therefore becomes apportionable—that is, I have only to pay a part proportionate to the property rightfully leased to me. By the Apportionment Act, 1870, all rents, interest, and periodical payments are to be deemed to accrue from day to day, so that they can always be apportioned between the people entitled where a change

of ownership takes place—e.g. in the middle of a quarter.

Apposition (Lat. *ad*, to; *ponere*, to place). Term used in grammar. When one noun is followed by another, which explains or limits it, the second noun is said to be in apposition to the first (George, king of England). In inflexional languages both nouns must be in the same case.

Appraiser (Lat. *appreciare*, to set a price on). One licensed to appraise or value property, real or personal. On distress for rent an appraisal of goods before sale is necessary only if tenant or owner of the goods demands it, or if the goods are growing crops. A yearly licence costs £2, and the stamp duty payable in the appraisal varies from 3d. for £5 value to 20s. for £500 or over. Licensed auctioneers and house agents and county court bailiffs do not need licences. No duty is payable on appraisements made for a person's own convenience, e.g. on insuring goods, or for an affidavit as to the estate of a deceased person or for fixing legacy or succession duty or made under order of an Admiralty court.

Apprehension (Lat. *apprehensio*, laying hold of). Philosophical term for the act or power of grasping with the intellect. According to Kant, this faculty plays a great part in the formation of concepts. All concepts are subject to time, and the mind must distinguish the time in the succession of impressions. Concepts arise from the synthesis or combination into a single whole of the manifold elements or characteristics apprehended.

Apprenticeship. The apprenticeship system of industrial training seems to have originated far back in the Middle Ages. There is abundant evidence that it was already fully established in England as the recognized system of training for all skilled trades as early as the 13th century, by which time the guilds had become the autocrats of commerce and industry throughout the country.

The system was successfully maintained by the guilds purely as a guild system, without any statutory sanction behind it, for over 200 years. When the power of the guilds had begun seriously to decline, the system received definite statutory sanction by the passing of the Statute of Apprentices or Statute of Artificers in 1562. The effect of this statute was to erect into a national system, obligatory on all desirous of entering a skilled trade, that which had previously

flourished merely as a guild custom, deriving its force and validity mainly from the guild, but recognized and supported by public opinion and the municipal authorities. In some cases, it is true, the guilds' hands had been strengthened by the grant of a royal charter.

The statute of 1562 remained nominally in force until repealed in 1814. It enacted, *inter alia*, that a uniform term of seven years' apprenticeship must be served as a condition precedent to the right to practise any manual trade, and until well into the 18th century the law was rigidly enforced. For many years, however, before its actual repeal, a certain laxity in the administration of the statute had begun, and with its repeal apprenticeship as a voluntary system of industrial training soon began to show signs of decay. This process was hastened by a variety of factors which came into play as the result of the far-reaching social and industrial changes that marked the course of the 19th century, among them the growth of large factories, which took the place of numerous small workshops and thus rendered the training of apprentices much more difficult.

Another factor was the substitution of limited liability companies for private firms, resulting in the weakening of the sense of responsibility towards the apprentice and the disappearance of the old personal relationship between him and his master. In addition, there was the obstinate retention of old forms of indenture unsuited to modern social and industrial conditions, and often in direct conflict with prevailing educational and hygienic ideals; while the lure of blind-alley occupations offered a high initial wage and freedom from the restraints of the apprenticeship system.

The Traditional System

The old apprenticeship system was calculated to produce a type of workman who was thoroughly master of his trade. It was no doubt largely as the result of the system that England produced for so many years the finest type of mechanic and skilled artisan in the world. Probably nothing contributed more to gain for her in the Victorian Age the distinction of being the workshop of the world. The system was based upon the principle that the apprentice was first and foremost a pupil or student, not an employee or wage earner, and, as a corollary, that the master had certain very definite responsibilities towards

him. This is clearly shown in the special legal status of apprentices consistently laid down and recognized by English judges for centuries.

The traditional form of apprenticeship practically placed the master *in loco parentis* towards the apprentice. This relationship almost necessarily resulted so long as it was customary for the apprentice to board and lodge with his master. Under these conditions the apprentice practically became for the time being a member of his master's household. The system had the virtue of imposing a most salutary discipline and restraint on the apprentice during the most difficult period of a boy's life. To this extent it was in striking contrast to the conditions obtaining since its decay in the case of the unbound lad who is free to come and go at his pleasure.

Modern Practice

The terms apprenticeship and apprentice, which originally always implied a strict form of indenture, are now used somewhat loosely. The indenture was from the earliest times a feature of the system, and there were certain definite covenants entered into by the contracting parties which have endured, with but little alteration, to the present time. In recent years the term apprentice has been applied to lads working either under a loose form of agreement of doubtful legal validity, or under no written agreement at all.

The term apprentice, in fact, now denotes any lad who is undergoing a more or less systematic course of training in a skilled trade, quite irrespective of any legal relationship between himself and his master.

The whole field of apprenticeship has been affected by the two Great Wars. The demand for unskilled and semi-skilled labour, commanding high wages, has to a very great extent killed the apprenticeship system. The fixing of the calling-up age for military service at 18 made the former system quite impracticable. The place of apprenticeship was largely filled by the Ministry of Labour's schemes of training, reconditioning, and resettlement centres. Originally these schemes had as their objective the training of men for war industry; but they were subsequently reviewed for the purpose of adapting them to the needs of civilian occupations in times of peace. See Education, Technical; Guild; and under various industries, e.g. Engineering.

Approbate. English legal term. It is an old doctrine of the English common law that a man cannot both approve and reprobate, that is, he cannot both affirm and deny; he cannot say an instrument is both good and bad. In Scots law one is said to be approve and reprobate when one takes advantage of one part of a document and rejects the rest.

Appropriation (Latin *ad*, to; *proprius*, own). Term in English law. When a debtor owes more than one debt to a creditor and makes a payment, he may appropriate the payment to whichever debt he pleases. Thus, if I owe my dentist a bill for 1943, another for 1944, and another for 1945, when I send him a cheque I have the right to say "Apply this cheque towards the 1945 account." If the debtor does not appropriate, the creditor may do so; and he can even apply it to paying a debt which he could not sue for, e.g. a debt barred by the Statute of Limitations. If neither debtor nor creditor makes any appropriation, the law appropriates the money to the earliest debt, unless this was manifestly not the intention of the two parties concerned.

In Parliamentary procedure the Appropriation Act is enforced at the end of each session, stating the purpose to which the money voted must be applied.

Appropriations in Aid. In British finance, cash receipts used by the various government departments towards meeting their gross expenditure. For instance, certain departments receive large sums from Empire governments for defence contributions, and most departments receive money as fees for services rendered, from rents, sales of materials, etc. If so shown in the estimate, these sums are not paid into the Exchequer, but are treated as appropriations in aid of the expenses of each department. See Finance, National.

Approver (Lat. *ad*, to; *probare*, to test, prove). Legal term used in Ireland to describe one who has turned king's evidence. Hawkins's Pleas of the Crown describes an approver as a person who, being an accomplice in treason or felony, tried to obtain a pardon by confessing before he was arraigned, and taking an oath to reveal all the treasons and felonies he knew. Carey, the Fenian, was a noted case of an approver.

Approximation (Lat. *ad*, to; *proximus*, nearest). Mathematical process of finding values which are

successively nearer the truth, though they may never reach it.

Appurtenant (Latin *ad*, to: *pertinere*, to belong). English legal term meaning very much the same as appendant. Certain rights of an accessory kind are frequently enjoyed because they are attached to property, and if acquired otherwise than by prescription are called appurtenances. If this is not the case they are called appendants. See Appendant.

Apraxin, FEODOR MATVEYEVITCH, COUNT (1671-1728). Russian admiral. He early entered the imperial service, and in 1692 was made governor of Archangel and in 1700 chief of the admiralty. By his efforts the Russian navy was established. In 1708 he successfully defended St. Petersburg against the Swedes, in 1710 captured Viborg in Finland, and in 1713, by inflicting a severe defeat on the Swedish fleet, he made Russia supreme in the Baltic. Fined for embezzlement in 1714 and 1718, he was too valuable to be dismissed, and he accompanied Peter the Great to Persia in 1722. He died at Moscow, Nov. 10, 1728.

Aprica Pass. Pass over the Bergamasque Alps in N. Italy. There is a carriage-road from Edolo, in the Val Camonica, to Tresenda, in Val Tellina. The village of Aprica is prettily situated just below the pass.

Apricot. A fruit tree of the natural order Rosaceae, *Prunus Armeniaca*. A native of Asia, it was introduced into England in 1652. The culture is the same as for peaches, but warm S. walls are needed to develop and ripen the fruit. The best soil is loam mixed with sand. Trees should be planted in autumn, and the best system of propagation is by budding in June or July. Under glass the apricot should be planted out in a soil consisting largely of lime and burnt wood ashes, and in such a position that light and air can be regulated easily. Sudden currents of icy wind are fatal to the proper ripening of apricots. The word, in French *abricot*, is probably a compound of Arabic *al*, the, and Latin *prae-coquus*, prematurely ripe, from late Greek *praiokion*. The earlier English word apricoek was derived from Portuguese *abricoque*.

Apries. Egyptian king of the XXVIth dynasty (c. 589-570 B.C.). The Greised form of the native name Uahabra, it appears as Pharaoh-hopra in Jer. 44. Capturing Sidon by a sea battle, he entered into an unsuccessful league

with Zedekiah of Jerusalem against Nebuchadrezzar II. He was deposed in favour of Aahmes II by a military revolt in Libya. He was then interned at Sais and finally strangled. See Memphis.

April. Fourth month of the Christian calendar. The name is usually derived from Latin *aperire*, to open, in allusion to the opening of the buds. The Anglo-Saxon name was Oster-monath, from the spring goddess Eoster, whence Easter. The risings in France in 1834 against Louis Philippe are known as the "days of April." See All Fools' Day; Calendar.

A priori; a posteriori (Latin, from the earlier, from the later). Terms closely connected with the question of the origin of knowledge. Aristotle, and after him the scholastics, distinguished *a priori* knowledge, obtained by arguing from causes to effects, from *a posteriori* knowledge, obtained from arguing from effects to causes. According to Kant, *a priori* knowledge consists of general, necessary truths, already existing in the mind, independent of experience; *a posteriori* knowledge is empirical, the result of experience, and cannot supply general truths, for experience merely tells us that a thing is, not that it must be as it is. See Philosophy; Logic.

Apron. Word of unsettled etymology, probably derived from O.Fr. *napperon*, diminutive of *nappe*, from Lat. *nappa*, a cloth. In the N. of England the form is *nappern*; elsewhere a *napron* was corrupted to an apron. The garment has been in use for centuries. Chaucer mentions a *barme* or lap cloth (A.S. *barm*, lap or bosom), while an old illustration depicts a 14th century smith in a leather apron. In Northumberland the term *barm-skin* survives. Pinner was a name applied when a bib was pinned to the dress: hence pinafore. Mary Queen of Scots is said to have left over 100 aprons. Queen Anne and her contemporaries wore aprons with rich embroidery and decoration. The apron of the Anglican bishop is a short cassock, worn in obedience to the 74th canon of Convocation,

1603-4. The symbolic aprons worn by Freemasons are of lamb-skin, and are variously embellished.

In engineering, an apron signifies a protective covering, such as the sloping masonry platform at the foot of a dam, which prevents water from injuring the foundations. In the First Great War balloon aprons were part of the aerial defence of London. The paved embarkation point of an airfield is also called an apron. See Balloon Defences.

Apron Stage. Part of a theatre stage which projects into the auditorium. Developed from the Elizabethan platform, this was at first peculiar to the English theatre. Its use died out with

Apron Stage. Modern example of this form of stage at the Memorial Theatre, Stratford-on-Avon

the introduction of the front curtain, but it has been revived in the present century, e.g. at the Maddermarket Theatre, Norwich, and Mercury Theatre, Nottingham Hill, for production of Elizabethan or Restoration drama.

Apsaras. In Hindu mythology, two classes, divine and mundane, of nymphs and fairies. Sometimes as insubstantial cloudy creatures, or as water sprites, they are regarded as Oriental parallels to the swan-maidens of western tradition, or the nymphs of the Greeks. They are also spoken of as nymphs of heaven, attendants on heroes, like the houris of the Mahomedan paradise.

Apse (Greek *apsis*, fastening, circle). In ecclesiastical architecture, the semi-circular or polygonal termination of the nave or of the aisles of a basilica. In medieval churches it was the space reserved for the altar, and usually vaulted. Some Norman churches in England have semi-circular apses at the E. end; that in Peterborough Cathedral has fine windows with geometric tracery. One of the transepts at Lincoln has semi-circular

apses to its E chapels, and the apse of Lichfield Cathedral is a polygon. The apse often had a diameter equal to the width of the church, allowing for aisles to surround the altar, forming what is known as the ambulatory. The early chapel of S John in the Tower of London has an apse with half domed roof, and the 12th century church of S Bartholomew the Great, Smithfield, London, restored 1864-1906, has the same feature. The apse was revived by Wren in S Paul's, and the church of S Mary le Strand, London, shows an example, balanced at the W end by a semi circular portico. Generally speaking, the apse was discontinued earlier in England than on the Continent, it may still be seen in numerous Romanesque churches in Italy.

Apsheeron. Peninsula of S W Russia. It extends for 40 m into the Caspian Sea and forms the E extremity of the Caucasus Mts. It is remarkable for its volcanic condition, petroleum wells, mud volcanoes, and saline lakes. Baku stands on the S coast.

Apsides. Astronomical term applied chiefly to the aphelion and perihelion points of any body in the solar system. The line of the apsides, therefore, joins the points in the orbits of these bodies when they are respectively farthest from and nearest to the sun, and so is the major axis of ellipse like orbits.

Apsley House. London residence of the dukes of Wellington. It is in Piccadilly, at the western end of Hyde Park end, and was built in 1771-8 by the Adam brothers for Lord Apsley on the site of Hercules' Pillars Inn. Presented by the nation in 1820 to the Iron Duke, its original red brick was faced with stone in 1828-29. See N V.

Apt. Town of France, in the department of Vaucluse. The ancient Apta Julia, it is 40 m by

rly E of Avignon, and stands on the Coulon. Apt was a bishopric until 1790, and its church of S Anne was the cathedral. Some traces of its city walls remain, although to a large extent boulevards have replaced them. It was a settlement of the Gauls and afterwards of the Romans, later it was in Provence.

Aptera (Gr *apteros*, wingless) Order of wingless insects, including the sub orders Collembola (Spring

Aptera. Two specimens, both of them greatly enlarged, of this order of wingless insects *Lepisma saccharina*, and (above) *Podura villosa*.

tails) and *Thysanura* (Bristle tails). In many respects they suggest that they have remained in the larval stage and failed to develop into perfect insects. They are all very small.

Apteryx. A genus of ratite birds found only in New Zealand. The native name is kiwi. The apteryx has small and rudimentary wings, hidden beneath the feathers and useless for flight. The feathers are long, narrow, and simple in character, giving the bird the appearance of being covered with coarse hair. The beak is of great length, and the nostrils are at the tip, a feature found in no other living species of bird. The apteryx

is nocturnal, and sleeps throughout the day. It is timid and inoffensive. The female lays one egg—rarely two, the nest is a hollow in the ground. The egg measures about 5 ins by 3 ins, enormous for a bird no larger than the domestic hen. The work of incubation is undertaken by the cock. The bird has become

Apteryx australis, or kiwi, known as the wingless bird of New Zealand.

scarce, but is protected by the New Zealand Government.

Apuan Alps. Outlying range of the Apennines in NW Italy. They extend for 30 m between the main range and the Mediterranean, and contain some of the finest marble in the world. The quarries were known to the Romans and are still worked. The highest point is Monte Pisanino, 6,383 ft. See Carrara.

Apuania. Municipality of Tuscany, Italy, which also gives its name to a prov. It was formed in 1935 from the neighbouring towns of Carrara and Massa, and had a prewar pop of 106,378. See Carrara, Massa.

Apuleius, Lucius. A Roman writer who flourished in the latter half of the 2nd century A.D. An African by birth, after travelling extensively he settled down as a rhetorician in Carthage. His best known work is *The Golden Ass*, a prose romance purporting to describe the experiences of one Lucius, whom an enchantress had transformed into an ass. The most interesting episode is the story of Cupid and Psyche. *The Golden Ass*, a forerunner of the modern novel, is written in African Latin, in the new style which had superseded that of the Augustan age. Apuleius was a student of neo Platonism, a strong supporter of paganism, and favoured a revival of the ancient mysteries. Some philosophical writings and his defence against a charge of sorcery are also extant. Eng trans of *The Golden Ass*, W Adlington, 1566, reprinted 1913, H E Butler, 1910.

Apulia (Italian *Puglia*). A com partimento or territorial division of SE Italy. It includes the provinces of Foggia, Bari, Brindisi, Taranto, and Lecce, and has an area of 7,442 sq m. Bounded E and N by the Adriatic, and SW by the Gulf of Taranto, it is largely level, the highest point being Monte Gargano, 3,464 ft. The only large river is the Ofanto, about 100 m. long. The chief industries are pastoral and agricultural. Sheep,

Apsley House, Hyde Park Corner, London. It is the residence of the duke of Wellington, having been presented by the nation to the first duke in 1820.

1 Apse of St Paul's Cathedral London, one of the finest of the world's Renaissance cathedrals 2 St Vicente Avila Spain, Romanesque 3 St Sernin, Toulouse France 4 Cathedral of St Cecilia Albi, France, a perfect example

APSE EXAMPLES IN ENGLAND SPAIN, FRANCE AND ITALY

cattle, horses, and swine are reared cereals, fruits, tobacco, and wine are produced. marble is worked, and olive oil exported. The chief ports are Bari, Brindisi, Taranto, Barletta, and Gallipoli. Other towns are Andria, Foggia, Corato, Lecce, Molfetta, and Monopoli. Originally civilized by Greek colonists, Apulia submitted to Rome in 317 B.C., and suffered severely in the Punic wars and also in the Social War of 90-88 B.C., after which it never recovered its ancient prosperity. Conquered in 668 by the Longobardi, and in 1043 by the Normans, who made it a duchy it became part of the Two Sicilies in 1734 and of the kingdom of Italy in 1861. Pop. 2,886,570.

Apuré. River of Venezuela. Rising in the Cordillera de Mérida, on the Colombian border, it flows 700 m. N.E. to the Orinoco. It receives the Portuguesa, Guarico, Caparro, and Caucagua, and is navigable for about 600 m.

Apuré. State in the N.W. of Venezuela. Bounded N. by the states of Barinas and Guarico and S. by Colombia, its main industries are cattle-breeding and exporting hides. San Fernando is the capital. Pop. 71,271.

Apurimac. River of south-central Peru. It rises in the Andes and flows N.E. and N.W. to the Ucayali, a tributary of the Amazon, of which it is considered a head water. A turbulent stream, broken by rapids and only partly navigable, it is called the Tambo after its junction with the Perené, and is 600 m. long.

Apurimac. Department of south-central Peru. It is watered by the Apurimac and its tributaries, and has an area of 8,187 sq. m. Mainly a plateau, with forests and pastures, it produces coffee, sugar, rice, cocoa, and rubber. The principal towns are Abancay, the capital, and Andahuaylas, about 50 m. to the N.W. Pop. 258,094.

Apus. In astronomy, the Bird of Paradise, one of the more recently discovered constellations of the southern circumpolar stars.

See Constellations.

Apus (Greek *apous*, footless). A small freshwater crustacean of the family of Phyllopods. It has a comparatively large carapace, covering the head and part of the thorax

Apus. *Lepidurus*, or scale-tailed apus (enlarged)

Aquarium. In the brilliantly lit tanks of the aquarium at the London Zoo are to be found fish from all the seas of the world

the abdominal appendages being exposed. Often nearly an inch in length, it swims on its back, the action of the legs resembling that of paddles. The eggs can survive long periods of drought. It is related to the familiar brine shrimp of the shore.

Aquae Sulis. Roman name for Bath, Somerset. The meaning was originally conjectured to be Waters of the Sun, but it is as probable that the derivation is from Sul, a local goddess identified with Minerva by the Romans when they founded the watering-place c. A.D. 44. A temple to this deity was one of the city's earliest buildings. See Bath

Aqua fortis (Lat., strong water). Ancient and still popular name for nitric acid (*q.v.*). The strongest is called double aqua fortis.

Aquamarine. Popular name of the bluish-green varieties of beryl, topaz, and apatite. The word comes from Latin *aqua marina*, sea water, in allusion to the colour and is also used as an adjective to denote bluish green. The aquamarine is found in the Ural Mts and in Brazil, the latter country also yielding pretty aquamarine chrysolite of a yellowish-green hue.

Aqua regia (Lat., royal water). A mixture of one volume of nitric acid and four volumes of hydrochloric acid. It was so called because it was found to dissolve gold, the king of metals

Aquarelle. French term for a process of painting with water-colours distinguished from other processes by the translucency of the pigments. As a rule Chinese and process whites are not employed See Water-Colour Painting

Aquarium (Lat. *aquarius*, pertaining to water). Vessel constructed as a cage in which one may observe living aquatic animals and plants in fresh or salt water. It usually takes the form of a four-sided tank, constructed of glass and slate or of glass and zinc. The best form has the front of plate glass, and the bottom, back, and ends of slate.

Aquatic animals, such as fishes and many insects, respire by extracting the oxygen that is dissolved in the water, and this has to be replaced by the activity of living plants under the influence of sunlight. The animal inhabitants of a tank must never be in too great a proportion to the plants, or insufficient oxygen will be given off to supply their needs, and they will die. Given a proper balance in this respect, there is no need to change the water, unless it becomes fouled by the decomposition of unconsumed food. Fresh water should be added to make up the loss by evaporation. Frogs and newts, which are lung-breathers, and only live in water in the breeding season, should not be admitted to the aquarium. Suitable water plants may be obtained from any dealer. The Canadian pond-weed (*Elodea canadensis*) is one of the best, as it is a quick grower and needs no soil for roots.

Care must be taken to exclude creatures that prey upon others. The large diving beetle (*Dytiscus*) and all the water-bugs (*Hemiptera*) are of this class, and will soon destroy fishes, tadpoles, and snails. Minute worms, thread-like fragments of raw meat, and crushed vermicelli may be given occasionally

as food; but only in such quantity as can be eaten at once.

The marine aquarium should be filled with sea-water, and a line should be marked on the glass front to indicate the original height of the water. As, owing to evaporation, the water sinks below this line, it should be made good by the addition of fresh water, otherwise it will become too salt. Small green seaweeds attached to pebbles or shells should be sought on the shore for removal to the aquarium; the brown or olive wracks are unsuitable for the purpose. Sea-anemones, zoophytes, shrimps, small crabs, molluscs, and a few of the smaller species of shore-haunting fishes are the most suitable inmates; and morsels of raw fish should be given as food. If any dead or decaying matter is at once removed, such an aquarium may be maintained without change of water for months. If far from the coast, provision for a change of water should be made at the beginning by obtaining a cask of sea-water equal to about four times the capacity of the tank. Should a change become necessary, draw off the whole of the water from the aquarium by means of a siphon, and refill from the store cask. Then carefully strain the foul water through two or three thicknesses of fine muslin, and pour it into the store cask. By admixture with the greater volume of water still left, and by being kept in the dark, the fouled water will soon become wholesome again.

Exhibition aquariums of large size have become increasingly popular with the public. Famous examples are at Monaco, Brighton, the London Zoo, and in New York, Boston, San Francisco, Washington, and New Orleans.

Aquarius. One of the oldest constellations. The name signifies the water-bearer. Its place in the heavens is indicated by the lines: Down from bright Vega cast your glance across the Dolphin's space, Then just as far again you'll find the Water-bearer's place.

Aquarium. Open-air tank form, made of reinforced concrete; and (above) a handsome form of stand aquarium

From time immemorial the constellation has been represented as a man pouring out a stream of water from a pitcher, apparently on Pisces, the Fish. The water-bearer's right arm is stretched backwards so as to reach over almost the entire length of Capricornus. The stream of water trickles down to the star Fomalhaut, one of the four ancient royal stars and the mouth of the Fish. See Constellations: Zodiak.

Aquatint (Latin *aqua tincla*, dyed water). The name applied to a mode of etching on copper with a resin ground resulting in resemblances to flat washes of water-colour in monochrome. Aquatints were first produced in France by Leprince, 1750, and in England by Paul Sandby, 1775. See Etching.

Aqua Tofana. Poison reputed to have been used in Italy in the 17th century. It was most probably a solution of arsenic, and was said to be a tasteless and odourless liquid, a few drops being sufficient to bring about death. The name is supposed to be derived from a Sicilian woman who first prepared it.

Aquaviva. Variant spelling of the name of the Jesuit general, Acquaviva (q.v.).

Aqueduct (Lat. *aquae ductus*, conveyance of water). Conduit in which water flows or is conveyed from one point to another. Actually

a water pipe or a canal fulfils this condition, but in the generally accepted sense of the word an aqueduct is an artificial channel in which water intended for domestic, power, or other purposes flows by gravity, at least for a considerable portion of the distance, between the source of supply and the destination. In modern practice detached sections of aqueducts proper are often conducted by pipe line sections and siphons.

The most famous builders of aqueducts were the Romans, and

many of the ruins of their structures exist in Italy and elsewhere on the Continent. Aqueducts brought water to Rome from the Alban and Apennine hills, but especially from the springs of Tivoli. One of these ancient waterways was the Anio Vetus, begun by M. Curius Dentatus about 273 B.C. It measured approximately 71,000 yds. in length.

The oldest Roman aqueduct was that of Appius Claudius, which dates from about 310 B.C. This conveyed the Aqua Appia to Rome over a distance of some 19,000 yds. Both these aqueducts had fallen into disuse by 150 B.C. It was then that the conduit for the Aqua Marcia was brought to Rome from Subiaco, some 20 m. beyond Tivoli. During the reign of Agrippa all the aqueducts were restored, and the later emperors added the Aqua Claudia and the Anio Novus. The height of some of the arches was about 100 ft.

A notable Roman aqueduct is that of Segovia in Spain. It begins in the Sierra Guadarrama, 10 m. distant, and, after traversing the intervening hills and dales, crosses the streets of the city to the Alcazar. It is built of great blocks of granite, without mortar or clamps, and its arches vary from 23 ft. to 94 ft. in height. Dating from the time of Trajan, it was restored by Queen Isabella of Spain in the 15th

century. There are also ruins of important aqueducts at Metz and at Nîmes. Other Roman aqueducts are to be found at Tarragona, Lyons, Fréjus, and Luynes. The Roman structures were mostly built of stone, but bricks and concrete appear to have been used. Roman aqueducts followed a uniform slope throughout, the water flowing by gravity.

The picture on this page shows a bridge-like structure used to carry the Birmingham aqueduct over Deepwood bridge; in modern practice, however, the original type of aqueduct has for most purposes been superseded by the use of pipes, which are now usually of cast iron or steel, or by closed conduits constructed of reinforced concrete. In some cases, however, where the natural slope of the ground permits of the requisite fall, a trench is dug, an inverted arch of concrete is formed on the bottom, side walls are raised on this, and an arched roof is added to exclude polluting matter. The trench is then covered with the excavated earth, which affords protection from heat and cold.

Tunnels are used where the watercourse has to go through an elevation or underneath a river. In the Lake Vyrnwy scheme for supplying water to Liverpool a tunnel 7 ft. in diameter and $3\frac{3}{4}$ m. long forms part of the 68-mile course of the aqueduct.

Much larger and longer tunnels have been driven for some of the American aqueducts. The Delaware aqueduct (completed 1942) brings additional water from tributaries of the Delaware river to New York, already supplied in part since 1917 by the Catskill aqueduct, 126 m. long. In the Delaware scheme a single tunnel, from 17 to 19 ft. in diameter and 15 m. long, pierces the Shawangunk mt. Three shafts, 840, 825, and 1,551 ft. deep, were

Aquila, Italy. The 13th century façade of the church of S. Maria di Collemaggio

sunk at points 5 m. apart, in order to allow of simultaneous tunneling at a number of points. Rock tunnels are usually concreted to promote ease of flow: earth tunnels are concreted or bricked for the same reason. In undulating country and across valleys, sections of steel pipe-line are interposed.

Aquifoliaceae. Small family of shrubs or trees having undivided, alternate, and often evergreen leaves. The flowers are small and white, in clusters (cymes) produced from between the base of the leaf-stalk and the twig. There are only five genera and about 300 species, natives of tropical and temperate regions. The common holly is a well-known type.

Aquila. City of Italy. The capital of Aquila province, it is on the Aterno, 50 m. direct and 145 m. by rly. N.E. of Rome. It is a summer resort, beautifully situated on a plateau at the foot of the Gran Sassa d'Italia. An archiepiscopal see, it has a 13th century cathedral and a citadel built by the Spaniards in 1534. Notable among

its churches are S. Bernardino di Siena, dating from 1472, and containing a finely sculptured tomb of the saint, and that of S. Maria di Collemaggio, built 1280, within which is the tomb of Pope Celestine V. Its chief industry is lace-making. It was founded by the emperor Frederick II about 1240. Razed by Manfred

twenty years later, it suffered further at the hands of the Spaniards in 1521 and the French in 1790. During the Second Great War, Allied troops of the 8th army, having crossed the Saline river, occupied the city June 13, 1944. Pop. 54,722.

Aquila (Lat., eagle). Name of a constellation in the northern hemisphere. Figured as an eagle carrying a harp about its neck, it is to the east of the star Vega and is traversed by a bright part of the Milky Way which here divides into two branches. Its chief star is Altair, occupying one of the angles of an equilateral triangle, the other two points being Vega and the star Alpha Ophiuchi. See Constellation

Aqueduct. Air view of the Pont du Gard (c. 18 B.C.) carrying the aqueduct that supplied Nîmes, France, across the valley of the R. Gard. Above right, Deepwood Dingle crossing of the Birmingham aqueduct

Aquila. An early convert to Christianity mentioned in the N.T. The husband of Priscilla, with whom he is always associated, he is referred to by S. Paul (Rom. 16; 1 Cor. 16; 2 Tim. 4). Born in Pontus (Acts 18) and a Jew, Aquila was driven from Rome, and with Priscilla entertained S. Paul at Corinth. Later they saved the life of the apostle at Ephesus. A late tradition makes Aquila one of the seventy sent out by Christ.

Aquilegia. Genus of perennial herbs of the natural order Ranunculaceae. Native of the N. temperate zone, it contains a few species and numerous hybrids. The leaves are broken up into stalked leaflets, which are again divided into three lobes. A familiar type is the common columbine (*A. vulgaris*), a native of Europe, Asia, and N. Africa,

Aquilegia vulgaris, or columbine

whose inverted flower is supposed to resemble a nest of five doves (Lat. *columbae*) or eagles (*aquilae*).

Aquileja. Small town of Italy, in Gorizia prov. In the Middle Ages it was known as Aglar. It stands 6 m. from the coast at the head of the Adriatic, 26 m. by rly N.W. of Trieste. From its foundation as a frontier fortress about 200 B.C. until its destruction by Attila in A.D. 452, Aquileja was one of the great cities of the Roman Empire, especially under the successors of Augustus. It was the nodal point of several roads, a station of the fleet, and a residence of the emperors, which combined to make it an important trading centre. At the close of the 4th century it was the ninth city of the Roman Empire.

Excavations have proved its importance, and the museum contains a valuable collection of antiquities. The bishop of Aquileja attained the rank of patriarch and was one of the most important

dignitaries of the medieval Church. The archbishopric existed in what remained of the city after its destruction in 452, and, although once or twice removed, was not suppressed until 1751. Its cathedral, dating from the 11th century, occupies the site of an earlier edifice. It was remodelled in the Gothic style about 1380, and has a campanile 240 ft. high.

Since Roman times the sea has receded and the city is now about 6 m. away, lagoons having been formed in front of it. It was included for centuries in the Holy Roman Empire, and was acquired by Austria in 1806 and by Italy after the First Great War. Councils of the Church were held at Aquileja, in 351, 553, 698, and 1184. Parts of its ancient walls have been excavated and a few fragments remain of the imperial palace built during the 4th century. Pop. 2,600.

Aquin. Seaport of Haiti. It stands on the S. coast, 50 m. W. of Jacmel, and exports dyewoods. Pop. 22,000.

Aquinas, THOMAS (1227-74). Saint and theologian. A son of the count of Aquino, he was born near Naples, and brought up at the Benedictine monastery of Monte Cassino. At the age of thirteen he was a student at the university of Naples. Here three years later he became a friar of the Dominican order, notwithstanding the opposition of his family, and, proceeding to Cologne, attended the classes of Albertus Magnus, with whom he was sent to Paris for a three years' course at the university. He graduated in theology in 1248, returned to Cologne, and was ordained to the priesthood, lecturing and teaching in that city for the next four years.

S. Thomas Aquinas, scholastic theologian

When in 1252 Thomas went to Paris to take his doctor's degree, his fame as a theologian and a teacher was already established. But Paris was the scene of bitter controversy between the friars and the secular clergy, and the friars, heavily attacked by the latter, called Thomas and S. Bonaventura,

the Franciscan, to their assistance. The cause was argued before the pope, and Thomas's brilliant defence broke up completely the case against the mendicant orders. Thomas received the doctorate in 1237. From that time until his death he was teaching, writing, and regulating the theological studies of the Dominican friars. Beyond attendance in London at a general chapter of the order in 1263, and two years in Paris, 1269-71, he remained in Italy—at Rome, Bologna, and Naples—refusing all high appointments in the Church, and remaining a simple friar. Summoned by Pope Gregory X to attend the general council called at Lyons for the reunion of the Greek and Latin churches, he died at the Cistercian abbey of Fossa Nuova, March 7, 1274. He was canonised by Pope John XXII in 1323, and declared a doctor of the Church in 1567, and patron saint of all Catholic schools and colleges. His festival is kept throughout the Roman Catholic Church on March 7.

The influence which Thomas Aquinas has exercised on both theological and philosophical thought is enormous. His learning was considerable, and his intellect brought every branch of knowledge within his system of theology. In addition to several commentaries on books of the Bible, a philosophical treatise on Being and Essence, a Summary of Philosophy, which is mainly occupied with the discussion of natural religion, and commentaries on Aristotle, there remains the greatest of all his works, the Summa Theologica, a compendium of all human knowledge in its relation to religion.

He taught that for the human soul there were two sources of knowledge, divine revelation (supernatural) and human intellect (natural); and that all our knowledge begins with the senses. Philosophical, i.e. natural, knowledge could only be brought to its fullness by broadening into theology under the grace of divine revelation. The intellect discerning the good determines the will, the latter being thus dependent on the former, and freedom simply the liberty based on knowledge. Without knowledge of justice the will is not free to choose the just course. Theology, Aquinas taught, is organized knowledge of God. While reason can prove the existence of God, revelation shows the essence of God. The divine will is bound to the divine wisdom, and a thing does not become good because God wills it; but He wills it because His wisdom has recognized that it is good. From all this it follows that true doctrine is

Aquileja, Italy, showing the 11th century cathedral

the cause and basis of all right practice, and that the intellectual appreciation of God—that is, knowledge proceeding from divine revelation—is all-important. The indebtedness of Aquinas to Aristotle is very great. All that is true in Greek ethics has its place in the *Summa Theologica*.

With Aristotle, Aquinas maintains that ethics is the science of directing the will to the real good, but he makes charity or love the central unity of the virtues. Today his great work is as essential to all students of theology as it was in the 13th century. The Fathers of the English Dominican Province are responsible for a complete and literal translation of the *Summa Theologica*.

Aquinas was a man of exceptional religious fervour and of simple piety. It was in 1263 that the festival in honour of the Holy Eucharist was, at the request of Aquinas, made by Pope Urban IV a feast to be observed throughout the Catholic Church, under the title of Corpus Christi. Thomas was deputed by the pope to compile the office for the festival, and his work includes the three greatest and best known hymns in honour of the Sacrament—*Lauda Sion, Verbum Supernum*, and *Pange Lingua*. All three, in translations, are often used at Holy Communion in Anglican churches.

Bibliography. *Summa Theologica*, 22 vols., 1909–22; *Summa Contra Gentiles*, 5 vols., 1924–29; Thomas Aquinas, *His Personality and Thought*, M. Grabmann, 1928; Thomas Aquinas, M. C. D'Arcy, 1930; St. Thomas Aquinas, G. K. Chesterton, 1933; *The Philosophy of St. Thomas Aquinas*, E. Gilson, 1937.

Aquitaine. Name given nearly 2,000 years ago to the district between the Pyrenées and the river Garonne. Gradually the name spread farther N., and in the time of Augustus the territory reached as far as the Loire.

After the fall of the Western Empire it was ruled by dukes, who were in practice independent, although nominally they were vassals of the Frankish kings. Charles Martel, however, recovered it, and Charlemagne gave it to one of his sons. In the 9th century a new line of dukes obtained authority over it. One of these, William, had a daughter Eleanor, who was the wife, first, of Louis VII of France, and, secondly, of Henry II of England. She was the heiress of Aquitaine, which thus became united with England, in whose possession it remained until the days

Arabesque. Part of the wonderful decorations in this style of the Hall of the Ambassadors in the Alhambra, Spain

of Henry VI. By then, the name Aquitaine had almost fallen into disuse, the S. part being known as Gascony and the N. as Guienne.

Aquitania. A Cunard liner, launched in 1913, and burning oil fuel. Gross tonnage, 45,647 tons; length, 868 feet; speed, 24 knots. Crew, about 580.

The liner performed useful service in the two Great Wars. In 1914 she was taken over as an armed cruiser, but was subsequently engaged on transport and hospital service, carrying upwards of 120,000 men, including 25,000 wounded. Between the wars she made 291 crossings of the N. Atlantic, and was at New York on Sept. 3, 1939. She returned to Southampton and was requisitioned for transport, operating in various zones until May, 1942; thereafter to the end of the war she carried troops across the Atlantic, in all 246,698 men.

Arabah, WADY EL. Valley in Transjordan. Known also as El Ghor, it extends from the S. of the Dead Sea to the N. end of the Gulf of Akaba, and is about 110 m. long; it is part of the Great Rift Valley which connects the Dead and Red Seas with Lake Tanganyika. On the E. is Mt. Seir.

Arabesque. Style of pictorial or plastic ornament, with some suggestion of the fanciful or grotesque. It is seen in Moorish

and Arabic architecture, and lent itself to beautiful patterns.

In music, arabesque was first applied by Schumann to one of his pianoforte pieces (op. 18) the form of which resembles a rondo. Debussy's two arabesques for piano (1888) are among his most popular pianoforte works. In dancing, the arabesque is a position in which the body is supported on one leg with the other extended behind, one arm outstretched in front, the other extended behind.

Arabi, AHMED (c. 1839–1911). Egyptian nationalist, known as Arabi Pasha. Born in Lower Egypt of fellah parents, he became an army officer in 1862, shortly afterwards joining a secret society for the overthrow of the khedive. He won popularity in the army by his speeches against the employment of foreigners and Turkish ministers in Egypt, and in 1882 forced himself upon the khedive, Tewfik Pasha, as war minister. His influence soon became supreme and he declared hostility to all forms of European control in Egypt. In reply the British bombarded Alexandria on July 11, 1882, and on Sept. 12 Sir Garnet Wolseley's forces defeated Arabi at Tel-el-Kebir. Arabi was condemned to death, but was sent to perpetual exile in Ceylon. Permitted to return to Egypt in 1901, he died there Sept. 21, 1911.

ARABIA: EARLY HOME OF LEARNING

Robert Machray and M. A. Canney

In this article are sketched the art, philosophy, language, etc., of the country as well as its history, with its renewed political importance in modern times. For further information see under Hejaz; Mahomedanism; Mecca; Nejd; Saudi Arabia, etc.

Called by its own people Jezirat-al-Arab, "the peninsula of Arabia," and by the Turks and Persians Arabistan, i.e. the land of the Arabs, Arabia is the great peninsula which forms the S.W. part of Asia.

AREA, BOUNDARIES, ETC. Its boundary on the N. may be taken as starting from the head of the Gulf of Akaba, and running S. and E. of Transjordan to Iraq and the Persian Gulf. On the W. it is bounded by the Red Sea, E. by the Persian Gulf and Gulf of Oman, and S. by the Gulf of Aden, Arabian Sea, and Indian Ocean. Approximately its area is 1,000,000 sq. m. From N.W. to S.E. it is about 1,800 m. in length. It is broadest on the S., its mean breadth being about 600 m. Vast portions are sandy wastes: on the N. is the Great Nefud, on the E. is the Little Nefud or Dahna, on the S.E. is the Ruba al Khali, and on the S. is El Ahkaf—all desert land with only an occasional oasis.

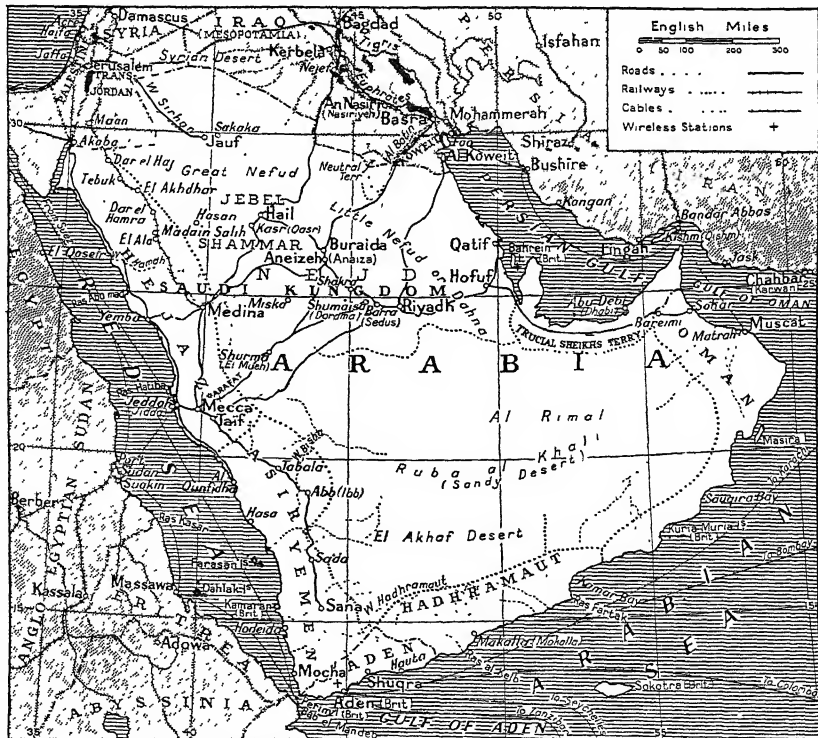

The mountain rim on the W. and the encircling deserts N.E. and S. isolate the central tableland of Nejd and Shammar; here are many hillocks and few hills. In the N., in Jebel Shammar, where the rock is granite, there are few oases; in the S.E. the limestone is more fertile and better watered; between the two in the sandstone is the comparatively fertile valley of Kasim. Throughout Nejd water can be obtained by digging, so that the area supports a relatively large population. Of the rivers no single stream flows all the year round. About half of the country is quite uninhabitable. Except in the

north-central regions inhabited Arabia consists of a series of states or more or less well-defined territories lying on the shores of the Red Sea, the Arabian Sea, the Gulf of Oman, and the Persian Gulf, their hinterlands being lost in the desert plateau, which on the N. is some 2,500 ft. and on the S.W. from 7,000 ft. to 9,000 ft. above the sea. Anciently Arabia was divided by Ptolemy into Arabia Petraea, which is the region in and about Petra, in the N.W.; Arabia Felix, i.e. the modern imamate known as the Yemen; and Arabia Deserta. The pop. is conjecturally put at 10,000,000. There are two strains of Arabs, one Ishmaelite, in the N., and the other Yektanic or Kahanitic, in the S., which derives from one of the descendants of Shem; both are Semitic. The Arabs in the S. consider their blood the purer. Roughly all are divided into two great classes—the Beduin or migratory Arabs,

who flit from oasis to oasis, and the Arabs who live in settled communities in Nejd, Shammar, and along the coast. The former have their tribal chiefs; the latter, with few exceptions, have independent or semi-independent princes.

Naturally the connexion between Arabia and Palestine-Syria has been intimate, and there are many Jews in the country, especially in the S. The most important political division is the kingdom of Saudi Arabia, which includes the Hejaz, Asir, and the great interior mass of Nejd. For the most part this is mountainous or plateau country, arid and uncultivated. Below this comes the Yemen, the best part of Arabia, where the monsoons yield a moderate rainfall, and below that is the British colony of Aden and the Aden Protectorate, casting its influence eastward throughout the Hadhramaut on the S. to Oman, an independent state in the S.E. Along the Persian Gulf, N.W. of Oman, come in order the territories of the Trucial Sheikhs; Hasa, part of Saudi Arabia; and Koweit, an Arab sultanate under British protection.

For the greater part Hejaz and Asir on the W. occupy the land

Arabia. Map of the great peninsula which forms the S.W. extremity of Asia

stretching back from the sea beyond the mountains that rim the central plateau. The narrow coastal portion of this tract, which in places is fairly thickly inhabited, is called the Tehama, or low-lying country, and is a hot and humid region, whose valleys produce maize, wheat, barley, cotton, coffee, sugar, tobacco, and indigo, and abound in spice and aromatic trees and plants. In Hejaz, inland of the mountainous plateau rim which here rises to over 8,000 ft., the Hejaz rly. runs parallel with the coast to Medina, and skirts the edges of the Nefud desert. In Nejd, Shammar, and on the S. and E. coasts the date palm supplies the chief means of subsistence. Arabia is famous for its horses and camels; the best of the former come from Nejd, of the latter from Oman. After the rainy season the Arabs move their flocks and herds into certain spaces of the desert plateau which have suddenly become green with rich vegetation, and for two or three months afford reasonably good pasturage.

The climate has extremes of heat and cold, the coastal tracts, particularly the littoral of the Persian Gulf, being in summer among the most torrid regions of the world. Wild beasts include the lion and the panther, but are not numerous, nor are there many birds. The country is not highly mineralised, though iron, copper, and lead are found. The Persian Gulf, on the Arabian side, has valuable pearl fisheries.

Arabia is very deficient in communications. There is only one railway—that part of the Hejaz rly. which runs from Transjordan to Medina, and this is not in working order (1947). A metalled road runs from Jeddah to Mecca and Medina. For the rest, motor transport follows the ancient caravan routes across the desert, from Mecca to Riyadh and the Persian Gulf to Hail and on to Iraq, to Medina and Transjordan and south into Yemen. In the world movements from E. to W. or from W. to E., no great armies ever traversed Arabia, and no vast migrations of peoples dropped settlers by the way.

Arabia has no large cities. The Hejaz contains Mecca and Medina, the holy cities of the Moslems, with the ports of Jeddah and Yembo; Asir has no town of importance; in the Yemen Hodeida has to some extent supplanted Mocha, both as a port and as the centre of the coffee trade; Sana

Arabia. Beduin camel driver. According to Arab tradition, the Beduins are descendants of Ishmael, while the pure Arabs are descended from Shem

is the capital. Muscat in Oman is almost the only town of any consequence from Aden to Koweit. In the interior are Hofuf, Riyadh, and Hail. The nature of the country forbids large aggregations of people in any part.

HISTORY. The Arabs are undoubtedly an ancient race, but until the advent of Mahomet and the development of Islam Arabia figured hardly at all in history. Unquestionably the deserts on the E. and the mountains on the W. that shut in the coastal tract, especially in the Hejaz, a word which itself means a barrier, precluded invasion or immigration on a large scale from either side, as was also the case with the inhospitable terrain on the N. For unnumbered centuries life proceeded with little or no change in the primitive patriarchal communities of the land. In the S.W.

there were some early attempts at organization. Such was the kingdom of the Sabaeans, traces of which go back to 700 B.C. and one of whose rulers probably was the queen of Sheba who visited King Solomon (1 Kings 10). Other such shadowy kingdoms of ancient times were those of the Minaeans and the Himyars, from whose period inscriptions survive.

On the extreme S.W., with Africa separated only by the narrow strait of Bab-el-Mandeb, there was some traffic with ancient Ethiopia, and the Abyssinians more than once crossed over and made conquests. The Romans tried to establish themselves in the country, but with scant success. In the first centuries of the Christian era Christianity made no mark on Arabia, the religious centre of which was then Mecca, as it is now. Mecca held the great

idol-house of the country, to which the tribes were wont to repair on occasion, their only other general meeting-place being Okaz or Okadh, near Taif, where an annual fair was held.

Early in the 7th century a wonderful change united the Arabs as never before. The Koreish tribe had charge of the idol-house, the Kaaba, at Mecca, and one of its members, disgusted with the idolatry of his countrymen, proclaimed the faith in the one God, whose prophet he asserted he was, which faith later was known as Islamism. This was Mahomet. In 612 he propounded his religion, and it soon became not only a religious but a powerful aggressive

Arabia. Typical scenes in the land of Mahomet, showing Menakha and Jebel (Mount) Shibam, in the Yemen, and (above) the beautiful mosque of Muzaffar at Taif, also in the Yemen, near the Aden frontier

political force, which originated the Caliphate and conquered large portions of Asia and Africa, as well as part of Europe. Nor was the conquest merely military and religious, for with it, in its best phase, went literature, art, and science. Under the Abbaside (*q.v.*) caliphs schools flourished as far apart as Bagdad and Cordova, and libraries were established at Alexandria, Cairo, and elsewhere.

The Arabs created the science of medicine, and the Arab Avicenna wrote the famous Canon of Medicine, which was the physician's first text-book. In mathematics and astronomy the Arabs excelled, and all this when Europe was passing through a period of declension and darkness. In the course of time the Arab conquest was undone, and the Turks squatted on its ruins, putting nothing in its place and blighting everything that escaped from the wreck. In the 16th century the Turks turned their attention to Arabia itself, and conquered the Yemen. During that period and in

the following century the Portuguese took Oman, and acquired a footing in the region of the Persian Gulf, which they eventually lost to the British, who captured Ormuz, or Hormuz, on the Persian side of the Gulf, from them in 1622. The 18th century saw the rise in Arabia of the Wahabi movement for reforming Islam.

The hold of the Turks on any part of Arabia was never very secure; the Yemen, for instance, was in a constant state of rebellion, and from 1891 Turkish rule was confined almost to a few places on the coast. For the pilgrim traffic to Mecca, and to consolidate her interests in the Hejaz, Turkey built the Hejaz railway, connecting Damascus with Medina, the latter city being reached in 1908. During the First Great War, the Hejaz under Hussein, grand sherif of Mecca, who adopted the title of king of the Hejaz, repudiated the authority of the Turks, and materially contributed to the success of the Allies. Before that war ended, the Arabs

on the W. had become united, and at the Paris peace conference the authority of Hussein was recognized. But his old rival Ibn Saud, king of Nejd and the Wahabis, made war on him and in 1925 drove him from his dominions. Ibn Saud who had overrun Shammar in 1921, in 1926 proclaimed himself king of the Hejaz, and in the same year reduced Asir to his suzerainty. Its complete incorporation in 1933 and the successful conclusion of a war with Yemen in 1934 made Ibn Saud ruler of most of the peninsula.

Bibliography. Arabia Deserta, C. M. Doughty, new edn. 1926; A Winter in Arabia (1942) and The Southern Gates of Arabia (1945), Freya Stark; Arabia (1930), Arabia of the Wahabis (1935), and A Pilgrim in Arabia (1946), all by H. St. John Philby.

LANGUAGE AND LITERATURE. The Arabic language is an offshoot of the original Semitic speech, and, owing to the comparative isolation of the Arabs of the desert, is related more closely to the prehistoric language of the Semites than any other of the Semitic languages. If Arabia was not the original home of the undivided Semitic race, it would seem to have been the centre from which the Semites radiated.

The earliest literary monuments of the Arabs have survived in a great number of Sabaeen or S. Arabic inscriptions, which since 1772 have been discovered, deciphered, and explained by European travellers and scholars. Many of these date from the 8th century B.C. The language is that which was spoken by the peoples of Yemen (Sabaeans, Himyarites, Minaeans, and others), who inherited an ancient civilization. It was superseded for the most part long before

Mahomet by the language of the ruder Beduins of the North.

The earliest Arabic writings that can be described as literature are the productions of the Arabian poets or minstrels. The oldest poems (5th century A.D.) were preserved for centuries simply by oral transmission. They were committed to memory and handed on by "reciters," who at first were attached to individual poets, but afterwards entered a wider field.

The custom of writing poetry did not begin until about A.D. 700 (i.e. towards the end of the first century after the Flight), when it was felt to be important to collect and preserve the utterances of the famous pre-Islamic poets. Several collections of these have come down to us. One of them is called the *Mu'allaqat*, or sometimes *The Seven Long Poems*. The Arabic name is derived from a root which has the idea of "hang up." Hence the familiar designation *Suspended Poems*, and the legend that the poems were hung up in or on the Kaaba at Mecca, as a precious thing is hung up in a treasury or storehouse. A more likely translation of the Arabic name is *The Pendants* (so A. Müller), the idea being that the poems were like a string of pearls. They were in fact called also "the necklaces of pearls." The authors were Amru-el-Kais, Jarafa, Zuhair, Labid, 'Amr ibn Kulthûm, 'Antara, and Al-Hârith ibn Hilliza. Another collection is called *The Diwans of the Six Poets*. The poets were Nâbigha, 'Antara, Jarafa, Zuhair, 'Alqama, and Amru-el-Kais. Nâbigha and the poet A'shâ rank with the greatest poets of the period. In the collection known as the *Hamâsa* of Abû Tammâm some of the poets belong to the early Islamic period.

Mahomet started his prophetic activity at about the beginning of the 7th century A.D. The Mahomedan period, which is dated from the Flight (Hegira) of Mahomet from Mecca to Medina in A.D. 622, saw the rise, efflorescence, and decline (A.D. 1258) of a remarkable literary activity, the impetus to which was provided by the Koran. To preserve and explain the text of the sacred book bequeathed to the Moslems by Mahomet, it was necessary to invent a science of grammar and lexicography, and to collect the pre-Islamic poems, the language of which provided Mahomet with his model. The language of the poets came to be regarded as classical Arabic, and it was this language that was spoken and written by cultured Moslems until the 13th century.

In the 13th century it had to give place in various Arabic-speaking countries (including Arabia) to a number of colloquial dialects.

The Koran was not committed to writing by Mahomet. The discourses of which it is composed were written down on palm-leaves, leather, stones, etc., by the companions and followers of the Prophet as they heard them. They were gathered up into something like what we know as the Koran soon after Mahomet's death. Subsequently, in 651 the caliph Othman ordered the preparation of a revised or standard edition. There gathered also about the Prophet a mass of tradition (*hadith*), a kind of table-talk, which was handed down at first orally

and was recorded later in books. One of the most ancient collections is that of Bukhârî (d. 870). This kind of material was embodied also in commentaries on the Koran, the most famous of which are those of Jabari (d. 923), Zamakhshârî (d. 1143), and Baydâwî (d. 1286).

The reigns of the caliphs Mansûr (754-775), Hârûn-al-Rashîd (786-809), and Mamûn (809-833) were marked by a kind of Oriental Renaissance. Literature, art, and science began to receive great encouragement, with the result that during some centuries a vast number of important and original works in all fields appeared, and many translations were made into Arabic from Greek, Syriac, and Persian. Thus the Arabs and semi-Arabs (many of the writers being half Persian) became, as R. A. Nicholson truly says, "pioneers of learning and bringers of light to medieval Europe."

About this time famous schools of learning sprang up at Bagdad, Basra, Bokhara, and Kûfa: and great libraries at Alexandria, Bagdad, and Cairo. Bagdad, where the caliph Al-Mamûn founded a university, is said to have attracted all the chief intellects of the empire. Mention may be made of some of the most important writers. There

were poets such as Abû Nuwâs (d. c. 810), Abû'l-'Atâhiya (748-828), Mutanabbî (915-65), and Harîrî (1054-1122), whose *Maqâmât* is considered one of the masterpieces of Arabic literature. The word *Maqâma*, meaning an assembly for literary discussion (French *séance*), is used to describe a new form of literature invented by Al-Hamad-hânî (d. 1007). The *Maqâmât* are written in rhymed prose, and are a mingling of philosophy and romance or fiction. Again, there were theologians such as the mystic Ghazâlî, who was surnamed "the Proof of Islam," and Shahrastânî (d. 1153), author of *The Book of Religions and Sects*. There were men of letters such as Ibn Qutayba (d. 889), author of a *Book of General Knowledge*, and Abulfaraj-al-Isfahânî, compiler of a great *Book of Songs*.

There were historians such as Ibn Ishâq (d. 768), who compiled the first biography of Mahomet; Jabari (838-923), who wrote a valuable history from the Creation to A.D. 915; Mas'ûdî, who has been called "the Herodotus of the Arabs"; Abulfaraj (d. 1289), who is also known as Bar-Hebraeus, the author of an *Epitome of Dynasties*; Abulfeda (d. 1331), who wrote an epitome of universal history; Suyûfî (1445-1505), who wrote a history of the caliphs; and Ibn Iyâs (d. c. 1524), who wrote a history of Egypt. Another famous historian of Egypt was Maqrîzî (1364-1442); and in Ibn Khaldûn (1332-1406) we have an example of the philosophical historian. Again, there were encyclopedists and dictionary-makers such as Al-Qazwînî, who in 1135 wrote a popular encyclopedia of a religious, moral, geographical, and historical character, and Ibn Khalikân (1211-82), whose *Obituaries of Eminent Men* is a great dictionary of biography. There were geographers such as Al-Idrîsî (b. 1099) and the famous Yâqût (1179-1229), who compiled a great geographical dictionary. There were philosophers such as Al-Kindî, who flourished at the beginning of the 9th century and was called "The Philosopher of the Arabs," Avicenna, and Averroes. There were scientists such as Al-Farghânî (Alfraganus), Abû Mas'har (Albuerhanus, d. 885), and Al Battânî (Albatagnius, d. 929). The fact that the words alchemy and algebra are Arabic indicates the great part that was played by the Arabs in the cultivation and spread of certain sciences.

The book so well known to Europeans as *The Arabian Nights* (Arabic *Alf Layla wa-Layla*, Thousand and One Nights) seems to have been based upon an old

Persian book, *Hazâr Afsâna* (Thousand Tales). Another famous work containing fables, the *Book of Kalila and Dimna*, was translated from Persian into Arabic by the Persian *Ibnû'l-Muqaffa'* (d. c. 760). The original work, *Fables of Bidpai*, from which it was taken, was in Sanskrit. A third work well known to Europeans is the Romance of 'Antar. In its present form it is probably not later than the Crusades.

A considerable revival of Arabic literature took place during the 19th century. To some extent it followed traditional lines, but there were strong Westernising influences, fostered by progressives such as Mohammed Ali and Ismail Pasha. Numerous translations were made from the French. The new modernist tendencies found expression notably in the writers of Arab communities in America. Throughout the Arab world an Arabic press sprang into being, and attempts were made to establish an Arabic theatre.

The 20th century saw Egypt gradually acknowledged as the centre of Arabic culture. Modern authors set out to adapt the language to modern themes. Their chief means of publication was in the literary journals, and consequently short stories and essays have been the usual form of expression. Among novels, the best known are the autobiographical story *The Days*, by Taha Hussein, and *The Return of the Spirit*, by T. el-Hakim; both have been translated into European languages. In poetry there is a wide range of style, from the traditional to the ultra-modern, of which the Iraqi poet el-Zahawi is an example. A literary drama exists, in both poetry and prose, owing its origins to French symbolism.

Newspapers and books in Arabic are published in Egypt, Syria, Tunis, Algeria, and Morocco.

Arabian Architecture. Before the time of Mahomet the Arabs possessed no architecture of their own, and even when they overran Egypt, Syria, and Persia they relied largely on Byzantine and Persian workmen for their buildings. Hence the so-called *Architecture arabe* in these countries can hardly be considered to have been evolved from purely Arab inspiration. In its earlier stages it was distinguished by the use of the pointed arch; there remain mosques in Cairo and Damascus (A.D. 600-900) with this feature. Later the horseshoe arch was developed, and as the Mahomedan

Arabian Architecture. 1. Court of a mosque at Cairo. 2. Upper part of a gateway at Damascus. 3. Part of the interior of the Cathedral or Mosque, La Mezquita, at Cordova. 4. Fountain at the Mosque of Mahomed Ali, Cairo

influence spread, this became the characteristic mark of the several groups of Oriental architecture classified under the heading of Mahomedan Architecture (*q.v.*).

Arabian Nights' Entertainments, THE. Popular title of a collection of Oriental stories of undefined antiquity. The Arabic name, *Alf Layla wa-Layla*, is more literally rendered in the alternative titles, *A Thousand Nights and a Night*, or *The Thousand and One Nights*. Arabic writers of the 10th century refer to the work as a Persian one, but the name given to the first rendering of it into Western languages has permanently associated it with the Arabians. The scheme of the work by which the various stories are linked may be summarised thus: The sultan Schahriar, convinced that all women are faithless, has sworn to take a new wife every night and to have her slain the following morning. Scheherazade voluntarily becomes his wife, and by the telling of the tales wins respite from day to day, until after a thousand and one nights she wins her own security, and changes Schahriar's views.

In the form handed down, the stories are variously said to have been compiled for the daughter of the Biblical Esther, to have been borrowed by the Arabs from Persian or Egyptian sources, and to have been a series of tales added to from century to century. The last theory seems probable, whatever the country of origin may have been.

The work first became known in Europe when French translations of portions of it by Antoine Galland were published, 1704-17. Numerous English translations followed, but in 1841 E. W. Lane's translation, directly from the Arabic, was published and became the standard edition for most readers. Then in 1885-6 was published Sir Richard Burton's very full version, of which a popular edition, prepared by Lady Burton and Justin M'Carthy, was issued later. Many of the tales, *e.g.* those of Ali Baba and Sindbad the Sailor, have become as familiar to the western peoples as their own folk-tales, and several of them have for many years been again and again drawn upon in England to provide the slight framework of story for Christmas pantomimes.

Arabian Sea (anc *Mare Erythraeum*) That part of the Indian Ocean lying between Arabia and India. Its N W extension is the Persian Gulf through the Gulf of Oman, and its S W arm is the Gulf of Aden, connected with the Red Sea by the strait of Bab el Mandeb. It contains the Laccadives, the Kuria Muria Islands, and Socotra and receives the river Indus.

Arabin OR **ARABIC ACID** Chief constituent of gum arabic. It occurs combined with calcium, magnesium, and potassium. It is prepared by adding hydrochloric acid to a mucilage of gum arabic and alcohol afterwards, when the arabin is precipitated. Allied substances are cerasin or metarabic acid, prepared from cherry tree gum, and parabin, obtained from beetroot and agar agar. Arabinose ($C_5H_{10}O_5$) is a sugar obtained by the action of sulphuric acid on gum arabic or sugar beet pulp. It is a sweet tasting substance used as a bacteriological medium.

Arabis OR **ROCK CRESS** Genus of annual and perennial herbs of the large family Cruciferae. They are natives of the N temperate zone.

Arabis The Alpine rock-cress

The hairy basal leaves are spoon-shaped, and the four petals of the flower usually white or purplish. The Alpine rock cress (*A. alpina*) of Europe is a popular garden plant.

Arabistan. Province of Persia. Known also as Khuzistan, and in ancient times as Susiana, it lies between Luristan on the N and Farsistan and the Persian Gulf on the S, and has Iraa Arabi or southern Mesopotamia on the W. It is watered by the Karun, and Dizful is its chief town. It contains extensive deposits of oil, which are worked by the Anglo-Iranian Oil Company. The N part of the prov is hilly, the S fairly level. The pop is nomadic.

Arabkir OR **ARAFKIR** Town of Turkish Armenia, in the vilayet of Malatya. It is 100 m N W of Diarbekir, and was the scene of a massacre of the Armenians by the Turks in 1895. At that time its pop was 30,000. It trades in cotton goods, and is noted for fruit.

Arab League. The establishment of a league of independent Arab states was decided on at a pan-Arab conference held at Alex-

andria, Sept 25-Oct 7, 1944 when the representatives of Egypt, Iraq, Syria, Lebanon, and Transjordan signed a protocol to establish a league of Arab nations. Two other delegates those of Saudi Arabia and Yemen, not being empowered by their governments to commit themselves submitted reports respectively to King Abdul Aziz Ibn Saud and the imam of Yemen, who subsequently gave their approval. The other Middle Eastern Arab country, Palestine, at that time administered by the British under League of Nations mandate, was represented by an observer sent by the Palestinian Arabs. In Feb, 1945, a further conference approved a constitution for the proposed league, which came into being March 22, when a "pact of union of the Arab states" was signed.

The organization began to make itself felt as a political power in 1946-47 when it supported Egypt's claims to the Sudan against Gt Britain. Then, in Sept, 1947, it declared it would fight for Palestine, in support of the Palestinian Arabs, and, after the U N had accepted the partition plan for that country in Nov, it began military operations. At first successful, these took late in 1948 an unfavourable turn, and the league lost its cohesion when its member countries began to discuss individual armistice terms with the state of Israel. Other sources of internal weakness arose from the contrasting attitudes of Haj Emrn el Hussein (*qv*), the ex-mufti of Jerusalem, and King Abdullah of Transjordan, of whose ambitions the other members of the league were perennially suspicious.

Arab Legion. Police force of Transjordan, later becoming a military formation. Raised in 1926, under Lt Col F G Peake, it was soon called on to deal with tribal raiding, and was divided into two sections. One was detailed for duties in settled areas, the other, a desert patrol, was formed under Major (later Brigadier) J B Glubb (*qv*). In 1939, on the retirement of Peake Pasha, Glubb succeeded to the command of the entire legion. During the Palestine troubles of 1936-38, the desert patrol helped to keep Transjordan clear of rebel activities.

When the Second Great War started, a mechanised regiment was formed from the patrol and placed by the emir of Transjordan at the disposal of Britain. It carried out desert reconnaissances

and protected lines of communication. In 1941 Major Glubb went with some of the legion to rally the Iraqis who were hostile to Rashid Ali in Iraq. Squadrons of the mechanised regiment guided the "Kingeol" flying column (under Brig J J Kingstone) across the desert from the Mediterranean to the Euphrates in May 1941, when this column relieved the R A F force encircled in the Habbaniyah aerodrome. Later the regiment gained distinction in actions against the Vichy French forces in Syria. For later history see NV.

Arabs. Southern stock of the Semitic race. It includes strictly the nomad N Arabian or Beduin tribes and the tribes which have settled in the S of Arabia, especially Yemen. The term is used in Egypt and elsewhere in N Africa for any people professing Islam, and by extension has become a general designation for most living Semites who are not Jews. In remote times Arabs crossed to Abyssinia (Gen 2). The introduction of Islam, AD 622, led to new migrations which within a century had flowed over N Africa into Spain and France, while others founded an empire in India, and voyaged to the Malay and African coasts. Similarly the nomad Beduin spread over what is now Iraq. Such a history has resulted in the physical characteristics of the Arabs now presenting wide variations, especially as in Africa they have intermarried freely alike with Hamitic (Berber) and with Negro stock. Only in Arabia itself, where they may number 10,000,000, have they bred more or less to uniform type.

They are dolichocephalic (long headed), black haired, scantily bearded, lithe, muscular, fine featured, averaging 5 ft 4½ ins, whereas the S Arabian is usually straight nosed, the Beduin tends to the aquiline. They are courageous, temperate, imaginative, and passionately fond of poetry. Other attributes appear contradictory: the Arabs are generous and hospitable to guests (anyone who has eaten a tribesman's salt is safe for four days) but in business are parsimonious and will cheat and lie for the pleasure of it. Normally chivalrous, they can also be savagely vengeful. Despising haste while dwelling inland, transplanted to the coast they become adventurous seafarers.

The social organization has preserved its rigid patriarchal form throughout, hence their brief empires invariably yielded to those

of more versatile Aryan character. Under monotheism they have given the world an intense poetry and a profound religious philosophy. Except for mathematics, the scientific concerns of the western world have drawn little response from them. Their medicine and surgery are mostly barbaric and tolerable only among people of stoical endurance. Mechanics and classified experiment are outside their purview. Women are regarded as natural inferiors to men, perform all the work, and are usually married in adolescence. Arabs live mainly on dates, other fruit as obtainable, milk, butter, bread, and mutton, and drink coffee. The Beduin economy is based upon the camel. See Arabia: Islam.

Aracajú. A town of Brazil. The capital of Sergipe state, it stands on the Cotinguiba, 7 m. from the Atlantic, and is connected by rly. with the interior. It has iron foundries, manufactures soap and cloth, and exports sugar, brandy, cocoa, coffee, cotton, salt, and hides. Pop. 59,460.

Aracaty. City and port of Brazil. In Ceará state, it stands on the Jaguaribe, 8 m. from the Atlantic and 75 m. S.E. of Fortaleza. It exports cotton, hides, rubber, and palm wax. Pop. 9,000.

Araceae (Latin *arum*, wake-robin). Family of herbs and climbing shrubs possessing poisonous properties. Mainly natives of tropical countries, a few occur in temperate and even cold climates. The rootstocks are tuberous and contain starch. The small simple flowers are clustered around a common support called a spadix, and protected by a cowl-like envelope called the spathe. There are about 100 genera and at least 1,000 species. See Wake-Robin.

Arachnida OR ARACHNOIDEA (Gr. *arachnē*, spider; *eidōs*, form). A class of the zoological phylum Arthropoda, to which the crustaceans and insects also belong. It includes spiders, scorpions, harvestmen, mites, and certain other animals. They have usually six pairs of limbs, of which four pairs are walking legs, the others being used for seizing food and conveying it to the mouth. The head and thorax are fused together, not separate as in insects, and the eyes, unlike those of insects, are generally simple. The abdomen is in some genera segmented, and may or may not bear appendages. In the scorpion its extremity is developed into a sting connected with a poison bag. The sexes are always separate, and nearly all the arachnids are car-

nivorous. (See Spider.)

The fossil forms of Arachnida belong chiefly to the marine orders Xiphosura and Eurypterida. Of the former the king crab is the only living representative. Similar forms appeared in the Silurian system, but reached their maximum in Coal-Measure times, the chief genera being *Belinurus* and *Prestwichia*. *Limulus* made its first appearance in the Triassic rocks. The Eurypterids are all extinct and their remains are found only in

Arachnida. 1. Scorpion. 2 and 3. Common garden spider, and enlarged section of same. 4. Harvestmen. 5. Water-mite. 4 and 5 greatly enlarged

the Palaeozoic rocks. In many respects they resemble the scorpions. They lived mainly in Silurian and Old Red Sandstone times, and occasionally attained great size. The scorpions are

Arad. General view of one of the chief thoroughfares of the capital of Arad county in the Hungarian plain

represented by fossil forms from the Silurian rocks of Gothland, S. Scotland, and N. America, from the Carboniferous of Scotland, of the Midlands, and of N. America, and from the Trias of Warwickshire. A few fossil forms are found in the Tertiary rocks of Prussia, usually preserved in amber. See Fossils.

Arachnoid Membrane. Very thin layer of tissue which covers the brain and spinal cord. It lies between the *dura mater* or outermost covering of the brain and spinal cord and the *pia mater* or inmost covering. See Brain.

Arachosia. A province of the ancient Persian and subsequently Macedonian empires. Known to the Parthians as White India, it now forms part of Afghanistan.

Arad. Two towns of Rumania, formerly in the kingdom of Hungary, both on the Alföld. Arad, the capital of Arad county, is a municipality on the right bank of the river Maros, 74 m. by rly. E. of Szeged. It is the seat of a Greek Orthodox bishop, is an important rly. and trade centre, manufactures leather and machinery, and has trade in cattle, flour, and grain. It was captured by the Hungarians

Arafat. View of the Arabian granite hill, known as Mount Arafat, and as the Mountain of Mercy, which stands about 15 m. S.E. of Mecca

in the war of independence, July 1, 1849. Here the Hungarian patriot Kossuth abdicated in favour of Görgei, Aug. 11, 1849. Liberty Square contains a monument to the 13 Hungarian generals shot by order of the Austrian commander Haynau, Oct. 6, 1849. Pop. est. 82,882. Arad co. extends N. from the Maros.

Uj-Arad or New Arad, in Temes county, now called Aradul Nof, is a smaller town on the left bank of the Maros, opposite Arad.

During the Second Great War railyards and repair shops at Arad were bombed by U.S. Italian-based planes, July 2, 1944. German and Hungarian forces in occupation of the town retreated towards the Hungarian plain

Arago

as Formentera the measurement of the arc of meridian between Dunkirk and Barcelona. In the Spanish rising of 1808, he fell into the hands of the insurgents, and did not recover his freedom until 1809. Soon after he was appointed professor at the École Polytechnique in Paris, and in 1830

Feb. 26, 1786, he entered the École Polytechnique in 1804, and was made secretary of the Bureaux des Longitudes in 1805. With Biot he continued as far

It was bounded N. by the Pyrenees, E. by Catalonia and Valencia, S. by Valencia, and W. by Castile and Navarre. Today it is covered by the provinces of Huesca, Saragossa, and Teruel. The Ebro flows through it and in it are the highest summits of the Pyrenees. Its capital is Saragossa (Zaragoza).

Aragon was one of the states that arose with the conquest of N. Spain from the Moors. It seems certain that in the 11th century a small part of it, the northern, was ruled by Sancho the Great of Navarre, while the remainder was in the Moorish kingdom of Saragossa. When Sancho died in 1035 his realm was divided among his sons, of whom Ramiro fought against the Moors and Castilians, by whom

Aragon. Map of the ancient kingdom which was later incorporated in the kingdom of Spain

shortly before Soviet and Rumanian troops entered the town on Sept. 22, 1944.

Araf OR **AL ARAF**. Mahomedan purgatory. It is described in the seventh chapter of the Koran as a wall or partition separating Paradise from Hell, into both of which those placed thereon can look. See Mahomedanism; Koran.

Arafat OR **JEBEL-ER-RAHM**. A hill in Arabia. It is known as the Mountain of Mercy, and is an object of pilgrimage to Moslems. It is about 200 ft. high, and lies 15 m. S.E. of Mecca.

Arafura Sea. Shallow sea in the E. Indies. It lies between the Northern Territory of Australia and the W. portion of New Guinea, and contains some easternmost islands of the Malay Archipelago.

Arago, DOMINIQUE FRANÇOIS (1786-1853). French astronomer. Born at Estagel, near Perpignan,

director of the Paris Observatory. He worked out theories of light, polarisation, galvanism, and magnetism.

In 1831 Arago was elected to the Chamber of Deputies as an extreme republican; he spoke there on education and the importance of scientific inventions. At the revolution of Feb., 1848, he became a member of the provisional government, holding the joint ministries of marine and war. On the *coup d'état* of Louis Napoleon, 1852, Arago declined to take the oath of allegiance and resigned the post of astronomer. Napoleon refused to accept his resignation and excused him the oath. He died in Paris, Oct. 2, 1853. *Consult* History of My Youth, Eng. trans. B. Powell, 1855.

Aragón. Name of one of the kingdoms into which Spain was divided before its union under Ferdinand and Isabella in 1479.

he was slain in battle. His son and successor, Sancho, maintained the war, extending Aragon at the expense of the Moors. The victory of the next king, Pedro, over Moors and Castilians in 1096, legend says, was mainly due to the intervention of S. George, and from then the kings of Aragon had as their device S. George's cross upon a silver shield.

Alphonso the Battler, who began to reign in 1104, married a daughter of the king of Castile and Leon and claimed those kingdoms. He could gain no foothold and, having divorced his wife, he turned against the Moors. He took Saragossa after a long siege, but was killed and his army routed.

As Alphonso left no sons, he bequeathed Aragon to the Templars and Navarre to the Knights of S. John. The people of both states objected; in 1134 the Aragonese

chose his brother Ramiro as king. Another period of conquest then began. The Moors were driven from Catalonia, and the boundaries of Aragon extended to the coast, taking in Barcelona. James the Conqueror took the Balearic Islands from the Moors and in 1238 reduced Valencia. With the accession of his son Pedro in 1276, Aragon began to take part in the affairs of Italy. Pedro's wife was heiress to Sicily, and the people of that island implored his aid against the French. In 1282 he sailed from Barcelona, was proclaimed king, and defeated the French by sea and land. After a brief separation Aragon and Sicily were again united under James in 1291, but almost at once the island was yielded to Charles of Anjou.

James also ruled the Balearic Islands and Roussillon, while in Italy he held the two Sicilies. Roussillon and the islands did not pass to his son Pedro III, but under Pedro IV (d. 1387) they were again ruled by a king of Aragon. Pedro III passed his reign of 50 years in struggles with his nobles and in warfare with Genoa for the possession of Sardinia. Martin (1395-1410) spent time and money in attempts to secure Sicily and Sardinia, and on his death without sons civil war broke out in Aragon. In 1412 three deputies each from Aragon, Catalonia, and Valencia met and voted on the monarchy. Fernando, grandson of Pedro IV and also a prince of Castile, secured a majority, captured his competitor, and, ascending the throne, prepared the way for the union of Castile and Aragon.

His brother Alphonso was chosen by Joanna, queen of Naples, as her heir. On his first expedition he drove the French from the city, but on the second his fleet was destroyed and he himself taken. Released, Alphonso defeated the French and Genoese, afterwards persuading the pope to recognize him as king of the two Sicilies, i.e. Naples and Sicily. His brother John was principally troubled by his Catalan subjects, who revolted against him, but the great event of the reign, which ended in 1479, was the marriage of his son Ferdinand to Isabella of Castile, 1469, and the foundation of the kingdom of Spain.

The constitutional history of Aragon is of interest, for one reason because it anticipates that of England. In the 12th century or earlier it had its Cortes, in which the communes were represented, and its justiza was an

official whose powers included the right to review the king's actions. Powerful nobles claimed that their privileges were independent of the king's grant or favour, but the people as a whole appealed often with success to ancient customs.

Aragon, Louis (b. 1895). French poet, novelist, and essayist. One of the founders of surrealism (q.v.), he afterwards became leader of a new movement whose manifesto he issued, *Pour un Réalisme Socialiste*. He was prominent in the management of the monthly *Commune*, the review *Europe*, and the daily *Ce Soir*. In the Second Great War he served with the French Tank div., 1939-40, and was decorated for gallantry. Taken prisoner by the Germans, he escaped, and, back in France, joined the resistance movement, writing under the name of *Francon la Colère* for the *Editions de Minuit*. Aragon's most enduring work is in his novels, of which *Les Beaux Quartiers* won the *Prix Renaudot*. Of his poetry, *Feu de joie*, *Le Crève-cœur*, *Persécuteur*, *Les Yeux d'Elsa*, and *La Diane Française* are typical.

Aragona. Town of Sicily, in Girgenti province. It is 7 m. by rly. N.N.E. of Girgenti, and has an old castle containing some fine paintings, and sulphur mines. Near is the small mud volcano, *Maccaluba*, 138 ft. Pop. 15,901.

Aragonite. Carbonate of calcium. It is of similar composition to calcite, but differs in having orthorhombic crystalline form. It is found in nature deposited from solutions and is extensively secreted by marine mollusca and other organisms, e.g. corals and algae, to form their calcareous shells and skeletons. It was first found in Aragon.

Aragua. A state of N. Venezuela. It lies between Miranda and Carabobo states, and is bounded on the N. by the Caribbean Sea. It produces cattle, coffee, sugar, tobacco, cocoa, and cotton. Cap., Maracay. Est. pop. 129,746.

Araguaya. River of Brazil. Rising in the Serra do Cayapó, it flows N.N.E. for 1,100 m. to the Tocantins, whose chief tributary it is, entering that river at São João. Known in its upper reaches as the *Rio Grande*, it bifurcates towards the middle of its course, the two branches, which form the island of Bananal with an area of 8,000 sq. m., uniting again about 100 m. lower down. Navigation, which is confined to small steamers, is obstructed by rapids.

Arakan. Division of Lower Burma. It covers nearly all the W. seaboard of the country, from the Naaf estuary bordering Chittagong to a point S. of Gwa. About 350 m. from N. to S., it varies in breadth from 90 to 15 m. The Kaladan, also called the Arakan, is the principal river. Akyab is the capital, a port 50 m. S.S.W. of the ancient city of Arakan, now called Myohaung. The people are Burmese Buddhists. The country, once independent, was seized by Aungmye; settled by Portuguese; conquered by Burmese, 1782; ceded to Great Britain by the treaty of Yandaboo, 1826. The Arakan Hill Tracts became in 1930 an organized territory under a superintendent responsible to the commissioner for Arakan. The Arakan Mts. run from the S. border of the division down the coast to the Bassein river. The Arakan Yoma are a central range which in places forms the boundary with Magwe; Mt. Victoria in the N. rises to 10,400 ft. Monsoon rainfall is excessive.

At the end of April, 1942, Arakan was overrun by the Japanese. On Dec. 19 British and Indian troops crossed from India into Arakan and advanced towards Akyab. Repeated raids smashed Japanese communications, and fighting raged for months along the Maungdaw-Buthidaung road. A powerful offensive was launched by the 14th army in Jan., 1944, and on March 13 it was announced that British and W. African troops had made successful landings on the Japanese coastal flank. With the capture of Akyab, Jan. 3, 1945, the Japanese threat to India was finally removed. Five landings within a month were made by the 15th corps (supported by naval and air bombardment) along the Arakan coast, and on Feb. 2 troops of the same formation occupied Kangaw, the last Japanese strong-point in the coastal area. The taking of Taungup, on April 16 marked the end of the Arakan campaign, which had been fought through two monsoons. See *Burma Campaign*.

Araki, Sadao, Baron (b. 1877). Japanese soldier and politician. Born in Tokyo, of Samurai descent, he spent his early years in poverty, working in a soya bean factory, but subsequently entered the army and fought in the Russo-Japanese war, 1904-5. During the First Great War he was attached to the Japanese military mission in Moscow and closely identified

himself with the Japanese imperialist party, though vehemently proclaiming his country's pacific intentions. Minister of war 1931-33, a member of the supreme war council, 1934-36, he resigned after army mutineers attempted to assassinate the civilian cabinet in 1936. In 1937-1938 he was a member of the supreme cabinet council. Tried before the international military tribunal in Tokyo, 1946, he was condemned in 1948 to life imprisonment. His chauvinist attitude was set forth in his book, *New Japan's Mission*.

Araktcheyev, ALEXIS ANDREYEVICH, COUNT (1769-1834). Russian statesman. Under Paul I he was set to reorganize the Russian army, but was dismissed in 1799 owing to hostility to his methods of discipline. Inspector-general of artillery from 1803 under Alexander I, he brought the army to a high state of efficiency. He retired in 1826 and died May 3, 1834, leaving 25,000 roubles to be awarded to the author of the best life of Alexander I.

Aral, SEA OF. Large inland sea or lake of Soviet Central Asia. It derives its name from the Khirgiz *Aral Denghiz*, meaning the island sea. Lying in the Aral Caspian lowlands, it is separated from the Caspian Sea by the Ust-Urt plateau. It has a greatest length of 235 m., extreme breadth of 180 m., and a depth varying from 50 ft. to 220 ft. It covers an area of 26,000 sq. m., which is continually decreasing by evaporation. Slightly saline, it contains a variety of fish, sturgeon, carp, and herring abounding. Seals are also caught. It is fed by the Amu-Daria and Syr-Daria, but has no outlet. The world's fourth largest lake, it freezes in winter for some distance from its shores.

Araliaceae. Family of climbers, shrubs, and trees. They have alternate leaves and regular flowers clustered in umbels or heads, and succeeded by berry-like fruits containing one or more seeds. There are 55 genera, including about 700 species. The order gets its name from the rice-paper plant (*Aralia papyrifera*), but a better known example is ivy (*Hedera helix*).

Aram OR ARAMAEA. Semitic name for Mesopotamia and part of Syria. Its vernacular was Aramaic or Aramaean, the language commonly spoken in Palestine in the time of Christ. See Aramaic Language.

Aram, EUGENE (1704-59). An English philologist and murderer. Born at Ramsgill, Yorkshire, he was the son of a gardener. En-

tirely self-educated, he became a schoolmaster at Knaresborough, but had to leave in 1745 under suspicion of being associated with frauds perpetrated by Daniel Clark, a shoemaker, who had secured possession of valuable property and then mysteriously disappeared. Subsequently a man named Houseman was arrested for the murder of Clark, and on his stating that Clark had been murdered by Aram and his body hidden in S. Robert's Cave, Knaresborough, search was made, the skeleton was found, and in Aug., 1758, Aram, then an usher at a school at Lynn, in Norfolk, was apprehended. Tried at York, Aug. 3, 1759, with Houseman the only witness against him, Aram defended himself with great skill, chiefly by insistence on the fallibility of circumstantial evidence. He was condemned, however, and executed on Aug. 6, before his death first attempting suicide, then confessing his participation in the crime, though maintaining that Houseman was the chief murderer. The body was hung in chains at Knaresborough.

In his spare time Aram had acquired amazing knowledge of Latin, Greek, Hebrew, French, Arabic, and Celtic, which he intended to utilise in the compilation of a great comparative dictionary. To Aram belongs the credit of discovering the affinity of Celtic to the other Indo-European languages. The case of Eugene Aram is the subject of Lord Lytton's novel of the same name and of Hood's *Dream of Eugene Aram*. Consult *The Genuine Account of the Life and Trial of Eugene Aram*, W. Bristow, reprinted 1832.

Aramaeans. A branch of the northern stock of the Semitic race. Aram or highland is a personal name in Gen. 10, 22, son of Shem; the Hebrews claimed descent from "a nomad Aramaean" (Deut. 26. 5).

Araliaceae. *Panax quinquefolium*, or ginseng, the root of which is used by the Chinese as a tonic or stimulant

They began to wander from their Arabian grasslands about 1350 B.C., and dominated the uplands from the Euphrates to the Lebanon. After breaking up the Hittite confederacy, their hold on the caravan routes gave them control of the commercial intercourse between Babylon and the Mediterranean. Syrians who adhered to the old pagan religion were called Aramaeans by Syrian Christians.

Aramaic Language. Branch of the Semitic family of languages. Originally spoken by the inhabitants of Aram, in early times it extended over a wide area, and during the siege of Jerusalem by Sennacherib, the officers of Hezekiah asked the Rabshakeh: "Speak, I pray thee, to thy servants in the Syrian (i.e. Aramaic) language, for we understand it, and talk not with us in the Jews' language (i.e. Hebrew) in the ears of the people that are on the wall" (2 Kings 18). In Babylonia, Assyria, and part of Persia it was the official language, and was used in Syria, Cappadocia, and also in Palestine. The Galilaean dialect, not the cultivated literary language of Jerusalem, was used by Christ and the disciples. Documents extant in this dialect include the Aramaic portions of the Palestinian Talmud. Up to the 6th century B.C. the alphabet used by the Aramaeans was the old Semitic, after which special local forms of the letters came into use. Some Aramaic papyri found in 1904 in Elephantine, an island in the Nile opposite Assuan, have language akin to that of the Aramaic portions of the O.T. and dating from the period 494-405 B.C. They contain a translation of part of the Behistun inscription of Darius; also an appeal to Bagoas, the Persian governor of Judaea, for help against the Egyptians. There are two main dialects of Aramaic: (1) Western, comprising Palmyrene and Nabataean, known only from inscriptions; Biblical Aramaic (wrongly called Chaldean), in which parts of Daniel and Ezra were written; the dialect of the Targums and the Samaritan version of the Pentateuch; (2) Eastern, including Syriac, the literary language of the Syrian Christians of Edessa, which split up into Jacobite and Nestorian. of the Gnostic Mandaean in lower Babylonia and of the Babylonian Talmud.

After the rise of Islam Aramaic mainly gave place to Arabic, and is now only spoken near Damascus, among the Jacobites of the mountains of Turabdin in Meso-

potamia, by the Nestorians of Mosul, and on the banks of Lake Urmia, Persia. In a literary sense it is inferior to Hebrew and Arabic, being poorer in vowel-sounds and grammatical forms. On the other hand, the variety of its constructions renders it specially suitable for translation purposes. *Consult* Grammar of Vernacular Syriac. A. J. Maclean, 1895.

Aramis. Character in *The Three Musketeers*, a novel by Alexandre Dumas. Little more than his name was found in the *Memoirs of D'Artagnan* on which Dumas based the romance. Aramis bears but an assumed name, his true one being known only by his captain. He is the least aggressive of the great trio, who also appear in *Twenty Years After* and *The Vicomte de Bragelonne*. Aramis finally enters the church. *See* Athos: Porthos.

Aranda, PEDRO PABLO ABARCA DE BOLEA, COUNT OF (1718-99). Spanish statesman. He served as colonel in the War of the Austrian Succession, and was made governor of Valencia in 1763. In 1766, when disturbances in Madrid had driven Charles III from the city, he sent for Aranda to restore order and made him president of the council and captain-general. For seven years chief minister in Spain, he carried out administrative reforms, and expelled the Jesuits. Ambassador in Paris, 1773-87, in 1792 he was again prime minister, but his sympathies with the French Revolution soon procured his dismissal. He died Jan. 9, 1799.

Arandora Star. Blue Star liner (15,000 tons). On July 2, 1940, while carrying 1,500 German and Italian internees from Britain to Canada, with a crew and guards numbering 500, she was torpedoed and sunk by a U-boat in the Atlantic, W. of Ireland. About 1,000 survivors were landed at a Scottish port.

Aran Islands (OR ARRAN). Three small islands of Galway, Eire. Known also as South Aran Islands, they stretch across the entrance to Galway Bay and have an area of 18 sq. m. The largest and northernmost is Inishmore or Aranmore, the middle island is Inishmann, and the smallest is Inisheer. The surface ends in precipitous cliffs attaining 354 ft. in Inishmore. Archaeological remains

abound, notably Dun Angus, a remarkable round cyclopean fortress on Inishmore. On this island, still known as Aran-na-naomh, or Aran of the Saints, are several shrines and altars of the religious recluses who once inhabited it. Mackerel fishing is the chief occupation.

Aranjuez (Latin *Ara Jovis*, Jupiter's altar). A town of Spain, in

Aranjuez. Former royal palace of Spain, 29 miles from Madrid. It was built by Philip. and altered and enlarged by successive sovereigns

Madrid province. It stands on the Tagus, 29 m. S.S.E. of Madrid on the rly. Its splendid royal palace, now destroyed, standing in one of Europe's most beautiful parks, was a favourite seat of several Spanish sovereigns. The scene of Schiller's *Don Carlos* is laid here. The town was the scene of a treaty with France in 1772 and another in 1805, and of the insurrection which caused the abdication of Charles IV, on March 19, 1808. Pop. 14,000.

Aran Mawddwy. Mt. of Merionethshire, Wales. It is the summit of the Berwyn range, and is 2,970 ft. high. To the N. is Aran Benllyn, 2,901 ft. high.

Arany, JANOS (1817-82). Hungarian poet. The son of peasant folk, he was educated at the college at Debreczin, joined a company of strolling players, and then settled at Szalonta as a notary. In 1845 he obtained with his satire *The Lost Constitution* the prize offered

by the Kisfaludy Society for a poem on current events, and two years later won the prize for the best Magyar epic with the first part of his trilogy *Toldi*. He became secretary to the Hungarian Academy in 1865, and died Oct. 24, 1882. His later works include *The Siege of Murany*, the second and third parts of *Toldi*, *King Buda's Death*, an epic, and numerous

ballads. By making his poetry the expression of national hopes and popular feelings he greatly influenced Hungarian literature.

Aranyi, JELLY D' (b. 1895). British violinist. Born at Budapest, May 3, 1895, she came to England at the age of 14 and made her first public appearance there, later becoming a naturalised British subject. In Feb. 1938, she gave the first performance in England of Schumann's violin concerto, which she and her sister, Adila Fachiri (*q.v.*), were chiefly instrumental in rediscovering. She claimed to have received a message from Schumann at a spiritualist séance, telling her of the concerto's existence in MS. form in Berlin.

Arapuni. Hydro-electric generating station in Auckland prov., North Island, New Zealand. It was constructed to supply all the requirements of the Auckland district. Development work began in 1925 and operation in 1929. In 1943 there were operating six units with a total capacity of 126,000 kVA, and the scheme provides for eight units with a capacity of 174,000 kVA. The static head is 175 ft. The station is linked with Horahora, Mangahao, and Waikaremoana.

Ararat. A region in Turkey, in the vilayet of Kars, watered by the river Aras (Araxes). The name has been erroneously applied to the highest mt. in the district, on which the Ark is supposed to have rested, but the Bible (*Gen. 8*) speaks of the "mountains of Ararat." The double-peaked volcanic summit of Ararat is known to the Armenians as the *Massis*, to the Turks as the *Aghri Dag*, and to the Persians as the *Koh-i-Nuh*, or Mountain of Noah. An earthquake

Ararat. Highest point of the Armenian plateau called by the Persians the Mountain of Noah

in 1840 dislodged large masses of the mountain and destroyed the village of Arghuri. The first complete ascent was made by Dr. Perrot in 1829. See Ark of Noah.

Ararat. Town of Victoria, Australia. It stands near Hopkins river, 130 m. by rly. W.N.W. of Melbourne, surrounded by a region given over mainly to growing wheat and rearing sheep. Other industries are extensive vineyards, a trade in timber, the mining of gold, slate, etc., and the making of soap, leather, and bricks. Pop. 4,900.

Aras. River of Asia Minor, the ancient Araxes. It rises in the Erzerum vilayet, flows E. through S. Caucasia, forms the boundary between Azerbaijan S.S.R. and Persia, and enters the Caspian Sea, partly by a direct channel and partly by uniting with the Kur. It is 600 m. long, and its chief tributaries are Arpa Chai and Kara Su.

Aratus of Sicyon (271–213 B.C.). Greek general and statesman. From 245 he was many years general of the Achaean League (*q.v.*), which he strengthened by securing several new states as members. Unfortunately he alienated Sparta, and to secure a counterpoise sought alliance with the Macedonians, depriving the league of its distinctive character as the champion of Greek freedom.

Arauca. A town of Colombia. Standing on the Arauca, here bordering Venezuela, it is the capital of the commissary of Arauca (pop. 11,156). The Arauca river is 450 m. long.

Araucanians (Quichua, rebels). Group of S. American Indian tribes inhabiting S. Chile. The name indicates their independent character. Long-faced, roundish-headed,

convex-nosed, pale yellow, muscular, averaging 5 ft. 3½ ins. in height, they reproduce in temperate S. America the vigorous type of such northern Amerinds as the Iroquois, at the cultural level of the Navaho. Ethnically akin to the Andean stock, they resisted the Inca domination, although those bordering upon the Peruvian civilization did not escape its cultural influence. They were the only aboriginal people who never submitted to the Latin subjugation, their first invader, Valdivia, having been slain by them in 1553.

Calling themselves Mapuche, or war men, they recognized such groups as Picunche, or north men, Huilliche, or south men, Moluche, or west men, and—centrally—Pehuenche, or pine men, and an outlying group E. of the Cordilleras are the Puelche, or east men. Their number in Chile is about 100,000. They have never risen to nationhood; when necessity arose a military chief (*toqui*) was elected from each of the four tribal divisions. Their primitive hunting life, with low skin tents for dwellings, has been largely displaced by more settled vocations, including stockbreeding and farming. There are traces of an ancestral totemism, and their animism included a recognition of a thunder-god (*Pillan*). Deceased warriors were interred with their weapons, and their steeds were consumed at funeral feasts, a hereafter in the Milky Way being inculcated. *Caupolicán*, a warlike chief of the Araucanians, offered so fierce a resistance to the Spanish until his capture and cruel execution in 1558 that his name and exploits became legendary, and were made the theme

of a fine Spanish epic, *La Araucana*, by the poet Ercilla. The figure of *Caupolicán*, typifying his race, is a favorite and much copied sculpture in Chile. After an attempt by a French adventurer, Antoine de Tounens, to found an Araucanian kingdom in 1861, the Araucanians formally acknowledged Chilean rule in 1870. See American Indians.

Arauco. Coastal province of S. Chile. It comprises much of the former region of Araucania. Area 2,222 sq. m. It has a productive soil,

Arawak. Types of S. American Indians inhabiting British and Dutch Guiana

large forests, and coal deposits. Lebu is the capital. Pop. 66,107.

Aravali Hills. Mountain range of India. It extends in a N.E. direction from Gujarat through Rajputana. Its loftiest summit is Mount Abu (5,650 ft.). The hills are the worn-down stumps of an ancient mountain range.

Arawak. Tribe of S. American Indians, inhabiting parts of British and Dutch Guiana. These cassava-eaters are forest-dwellers, interposed between the coast Warraus and the inland Caribs. They are a weak-bodied, peace-loving people, who once extended from Bolivia to the W. Indies and Florida, where they were in process of displacement by the Caribs at the Spanish conquest. They use bows and arrows and blow-guns. Their dress is little more than an apron; ornament is furnished by feathers, seeds, and shells. Their primitive animism involves the resort to medicine against unfriendly spirits. See American Indians.

Arbaces. Median chieftain. The statement of Ctesias that he revolted against the Assyrian king Sardanapalus, destroyed Nineveh about 876 B.C., and founded the Median empire, is unhistorical. Cuneiform records of that age reveal a place-name *Arbaki*; later the personal name *Arbaku* appears. Nabopolassar of Babylon may have had a Scythian ally of this name at the siege of Nineveh in 606. Xenophon mentions a Median satrap *Arbaces* in the army of Artaxerxes Mnemon at Cunaxa in 401. *Arbaces* is the name of a character in Lytton's *Last Days of Pompeii*.

Arbalest (Latin *arcus*, bow; *ballista*, projectile machine). Ancient weapon, also known as a cross-bow, for discharging short arrows, stones, or bullets, which obtains its power from a spanned bow of spring steel. Suggested, probably,

Araucanians. Statue of the chief *Caupolicán*, typifying his race. Right: Photograph of Araucanian woman

from a knowledge of the ballista or mangonel, the arbalest seems to have come into use in the 11th century, but is not depicted on any monuments of the time. The Second Lateran Council in 1139 forbade its use in warfare by Christians as being too murderous. It is believed to have been introduced into England by William the Conqueror, but for some years was only used for hunting purposes. It began to assume a position of military importance during the Crusades. In England it was almost completely superseded by the long bow in the 14th century; in most other countries it was displaced by firearmstowards the end of the 15th. Its last appearance in European warfare was in 1807, against Napoleon in Poland, though the Chinese used it at Taku in 1860.

The majority of arbalests were used as hand weapons, but a few specimens of enormous proportions are known, which were permanently fixed on the walls of castles

powerful to kill a man or horse at 250 paces and had a maximum range of 400 paces.

Even after the introduction of firearms, the arbalest was preferred to the arquebus as being more efficient for military use, while the absence of noise, smoke, and flame was considered a great advantage in hunting even after firearms had been much improved, as it enabled several shots to be fired without the quarry being frightened or disturbed.

Arbe (Slav., *Rab*). An island of the Adriatic belonging to Yugoslavia. It is in the Gulf of Quarnero, an opening of the Adriatic Sea, and is about 12 m. long. The inhabitants are mainly fishermen and tillers of the ground. Arbe, the capital, is a picturesque walled town on the W. coast, with an old cathedral, a castle, and other buildings of interest. In the Middle Ages the island belonged to the republic of Venice.

Arbela. An ancient town of Assyria. The modern Arbil or Erbil, of Mesopotamia, and known to the Assyrians as Arbailu, the city of four gods, it lies 40 m. S.E. of Mosul. It gave its name to the battle in which Alexander the Great finally defeated Darius, 331 B.C. The actual scene of the battle is said to have been Gaugamela, about 25 m. N.W. Pop. 4,000.

Arber, EDWARD (1836-1912). English editor, chiefly of works previously almost inaccessible to the general public, as in his English Reprints series, 1868-71. He was born in London, Dec. 4, 1836, and died there Nov. 23, 1912. He was professor of English at Mason college, Birmingham, 1881-94.

Arbitrage. Term used in stock exchange circles for the relation between the value of a particular stock in one market and its value at the same time in another, say London and Paris. A dealer might be able to buy French Rentes in Paris somewhat cheaper than in London; he does so and sells them in London, and the transaction is called an arbitrage. It is also applied to the buying and selling in a similar fashion of bills of exchange, bullion, etc. The words arbitrage, arbiter, arbitration are derived from Lat. *ad*, to; and *bitere*, to go; thus an arbiter is properly one who goes to see, who is called in to settle a question. See Stock Exchange.

Arbitration. In English law, the decision of a matter in dispute, not by a court of law, but by a person called an arbitrator. The general law relating to arbitration

is contained in the Arbitration Act, 1889. Arbitration under this Act is voluntary. There may also be compulsory arbitration by order of the court.

(1) Voluntary arbitration is where two or more parties have made a *submission* in writing, agreeing to submit a specific dispute, or a class of disputes, or all disputes between them to arbitration. They may agree to have two arbitrators, one appointed by each party. If they do not so agree, a single arbitrator acts, and if the parties cannot agree on one, the court will appoint one. If there are two arbitrators, these two must appoint an umpire to decide, if they should differ. If the arbitrators cannot agree on an umpire, the court will appoint one. If the submission is to two arbitrators, and one party refuses or neglects to appoint his man, the other party should appoint his, and give notice, and if his opponent does not appoint within seven days, the one arbitrator may be appointed sole arbitrator. An arbitrator must not take sides. He is sitting as a judge, and should have no private communications with either party. He must not be interested in the result of the case. He must not make up his mind beforehand. If he does any of these things, or is guilty of any misconduct in the arbitration, he can be removed by the court, and a new arbitrator appointed.

(2) Compulsory arbitration is where the court refers to a special referee, or to one of the official referees, a case involving investigation of complicated accounts, or very numerous items, or scientific or technical matters. The most common of these cases are claims for dilapidations to house property, builders' accounts, claims on engineering contracts, and the like, in which a very large number of small items must be dealt with. An appeal lies from an official referee and from other arbitrators on questions of law.

Certain statutes, e.g. the Friendly Societies Act, provide for the settlement of disputes by arbitration, and arbitration is frequently employed in cases where the price of land required by rly. companies and other public bodies is in dispute.

Arbitration, INDUSTRIAL. Method by which disputes between employers and workmen are referred to an independent arbitrator for settlement. Where the submission is made by the actual parties to the dispute, the arbitration proceeds on the same lines as commercial arbitrations in general.

Arbalest. 1. Lever arbalest, a cross-bow fitted with a cranequin. 2. Arbalest with windlass and compound pulley-gear. 3. Simple arbalest. 4. Bullet arbalest. 5. Arbalest for stones (16th century)

or towns and discharged arrows 12 ft. long with sufficient violence to pierce the bodies of several men in succession. In all types, after spanning the bow, the string was placed on a catch, whence it was released by pressing the trigger after the missile had been put in position and aim taken, the latter being done as with a modern rifle, except that in earlier types the stock was rested on top of the shoulder instead of being pressed against it.

The ordinary type of arbalest used by hand was sufficiently

and is governed in Great Britain by the Arbitration Acts. Often, however, the dispute arises out of a trade union agreement, the parties to which are associations of employers and workers; in such cases, unless the associations are acting expressly as agents of named and identifiable groups for the purposes of the arbitration, the award is binding only on the associations as distinct from individuals. Another point of difference is that whereas the subject matter of an ordinary arbitration is usually an *existing* contract, industrial arbitrations are commonly concerned with the terms and conditions of *future* contracts of employment.

Industrial arbitration can be (a) compulsory, as operated during the First Great War under the Munitions Act in this country, and as has been the practice in New Zealand since 1894, and Australia since 1904; or (b) voluntary. Since the Whitley committee in 1917 pronounced against compulsory arbitration, the voluntary principle has been the accepted rule in industrial arbitration in the U.K.

As early as the reign of Elizabeth magistrates were entrusted with special powers for settling labour differences. The Employers and Workmen Act, 1875, still in operation, is another example of the use of the courts for the purpose. But industrial arbitration proper began with the Conciliation Act, 1896 (itself the result of a Royal Commission of 1891), whereby the Board of Trade was *inter alia* empowered to appoint an arbitrator to determine an industrial dispute on the application of the parties thereto. From 1908 onwards standing panels of independent persons have been maintained for the purpose of constituting courts of arbitration, and in 1916 the Board of Trade's functions in the matter were transferred to the newly formed ministry of Labour.

Modern Practice

The 1896 Act, although still on the Statute Book, has now for all practical purposes been superseded by the Industrial Courts Act, 1919 (the consequence of another recommendation of the Whitley committee). The industrial court was thereby set up as a permanent body for the settlement of trade disputes, the members being appointed by the minister of Labour from employers' and workers' representatives, independent persons, and one or more women. The president is appointed by the minister from among the independent members.

The president may call in the assistance of assessors. On a trade dispute being reported to him by either of the parties, the minister may, with the consent of both parties, refer the matter to the industrial court, or to an arbitrator or arbitrators appointed by him, or to a board of arbitrators comprising nominees of the parties concerned in equal numbers, and an independent chairman nominated by the minister. But where arrangements already exist in the trade for conciliation or arbitration the minister may take action only after those arrangements have failed to produce a settlement. There is no compulsion on the parties to accept the decisions of the industrial court, but there have been few cases of rejection, and the cumulative experience of the members of the court in the handling of these disputes has been a decisive factor in the growth of industrial arbitration.

National Arbitration Tribunal

The setting-up of the national arbitration tribunal to exercise functions which are to some extent parallel with those of the industrial court was one of the emergency measures of the Second Great War. By the Conditions of Employment and National Arbitration Order, 1940 (made under Defence Regulation 58 AA), and with the object of reducing industrial stoppages which would impede the war effort, the national arbitration tribunal was set up, consisting of five persons appointed by the minister, *viz.* three appointed members including the chairman, one representing employers, and one representing workers. Any trade dispute reported to the minister by either party may be referred by the minister to the tribunal where in his opinion no suitable means for settlement exist under a trade union agreement. It is illegal for an employer to declare or take part in a lock-out, or for a worker to take part in a strike, unless the dispute has been so reported to the minister and the minister has not, during 21 days following the report, referred the dispute for settlement. This provision follows the lines of the Canadian law, the Industrial Disputes and Investigation Act, 1907 (known as the Lemieux Act), and has been a powerful means of preventing industrial stoppages.

The trade union agreements covering the larger industries almost invariably contain arbitration clauses which often include a

provision for negotiating or for conciliation machinery as the first step towards the settlement of differences, and this practice is now generally adopted in the smaller industries as well. **H. Samuels**

Bibliography. Survey of Industrial Relations (Balfour Committee on Industry and Trade), 1926; Towards Industrial Peace (League of Nations Union publication), 1927; Conditions of Industrial Peace, J. A. Hobson, 1927; Industrial and Labour Relations in Great Britain (I.L.O. publication), 1939.

Arbitration, INTERNATIONAL. This subject is fully discussed under International Law.

Arblay, FRANCES D. Married name of the British novelist known as Fanny Burney (*q.v.*).

Arboga. Town of Sweden, in Vestmanland province. It stands on the Arboga, 25 m. by rly. N.E. of Orebro, and has communication with Lakes Mälär and Hjelmär by river and canal. The town was important in the Middle Ages, and diets were held here, notably those of 1561 and 1597, as were several church assemblies. The church has a Rembrandt altar-piece. Pop. 5,500.

Arbogast (d. A.D. 394). Frankish general. Under the emperors Gratian and Valentinian II he was in the Roman service and distinguished himself by victories over the Goths and by overthrowing the usurper Maximus. He is said to have contrived the murder of Valentinian in 392 and set up Eugenius, a puppet of his own, as emperor. Theodosius, the emperor of the East, then intervened; Italy was invaded, and Arbogast was defeated on the river Frigidus, near Aquileja, in 394, and soon afterwards put an end to his life.

Arboriculture (Lat. *arbor*, tree; *cultura*, cultivation). In its widest sense, the cultivation of trees. In modern practice the term is usually applied to the culture of trees for ornamental and decorative purposes, as distinct from planting in large quantities for the sake of timber values, which is technically known as forestry. The planting and maintenance of standard fruit trees, such as apple, plum, and pear, is also an important branch of arboriculture. Evelyn's *Sylva*, published in 1664, rendered great service to arboriculture, and many ornamental plantations in England are the outcome of it.

Arbor Low. Megalithic structure near Bakewell, Derbyshire. A circle of 30 stones, now overturned, enclosing a megalithic ruin, is surrounded by a fosse and rampart 250 ft. across. Its late

Neolithic age was proved by a British Association Committee in 1901-2. The term low (O.E., hill) is due to an adjacent Bronze Age round-barrow.

Arbor Vitae (Lat., tree of life) Popular name for cypress-like evergreen coniferous trees, of which

Arbor Vitae, or the tree of life

the principal species are the American (*Thuja occidentalis*) and the Chinese (*T. orientalis*). The leaves are reduced to minute scales which overlap one another and are closely pressed to the twigs and branches. Their under-

surface is coated with wax, which gives it a whitish appearance. Both species have a strong aromatic odour.

Arbroath OR ABERBROTHOCK. Royal, mun., and police burgh and seaport of Angus co., Scotland.

Arbroath arms

It stands on the Brothock, near its mouth, about 17 m. N.E. of Dundee by railway. The principal industries include ship-building, flax-spinning, engineering, sailcloth, and linen. It is the chief town of a rich agricultural county. There is an airfield, used jointly by the R.N. and R.A.F. in the Second Great War. The harbour is accessible to vessels of 1,000 tons. There are ruins of an old abbey. Arbroath, the Fairport of Scott's Antiquary, has a signal tower, 50 ft. high, in communication with the lighthouse on Bell or Inchcape Rock, 12 m. S.E. Market day, Thurs. Pop. 19,437.

Arbues, PETER (1441-85). Spanish inquisitor. He was born at Epila, in Aragon, studied at Bologna, and then became a canon regular at Saragossa. In 1484 he was appointed chief inquisitor of Aragon, and his severity to the Marranos, Jews who after receiving baptism returned to Judaism, provoked retaliation. He was stabbed by hired assassins in the cathedral of Saragossa, and died of his wounds two days later, Sept. 17, 1485. Regarded as a martyr in Spain, he was canonised by Pope Pius IX in 1867.

Arbuthnot, JOHN (1667-1735) British physician and author

Born at Arbuthnott, Kincardineshire, he came to London in 1691, studied at University College, Oxford, and graduated in medicine at St. Andrews in 1696. He became court physician to Queen Anne, 1705, and soon built up

John Arbuthnot, British author

a large and fashionable practice. Among his friends were Pope, Swift, Congreve, Gay, and Prior, and he was closely associated with Swift in writing for the *Torres*. He was the author of the well-known political satire, *The History of John Bull*, 1712, and *The Memoirs of Martinus Scriblerus*, published among Pope's works, 1741. See *Life and Works*. G. A. Aitken, 1892.

Arbuthnot, SIR ROBERT KEITH, BART (1864-1916). British sailor Born March 23. 1864, he entered the navy in 1877. In 1889 he succeeded his father as 4th baronet in a Scottish title dating from 1823, and in 1912 he attained the rank of rear-admiral. In 1913 he commanded part of the 2nd Battle Squadron, and after the outbreak of the First Great War

took over the 1st Cruiser Squadron. He led this to the battle of Jutland, flying his flag in the *Defence*. About 6.15 p.m. on May 31, 1916, his ship was sunk while fighting some German light cruisers, and Sir Robert and all his crew were lost. He wrote books on naval matters. See *Jutland*, *Battle of*.

Sir Robert Arbuthnot, British sailor

Arbutus (Lat., wild strawberry). Genus of evergreen trees and shrubs of the natural order Ericaceae. Natives of the N. temperate regions,

Arbutus unedo, or the strawberry-tree

they have alternate leaves, and bell-shaped or globular white or red dish flowers in clustered sprays. *A. unedo* is the strawberry-tree of S. Europe and W. Ireland, so called on account of its

large orange-red edible fruits. See *Strawberry-tree*.

Arc (Lat. *arcus*, bow). In mathematics, part of any algebraic curve, most commonly of the circle.

An electric arc is an arc formed when two conductors or electrodes are brought into contact and then separated to within a certain distance while current is flowing. The arc (so called from its shape) consists of incandescent and conductive vapour arising from the volatilisation of the substances forming the electrodes. An arc will continue until, by wastage, the increase of space between the electrodes introduces a resistance beyond the conducting power of the vapour stream. With continuous current a cavity or crater is formed in the positive electrode, but the negative does not waste; with alternating current both electrodes tend to be equally affected. Practical applications of the arc are lighting, heating, and the cutting or welding of metals. In welding (*q.v.*), the metal usually forms one electrode, and a carbon or metallic rod the other, the arc being maintained between. See *Arc Lamp*; *Electric Furnace*.

Arcachon. Town of France, in the department of Gironde. Standing on the Bassin d'Arcachon, a shallow opening of the Bay of Biscay. 34 m. by rly. S.W. of Bordeaux, it is a pleasure resort in summer, and its climate and pine woods, which clothe the dunes encircling the town, make it popular for invalids in winter. Its broad smooth sands afford excellent bathing facilities. Arcachon is a fishing centre and has extensive oyster beds. Pop. 10,266.

Arcade (Lat. *arcus*, bow, arch). Range of arches standing on piers or columns, either free-standing or attached as decoration to the surface of a wall. In the latter sense the arcade was a feature, though a rare one, of Greek architecture. On the S. side of the Acropolis at Athens there is a wall composed in part of piers and arches, which dates from the time of Eumenes II, king of Pergamum 197-159 B.C. The arcade, however, like the arch, assumed no real importance until Roman times. By the Romans it was transmitted to the medieval Italians, and the Italian cities are still rich in this feature. In Venice, Bologna, Naples, Turin, and other towns there are many streets of houses the fronts of which rest on highly picturesque arcades. The long porticoes surrounding the Vatican and other Roman palaces are arcades, or, when the arches are carried by columns, arcaded colonnades.

Arcades. 1. Front of the Ducal Palace at Venice, showing its beautiful double arcade, that on the ground, and that of the gallery above it. 2. Arcaded front of the church of S. Francesco di Paola, at Naples, the pillars of which are like those of a classic colonnade. 3. Arcade, to the right, of the Piazza S. Carlo at Turin. 4. Palazzo Fava at Bologna

Arcades are usually built round public courts or squares, market places, and in other situations where they can serve a distinct utilitarian purpose. It is in ecclesiastical architecture principally that they have been transformed into objects of beauty. The nave arcades of many Romanesque and Gothic cathedrals are frequently their chief architectural feature. The cushion capital, which enabled the Byzantine builders to spring their arches directly from the piers or columns, was afterwards adopted eagerly by the Romanesque and Gothic architects, and arcades of this character are the most graceful. Medieval church architecture abounds in instances of the arcade as an ornamental dressing to the wall, taking the form of moulded arches supported by colonnettes. A more modern application of the term is to glass-roofed streets of shops, e.g. the Burlington Arcade, London, or those in many seaside resorts.

Arcadia. Country of ancient Greece. It occupied the centre of Peloponnesus, and was completely cut off from the sea by Achæa on the N., Argolis on the E., Messenia and Laconia on the S., and Elis on the W. A very mountainous country, its physical characteristics enabled the inhabitants continuously to preserve a semblance of independence. It was extremely well watered. The Stympalian lake (mod. Zaraka) was the fabled home of the terrible Stympalian birds whose destruction by Her-

cules was one of the hero's Twelve Labours. Its waters were conveyed to Corinth by an aqueduct constructed by Hadrian. The chief towns were Mantinea, Tegea, and Orchomenus. According to ancient tradition the inhabitants were racially the oldest in Greece. They were devoted to pastoral pursuits and fond of music; hence the poetic identification of Arcadia with romantic simplicity. Originally governed by kings, Arcadia was later divided into independent republics such as Mantinea and Tegea. After the battle of Leuctra in 371 B.C., Epaminondas formed an Arcadian League with a new city, Megalopolis, as its capital, but the league was of short duration. The modern Arcadia forms a division of Greece, and has an area of 2,020 sq. m. Pop. 187,327. *See* Greece: History.

Arcadia. Name of several pastoral romances, written partly in prose and partly in verse. All owed something directly or indirectly to the Greek romances of Heliodorus (3rd century A.D.) and Achilles Tatius (3rd century A.D.). The Arcadia of the Italian poet Jacopo Sannazaro appeared in 1590; that of Robert Greene, 1599, was first published as Menaphon, or Camilla's Alarum to Slumbering Euphues, in 1589; and the most notable of all, that by Sir Philip Sidney, appeared originally in 1590.

Sidney's work, one of the foundation books of English literature, was written for his sister, and called *The Countess of Pembroke's*

Arcadia. Its composition was influenced by Sannazaro's *Arcadia* and the *Diana* of the Portuguese Spaniard Jorge de Montemayor. In turn its influence was reflected in Shakespeare's *King Lear* and *The Two Gentlemen of Verona*; Beaumont and Fletcher's *Cupid's Revenge*; John Day's *Ile of Guls*; James Shirley's pastoral, *Arcadia*; Francis Quarles's *Argalus and Parthenia*; and the writings of Samuel Richardson, Sir Walter Scott, and others. It is recorded that Charles I read *The Arcadia* while in prison.

Arcadia. Title-page of the first quarto edition of the Countess of Pembroke's *Arcadia*, by Sir Philip Sidney

A first draft, in five books, was circulated in MS. The first printed edition, 1590, perhaps edited by Fulke Greville, ends where the author left his revision, in ch. 29 of Book III. In 1593 another edition was issued with preface by Henry Sandford, the earl of Pembroke's secretary. Twelve editions came out between 1593 and 1674, with additions by Sir W. Alexander (1621), R. Beling (1624), and others. Translated into French 1625, and German 1629, it was modernised by Mrs. Manley, 1725.

As first written *The Arcadia*, which is interspersed with poems, some of great beauty, formed, says Bertram Dobell, a complete and coherent story with a well conceived plot, which the revision lacks. Sidney is usually identified with the character of Philisides, Penelope Devereux with Philoclea.

Arcadia, GULF of. Opening on the W. coast of the Morea, Greece. It lies between Cape Katakolo and Cape Konello, 35 m. apart.

Arcadians, THE. A "fantastic musical play" by Mark Ambient and A. M. Thompson, with music by Lionel Monckton and Howard Talbot. Produced at the Shaftesbury Theatre, London, April 28, 1909, it had an unbroken run for more than two years. The musical score was notable for such well known songs as *The Pipes of Pan* and the lugubriously amusing *I've Got a Motto*.

Arcadius (c. A.D. 377-408). First East Roman emperor. Elder son of Theodosius the Great, on the division of the empire at his father's death in 395 he received the eastern part and his brother Honorius the western. Arcadius

played a subordinate part, the real rulers being the prefect Rufinus, who was murdered in 395, the eunuch Eutropius, executed in 399, and Eudoxia, the emperor's consort, who died in 404. The Goth Garmas held the chief power 400-2, and on his death Aurelian, the pretorian prefect. The banishment in 404 of the patriarch S. John Chrysostom for his outspoken sermons against the vices of the imperial court established the supremacy of the emperor.

Arcanum (*arcere*, to shut up). Latin word meaning a secret or mystery. It is generally used in the plural, *arcana*, which in the 17th and 18th centuries was often treated as a singular, with plural *arcana*. The term was applied by the alchemists to the secrets of nature, and especially to wonder-working remedies and preparations. The great *arcanum* was the secret of transmuting base metals into gold. See *Alchemy*.

Arc de Triomphe. Name of two arches in Paris commemorating the Napoleonic triumphs of 1805-6. The *Arc de Triomphe de l'Étoile* (triumphal arch of the star) was begun by Napoleon from designs by Chalgrin, and completed by Louis Philippe. Standing in the centre of the high *Place de l'Étoile*, at the W. end of the *Champs Élysées* Avenue, this structure is 162 ft. high, 147 ft. wide, and 73 ft. deep, and has a number of fine sculptures on its façades. There is a spacious view of Paris from the top of the arch, to which the public is admitted. After the French defeat in the Franco-Prussian war of 1871 the archway gates were closed until

Marshal Foch led his armies through in the victory march of 1919. Later the body of an unknown French soldier of the First Great War was buried under the arch and a flame kept perpetually burning at the head of the tomb stone. The *Arc de Triomphe du Carrousel* (triumphal arch of the tilting yard) is at the E. end of the *Tuileries* Gardens, and, though much smaller (48 ft. high and 63½ ft. wide), is more beautiful.

Arcesilaus (315-241 B.C.) Greek philosopher and founder of a philosophical school known as the *Middle Academy*. This school taught that absolute knowledge about anything was impossible, and that probability was the nearest it was possible to attain. See *Academy*, *Philosophy*.

Arch. Term used in architecture to denote a structural member spanning vertically an opening or recess. Mechanically, it is an assemblage of pieces arranged over the opening in such a way that the vertical pressure of the load carried becomes two lateral pressures on the abutments. An arch is composed of a crown with two supporting flanks, known as haunches or reins, the width between which is called the span. It is divisible into two main species, round and pointed, as exemplified by the Roman and the Gothic, but there are many varieties of each. The chief forms of round arch are the semi-circular, horseshoe, segmental, and elliptical. Pointed arches include the lancet, four-centred Tudor, the fantastic ogee arch, the trefoil, cinquefoil, and polyfoil arches, and the "rampant" arch, of which the impost on one side is higher than that on the other. The material

Arc de Triomphe and (right) Arc de Triomphe du Carrousel, Paris. These arches were erected to commemorate Napoleon's triumphs in 1805-6. The former, also commemorating the successes of the Revolutionary army, is noted for its sculptures.

ARCHES IN THE ARCHITECTURE OF MANY AGES AND PEOPLES

of which an arch is composed are called *voussours*: the inner side of the arch is known as the intrados, and the outer side as the extrados. The keystone is the brick or block of other material occupying the centre of the crown, and the springer, or springing stone, is that placed immediately over the impost.

Historically, the arch is identified with Roman building, though the Romans were not the originators. Just as the Greeks took the lintel and post construction from the Egyptians, and developed it in their own manner, so the Romans adopted the arch from the earlier Etruscan architecture. The arch was not unknown either to the Egyptians or to the Greeks after the time of Alexander: the elliptical arch form and even the pointed arch were used by the former, though only for strictly utilitarian purposes. In the same way the Chaldeans and Assyrians employed the arch for bridging the Mesopotamian rivers. In Roman hands, however, its use marks a definite break with the Greek building tradition of horizontal and vertical lines. The Romans confined themselves almost exclusively to the semi-circular arch. The Colosseum at Rome and the public baths erected by successive emperors show the use of the arch in combination with the column and lintel, by means of which Roman architecture still preserved its connexion with the Greek. But whereas in Greek work the columns are real supports, carrying the entablature, in Roman they are mainly decorative attachments to the face of piers carrying the arches.

TRIUMPHAL ARCHES A peculiarly Roman product was the triumphal arch. These arches were generally erected to commemorate a victory, but occasionally with other objects, e.g. as entrances to towns or great market places. Some consisted of a single arch, such as the Arch of Titus; others of three arches, a large central opening for chariots and two flanking ones for foot passengers. The Arch of Septimius Severus is generally considered the best of the latter kind, but much of the detail of the Arch of Constantine is excellent. At one time there were thirty-eight of these triumphal arches in Rome alone. There are also arches at Beneventum and Ancona, both in honour of Trajan, while outside of Italy the Arch of Marcus Aurelius at Orange, France, is one of the best known. Roman triumphal arches, however, were scattered far and wide through Europe and North Africa. The triumphal arches erected by Napoleon, and the Marble Arch leading

into Hyde Park, London, are all based on Roman models.

BYZANTINE AND NORMAN ARCHES. In Byzantine architecture the round arch was further developed in conjunction with the column. The Roman builders had used column and capital as embellishments to the arch rather than as structural necessities. The Byzantines, by inventing the cushion capital, enabled the column to be used as the direct support of the arch. Further, they extended the arch principle in the direction of the vault and the dome. The Mosque of S. Sophia at Constantinople, the last word in Byzantine building, illustrates the strength and beauty achieved by the application of this principle. The round arch was kept alive by the Romanesque builders and when the Gothic pointed manner had spent its force, was revived by the Renaissance architects. Meanwhile the Norman style, a derivative of Romanesque, had received its great impetus in Britain. Norman arches are nearly always semi-circular and plainly moulded, the exceptions being the entrance arches to great churches such as Ely Cathedral, which are profusely ornamented. Different varieties of the round arch are found in Moorish architecture. Here the horseshoe form is a favourite one. The Alhambra and other Moorish remains in Spain provide countless examples. The horseshoe arch frequently occurs in Buddhist architecture, where it is better known as the lotus-leaf arch.

THE POINTED ARCH. Though not unknown in the early Egyptian and Etruscan civilizations, this obtained no considerable footing in western Europe until the 10th century. It had a religious significance long before it was adopted as a useful architectural contrivance. To the Christian it expressed the aspiration of the human soul to heaven; to the Brahman it symbolised the clasping of hands in prayer. Hence it figures very conspicuously in the religion-inspired architecture of both East and West. In Europe, the history of the pointed arch is contained in that of the Gothic cathedrals. The lancet form of pointed arch has given its name to the first period of English Gothic, that of the 13th century. The lancet is the keynote of the design of Southwark Cathedral; and in the succeeding Decorated and Perpendicular periods the pointed arch determined absolutely the structure and the form of the building. The secular architecture of the Tudor period gave less scope for its employment, but it persisted in the Tudor arch, the four-centred

arch which is found in the old gatehouse to Lincoln's Inn, and in certain other London and provincial buildings. To-day the popularity of the Renaissance style demands the employment of the round arch except in church building, where a section of opinion still favours the Gothic. See *Architecture*; *Building*.

Arch, JOSEPH (1826-1919). British labour leader. He was born Nov. 10. 1826. at Barford, War-

Joseph Arch,
British labour leader
Elliot & Fry

wickshire, the son of an agricultural labourer, and trained himself by reading and as a local preacher among the Methodists to become the organizer and leader of his fellow labourers in their struggle for better social conditions. Not until 1872 was he able to establish the National Union of Agricultural Labourers. Arch's influence endured in the eastern counties, and he was elected Liberal-Labour M.P. for N.W. Norfolk, 1885, 1892, and 1895. In 1900 he retired from public life to a cottage at Barford, where he died in his 93rd year. Feb. 12, 1919. See his *Autobiography*, 1898.

Archæan (Greek *archaios*, ancient). Name applied to ancient pre-fossiliferous rocks. They occur beneath those of the Cambrian system, and are therefore synonymous with Pre-Cambrian. Usually the term is restricted to a series of gneisses, schists, and intrusive rocks that form the oldest recognizable portion of the earth's crust and upon which the first sediments of Pre-Cambrian age were deposited. See *Pre-Cambrian*.

Archæological Association, BRITISH. Society for the study of archaeology. Founded in 1843 for promoting the study and preservation of antiquities, it holds itinerant annual congresses in May. The offices are at 11, Chandos Street, London, W.1. It controlled the first issues of *The Archaeological Journal*, afterwards taken over by *The Royal Archaeological Institute of Great Britain and Ireland*, which has offices at 37, Onslow Gardens Kensington, S.W.7.

ARCHAEOLOGY: STUDY OF THE PAST

John Garstang, D.Sc., Professor of Archaeology, Liverpool University

This outline deals with the growth of archaeological methods and the aims of the trained investigator. The actual achievements are described under such headings as Aegean Civilization; Assyria; Babylonia; Crete; Egypt; Palestine; Ur; Verulamium

Archaeology, strictly the science of ancient remains (Gr. *archaios*, ancient; *logos*, science), must now be defined, in view of its modern development, as the study of human handiwork of the past. Originally a science of restricted scope, archaeology has maintained a close contact with the progress of cognate sciences, ethnology, geology, etc., and acquired an inseparable relationship with the fine arts. It is now the recognized intermediary between anthropology and ancient history, interchanging with each both methods and results, and in its broader aspect overlapping, to a certain limited extent and with a special purpose, the provinces of both.

Modern Progressive Changes

Anthropology is primarily concerned with man in his primitive state, and therefore with man's works as an example of human tendencies. Archaeology makes a specialised study of man's works of the past: while ancient history, within the more limited field illuminated by the light of written records, investigates man's deeds, of which man's works are the material witness. By this contact, archaeology has greatly benefited from the modern development of anthropological and historical research, the two most progressive changes being a widening and humanising of outlook and precision of method.

DEVELOPMENT. The development of the science of systematic archaeology out of the old-world antiquarianism is comparatively modern. Previously restrained by misconceptions of the Flood, and later circumscribed by the pan-Roman theorists who referred all examples of primitive culture to a classical origin, the subject owed the first stage of its radical emancipation to the antiquaries of the north. In Sweden and Denmark there was an exceptional wealth of unmixed archaeological remains, which could not readily be explained by the methods current in the classical areas. Application of the processes of induction and new methods of comparison resulted in the fundamental demonstration of a general uniformity in the evolution of primitive culture, of a natural sequence in the use of stone, bronze, and iron in the normal development of human experience and skill.

Archaeologists now held a master key which was applied in turn to the locked secrets of other lands with almost unvarying results, exceptions being noticed only where special metals or materials were indigenous or relatively easy of access. The principle of the evolution of primitive culture thus established, the science of primitive archaeology emerged, claiming for itself a hearing on all that concerned the material remains of the past from the diluvial period to the dawn of history. But while the principle became admitted the survival of primitive types until recent times in various sequestered spots on the globe indicated that the evolution of human culture was not generally contemporaneous. The principles of geology were no longer applicable to the details of the problem. It became obvious, rather, that in the process of civilization man was essentially sensitive to the circumstances of life and his environment. So the new science was saved from the fundamental error of too general application of its first principles. Historical methods became essential to further progress.

Archaeology and Humanity

Meanwhile, the archaeologists had recognized their now familiar tools and implements of stone and bronze in the hands of living man, and learnt to explain the usage of objects of primitive character in the past from the uses of primitive objects in the present. The human factor had been introduced into the formerly materialistic study. Thenceforward, in the treatment of ancient objects, it could never be forgotten that they were the product of man's hands, made by him to serve some purpose. To separate archaeology from its relation to humanity would be not only to deprive early history of its fundamental material, but would be prejudicial to a proper interpretation of early remains.

In such ways as these, proportionately to the general advance of knowledge, the methods of archaeology gradually developed. So, too, did the horizon of the archaeologist widen as a result of investigations in the morning lands, the homes of the great, old civilizations of the Nearer East. The discoveries of Layard in Mesopotamia, of Newton in the Levant, of Mariette in Egypt,

of Schliemann in Western Asia Minor, and of other pioneer explorers in these fields produced a profound impression. Hitherto the Assyrians, Babylonians, Egyptians, had been names of peoples, familiar indeed from childhood in the legends of the past, but visible only dimly in the distance through the mists of time; while Homer's story of Troy held almost the place of a national epic among the educated societies of Europe.

New Criteria for Historians

Now one by one these legends seemed to materialise, the people to become real, their works to become tangible. The mists were dispersed, and the old world came into view. Temples and images of gods, palaces and portraits of known kings, pictures of national events, the hearths and domestic objects of daily life, provided just the material wanting to complete the pictures of antiquity for which historical narrative had already prepared the outlines. The historian, further, received new and reliable criteria upon which to test the accuracy of ancient legends and to focus their relative importance. Archaeology became the accepted handmaid of ancient history. The barrier was finally broken down, enabling the two subjects to reap the advantages of collaboration, while at the same time opening the door for the mature development of the science of archaeology as it stands to-day.

We have briefly traced the development of antiquarianism into systematic archaeology and the establishment by common need of a science of primitive archaeology. We have realized the more recent improvement of method and the expansion of the field of archaeological inquiry, necessitating in effect the division of the growing subject into geographical branches. In this latest phase we shall find how the gradual overlapping with the domain of history has led to a reconstruction of the science, so that archaeology is now recognized as a collateral, co-related, albeit independent subject, treating of man's works, not only in prehistoric but in historic times, hence dealing, not only with primitive remains, but with all the culture products illustrative of civilizations.

RELATION TO HISTORY. This overlap with the domain of history has been foreshadowed already in the survival, here and there, of primitive types until modern times. It is definitely indicated by the fact that the transition from the Bronze to the Iron Age in the Greek world took place in the light of its contemporary history. The Iron Age

in this case becomes an historic phase, nor can its culture be classed as primitive. In the north, as we have seen, the three phases had glided one into the other in prehistoric times, that is to say, before the days of local or contemporary records; and as regards Western Europe generally, the Iron Age had already appeared before the expansion of the Roman empire interrupted the normal sequence of development, and at the same time, as it were, artificially opened the historic age.

But the growing acquaintance with the Nearer East disclosed the dawn of history there to be, relatively and actually, much earlier. In Egypt, for example, where nature granted its primitive population unusual protection from violent intrusion, writing is found in its primitive forms in the closing Stone Age of the earliest dynasties; while written narrative, the veritable boundary of history, appears with the fuller development of the Bronze Age in the time of the pyramid-builders 3000 years B.C.

Limits of Primitive Archaeology

Reciprocally, the progress of historical method has given rise to a parallel demand among historians for a systematic examination of original authorities, and hence to a recognition of the fact that the formerly dumb witnesses of man's handiwork may be made to yield, with proper handling, evidence at once reliable and of human interest in the story of men's deeds. The whole, in this aspect, involves the part, for man's works are a feature and illustration of his deeds.

From such considerations it becomes self-evident that there can be no real frontier between archaeology and history. The two are to be regarded as collateral and conterminous. Only the aims and to some extent the methods of these two branches of study are different. But the historian today, in reconstructing the fabric of society, cannot neglect to examine the foundations thereof; nor can he adequately describe man's deeds without the illustrations which man's contemporary handiwork alone affords.

MODERN SCOPE. To sum up, past generations have witnessed a noteworthy development in the study of archaeology, manifested in three several directions. First, expansion of field, leading to the division of the whole science into branches corresponding with known civilizations or culture areas—Assyrian, Egyptian, Hittite, Greek, Roman, Gallo-Roman, Celtic, etc. Secondly

extension of scope, admitting the consideration of the culture-products of historic times and so involving a further subdivision by sections corresponding to the subjects concerned, e.g. architecture, art, coins, cults, etc. Thirdly, improved methods and ever increasing results in practical investigation, fostering the tendency to specialisation, the natural outcome of this development.

Achievements in the Near East

The steady expansion of field is well seen in the researches of British archaeologists following up the threads left by earlier explorers. For example, the explorations of the interior of Asia Minor by Sir William Ramsay; the recovery of the Hittite Empire from its scattered remnants by Prof. A. H. Sayce; the systematic excavations in Egypt and Palestine by Sir Flinders Petrie and his followers, and particularly the establishment by the former of a series of sequence dating for prehistoric remains; Sir Arthur Evans's discovery of the Minoan civilization of Crete contemporary with the earlier civilizations of the Near East; Dr. D. G. Hogarth, who for over thirty years explored and illuminated by his writings Asia Minor and Arabia; Sir Leonard Woolley, whose work at Al Ubaid and Ur has revealed much early Mesopotamian history and prehistory, while his excavations at Alalakh in Syria, interpreted by Sidney Smith, have helped to rectify Mesopotamian chronology.

Others who have toiled in the Near Eastern field are: Dr. Henri Frankfort, who has made invaluable studies on Near Eastern pottery and cylinder seals; Miss (later Professor) Dorothy Garrod, who found in Palestine a link between Neanderthal man and *homo sapiens* in the caves at Mt. Carmel; while in Greece Professor Wace's work in Thessaly and Mycenae, as well as that of Professor Myers in Cyprus and the Aegean, Mr. Hentley in Macedonia, and A. Pendlebury in Crete and Egypt, must not be forgotten.

The link between British Near Eastern and Western European archaeologists is best exemplified by Professor Gordon Childe, whose synthesising studies embrace the whole field of European, British, and Near Eastern pre-history.

BRITISH ARCHAEOLOGY. British antiquaries early recognized the significance of the results obtained by the methods of systematic analysis and comparison in Sweden and Denmark; and, with the

Roman period as a convenient and determining landmark, the remains of Great Britain were more critically examined. The catalogues of British stone and bronze implements, by Sir John Evans, gave permanent expression to the value of comparative treatment; while Prof. Boyd Dawkins's Cave Hunting, General Pitt-Rivers's Excavations in Cranborne Chase, and other works revealed the advent of scientific method in practical investigation. The county surveys undertaken by the Society of Antiquaries provided a basis of scientific classification of prehistoric remains.

Prehistoric Britain

In the prehistoric field much has been done on the Palaeolithic, Mesolithic, and Neolithic periods. To mention only a few names, Dorothy Garrod's publication on the Upper Palaeolithic of Great Britain; Dr. Graham Clark's studies of the Mesolithic of Britain and western Europe, and Stuart Piggott's chronology of British Neolithic pottery. The work of Dr. Bullied and H. St. George Gray in the lake villages of Somerset revealed one facet of the Iron Age; while in the exploration of the hill forts of southern England much was done by C. F. C. Hawkes, Sir Cyril Fox, and Dr. R. E. M. Wheeler to prove links with the Continent. The present knowledge of Roman Britain is due largely to Francis John Haverfield, as shown by his book on the Romanisation of Roman Britain first published 1906. Haverfield's work was complemented by Dr. R. G. Collingwood's systematic accounts of every class of Roman antiquities in this country. In addition there have also been studies related to particular aspects, such as Drs. Oswald and Pryce's monumental work on *Terra Sigillata*.

Other contributors to the illumination of Roman Britain include J. P. Bushe-Fox's excavations at Richborough; Ian Richmond's Roman camps at Cawthorn; Dr. R. E. M. Wheeler at Caerleon, Lydney, and Verulamium, C. F. C. Hawkes at Colchester, and Miss Kenyon at Wroxeter and Leicester. There has been a marked improvement not only in the technique of excavation but in the use of new methods, such as geochronology and the use of soil and pollen analysis. The greatest development since the First Great War has been the use of air photography both for discovering new sites and for revealing new aspects of

1. Excavated wine shop at Pompeii; tapering bottles were inserted in circular holes in the ground or in masonry. 2. Roman mosaic floor uncovered at Verulamium, Herts. 3. Experts examining soil from the great earthworks at Maiden Castle, Dorset. 4. At

work on the debris covering the Temple of the Moon at Ur. 5. Site of a Roman villa at Ditchley, Oxon, the outlines of which were first revealed by differences, seen only from the air, in the corn crop covering the whole area. The outlines are emphasised here

ARCHAEOLOGY: HOW THE HIDDEN PAST HAS BEEN BROUGHT TO LIGHT

Photos, 2, John Gibson; 4, H. R. Hall 5 Ashmolean Museum, Dept. of Antiquities

old ones; with this work the name of O. G. S. Crawford is inevitably linked. His best known publications are *Air Survey and Archaeology*, and *Wessex from the Air*, but he also initiated a fine series of ordnance maps, e.g. that of Roman Britain, as well as editing the periodical *Archaeology*.

ACADEMIC REACTION. The widening field, the spreading branches, and the consequent tendencies of modern scholarship are well, though tardily, reflected in the development of archaeology as an academic subject in the universities and learned institutions. The first professorship in archaeology was instituted at Cambridge about the middle of the 19th century; it has established a firm tradition as a training school for archaeologists. There are now two chairs at Cambridge, the Disney chair in prehistoric archaeology, and the Lawrence professorship of classical archaeology. In the university of London the Yates professorship of archaeology, founded in 1880, was supplemented by the Edwards chair of Egyptology in 1892. A professorship in Western European archaeology has now been added. In addition the Courtauld Institute was established with a chair of Chinese art and archaeology; while the Institute of Archaeology, founded 1936, has a chair in Near Eastern archaeology.

Oxford's Lead

Oxford has gone farther than all other universities in recognizing the widening interests and special features of this subject. The first chair of classical archaeology and art there was not founded until 1884, but it has been supplemented by professorships or high posts in the special fields of Assyriology, Egyptology, Epigraphy, and Papyrology. The study facilities at Oxford have been much increased by the foundation of the Griffiths Institute, established for the study of ancient Egypt and the Near East, just before the Second Great War.

The British Museum maintains an organization that is proportioned to modern requirements. In addition to publishing handbooks and guides to the archaeology of various periods, it has a highly trained technical staff for the preservation of antiquities.

The first of the newer universities to take up this subject, Liverpool, early in this century established an institute with three chairs in classical archaeology, Egyptology, and the methods and

practice of archaeology. Edinburgh, which in 1882 had established a chair in Celtic language, literature, and antiquities, followed this by setting up the Abercromby chair in prehistoric archaeology in 1926. In Eire, Dublin set up the first chair in Celtic archaeology. This was followed by the University Colleges of Cork and Galway establishing professorships in archaeology and Celtic archaeology. Other British universities, e.g. Durham, Leeds, Cardiff, Belfast, have courses of lectures in archaeology.

Archaeology of Western Asia

Another development was the British School of Archaeology at Jerusalem, the object of which is to promote the study of the archaeology of Western Asia in a manner worthy of the opportunity afforded by the First Great War. The Palestine Exploration Society had a fine record in pioneer research. The names of Conder, Warren, Kitchen, Macalister, and many others are still familiar. The new school was founded by the British academies in concert with this society. It aims at facilitating and organizing practical investigation, at training and equipping explorers for this work, as well as providing instruction and guidance for those pursuing special studies.

Another school founded since the First Great War is the British School of Archaeology in Iraq, whose main work has been the publishing of a journal of the same name. The British School of Egyptian Archaeology founded by Sir Flinders Petrie has published a vast series of excavation reports on Egyptian and Near Eastern subjects. There are two other British Schools of Archaeology, those at Rome and Athens, but they do not fall within the province of this article.

PRACTICAL ARCHAEOLOGY. The whole function of a practical archaeologist is threefold: (a) investigation, (b) exposition, (c) interpretation. The first may be regarded as his special function, the second as his inalienable duty, the third as his academic opportunity.

Investigation includes exploration, excavation, examination of material, whether concrete or documentary, comparisons, analyses, and all that contributes to the increase of material information.

Exposition is the making public of the results of investigation. The archaeologist who fails to offer the community the fruits of his investigations fails in his elementary public duty. The ex-

cavator, in particular, to whom the opening of ancient ground is entrusted, accepts in this regard responsibilities which involve not only the preservation of antiquities and monuments disclosed, but all information derived from the association of remains and their relative positions in the ground. Exposition may be effected by arrangement and classification of material remains in museums, conservation of sites, or publication of plans, photographs, and memoranda.

Interpretation is the further synthetic treatment of the materials rendered available by investigation and exposition. Such treatment will involve the domains of anthropology and of history, and will demand a preliminary handling by specialists according to the subjects involved. A modern excavator surcharged with the duties of personal observation and attention to details can rarely obtain the leisure necessary or acquire the knowledge essential for final interpretation of his results. But the excavator's personal impressions are irreplaceable; hence collaboration and organization are almost indispensable.

The Archaeologist's Training

Proportionately to the general progress of archaeological method, the processes of practical archaeology have become increasingly scientific, involving an adequate general training together with special training in architecture, draughtsmanship, photography, ceramics, mechanics, surveying, petrology, etc., and a knowledge of arts and crafts.

EXCAVATION. The days are past when sites may be recklessly turned over in search of archaeological treasure. The most learned professor or enthusiastic amateur untrained in excavation, digging in rubbish heaps outside a city wall, may destroy by inexperience or ineffective supervision during one minute the stratification that would have illustrated to the expert not only the development of the city, but the evolution of a civilization. An excavator's dominating ideal should be so to preserve every object, so to record every position, that it might be possible for some one else working upon his exposition to replace everything accurately where it had been found. This precept applies to the stratification of the earth and debris no less than to the superposition of more tangible remains. The relation of each to the whole is the key to correct interpretation. The excavator must preserve an

open mind, free from preference for one class of evidence over another, ready and desirous always of testing points of view that differ from that towards which his human temperament may tempt him to incline.

Faced with the duty of recording even that which he cannot perceive, the excavator calls the camera to his aid, and by a regular series of photographs registers the stages of his work commencing with the surface. In this he has been greatly assisted by the development of air photography, which reveals the shape of buildings invisible from the ground.

Methodical Excavation

An excavator's first considerations in attacking a new site will be his criteria. If his site be a deserted Syrian mound, he will examine other mounds still in occupation, and will also study the results of others who have excavated similar mounds. If his site be a Roman fort in the northern or western frontier of Britain, he will study the different examples already brought to light, noting particularly the differences in plan and construction. In either case he will familiarise himself with the types of common objects, among which the potsherds are at once the most numerous and the most instructive. His imagination will then be able to trace out the processes by which the site may have developed its present appearance, so that he is working mentally from the bottom to guide his hand in proceeding from the top.

In the case of a Syrian mound, it may be conjectured that a natural knoll was occupied in antiquity by its primitive settlers. The original form of the mound remains undetermined. His imagination can usefully follow up the normal processes of decay, repair, destruction, restoration, with the ever-rising accumulation of walls and floors and debris. The body of the mound will be composed of disintegrated bricks of mud, which he will have to distinguish from standing walls of the same material, often difficult in the case of those partly ruined. There will have been periods, too, when the mound after some shock, or for other reasons, was abandoned, leaving its habitations and main walls partly in ruins. Natural decay would ensue with successive rains. New-comers would then partly level up and rearrange the buildings, using in some cases old walls as foundations, in other cases digging foundation trenches through the pre-existing floors, lay-

ing up new and delicate problems which the excavator must solve.

The second series of observations will be directed to the surface of the mound, seeking for the line of demarcation between the natural and the artificial, noting everything that might suggest intrusion, testing and recording the angles of its slopes. He will recognize the natural angle of rest of accumulated earth, an angle which varies with the tenacity of the soil. When the slope is steeper, he will suspect the presence of existing, though buried, walls; where it dwindles away, he may infer usage in more recent times. The rain-washed surface and the foot of the mound will present a shallower angle.

The Excavator's Guiding Principles

His third considerations will be of a technical order—organization of staff, the disposition of workmen, the placing of apparatus, the disposal of debris, the preservation of what must not be destroyed.

Trial sections will aid materially in solving all of these technical problems. Such exploration sections, whether up the slope or upon the surface, should run diagonally to avoid difficulty with the debris, which in the preliminary examinations he will place along the lower side of the trenches and on the surface, because the presence of various walls, assuming them to be roughly parallel, will be more easily detected. A parallel trench might fall between walls. Walls, when discovered, should be followed by cross cuts. They will expose, upon the slope, the foot of the artificial mound and at intervals the position of the enclosure walls. Upon the shoulder they will be especially instructive. The nature of the walls, the styles of building, the character of potsherds and small objects will be noted. Upon the surface long trenches extending over the shoulder, descending from half a metre to two metres with occasional deep shafts when no floors are found, will establish a number of local criteria and provide the basis for the plan of campaign. The sides of such cuttings should be examined minutely at successive stages as they dry out. The excavator should not be tempted to enlarge upon them—as, for example, by following up individual walls which they may cross—until their completion. It is, indeed, inadvisable, as a rule, to follow walls at first sight.

When a room has thus been located by cross cuts, trial shafts should determine the depth of its floor, the real relation between

floor and wall, and the striation of the filling of the chamber. The earth should then be removed layer by layer, not necessarily horizontal, down to the level which indicates contemporary occupation. The clearing of the chamber will then proceed minutely and by hand. The main walls, if any, around the mound should only be bared after section cuttings have determined their relation to the stratified deposits outside and to the successive building periods within. It is a useful precept, in seeking for a wall face, to approach the suspected position from a distance, digging relatively deep and letting the surface earth fall in untouched. The face of the wall will thus disclose itself, whereas it might otherwise have been damaged. Workmen should not, as a rule, be informed of the expected position of walls.

Clearance rather than excavation is hardly ever justifiable; blown sand almost alone can be safely dealt with in bulk. In this way buildings and tombs in Egypt often present simpler problems and a suitable training ground for students. The blown sand from the tomb shaft is passed through sieves, and the burial chamber, when reached, will be cleared by hand. Superposition of burials, though not common, will provide practice in detecting strata. More commonly tombs were partially cleared out in antiquity before re-use, and the great majority have been disturbed more recently by plunderers. The grouping of objects in a series of tombs is not less important in establishing morphological sequence upon the basis of average association.

Three Fundamental Formulae

The excavation of Roman forts in Great Britain is another relatively simple class of problem. The principles to be observed will be generally the same, except that there is, presumably, no slope or mound other than the natural contour of the site. The problem of tracing the ground plan becomes secondary to that of the minutiae, on which all attention should be concentrated. The importance of minor objects is their relation to the whole.

Three general formulae are of a fundamental character: (1) Study the criteria, (2) Examine by sections, (3) Dissect by layers. For the rest the general methods of archaeology apply. The position of each object found, whether important or not, is to be recorded in due relation to its surroundings.

whether as part of a layer or directly referred to some determined base, like a floor or wall. The generous use of the camera and sketches, and the prompt recording of observations and impressions as the work proceeds, are the safeguards of a conscientious excavator.

Bibliography. Ancient Bronze Implements of Great Britain and Ireland, John Evans, 1881; Prehistory of the North, J. J. A. Worsaae, Eng. trans. H. M. Simpson, 1886; Ancient Stone Implements of Great Britain, John Evans, 1897; Authority and Archae-

Archaeopteryx (Gr. *archaios*, ancient; *pteryx*, wing). Primitive lizard-tailed bird. About the size of a pigeon, its fossil remains are found in the Upper Jurassic lithographic stone of Bavaria. The jaws were furnished with conical teeth, showing affinities with the Reptilia. The wings were small for the size of the animal and exhibited three digits, each of which terminated in a claw. The hind limbs were characteristically those of a bird. The vertebral column extended to form a long tail, from each vertebra of which was given

flowers. It is also sometimes given to *L. album*, with white flowers. All of these plants belong to the genus of labiates commonly known as dead-nettles, owing to the superficial likeness of their leaves to those of the stinging-nettle (*Urtica*). They are found growing along hedges and about waste land. The names archangel and archangelica are also sometimes given to the umbelliferous plants more frequently known as angelica (*q.v.*).

Archangel Seaport and city of N. Russia. Near the mouth of the Dvina and the head of the Gulf

Archangel. Russian seaport on the Dvina at the head of the Gulf of Archangel. It is ice-free from June to September. Dome-topped towers and spires are characteristic of its architecture

off a pair of opposite quill-teathers. The whole body appears to have been covered with feathers, impressions of which are preserved in certain specimens *e.g.* one formerly in the Berlin museum.

Archangel (Gr. *archi*-, chief. *angelos*, angel). The title of the highest order of angel. The Jews named seven. Michael, Gabriel, Raphael, Uriel, Chamuel, Jophiel, and Zadkiel, the last three being unrecognized in the Christian Church. The first two are mentioned in the A.V.: Michael, *i.e.* "who is like God," Dan. 10. Jude. and Rev. 12: Gabriel, *i.e.* Man of God, Dan. 8 and 9: and Luke 1. Raphael, *i.e.* "God has healed," is referred to in Tobit, and Uriel, *i.e.* "light of God," in 2 Esdras 4, 5, 10. Chamuel means he who sees God. Jophiel, the beauty of God, and Zadkiel, the righteousness of God. See Angel.

Archangel. In botany this is a popular name given to two common

Archangel. *Lamium Galeobdolon*, the yellow dead-nettle

British wild flowers, both belonging to the family of Labiatae, and are respectively *Lamium Galeobdolon* and *L. purpureum*, the first with yellow and the other with purple

flowers. It is also sometimes given to *L. album*, with white flowers. All of these plants belong to the genus of labiates commonly known as dead-nettles, owing to the superficial likeness of their leaves to those of the stinging-nettle (*Urtica*). They are found growing along hedges and about waste land. The names archangel and archangelica are also sometimes given to the umbelliferous plants more frequently known as angelica (*q.v.*).

The place was visited in 1553 by Sir Richard Chancellor, the town being founded in 1584. During the First Great War it was a supply base for the Russian army and the scene of two explosions causing casualties among British subjects. In 1918 it was occupied by an Allied force opposing the Bolsheviks. During the Second Great War it became one of the chief ports for reception of Anglo-American war materials brought to Russia by Arctic convoys, 1942-43.

ARCHANGEL EXPEDITION of 1918. In the spring of 1918 the Allies of the First Great War decided to occupy Archangel and Murmansk, together with the Murmansk Rly. Their object was to safeguard against attack by the Red Army the huge accumulation of military stores at Archangel, and to facilitate if possible

the reconstitution of an eastern front against Germany by eventual contact with Czecho-Slovak forces and Admiral Koltchak's White Army W. of the Urals.

Murmansk was accordingly occupied by British, French, and U.S. troops in June-July. Allied warships, overcoming Red Army opposition, anchored in Archangel harbour on Aug. 2. and British troops entered the city next morning. Further British detachments were landed at Onega Bay, S.W. of the White Sea. After spasmodic fighting, the Allies, under General Ironside, had occupied by the winter a curve of territory which was deepest at Shenskursk, about 180 m. S.E. of Archangel. They were driven from Shenskursk on Jan. 24, 1919, and were forced to make other minor withdrawals during the ensuing months. A general Red Army offensive in May was completely repulsed, and a first contingent of reinforcements, consisting of British volunteers, reached Archangel. But the British government had meanwhile decided, early in March, to evacuate both Murmansk and Archangel. Allied policy became limited to the equipping of local anti-Bolshevik Russian forces (about 23,000 men) and subsequent withdrawal under cover of an offensive. Lord Rawlinson was appointed supreme commander to coordinate the withdrawals, which began in June. In July the Red Army was defeated on the Dvina and at Yemtsa. Evacuation proceeded through Sept. and on Sept. 27 the British naval base at Archangel was closed. Evacuation of the Murmansk area was completed by Oct. 12, 1919.

Archangel, *GULF OF*. Bay of N. Russia. An inlet of the White Sea, it extends inland about 65 m. and receives the waters of the Dvina.

Archbishop (Gr. *archi-*, chief: *episkopos*, overseer). Principal bishop of a province, who while governing his own diocese presides over the bishops of a group of dioceses. Athanasius (d. 373) so described himself and his predecessor in the diocese of Alexandria, but the term was not strictly used in its present sense before the 6th century, and the date of its origin cannot be fixed. The titles of archbishop and patriarch were once interchangeable: archbishop and metropolitan are still identical.

The design of Pope Gregory I to divide Britain into two sees, London and York, was abandoned because Kent was the first part of

the kingdom to receive Christianity. Augustine was the first archbishop of Canterbury, but the claim of the holder of the see to be primate of all England was not definitely settled until 1353. Lichfield in the 8th century and St. Davids in the 12th had archbishops. Paulinus, as bishop of Northumbria, held the pall or pallium of an archbishop, 625-33. The first archbishop of York was Egbert (732). Irish bishops received consecration from Canterbury until 1152, though Ferns was once archiepiscopal. In 1470 Pope Sixtus IV created the bishop of St. Andrews archbishop and metropolitan of all Scotland.

In the Church of England the archbishop of Canterbury is primate of all England and metro-

Archbishop. The Primate of All England in his robes

politan. He ranks as a prince immediately after the princes of the blood royal and before all other subjects. He has the right of crowning the sovereign. His brother of York, as primate of England, has precedence of all dukes save those of the blood royal and all officers of state save the lord chancellor, and the right of crowning the queen consort. In speaking and writing they are given the title of Grace and Most Reverend Father in God, and write themselves "by divine providence," with, as signature, their Christian name followed respectively by Cantuar and Ebor, abbreviations of the Latin forms of Canterbury and York. The archbishop of Canterbury has under him all bishoprics in England, except those of Durham, Ripon, Chester, Newcastle Wakefield, Liverpool, Manchester Carlisle, Sodor and Man, Sheffield, Blackburn, Southwell, and Bradford, which are in the province of York. The Protestant archbishop of Armagh is primate of all Ireland; the archbishop of Dublin is primate of Ireland. On the disestablishment of the church in Wales, which came into effect March 31, 1920, Wales was constituted a separate province under its own archbishop, who is chosen out of the six bishops.

The episcopal church of Scotland has no archbishop, but its bishops elect a primum of their number to whom is given metropolitan authority. In the British Empire overseas there are Anglican archbishops in *Canada*: Toronto, Nova Scotia Rupert's Land, Ontario, British Columbia, *Australia*: Perth, Sydney, Melbourne, Brisbane. *New Zealand*: Christchurch; *S. Africa*: Cape Town; *India*: Calcutta; and in the West Indies.

In England and Wales there are four Roman Catholic archbishops: Westminster, Cardiff, Birmingham, and Liverpool. In Scotland, two: St. Andrews and Edinburgh, and Glasgow in Ireland, four: Armagh, Dublin, Cashel and Tuam; in Canada, fourteen; ten in India; one in Ceylon; seven in Australasia. In the U.S.A. there are twenty-one R.C. archbishops, but no Protestant holder of the title. See Episcopacy.

Archchancellor (Latin *archicancellarius*). A dignity of the Holy Roman Empire. The archbishops of Mainz, Cologne, and Trier (Trèves) were respectively archchancellors for Germany, Italy, and the kingdom of Burgundy or Arles. They were merely chancellors who received a higher title on account of the greater importance of their office. The archchancellorships of Italy and Arles gradually declined in importance, but that of Germany lasted until the dissolution of the Empire in 1806. See Chancellor.

Archdeacon (Gr. *archi-*, chief: *diakonos*, minister). Official of the early Christian Church and existing today in the Roman Catholic but more especially in the Anglican Church. As the name suggests, he was chief of the deacons serving a cathedral. First appearing in the 3rd century, archdeacons were soon the chief assistants of the bishops, their special duties being to look after clerical morality, church buildings, etc., and in general to relieve the bishops of much detail work. In the 11th century districts were allotted to them, and their authority, thus encouraged, grew at the expense of that of the bishops, until they became practically independent, with full control over the secular or administrative side of the Church's work. It was then that they earned an unenviable notoriety for rapacity and harshness towards the lower clergy, evidenced in the question of the medieval schoolmen: Can an archdeacon be saved? Roman Catholic archdeacons are titular dignities,

their only duty being to present candidates for ordination.

In the Anglican Church, on the other hand, the archdeacon is still a prominent official, for, having come in with the Normans, he survived the vicissitudes of the Reformation. Before 1836 there was one for each diocese, but afterwards the number was increased to two or four, each having his own archdeaconry. Their duties include the visitation of the parishes, the supervision of church buildings, the hearing of cases in their courts, and the admission of churchwardens. They are members of Convocation and almost invariably hold a canonry or other living in the diocese. In order to be appointed an archdeacon, one must have been for six years a priest. Archdeacons are appointed by the bishops. See Church of England; Ecclesiastical Law.

Archduke (Gr. *archi-*, chief. Lat. *dux*, leader). Title long borne by princes of the family of Hapsburg, rulers of Austria. It was assumed about 1358 by one of the dukes of Austria and from that time that country's rulers were always known as the archdukes. Later came the practice of calling all the princes of the Hapsburg family archduke and so we have the archduke Charles, the archduke Francis Ferdinand, and others who were not rulers. The title has never been borne by any other family. The archduke Otto (b. 1912), eldest son of the last emperor, Francis Charles, became the claimant to the Austrian throne on the death of his father, 1922.

Archelaus. King of Egypt. Of the Ptolemaic dynasty, he was a son of the Cappadocian Archelaus, one of Mithradates' generals, and Pompey made him high-priest of Comana in Pontus. In 56 B.C. he wedded Berenice, daughter of Ptolemy Auletes, who had been raised to the throne in place of her father, but after six months both were slain, during an invasion led, at Ptolemy's instigation, by the Syrian proconsul Aulus Gabinius.

Archelaus. Ethnarch of Judaea, son of Herod the Great by the Samaritan Malthace. His succession being disputed by his brother Antipas, to whom Judaea had been assigned by an earlier will, Archelaus appealed to the Roman emperor Augustus, who in 4 B.C. made him ethnarch of Judaea, Samaria, and Idumaea, and Antipas tetrarch of Galilee and Peraea. For his cruelty and marriage with his brother's widow he was deposed c. A.D. 7

and banished to Gaul. A tradition existed that he was the nobleman mentioned in the parable of the ten pieces of money (Luke 19).

Archelaus. King of Macedonia, 413-399 B.C. He introduced Greek culture into his country, constructed roads and built towns, and reformed the army. The dramatist Euripides and the painter Zeuxis were resident at his court.

Archer, FREDERICK JAMES (1857-86). British jockey. He was born at Cheltenham, Jan. 11, 1857, and as a boy of 13 rode Athol Daisy to victory in a nursery race at Chesterfield in 1870. Altogether he rode in 8,084 races and won 2,748, heading the list of winning jockeys from 1873 to 1885. He was successful in five Derbys, six St. Legers, and was on the back of four Two Thousand and Oaks winners. He shot himself when lying ill of typhoid fever at Falmouth House, Newmarket, Nov. 8, 1886, and was buried at Newmarket.

Archer, WILLIAM (1856-1924). British dramatic critic and author. Born at Perth, Sept. 23, 1856, he

Fred Archer,
British jockey

William Archer

was educated at Edinburgh. He came to London in 1878 after travelling in Australia in 1876-7. He was dramatic critic to many journals including The London Figaro, The World, The Tribune, The Nation, and The Star. It is, however, as a disciple of Ibsen that he was best known. He edited Ibsen's prose dramas in five volumes and the complete works in 11 volumes, besides collaborating in a translation of Peer Gynt. He was also the author of a Life of W. C. Macready, 1890. Poets of the Younger Generation, 1902; Through Afro-America, 1910; The Old Drama and the New, 1923 and other books; also a drama, The Green Goddess, and other plays. He died Dec. 27, 1924. *Consult* William Archer, his Life, Work and Friendships. C. Archer, 1931

Archer Fish. Name of a small East Indian fish. It is so called from its power of squirting drops of water from its mouth at its prey

which consists of small insects. One species, *Toxotes jaculator*, has been known to squirt a drop of water as far as 5 ft.

Archery. Art and practice of shooting with a bow and arrow. Employed from the earliest times in warfare and hunting throughout the world until invention of gunpowder, it is now indulged in only as a pastime. It was revived as such in 1780 by Sir Ashton Lever and some friends at Leicester, and in 1781 the Royal Toxophilite Society was founded ever since regarded as the controlling authority. The Royal Company of Scottish Archers, which constitutes the sovereign's bodyguard for Scotland, dates from c. 1650. The Honourable Artillery Company of London originated with a body of archers established by Henry VIII.

The implements used for the sport in its modern form comprise the bow, arrows, tips for covering the fingers, the bracer or arm-guard, and the target. Bows, if made of one piece of wood, are termed "self"; but if composed of two or more strips of wood glued are described as "backed." The former are invariably made of yew, the latter of various combinations. The length of a woman's bow should be about 5 ft. 6 ins., that of a man's 6 ft. The strength of a bow is reckoned by the number of pounds it takes to pull it a distance (from string to bow when fully bent) of 25 ins. in the case of a woman and 28 ins. in that of a man. The former bow would be marked 25 lb., the latter 48 lb.

Arrows are made of deal, of four different shapes; either they are of the same thickness from end to end, or are barbed or tapered in different parts. The feathers with which they are winged are either of the straight pattern or parabolic variety. Tips are leather protections for the fingers of the right hand; they should fit accurately. The bracer is the leather guard strapped on the left arm to protect it from the recoil of the string after the arrow is released. The target is circular, 4 ft. in diameter, stuffed with straw, having a canvas face on which are painted

Archer Fish, which shoots its insect prey with squirted drops of water

Archery. 1. Early English bow, period Edward IV. 2. Two English arrowheads. 3. Grecian bow. 4. Bow of whalebone and wood, N.W. American. 5. Egyptian quiver. 6. Greco-Egyptian quiver. 7. Egyptian arrow. 8. Theban bow-case and quiver. 9. Etruscan bow

five rings: the centre or bull's-eye being gold (technically called the gold), then red, blue, black, and white, and counting respectively 9, 7, 5, 3, and 1. The distances shot over vary from fifty to one hundred yards.

Bibliography. Toxophilus, Roger Ascham, 1545, repr. by Edward Arber, 1868; another ed. by W. A. Wright, 1904; Archery, C. J. Longman and H. Walrond, 1894; Modern Methods in Archery, N. Reichart and G. Keasey, 1936; The New Archery, P. H. Gordon, 1939.

Arches, COURT OF. An English court of law, so named from being held in the church of S. Mary-le-Bow (*Maria de Arcubus*). It is the appellate court of the archbishop of Canterbury as metropolitan of the see of Canterbury. The presiding officer is commonly called dean of the arches, though his real title is official principal. He must be a judge, or ex-judge, or a barrister at least 10 years in practice. Most important ecclesiastical cases are decided in this court, from which there is an

appeal to the Privy Council. *See* Ecclesiastical Law.

Archibald, JAMES FRANCIS JEWELL (b. 1871). American war correspondent. He was born in New York, Sept. 22, 1871, and attended Ohio Wesleyan university. He served in the Spanish-American war of 1898, was with the British in the Sudan, 1899, and with the Boers, 1900-1. He represented Collier's Weekly in the Russo-Japanese war of 1904-5, and reported other fighting in Morocco, Albania, and China. In 1915, engaged as a correspondent with the Central Powers, he was detained by the British govt. on his way to Europe, but he was released and returned to the U.S.A. after his dispatches had been confiscated.

Archidamus. Name of five kings of Sparta. The first ascended the throne about 630 B.C. The second reigned 42 years from about 469; he crushed the helots, and in 431 led armies into Attica, where he ravaged Athenian terri-

tories. He was the father of Agesilaus (*q.v.*), whose son, the third Archidamus, became king in 361. Ten years earlier this latter had laid waste Arcadia, and in 362 had successfully resisted Epaminondas. He died in Italy in 338. His grandson, fourth of the name, was captured by Demetrius Poliorcetes in a battle near Mantinea about 296. Archidamus V, last of his line, acceded on his brother's murder in 240 B.C. He fled to Messenia, but was recalled and soon put to death by the same assassins.

Archidona. Town of Ecuador, in Napo Pastaza prov. It stands near the Napo, 121 m. E.S.E. of Quito. Established about 1556, it became a centre of the Jesuit fathers, who were expelled in 1767 but returned a century later. It trades in rubber, timber, feathers, and vegetable ivory.

Archil or **ORCHIL.** Purple dye prepared from various lichens of the genus *Roccella*. It appears in commerce as archil, a pasty mass, persis, a drier paste; and cudbear, a red-brown powder. The art of dyeing with archil was discovered by a citizen of Florence, who adopted the name Rucellarii or Oricellarii. The lichens from which the dye is prepared grow on the coasts of warm and tropical regions, e.g. the Mediterranean, Canary Islands, Zanzibar, Ceylon, and Java.

The dye is prepared by treating the finely chopped lichens with dilute ammonia and keeping at the temperature of the air until a dark violet paste forms. The mass is then thinned with more ammonia and pressed, the liquid obtained being blue archil. Red archil is obtained by heating this solution, when the ammonia is driven off. When carbonate of soda is used, litmus results. After the discovery of aniline dyes archil lost its importance. *See* Dyes.

Archilochus (c. 700 B.C.). Greek lyric poet. He was an Ionian of Paros by birth, and went to Thasos in early life. There he wrote the verses satirising the family of Neobule, whose father Lycambes had forbidden her marriage with Archilochus after giving his consent. According to the story, Neobule and her sisters were so overwhelmed with shame that they hanged themselves. The latter part of the life of Archilochus was spent at his native Paros, and he died fighting in a war with the people of Naxos. Only fragments of his poetry survive, but he was regarded as one of the great poets of Greece,

and, incidentally, the first to perfect iambic verse, especially as a vehicle of sarcasm.

Archimandrite (Greek *archi-*, chief; *mandra*, fold). Title in the Eastern Church for the superior of a monastery, or for an abbot who presides over more than one monastery. It dates from the 4th century. See Greek Church.

Archimedeian Screw. Device used to raise water to a higher level. Its invention is attributed

Archimedeian screw, for raising water

to Archimedes (q.v.). In form it consists of a cylinder in which a spiral screw revolves, and it is an essential principle that the lowest point of one thread must not be higher than the highest point of the thread immediately below. The cylinder was placed with its lower end in water, and with its body inclined at an angle that met the condition mentioned. Then by rotating the spiral screw by a handle usually placed at the upper end, water was raised through the long spiral chamber formed by the screw in contact with the internal wall of the cylinder. When the water reached the top of the cylinder it flowed out at the higher level.

Archimedes (c. 287–212 B.C.). Greek mathematician. Born at Syracuse, Sicily, he wrote on nearly all the mathematical subjects known in his period, and his theory of the lever supported the science of statics for some 1,700 years, until the time of Stevinus (A.D. 1586). His theory of hydrostatics was nearly as long-lived for little advance was made in it until Stevinus investigated the pressure of liquids. His geometrical discoveries of the quadrature of a parabolic area, and of a spherical surface, as well as of the volume of a sphere, were notable achievements. The Romans, at whose hands he fell during the capture of Syracuse, erected a tomb to him on which was engraved the figure of a sphere in its circumscribing cylinder.

Among his numerous extant writings, consisting of detached essays, are three on plane geometry—on the circle, the parabola, and spirals; two on three-dimensional geometry—on the sphere and cylinder; two papers on arithmetic; and two works on mechanics and hydrostatics. His hydrostatics recalls the famous story that once he ran naked from

the bath through the streets of Syracuse shouting Eureka! (I have found it!). The discovery prompted by the upward pressure of the water on his body in the bath, was that equal weights of different metals, such as gold and silver when weighed in water will no longer appear equal. Each seems lighter than before by the weight of water displaced, but the bulkier metal, silver, will suffer in water a greater diminution in weight.

The discovery, according to the story, was utilised to detect the introduction by a fraudulent goldsmith of some silver into a golden crown made for King Hiero.

The Archimedeian screw for raising water, and the apocryphal burning glasses which set fire to ships by focussing the rays of the sun on their sails, are attributed to him. His works have been edited in modern notation by T. L. Heath, 1897.

Archipelago (Gr. *archi-*, chief; *pelagos*, sea). Name originally given to the island-studded Aegean Sea. It is now applied generally to groups of islands, e.g. the East Indian Archipelago.

The islands familiarly known as the British Isles are strictly an archipelago, which rises above the shallow continental shelf of Western Europe. This fact is an illustration of the circumstance which gives a geographic unity to an archipelago: the islands are all joined by submarine shelves, banks or ridges; the West Indian

Archimedes, Greek mathematician

Archipelago, for instance, comprises the remnants of the ancient Antillean continent, most of which has been submerged. Archipelagos have been of considerable importance in the history of civilization; it would be difficult to estimate the value of the Aegean Archipelago in the development of the might of ancient Greece; one of the chief factors in the growth of Britain has been the fact that it is an archipelago.

Architect (Greek *archi-*, chief; *tekton*, worker). Term for a master builder in classical and medieval times, and at present for one who designs buildings and superintends their erection. The master builder's business was to prepare plans of a building, he was responsible for the materials used, and exercised a general superintendence over the workmen. Thus he had to combine in his own person the functions that are now distributed among the architect, builder, contractor, clerk of the works, and artisan. In addition, he fulfilled the duties of a civil and military engineer, involving both a practical and philosophical knowledge of mathematics and mechanics; the Italian architect of the 15th and following centuries was sculptor and painter as well. In the later days of Roman art there were isolated instances of architects designing works without being charged with the responsibility for their execution, but, generally speaking, the architect was then, and subsequently, a master builder. His expenditure was subject to control by the municipal officer of the province, by a senator or other civil functionary, by some army officer of high rank, and sometimes by a resident board; otherwise he appears to have had sole responsibility.

Josephus states that for the third temple of Jerusalem Herod supplied a thousand priests expert in building and ten times that number of workmen, and Polybius mentions the sending of one hundred architects to Rhodes. This suggests the existence of an immense number of practitioners and correspondingly a rather low standard of attainments; nor is there much mention of architectural training until the time of Constantine, who was so much disappointed with his "architect's" failure to interpret his own building schemes that he ordered the governors of the provinces to institute schools and appoint professors. Few names of these classic architects have come down to us. Indeed, the classic Italian authors mention none before 200 B.C., and it is not until the Renaissance that anything like full justice is done to the men who planned and

Architect. Façade of the Royal Institute of British Architects, Portland Place, London, W.

Courtesy of R I B A.

carried out noble buildings. There is a similar obscurity about the early Gothic master builders, and even about the pioneers of the Renaissance in France.

It is not until the 17th century that the modern architect—i.e. a person competent to design and superintend the execution of buildings, without having undergone the manual part of an artisan's training—can be separated from the master builder. Inigo Jones was not only one of the greatest but also one of the earliest of British architects.

The divorce of architect from builder has not proved an un-mixed benefit, since a century ago it produced a number of architects whose qualifications were mainly academic. But architectural training today is well guarded by the various professional institutions, and the tendency is to insist on a practical no less than a theoretical knowledge of the art of building.

Since 1940 nobody in the United Kingdom is legally entitled to practise under any name containing the word "architect" unless he or she is registered. This does not apply, however, to a "naval architect," "landscape architect," or "golf-course architect," nor to certain people employed in local government work. The register is maintained by the Architects' Registration Council. A name may be expunged from the register on account of misconduct, but appeal against this may be made to the High Court (in England) or the Court of Session (in Scotland).

Architects, ROYAL INSTITUTE OF BRITISH. The chief architectural society of Great Britain and N. Ireland. It was founded in 1834 as the Institute of British Architects, endowed with a charter by William IV in 1837, and permitted to use the prefix Royal by Queen Victoria. At the same time a royal gold medal for the promotion of architecture was instituted; this is awarded every year to an architect of distinction, British or foreign. The Institute is conducted under a new charter granted in 1889. The constitution provides for a president and council, fellows, associates, and licentiate members, the last consisting of those who have passed neither the preliminary nor other examination held by the Institute. Associate-ship follows the passing of the final examination. In certain cases, architects of reputation who have not been through the Institute's course of training are elected associates or fellows. The offices are at 66, Portland Place, London, W.1.

Architecture. Three buildings which show the modern trend in Great Britain. Top, De la Warr Pavilion, Bexhill (1936). Centre, Peter Jones's department store, Sloane Square, London (1934-38). Bottom, London Transport offices, St. James's Park Station, London (1929). See p. 568 *et seq.*

ARCHITECTURE: BUILDING AS A FINE ART

Sir ERNEST GEORGE RA Past President, R.I.B.A.

This article and the one on Modern Architecture immediately following deal with the excellence attained by man as a builder. They are supplemented by subsidiary articles e.g. Gothic Mahomedan Renaissance Rococo etc. Arch. Cathedral House Wren and other great architects Town Planning etc.

Architecture is not mere building. It is not dependent upon size or importance nor on the quality of material, whether of brick or of marble, neither does it depend upon decoration, for some buildings of the severest type charm simply by the beauty of proportion while those that most often offend are the over decorated. It is the result of the artist's knowledge and skill brought to bear on his work, giving it distinctive character and style and raising it to the rank of an art—of architecture. The art includes the building of fortifications and in a wider sense of ships, and in these it generally possesses the element of constructive fitness and suitability to its purpose which are essential qualities in architecture.

Landmarks of Ancient Races

When the instinct for shelter in rock caves and wigwams ceased to satisfy our forefathers, they built themselves walls of mud or of sun baked clay, with boughs for roofs. They used stones from the rock side, shaped trees from the forest, until, with growing skill a system of building was developed. It is questioned whether the beginning was made on the Tigris or the Nile, but it is in Egypt that we find substantial evidence of a highly civilized people with a distinct architectural style and one that remained with them for four or five thousand years, with only unimportant variations.

Contemporary with the Egyptian civilization were the Babylonian, Assyrian, and the Aegean, whose centre was Crete. Of the last the excavations at Knossos show the scale and grandeur of a royal palace, while in the Louvre may be seen the pictured walls of the palace of Darius in vitrified tiles. The Pyramids are the most definite memorials of man's early works. These vast monuments with their simple form and scientific construction have remained almost in their completeness. The rock hewn Sphinx that after countless ages, still overlooks the desert, remains an inscrutable mystery. The tombs of the sacred bulls near Memphis and their huge porphyry sarcophagi are among the most impressive landmarks of an ancient race.

EGYPT Ascending the Nile to Thebes, we meet with veritable architecture. The temple of Karnak spreads over more space than

any known building and, while it is but one of a group of temples it may be taken as a type. Two massive pylons or battered pyramid shaped walls, form the main front the entrance door being between them. Entering there is an outer court then a colonnaded inner court, from which the Hypostyle Hall is approached. This hall has a central nave flanked by vast columns its aisles have shorter columns with a clerestory above for lighting the carved and coloured decorations that cover the surfaces these telling in hieroglyphics the history of the kings. The hieroglyphics, countersunk, are so treated that they enrich the walls without destroying their breadth their sinkings carry colour that through ages has been respected by the climate. Beyond the Hypostyle Hall are smaller halls and finally the shrine of the deity is reached surrounded by the chambers of the priests. Outside Karnak an avenue of sphinxes leads for two miles to the temples of Luxor. These great Theban works extend from the 19th to the 12th century B.C.

Tombs of Egyptian Kings

Across the Nile and opposite Luxor are more Rameses temples, the colossal Memnons and the tombs of the kings. The last are descending passages cut in the limestone leaving a smooth face for the biographer to tell his story in hieroglyphics. The temples through thousands of years adhered to the same general plan and it is interesting to find Romans during their occupation building temples on the Nile with all the semblance of Egyptian work. The temples of ancient Chaldaea were towers rising in steps or stages, and such was the tower of Babel. Assyrian temples also were of this type. The Phoenicians were temple builders, and probably helped in the building and decoration of Solomon's great temple about 1000 B.C.

INDIA The Aryan race, worshipping out of doors, had no priesthood or temple. Two centuries B.C., however, the Buddhist religion was formulated and became a state religion and various toposes were set up. These were monolith pillars, they also took the form of mounds or tumuli, stone covered and forming a solid dome with a chamber for the sacred relic contained therein. There are rock cut temples of antiquity, also rock cut monasteries for the multitude of priests who

formed a large percentage of the people. Later there are the Buddhist temples covered with sculpture even on the surface of the cone shaped domes these carvings projecting and breaking the outline of the building. Here are the Jain temples with simpler and cleaner lines their stone posts cantilevers and lintels showing a derivation from wood construction. The sacred tanks with their ghats and stairs for the bathers are of interest and beauty, as also are the canals and marble pools laid out around the temples and palaces.

Ideal Indian Architecture

The Mahomedan mosques have more of restraint and simplicity of line than the earlier temples though both were the work of Hindu hands. The arcades of pointed arches bear some resemblance to the Gothic work of the same period, though the Indian pointed and ogee arch is Persian in origin. The construction of the dome was skilfully developed in India, where ties take the strain internally instead of massive buttresses outside.

The famed Taj Mahal a mortuary raised over a favourite wife is perhaps the most complete example of ideal Indian architecture. Round the central dome are four smaller domes and beyond these are the minarets, gardens, cypresses, fountains, and marble canals enclosed by an arcaded wall with its gateways on four sides. The interior is rich in inlay or pietra dura with precious stones. Externally the beauty of the composition with the tenderness of colour have made this monument famous. It has been said that an Italian assisted in this work, but in all respects it follows Indian tradition. The great walled cities, forts and palaces impress one by their magnitude, as do the buildings piled together above the ghâts of Benares, but in India generally the beauty of detail has absorbed the force of the designer and craftsman.

GREECE Of all the early civilizations the most refined and most magnificent was that of Greece which reached its zenith in the golden age of Pericles. The Greek temple was a shrine providing shelter for the image of the particular deity rather than a place of assembly for worship. It was a house set on a high base and generally on a hill, and was either rectangular or circular in plan. The Greek temple had its colonnade

all round its walls, while the Egyptian temple had walls outside its colonnades. The student has been taught to look to the Greeks for the beginnings of architectural inspiration. Through a period of about six hundred years their great works evince the intellectual power and perception of beauty of the Greek architects and sculptors.

This chapter of history begins with the Doric order, but we must not look on the Greek as the originator of the column and lintel. Long before his day the Assyrians on one side and the Egyptians on the other had erected monuments from whose columns, lintels, and cornices the massive Doric drew its inspiration; beginning with sturdy shafts three and a half diameters in height, coming by degrees to the later refinements.

Ionic and Corinthian Orders

The volutes that distinguish the Ionic order are as assuredly traceable to an Asiatic origin, but the developments of the styles as culminating in the Parthenon and in the Erechtheum are the result of study and calculation on the part of a people to whom art was the soul of existence. The Corinthian order is a later and more elaborate composition comparatively little employed in the great days of Greece; it was in more general use in Rome.

In a Greek structure laws minutely defined the exact size of its mouldings and parts, with fine calculations for the entasis or gentle curve in the profile of its columns; a delicate and hardly perceptible bow in the line of the steps; also the depth and number of its flutes. In addition to this study of form, the whole was subjected to colour. The overlaying with precious metals, together with the painting of sculpture, does not accord with northern ideas, but it met Greek needs.

ROME. The Etruscans, an Asiatic and nomadic race, migrated through Greece to Umbria, where they settled and built cities. They were imbued with the Greek feeling, and they and their art spread through Italy. Their primitive work is recognized by the great stones they used in walls built with mortar. Few of their works remain, but they had a wide influence in the country of their adoption. The temple of Jupiter Capitolinus in Rome was Etruscan. The Romans borrowed the Doric and Ionic orders from the Greeks, making their own version of the same, while the richer features of the Corinthian were more in favour. The Composite order, a mixture of the Ionic and the Corinthian, was much

in vogue. Arched construction was found capable of many forms that columns and lintels had not attained to, and it is the method generally employed by the Romans.

The Romans built temples to many gods, but the monuments of ancient Rome are of diverse kinds. There are the defensive walls and city gates, the aqueducts, tombs, triumphal arches, and the baths, which were on a sumptuous scale. In those of Diocletian and of Caracalla can be traced the magnitude of these vast institutions, with their thermal schemes, their great halls, vaulted roofs, and painted walls, together with gymnasias, stadia, and courts for wrestling.

The foremost feature of ancient Rome is the Colosseum, where her citizens made holiday. It is of arched construction, the vast oval being formed by mounting tiers of vaulted corridors, their sloping surfaces carrying stone steps or seats for 60,000 spectators of the gladiatorial and other shows. The outside wall is 150 ft. in height, its three tiers of arches divided by pilasters and cornices of the three orders, applied as surface decoration.

Features of the Pantheon

The Pantheon is a beautiful domed building. The cupola is of brick, in strong cement, not in arches, and was probably built without centring, making the vault a single homogeneous mass or whole as an inverted concrete cup, resting on the walls without thrust. The roof has lost its bronze covering, while Agrippa's fine portico differs in date from the circular temple itself. The lighting by one central eye in the vault has great charm. The triumphal arch was the Roman way of preserving the memory of victories and of victors; the latter were not always artists, and the results are sometimes barbaric, but it is interesting to come upon these memorials of conquest in northern cities as well as in the African desert.

The Romans were a practical people, and before achieving architectural glories Tarquin built the Cloaca Maxima, the finest sewer the world has known; it is formed of three rings of stone arches, and drains the city to the Tiber. The boldest civic undertaking was the conduit of fresh water from the Alban hills by the great arcaded aqueducts, sometimes two storeys in height, that wander over the Campagna. The Pont-du-Gard near Nîmes is, perhaps, as impressive as any of these, though Roman aqueducts in Spain are also on as large a scale. It is customary to contrast

Roman brute force with Greek refinement, giving too little praise to the Roman civilizers of the world; the Roman ideal was noble, and when in a medieval city we come upon a fragment of Roman work, be it only an arch or column, it is bold and masterful beside its more ephemeral later surroundings.

ROMANESQUE. On the fall of Rome and the influx of barbarians there was a period of chaos, lasting until, under the emperors Constantine, Justinian, and Theodosius, Christian churches were built in the manner which grew out of the Roman and is known as Romanesque, coeval with Byzantine.

The Roman basilica, the law court and merchants' exchange rather than the Roman temple, was adopted as the type for the Christian church. The plan of the basilica is a parallelogram divided into three parts longitudinally by two rows of pillars and arches. At one end was the tribune for the judges arranged in a semi-circle. This became the apse of the church.

In Ravenna are famous churches of the 6th century, notably Sant' Apollinare Nuovo, a rectangular building with its arcades and aisles and mosaic walls; and San Vitale, circular and domed, with a two-storeyed aisle. This church was taken by Charlemagne as a model for his Christian church and tomb at Aix-la-Chapelle.

The early churches of Germany were developments of these Romanesque types with their round arches and apses. Externally the grouping of their apses and towers makes a fine composition, though there is sometimes dullness and want of interest in detail; Mainz, Worms, and Grosser S. Martin and S. Gereon at Cologne are examples.

Roman Detail in French Churches

With the Latin races of southern France the Romanesque had a happier growth, often preserving Roman detail in mouldings, caps, and even fluted pilasters. Fragments of old buildings were frequently employed without doing violence. Much fancy is displayed in the arcaded cloisters with their coupled or clustered shafts, while the western portals of early southern churches, as at Saint Gilles, are rich and on a scale that causes disappointment on entering. In some early churches shallow domes are formed in the vaulting of the nave for internal effect, the domes being generally hidden by roofs outside. Such are Angoulême, Loches, and Cahors, also Périgueux, with its five domes.

Beside the influence of Rome was that of the Lombards, a Gothic

race who invaded and colonised northern Italy and inspired the building of the churches of Piacenza, Novara, Pavia, S. Ambrose of Milan, and others. In these the small arcaded corridor, open to the outside, is an interesting feature, as in the German churches, where it has the same Lombard origin. Of Italian churches, San Miniato at Florence, 1013, and Pisa cathedral, half a century later, are Romanesque basilicas with a slight Lombard influence.

Byzantine and Moorish Work

The famous shrine of S. Mark, Venice, is a creation apart. With her fleet and commerce Venice was more in touch with the East than the West, and her cathedral with the five domes and other Oriental features is practically Byzantine. The interior, notwithstanding its wealth of marbles, mosaics, and gathered treasures, has a breadth, restraint, and solemnity perhaps unsurpassed in any other Christian church. As for the Gothic churches of Italy, the manner was an importation from the North, and was never at home in Italy. The western marble façades of Siena and Orvieto have steep gables with nothing behind but their low-pitched roofs, and other northern features are copied without a reason.

BYZANTINE. Of Byzantium, the capital of the Eastern Empire, the great work is Santa Sophia; and one marvels that this early Christian church, with its original scheme and daring construction, should have risen in its completeness while the Western world was emerging from a period of anarchy and darkness.

The Byzantine church is generally a Greek cross in plan. This style, of Roman origin and with eastern characteristics, was for centuries used by the Slavonic races, being the mode of building in Greece, Russia, Syria, and wherever the Greek Church obtained. Its leading feature is the dome in its varied forms, and combinations of domes. It has influenced Asia and has received inspiration from that continent. With the Arab conquests in the 7th century came a check to the development of the style, but it forms the root of Mahomedan work in Egypt, N. Africa, Syria, and Spain.

In Spain the mosque at Cordoba with its thousand pillars, and the palace of the Alhambra at Granada, are typical examples of the Moorish Saracenic; as also is the great Giralda tower at Seville, fine in its proportions and simpler in line than Indian towers of the same date. Some of the mosques may compare not unfavourably with

British Gothic work of the time, in the treatment of masonry and especially in the beautiful working out of the pendentives.

SAXON AND NORMAN. For 400 years the Romans occupied Britain, building many cities and towns with all the amenities to which they had been accustomed. Their mosaic pavements and admirable heating schemes show the character of their English homes. They built themselves palaces, halls, baths, and theatres, and these would have afforded models for the islanders to follow; but Britons and Saxons spent their strength in fighting. When Saxons began to build there were the Roman examples before them, and the ruins as a ready quarry. With this inspiration their work may be styled Romanesque.

In the 7th century, when King Egrith ordered the building of a monastery in Northumbria, the bishop, finding no masons in England, went to Gaul, bringing back artificers in various trades, some stopping to teach the islanders glass-making and other crafts. Saxon towers were square, without buttresses and diminishing in stages, with long and short quoins stones at the angles, also small shaped or turned balusters as shafts in their coupled windows; and although they used the round arch, an opening is frequently covered by two stones inclined to a point. For decoration the walls are often divided into panels by narrow strips of stone, as in Earls Barton church.

Norman Builders in England

Of the small early Saxon churches some have the apse, but the British form, as at Bradford-on-Avon, was the square east end, which has remained the distinguishing feature of English work. Westminster and Canterbury are exceptions, with the chevet and apsidal chapels, but they are by Lanfranc and Guillaume de Sens. The Saxon churches were mostly swept away by the energetic Norman builders, whose numerous great works, churches, abbeys, and castles in England were nearly all accomplished in a period of 50 years. Of these are Rochester, Winchester, Peterborough, Durham, St. Albans, Ely, etc., as well as many great abbeys. At the same time in Normandy the Conqueror was building the Abbaye des Dames and the Abbaye aux Hommes at Caen, and many castles in both lands.

The aisles of the Norman church were usually vaulted, while the wider nave had its wooden ceiling, as at Peterborough and St. Albans; the smaller English church is

generally wood-roofed. In France vaulting was earlier used, and has been the general treatment of roofs in France. The enrichment of Norman work in England is almost entirely with chevron, billet, and dog-tooth forms on the several rings or orders of arches. The small churches of Barfreston, near Dover, and Iffley near Oxford, are good examples.

GOTHIC. In the last quarter of the 12th century came a change in the character of construction. The Normans, with their massive piers and columns, had been prodigal of stone; science demanded economy in the use of material and of space. Lighter piers and shafts were employed, and instead of the round arch the pointed arch was found to give less thrust, the thrust being transferred from the nave to the aisle walls by flying buttresses above the aisle roof.

English Transitional Architecture

At first round arches and pointed arches were used together indiscriminately; this period is known as Transitional. The choir of Canterbury by Guillaume de Sens is of this type. The windows, either single or grouped, were lancet-shaped without tracery; the Five Sisters of York North transept are an illustration. S. Denis, in France, anticipates the English Transitional work. A beautiful and fully developed example of the English pointed is S. Hugh's choir of Lincoln Cathedral, belonging to the end of the 12th century.

Then followed simple tracery in the window, generally a shaft between two lights and a circle above. Salisbury was begun in 1220. It is internally rather dull and cold, in spite of its noble size and proportion. The pillars have detached shafts of Purbeck marble, which became the fashion at that period, sometimes to the detriment of the building.

A perfect achievement of this period is Westminster Abbey. After the destruction of the Confessor's Norman church, the present beautiful structure was begun in 1245 for Henry III, Master Henry being the master mason or architect. He saw the choir and transepts carried out. His successor completed the nave, adhering to Henry's design, appreciating its charm, although it was the mediæval custom to introduce the new characteristics of the day. The proportion, the refinement of mouldings, and the diaper enrichment of the surfaces unite in making the abbey unrivalled even by the greater Continental cathedrals; its narrowness accentuates its apparent height and length. Through the Gothic age there were

recognized architects, laymen, who designed for William of Wykeham and other churchmen.

At this period the cathedrals of the growing cities were enlarged or rebuilt, vying with the great abbey churches of the wealthy monasteries. There was no building of sumptuous houses, and the wealth of the baron was spent in building a shrine where prayers would be offered up for his soul. Gothic went rapidly through its various changes of Early English, Decorated, and Perpendicular.

Decorated and Perpendicular

The Decorated is marked by its rich geometrical and flowing tracery; the Perpendicular by its insistence on vertical lines, including the upright panelling of walls. Vaulted roofs when of stone had elaborate, lace-like fan tracery; when of wood they were hammer-beam roofs, like that of Westminster Hall. There is a stateliness as well as proportion about the buildings of this period, as shown in the churches of Norfolk or of Somerset, and in the chapels of King's College, Cambridge, St. George's, Windsor, Henry VII at Westminster, Bath Abbey, and St. Mary Redcliffe, Bristol. The Perpendicular is strictly English; during its reign the Flamboyante was running its course in France, where works of wonderful play and fancy were produced. The Palais de Justice, Hôtel de Bourgtheroulde, and the central crown of St. Ouen, Rouen, exemplify the Flamboyante style. The Perpendicular continued a little longer in England before it disappeared under Italian influence.

Mention must be made of the noble Gothic churches of France, e.g. at Laon, Soissons, Reims, Bourges, Amiens, Beauvais, and Chartres, and of the Gothic achievements of Spain—her grand cathedrals with their sculptured screens, retables, metal grilles, and splendid tombs. The small amount of space devoted to windows, and those high up, allows a breadth of wall space giving to Spanish Gothic a character quite apart from the northern types. In Spain the early or Romanesque buildings have much Norman character. Saracenic had no great influence during the Gothic period, though sundry Moorish towers were incorporated in medieval buildings, as notably the fine Giralda of Seville. The bridges of Spain, too, are grand architectural works, each with special individuality, and we realize that the

ARCHITECTURE : THE MAIN HISTORIC STYLES AND PERIODS

STYLE, DATE, AND SUBDIVISIONS	PRINCIPAL FEATURES
GREEK 7th century B.C. to 3rd century A.D. <i>Archaic Period, lasting to the 5th century B.C.</i> <i>The Golden Age, 5th to 4th centuries B.C.</i> <i>Hellenistic Period, 4th century B.C. to 4th century A.D.</i>	Principal material: Wood, clay, stucco, and stone. The basis of Greek architecture was lintel and post construction, the use of the arch being practically unknown. The column and capital were of three kinds, known as the order: Doric, Ionic, and Corinthian. The last was developed, to the exclusion of the others, during the later (Hellenistic) period. The greatest period of Greek architecture was the 5th century B.C., during which the Parthenon was built.
ROMAN 2nd century B.C. to 4th century A.D.	Roman architecture took from the Greeks their three orders: Doric, Ionic, and Corinthian, and added a fourth ("Composite") order of its own. From the Etruscans it borrowed the arch and vault, and these were developed into the outstanding feature of the Roman style. Massiveness and solidity were characteristic of their buildings, which consisted of temples, baths, aqueducts, theatres, etc. The finest monuments, e.g. the Pantheon and Colosseum, were erected during the Imperial regime. Traces of public buildings and villas may be found wherever the Roman power penetrated.
BYZANTINE 4th to 12th centuries. <i>Neo-Byzantine, 8th to 12th centuries.</i>	The great feature of Byzantine building is the dome, more particularly the dome fitted on to square or octagonal apartments, by means of pendentives. By means of the "cushion" capital, they were also the first builders to "spring" the arch direct from the summit of the column without the employment of an intervening entablature. Brick is the principal material in Byzantine building. The most notable monument of the style is the cathedral of St. Sophia at Istanbul (Byzantium), completed A.D. 537. St. Mark's, Venice, is a typical example of Italian 11th century Byzantine.
ROMANESQUE 9th to 13th centuries. <i>Norman, 11th to 13th centuries.</i>	Romanesque is really the continuation in the North and West of Europe of the Byzantine style, and its development was largely in response to the needs of religious ritual. The cushion capital and the barrel vault are both characteristic of Romanesque, as of Byzantine, and similarly the apse (see illus. p. 581) is a prominent feature of the Romanesque church. Examples: Pisa Cathedral; S. Zeno Maggiore, Verona; S. Trophime, Arles; S. John's Chapel, Tower of London.
GOTHIC 11th to 15th centuries. <i>French Gothic.</i> <i>German Gothic.</i> <i>English Gothic:</i> (1) <i>Early English</i> (13th century), (2) <i>Decorated</i> (14th century), (3) <i>Perpendicular</i> (15th century). <i>Italian Gothic.</i>	The distinguishing feature is the pointed arch, as opposed to the round arch. Windows are filled with Tracery work, the massive piers of Norman architecture give place to clusters of columns, and capitals are rounded. Verticality is the principle underlying Gothic architecture, and the walls and towers of Gothic cathedrals rise to a great height, the buttress often being employed as a support. Siena Cathedral is a fine example of Italian Gothic, and in France, Chartres Cathedral (late 12th century) represents the style at its most magnificent. In English Gothic, the extensive use of ornament was developed during the Decorated and Perpendicular periods. Examples are to be found in the great cathedrals, abbeys, and churches such as Canterbury, York, Durham, Salisbury, Westminster Abbey, etc., as well as many beautiful old parish churches.
RENAISSANCE 15th to 18th centuries. <i>Italian Renaissance.</i> <i>French Renaissance</i> (Neo-Classic). <i>English Renaissance:</i> (1) <i>Tudor</i> (16th century), (2) <i>Jacobean</i> (17th century), (3) <i>Georgian</i> (18th century).	A reversion to the classic principles, modified by the general humanistic influences of the time. Fine planning, proportion, and scale were aimed at, and ornament selected with discrimination. Wren drew his inspiration for his Renaissance masterpiece, St. Paul's Cathedral, London, from S. Peter's, Rome. In English Renaissance a combination of brick and stone was used, e.g. at Hampton Court. A monumental instance of English Renaissance style applied to domestic building is Vanbrugh's grandiose Blenheim Palace.
ORIENTAL 6th century B.C. to 18th century A.D. <i>Mahomedan Architecture, 7th to 17th centuries A.D. (Syria, Mesopotamia, Persia, Asia Minor, North Africa, Sicily, Spain, Turkey, India).</i> <i>Buddhist Architecture, 6th century B.C. to 7th century A.D. (India).</i>	Assumed a great number of local characteristics, differing according to diversities of climate and material. The cupola, horseshoe arch, and minaret are outstanding features. Construction is mainly light and flimsy compared with Western architecture. Ornamentation is generally very rich and, particularly as regards Indian varieties, fantastic. Colour is freely employed. Good examples are innumerable: but the rich ornamentation characteristic of the Moorish style is probably seen at its best in the Alhambra, Granada; while the beautiful proportions and symmetry of the Taj Mahal, near Agra, reveal the underlying kinship of all great design, in whatever style it may be expressed.

Architecture. S. Peter's, Rome, culmination of Italian Renaissance architecture; dome by Michelangelo, colonnade by Bernini

cities of Spain were built by artists with a great ideal. A nation's perception of art, or indifference to art, may be measured by the bridges that it throws across its streams.

Although churches have been taken to exemplify the styles of medieval architecture, all other buildings were constructed in the prevailing style of the period. The cities of Flanders, the Hansa towns, and the Lombard cities would build their warehouses, halls of the guilds, and merchants' houses in the manner of the day. The style was not essentially an ecclesiastical style; it was adapted in every case to the special needs, e.g. the mulioned windows that fill the width of frontage of each house in an Antwerp street, as well as the timber house fronts of Exeter.

RENAISSANCE. After the eclipse of Imperial Rome, the Romanesque, Lombard, and Gothic prevailed for about a thousand years. Then came new life into literature with Petrarch as chief agent. An age of research and of the discovery of the long-unheeded treasures of the neglected past began, and by the infusion of classic feeling during the 14th and 15th centuries new vigour was given to the designer and artificer. Michelozzo and Brunelleschi and their follower Alberti initiated a new development in architecture which produced palaces and churches in Rome, Florence, and other parts of Italy, each stamped with the individuality of the master's hand, until the period culminated with Michelangelo in the cathedral of S. Peter at Rome.

In France the Italian revival made a strong impression. Under

neys, and other details, while there was often an indifference to the composition or design of the whole; the result had some resemblance to the Jacobean, but the French sculpture was of a higher order. In the Louvre the style is found developing under the hands of Lemercier, de l'Orme, du Cerceau. Jean Goujon, and Mansart, with whom French Renaissance and the employment of the orders became the mode for those who built; and with various modifications it obtains in France today. Distinct phases follow one another rapidly at the hands of these eager artists and their royal patrons. We can distinguish in the work of Louis XII, Francis I, Henry II, and Henry IV, and of the succeeding Louis XIV, XV, and XVI, marked characteristics attaching to each reign, especially in internal decoration and furniture

Baroque and Rococo

The style known as Baroque was a further neo-classical development, which spread from Rome, where it culminated in the work of Bernini (1598-1680) and Borromini (1599-1657), to Austria, Germany, France, and Spain. Evident in this style was a high sense of the dramatic and a love of ornate detail. Though pompous in effect, it was, at its best, always vigorous, giving an illusion of harmonious movement. In Spain it was carried to excess, particularly in the work of José Churriguera (1650-1725). A late development of the Baroque style of decoration was the Rococo, popular in the first half of the 18th century. Opulent designs reached the height of capriciousness, pat-

terns being lavishly embellished with fantastic and irrelevant detail. The Zwinger palace at Dresden (1711-22) is the finest example of the style.

Baroque found few adherents in England. The nearest approach was seen in the development of the Palladian style during the early part of the 18th century, and in the plaster decorations of wall panels and ceilings in country houses of the same period. An unsuccessful attempt to introduce Baroque motifs in the façades and interior decoration of certain London buildings was made in the opening years of the 20th century.

Renaissance in England

After the great fire of London in 1666 there was by good fortune an architect with exceptional powers to re-scheme the city and rebuild its cathedral and its fifty churches. Sir Christopher Wren, while using elements of Roman origin, developed a treatment distinctly his own, which became the English mode of building for the following 150 years. Among Wren's monuments are S. Paul's Cathedral, Greenwich Hospital, Chelsea Hospital, his half of Hampton Court Palace, and his City churches with their varied forms and plans, and with their specially English feature of classic steeples in successive stages or orders, as in Bow Church, and S. Bride's, Fleet Street.

A great Renaissance architect was Inigo Jones, who travelled to Italy and became imbued with the spirit of the new birth. Among his works are the Queen's House, Greenwich and Ashburnham House.

Sir John Vanbrugh designed Blenheim and Castle Howard, houses on a grand scale; Hawksshaw, the pupil of Wren, James Gibbs, Colin Campbell, Sir William Chambers, William Kent, and others continued the classical tradition, as did the brothers Adam (*q.v.*). Gandon and others who built the Custom House, Parliament Houses, Four Courts, and other important public works and houses in Dublin, demonstrate the accomplishment of fine design in that city. So also the city of Bath bears witness to the skill of the Woods, father and son, and other 18th century architects.

With the end of the 18th century the revival of classic forms had spent itself. Greek, Roman, and Italian styles remained the dominating influence in the early part of the 19th century, but only occasionally was the convention adapted with a flash of inventive genius, as in the stucco Regency

houses and terraces of John Nash, and the neo-Greek of S. George's Hall, Liverpool, Smirke's British Museum, and Sir John Soane's Bank of England, the last being a good practical application of Greek treatment. The architecture of the 19th century in Great Britain was chiefly notable for the results of the Gothic revival. In the battle of the styles, argued through several decades, the Gothic finally triumphed. Examples of neo-Gothic, sometimes called Victorian Gothic, are evident all over the country, and not only in the many new churches that were built to meet the needs of the swelling urban populations. Welby Pugin (1812-1852) was the leader of the revival. He built over sixty new churches in the Gothic style, including Southwark Cathedral. Other notable churches of the same period and style include S. Mary's Cathedral, Edinburgh; S. Mary Abbots, Kensington; S. Giles, Camberwell; Truro Cathedral. But of secular buildings the Houses of Parliament, the Law Courts, Birmingham Grammar School, and the town halls of Manchester and Bradford were among many buildings which showed that the style was by no means to be confined to ecclesiastical work. Even rly. stations,

e.g. S. Pancras, London, and Temple Meads, Bristol, were brought within its orbit. Besides Pugin, the chief names associated with the movement were those of Sir Charles Barry, George Edmund Street, J. L. Pearson, Sir Gilbert Scott, and (later) Sir Giles Gilbert Scott, whose Liverpool Cathedral begun in 1903 may be considered the consummation of the movement.

ARCHITECTURE: THE MODERN VIEW

Clough Williams-Ellis, F.R.I.B.A.

Here the history of architecture is continued to include its development, often along new lines and with new materials, through the first half of the 20th century. and the modern architect's approach to his problems is defined

Obviously every phase of architectural development, from the time of the Pyramids down to that displayed in a contemporary atomic-bomb laboratory, is "modern" within its own period and in so far as it is authentically evolutionary and not a deliberate throwback to some past convention.

After a century and more of dressing-up in the cast-off architectural finery of almost every past age and almost any clime and country, the world seems to have become a little tired of the masquerade, to see that there is perhaps something a little absurd in trying to pack and squeeze our new and strange requirements into old containers designed for entirely different purposes and other ways of living.

The old forms may be beautiful and have great historical and sentimental prestige, and it may well and justly please us sometimes still to express ourselves in a by-gone manner of speech on special

occasions or for particular good reasons, when, for instance, it might seem ill-mannered to put a group of old buildings out of countenance, by arbitrarily introducing a quite new, alien, and inharmonious convention beside them.

Yet because architecture is evolutionary, and because the pleasure a building can give to an instructed beholder seems to depend on certain principles that are basic to designing in whatever style, there can be just as much difference in the artistry and quality displayed by perfectly plain, straightforward modern buildings as between a collection, say, of Venetian palaces or medieval cathedrals.

There may not be a single inch of moulding or enrichment or decoration of any sort on buildings by such leaders of the modern school as, say, Maxwell Fry the Englishman, Frank Lloyd Wright the Welsh American, Le Corbusier the French Swiss, Dudok the

Dutchman, or Gropius the ex-German—yet the work of each is immediately recognizable as characteristic of the individual approach of each to the solution of similar problems in design, that approach being in every case "modern" or "functionalist." This largely utilitarian attitude has, like all other cults, been brought into some contempt by its too wholehearted partisans who insisted that efficiency was all, and that to be completely "useful" was to be completely beautiful. This may be true of machines and tools and things that exist only to be used, but not for buildings (except possibly certain factories) because, unlike most machines and engineering works, there are generally many ways in which a building can be designed, all of them perhaps equally good from the single point of view of use. Yet the difference between the several designs as "architecture" may be immense, ranging from the completely banal to the really inspired. That is because the architect usually has far more individual choice than has the engineer.

Window Design and Arrangement

For example, in the English climate, for reasonable light and ventilation, the windows of ordinary rooms are generally about one-tenth of the floor area, that indeed being the minimum required by our building by-laws.

Accepting that convention, the architect can still arrange his required window spaces or "voids" in an almost endless variety of shapes and positions in relation to his "solids" (the walls), thereby determining the pattern, proportion, rhythm, and so on of his building, both within and without.

Granted that the allowance is sufficient and the positions suitable for all practical needs, the architect may distribute his window ration at will to achieve whatever general effect he may deem most fitting to the particular work and its setting. Through this one choice of arranging his openings he has the power to give purposive character to the simplest building, and it is precisely on such broad basic manipulations, and not on detailed ornament, that the modern designer depends for his effects.

He can, if he has the skill, get striking and sometimes really beautiful effects by the simplest and most economical means, by slight changes in proportion, projection, texture, or colour, or by grouping his windows instead of

setting them out regularly, by making his building only "balance" or exactly repeat on either side of its axis. Or, again, by giving prominence and importance to this or that selected feature, perhaps a doorway, a roof, or a chimney, by a mere change in scale or colour, or possibly by some rare splash of ornament sufficient to arouse special interest and to focus attention on that which is thus exceptionally distinguished.

But thus far, modern architecture has been puritanically ascetic in obvious and healthy, if sometimes excessive, reaction to the long overdosing with trite and perfunctory ornament from which building has suffered.

As we get clear of the Edwardian hang-over, our appetite is likely to become once more robust, and we may well regard our recent performances as rather too antiseptic and anaemic to take a very high place in the never-ending pageant of building.

But it will always deserve respect for its honesty of aim, its reforming zeal, and its purging away of vast accumulations of lumber from the past that had too long and too insistently distracted the architect from fresh and purposeful *designing*.

The worst enemies of architectural modernism are the inevitable charlatans and hangers-on who, having picked up a few easy, superficial, and perhaps once fashionable tricks, splash these about on shops, cafés, and cinemas that may be smart enough to delude an ignorant if enterprising tradesman but have no single quality of real architecture or design about them—ancient or modern.

Influence of Crystal Palace

For the origin of modern architecture it is now usual to go back to the old Crystal Palace that housed the 1851 exhibition in Hyde Park and was later removed and re-erected on Sydenham Hill.

Certainly it was a portent, not merely because it so notably exploited new materials and a new technique—iron and glass, with standardised, mass-produced, prefabricated parts—but because, whereas the walls and columns of London's next largest building, St. Paul's Cathedral, take up no less than $\frac{1}{4}$ th of its total floor space, those of Paxton's great palace took up only $\frac{1}{2000}$ th. Revolutionary as it was in the technics of building, its immediate influence on modern architecture was, and long remained, negligible, though the railway engineers

exploited the possibilities it had revealed in the building of some of their larger stations.

Though new materials and techniques can and do modify designs assuredly they should, there is also *fashion*, which can be and often is quite capricious, and it was really fashion rather than logic or the compulsion of use that first set architects thinking in the late 1850s along the new lines that we still call modern.

The Red House, built by Philip Webb for William Morris at Bexley Heath in 1859, is commonly cited as the first faint herald of the far-off dawn, in that it dared to omit a number of outworn conventions, though in many ways it seemed to look back to the middle ages rather than forward to a new one.

Simplicity and Honesty

Other architects of some eminence wavered unstably between past and future until Lethaby, Voysey, Ashbee, Gimson, Baillie Scott, Walton, and Mackintosh really did seem to give us something fresh and new, though chiefly by cutting out all the meaningless claptrap that still passed current for architecture at the time and, as it were, saying what they had to say in a plain straightforward way.

Simplicity and honest good craftsmanship are what distinguish their work from the general ruck of their time, the most significant single building of that period being Mackintosh's Glasgow School of Art, completed in 1909, though its tremendous lessons were better learnt on the Continent and in America than they were in England.

In a way, Lloyd Wright and others began where Great Britain temporarily left off, and from them derived in turn Dudok and Gropius and a number of Austrian and Scandinavian architects, from whom again Great Britain later received back the torch she had originally lit, flaming ever more brightly until the universal black-out of the Second Great War made an end of all but stark utility building. From that austerity we can emerge only slowly, and what effect the harsh discipline may have had cannot yet be judged.

During her early and most difficult reconstruction years after her 1917 revolution, Russia built immensely, badly, and to the most austere designs of Le Corbusier, May, and other foreign architects of the extreme ascetic school.

The Russians of that period were what might be called Mechanically Romantic, and if a building

could somehow be made to look like some great machine, so much the better. When, later on, before the Second Great War, they had acquired skill and wealth and power, they proceeded to demonstrate their "arrival" by the elaborate opulence of their buildings with all the naïve ostentation of a *nouveau riche*.

It was human and understandable, but it was not altogether good for the cause of real architecture, modern or other. America, too, has suffered somewhat from the false standards set up by competitive "prestige building," though some of her domestic country building has been a model of simple elegance. Holland has steadfastly remained *par excellence* the country of fine brick building, and the town of Hilversum, particularly, shows to what effective new use this ancient material can still be put.

In the short time between the Gothenburg exhibition of 1923 and that of Stockholm a few years later, Sweden swung right over from her admired and most elegant version of free classic to full-blown functionalism, with, of course, a later swing back again. There has probably been a higher proportion of architecturally distinguished buildings put up in Sweden during the 20th century than anywhere else in the world. If Great Britain is to follow an architectural example and not to set one, she could assuredly do worse than look to Stockholm.

Architrave (Gr. *archi-*, chief; Latin *trabs*, beam). A term in classical architecture, signifying

Architrave. In classical architecture, the stone beam above a column, carrying the frieze

a member of the entablature, i.e. the stone beam carried by the capital of the column and supporting the frieze above it. The architrave is essentially a feature of lintel and post construction, and disappears with the rest of the entablature from the matured styles of arch construction wherein the arch springs direct from the capital. In modern use an architrave is a plain or moulded strip, around a door or window opening, which covers the joint between plaster and woodwork.

Archivolt (Gr. *archi-*, chief; Ital. *volto*, vault, arch). In Roman and mediæval architecture, a term applied to an architrave which is carried round a curved opening. The archivolt's development follows that of the round

Archivolt, or architrave carried round a curved opening

arch, and in Romanesque, Italian, Gothic, and Mahomedan architecture great attention was paid to the decoration of this member with carved or plain mouldings and contrasted colours.

Archon (Gr., ruler). Name of the chief magistrate in towns of ancient Greece, especially of the nine chief magistrates of Athens. When the kingship was abolished, one archon was appointed for life, the term being subsequently limited to ten years and finally to one, when a board of nine was instituted (683 B.C.). The manner of their election varied from time to time—by the Areopagus, by the ecclesia, by lot. As the powers

of the democracy increased, their functions became mainly judicial and religious. The chief officer was called simply archon: the title *eponymos*, often attached to him, does not mean that the year of his office was named after him, but that his name headed all the official lists and documents. He exercised jurisdiction in matters affecting family rights and guardianship, and arranged the feasts of Thargelia and Greater Dionysia.

The archon Basileus (king), who succeeded to the priestly functions of the kings, supervised the Eleusinian mysteries and various sacrificial rites, and, generally, everything connected with the state religion. The archon Polemarchos (war-chief) was originally head of the war-office, but his functions were subsequently restricted, chiefly to arrangements in connexion with the burial of fallen warriors and the status of foreigners and resident aliens. The remaining six archons, called Thesmothetæ (law-givers), saw that the law was properly administered. Even after Greece had lost her political independence the office was highly esteemed, and Roman emperors did not disdain to hold it. It disappeared in the time of Theodosius II (402-450).

Archpriest or **ARCHIPRESBYTER** (Gr. *archi-*, chief; *presbyteros*, elder). Title given in the 4th century to the principal, usually the senior, priest of a diocese. In a cathedral he acted as the bishop's representative; in rural districts his relations to the local clergy were the same as those of a cathedral archpriest to the other cathedral clergy. In time the cathedral archpriest became the dean, the rural archpriest the rural dean. Their privileges were often usurped by laymen. In England, between 1598 and 1623, archpriests appointed by the pope had jurisdiction over the Roman Catholic clergy; in 1623 they were superseded by a vicar-apostolic. See Aaron; Church.

Arçis-sur-Aube. A town of France. It stands on the Aube, in the department of that name, 16 m. N.N.E. of Troyes. Of its old buildings a 15th century church and an 18th century château remain. Danton was born here, Oct. 26, 1759, and in the neighbourhood, on March 20-21, 1814, Napoleon was defeated by the allied forces, who were thus enabled to march on Paris.

Arc Lamp. Lamp in which the source of light is a luminous electric arc. Before the manufacture of incandescent filament

lamps of high candle power, arc lamps were extensively used for street lighting, etc. Present uses are for searchlights, cinema projectors, and lamps for treatment of disease. See Lighting, Electric.

Arcola. BATTLE OF. Fought between the French under Napoleon and the Austrians under Alvinczy, Nov. 15-17, 1796. Arcola is a village on the Alpone, a tributary of the Adige, about 16 m. E.S.E. of Verona.

To relieve Mantua, then besieged by the French, a new Austrian army, about 29,000 strong, under Alvinczy, was sent into Italy. It was to unite at Verona with another army of 18,000 men, then in Tirol. Napoleon had about 43,000, but some were stationed under Vaubois to check the advance, others had to invest Mantua, and only about 18,000 were available for any new movement. On Nov. 14 Napoleon, despondent and fearing the loss of Italy, decided to stake all on an attack on Alvinczy's army before it united with the other Austrians. He crossed the Adige to work round their rear, and threw his forces upon them. Two days passed in indecisive encounters, but in a new attack on the 17th around Arcola there was some stubborn fighting. At first the Austrians had the advantage, but two of the French divisions came up, and drove the defenders from the bridge across the Alpone and out of Arcola. As the fighting was now on drier ground, and the troops were able to spread out, the Austrians, slowly giving ground, fell back to San Bonifacio. They were defeated, but not decisively.

Arcona. CAPE. The northernmost point of the island of Rügen in the Baltic Sea.

Arcos de la Frontera. Town of Spain, in Cadiz province. It is on the Guadalete, 19 m. N.E. of Jerez. Situated on a rocky bluff, and occupying the site of an

Arc Lamp. Carbon lamp used in a cinema projector

Arcola Battle. The fight at the Bridge, Nov. 17, 1798, when, amidst a hail of bullets, Napoleon snatched a standard and, leading his men in a furious charge, shattered the Austrian defence

From an old lithograph

Iberian settlement, it was a Roman colony, and took a prominent part in the struggle against the Moors. It has a Gothic church, a ruined citadel, and remains of the palace of the dukes of Arcos. The rock is pierced by numerous ancient cave-dwellings. Pop. 16,000.

Arcos Raid. Police action taken May 12-15, 1927, against the firm of Arcos, Ltd., agents for trade with the U.S.S.R., at their offices in Soviet House, Moorgate, London. The raid was made by Scotland Yard on the orders of the Home Secretary, Sir W. Joynson-Hicks, later Lord Brentford (*q.v.*), ostensibly to search for a missing War Office document. It was stated that papers were found connected with espionage and subversive propaganda, together with photostat apparatus and a few old rifles. The government declared that the U.S.S.R. had thereby contravened the terms of the trade agreement of 1921; and on May 24 not only was this agreement cancelled but diplomatic relations with the U.S.S.R. ceased for two years.

Arcot. Two districts in Madras province, India. North Arcot lies inland, W. of Madras city, and South Arcot is a maritime district stretching S. to Tanjore and Trichinopoly. The two were ceded to the British with the Carnatic, of which they form part.

North Arcot has an area of 4,671 sq. m. and a population of 2,577,540. Its surface is mountainous in the W., but elsewhere generally flat. Of its rivers, all of which dry up during the hot season, the largest is the Palar, on whose banks stand the towns of Arcot

and Vellore. Agriculture and weaving are the chief industries.

The district of South Arcot has an area of 4,205 sq. m. and a population of 2,608,753. Mountainous in the W., and low and sandy along the Coromandel coast, it is mainly a level plain drained by the Coleroon, Vellar, and other rivers, whose waters are drawn off by channels for irrigation purposes. The occupation of the inhabitants is mainly pastoral and agricultural, indigo and rice, millets and other cereals being the chief crops. The French settlement of Pondicherry lies within South Arcot.

Arcot. Town of Madras, India. The capital of N. Arcot district, and a military cantonment, it stands on the Palar, 65 m. W.S.W. of Madras, on the rly. to Beypur. Formerly the capital of the Carnatic, it was taken by Clive in 1751 and in 1758 by the French, who lost it in 1760. Hyder Ali captured it in 1780, and it became British in 1801. It has some ancient mosques and tombs. Pop. 16,583.

Arcot, SIEGE OF. British victory over the French in 1751. When the British and the French were fighting in India, Clive, with 200 English troops and 300 sepoys, took possession of the fort of Arcot, just outside the city, which the defenders left on his approach. His object was to draw off the French from Trichinopoly, where they were closely besieging an English garrison, and he succeeded.

Clive entered the fort on Aug. 31, 1751, strengthened the dilapidated defences, gathered provisions, and sallied forth against the enemy. On Sept. 23 the

French, with a large body of natives, took up their quarters in the city, and the siege of the fort began. Soon Clive had only 80 Europeans and 150 sepoys fit for duty, but, in spite of the ruinous condition of the walls and towers, he kept the enemy out. The fort was more than a mile in circumference, and the enemy were estimated at 10,000.

On Nov. 14 a final attack was delivered, elephants with iron plates on their foreheads being sent against the gates, but even this failed before the courage of Clive and his men, and the siege of seven weeks came to an end.

Previously the people of S. India had regarded the French as the dominant military power. But from this time the French never regained their influence, and the siege is therefore regarded as the turning point of the fortunes of Great Britain in India.

Arctic Circle. Parallel of latitude drawn $23\frac{1}{2}^{\circ}$ (approx.) from the North Pole. At midsummer, June 21, the axis of the earth is so tilted with reference to the sun that the rays of the latter pass $23\frac{1}{2}^{\circ}$ beyond the North Pole and fall short of the South Pole by the same distance. At midwinter, Dec. 21, the conditions are reversed. Thus it will be seen that the positions of the Arctic and Antarctic Circles are due to the inclination of the earth's axis, for if that were vertical, the half of the earth's surface illuminated by the sun at any given time would extend from North to South Pole, a condition only true on the days of the Equinoxes, *i.e.* March 21 and Sept. 23.

ARCTIC EXPLORATION AND DISCOVERY

Admiral Lord Mountevans, K.C.B., D.S.O.

This narrative describes the various expeditions that have gone out to discover the North Pole and to lands around it. See further the articles on those lands and those on the several explorers, Amundsen, Franklin, Nansen, Peary, and others

The exploration of the North Polar region has been actuated by two motives, the need for new trade routes or new trade commodities and a spirit of geographical inquiry which drove men towards the Pole itself. These two motives have been frequently combined, but, in general, the early explorations resulted from a trading search for either a N.W. or a N.E. passage to China, and the later journeys were scientific in aim. The early desire to achieve a voyage to the Far East by the Arctic Ocean awoke during the period of the great discoveries, and was akin to the spirit which prompted Columbus, Vasco da Gama, and Magellan; the later scientific expeditions aimed at investigating the magnetic, climatic, and oceanographic conditions which prevail in the frozen North.

Story of the North-West Passage

John Cabot began the search for a N.W. passage to the Indies in 1497; he discovered Newfoundland and in 1498 his son Sebastian reached 67° 30' N. Corte-Real, Verrazzano, and Gomez, in the period 1500-24, followed the Cabots, but did little more than inaugurate the lucrative Newfoundland fisheries. Frobisher in 1576 discovered the straits now named Frobisher and Hudson. John Davis made three voyages, achieved a farthest north at 72° 41' N., and explored long stretches of the coasts of Greenland and Labrador. Sanderson's Hope on the map indicates the headland which was his turning-point, and the name was abbreviated from the full title: "Sanderson His Hope of a North West Passage to India." Henry Hudson explored the east side of Hudson Bay and was left to his fate by mutineers after a winter in the ice of James Bay, 1610-11. Baffin attained on July 5, 1616, the lat. 77° 45' N., which was a record in that area for 236 years; he discovered Baffin Bay, Ellesmere Island, and Prudhoe Land. John Ross confirmed Baffin's discoveries in 1818 and penetrated Lancaster Sound for 50 miles. Parry in 1819 traversed Lancaster Sound and reached 114° W in 1820 among the Parry Islands, after spending the winter on Melville Island, and by so doing earned a reward of £5,000 offered by the British Government to the explorer who first went westward beyond 110° W. Other

explorers penetrated among the islands north of Canada, and in 1831 James Clark Ross located the North Magnetic Pole in Boothia Peninsula in 70° 5' N. and 96° 44' W. In 1845 Sir John Franklin with the ships *Erebus* and *Terror*, which had just returned from the Antarctic, led a well-equipped and very promising attempt to sail west from Lancaster Sound; he was last seen near the opening of Lancaster Sound. His failure to return as planned in 1847 stimulated both official and private persons to make vigorous efforts for his relief or to solve the problem of his disappearance.

The search for Franklin marks an epoch in the story of the N.W. Passage, but during the three centuries and a half between 1497 and 1848 other Arctic journeys had been made, most of which had some effect in producing the great outburst of activity in the years which followed 1848. James Cook in 1778 had sailed along the Asiatic and American shores east and west of Bering Strait, in an area where Russians had previously made explorations; in 1816 Kotzebue and in 1826 Beechey reached Kotzebue Sound. The fur trade, inaugurated in 1670 by the establishment of the Hudson Bay Company, led to overland journeys all aimed at discovering the North-West Passage. The mouth of the Coppermine was reached in 1771 by Hearne; and Mackenzie reached the mouth of the river which bears his name in 1789. In 1820 Sir John Franklin made great journeys by sledge and canoe in this region and discovered Point Turnagain; Back reached the Great Fish river in 1833, Dease and Simpson made further journeys in 1838-9; and Rae in 1845-7 completed the exploration of the Hudson Bay region.

Discovery of Franklin Relics

All these travellers had made the N. of Canada sufficiently familiar for land journeys in search of Franklin to be undertaken with some hope of success. Rae in 1848-54 traversed large areas and obtained from the Eskimos Franklin relics and an account of the death of 40 white men. Anderson in 1855, Hall in 1860-2, Schwatza and Gilder in 1878-9, continued Rae's work.

Search was also made by sea in Lancaster Sound, Hudson Bay, and Bering Strait; on one such voyage

McClintock in the *Fox* was beset by the ice in Melville Bay and drifted about 1,200 m. before he was free. He discovered in 1859 the only Franklin document ever found. The intrepid old man had died in June, 1847, and the ships had been deserted in the following April after being fast in the ice for eighteen months. Meanwhile McClure in the *Investigator* in 1850-3 reached Banks Island, which had been discovered by Parry, and demonstrated that there was a continuous N.W. passage by sea north of Canada; Collinson in the *Enterprise* during the same period made a similar voyage and obtained Franklin relics.

The cumulative result of all the discoveries showed that most of the members of the Franklin expedition had perished in an attempt to reach safety by a land journey for which they were ill-equipped, and demonstrated that Franklin had penetrated sufficiently far west to reach water navigable to the Pacific. The N.W. passage had been discovered, but it was not until Roald Amundsen navigated the *Gjoa* from sea to sea in 1903-5 that a ship made the complete voyage.

Trading Voyages to the Yenisei

The first efforts to make the N.E. passage led to Novaya Zemlya. Willoughby and Chancellor in 1553, Burroughs in 1556, Pet and Jackman in 1580 led the way for Barents, who made important discoveries in 1594-6. The Muscovy Company and the Amsterdam merchants profited by these discoveries to open up trade with Russia. Russian fur hunters gradually pushed their way along the coasts, the most notable being Deschnef, who sailed through Bering Strait to Kamchatka in 1648. Details of the coast were more fully explored during the period 1733-42 by the Russians Muraviev, Pronchistshof, Laptiev, etc. Nordenskiöld, after gaining experience in many expeditions during the years 1858-72, proceeded in 1875 to the Yenisei and returned overland, and repeated the journey in 1876; since then many trading voyages to the Yenisei have been successfully accomplished. In 1878 Nordenskiöld took the *Vega* within 120 m. of Bering Strait in one season, wintered off the coast at 123° E., and completed the voyage to the Pacific in 1879.

Whalers went to Spitzbergen, where it became a custom to pass the winter in time to be ready for work in the early spring. Pelham in 1630 was the first to do this. Henry Hudson had explored parts of the island in 1607; Norden-sköld, Leigh Smith, and many

others continued the explorations. The records "farthest north" attained in this area were Barents, 1594, 77° 20', near Novaya Zemlya; Hudson, 1607, 80° 23'. Whalers had habitually fished the waters of Davis Strait and the ocean E. of Greenland for nearly 250 years; the most notable of these was Scoresby, who followed much of the coast of East Greenland, and reached, in 1806, 81° 30' N., which was a record for this part of the Arctic.

The British Nares Expedition

The 19th century saw many attempts to reach the Pole, which were chiefly made from the Spitsbergen area on the east and by Smith Sound north of Baffin Bay on the west. Parry sailed in the *Hecla* in 1827 and reached 82° 45' N., north of Spitsbergen, on a sledge journey which kept him 61 days away from the ship. Kane left New York in 1853 in the *Advance* with the intention of using Eskimo help in a journey to explore N.W. Greenland; he spent two winters in the Arctic, passed through Kane Basin into Kennedy Channel, and reached 80° 10' N., a record for that region. Hayes in the *United States* followed up these voyages and added to men's knowledge of Ellesmere Land. In 1871 the *Polaris* in the Hall expedition had the good luck to sail through Kane Basin, Kennedy Channel, Hall Basin, and Robeson Channel into the Polar Sea and to achieve the record for a ship of 82° 11' N. This success led to the British Nares expedition of 1875; with great difficulty the ships were taken through the unfavourable ice conditions and the *Discovery* wintered in *Discovery Harbour* and the *Alert* wintered at *Floeberg Beach*, 82° 24' N., and established a new record; sledge journeys were undertaken and Aldrich beat Parry's furthest by attaining 82° 48' N., and A. H. Markham the next year reached 83° 20' N.; coast lands were explored and valuable observations made concerning geology, natural history, meteorology, and tidal conditions. The sledge journeys were carried out under very great hardships.

Meanwhile Swedish expeditions had been at work north of Spitsbergen; von Otter took the *Sofia* to 81° 42' N. in 1868, and Nordenskiöld tried to reach the Pole by reindeer sledging in 1872. In this year Weyprecht and Payer started on an Austrian expedition with the *Tegetthof*, discovered Franz Josef Land, and reached in 1874 Cape Fligely, 81° 51' N., the nearest known land to the Pole;

Leigh Smith in the *Eira* explored much of this archipelago in 1880-1. In 1894 Alfred Harmsworth patriotically sent Jackson in the *Windward* to explore this area thoroughly; he returned in 1897.

From 1770 to 1820 Russians had explored the islands north of Siberia, and Wrangel's companion Anjou reached 76° 36' N. in 1823 and failed to discover the large area of land which was believed to exist in that region. This belief was held until 1881, when De Long's ship, the *Jeannette*, made a great drift across the Arctic Ocean from north of Wrangel Island to N.W. of De Long Islands.

Scientific work in the Arctic received a great impetus by the establishment in 1881-3 of the international circumpolar stations set out below:

Lat. N.	Long.	Country	Leader
81° 44'	64° 45' W.	U.S.A.	Greely
78° 25'	16° E.	Sweden	Ekholm
73° 23'	124° E.	Russia	Jurgens
72° 23'	52° 44' E.	Russia	Andeff
71° 16'	158° 40' W.	U.S.A.	Ray
71° 0'	64° E.	Denmark	Hovgaard
70° 0'	8° 28' E.	Austria-Hungary	Wohlgermuth
69° 56'	23° E.	Norway	Steen
67° 24'	26° 36' E.	Finland	Lemstrom
66° 36'	67° 19' W.	Germany	Giese
64° 11'	51° 40' W.	Denmark	Paulsen
62° 39'	115° 44' W.	Britain and Canada	Dawson

The importance of the scheme lay in the attempt to make throughout a whole year systematic and simultaneous observations by trained scientists at as many spots as possible on the edge of the unknown Polar Sea.

Nansen's Famous Voyage

The most notable of these expeditions was that of Greely. Lockwood, his second in command, explored the Greenland coast and discovered Lockwood Island in 83° 24' N., and set up a new record for nearest the Pole; and both Lockwood and Greely made land journeys and explored some 6,000 sq. m. of newly discovered land.

In 1893-6 Nansen, who had previously, in 1888, accomplished the first crossing of the Greenland ice-cap from E. to W., made one of the most famous of polar voyages. He had a specially constructed ship, the *Fram*, and set out deliberately to have his ship beset by the ice in order to drift over the Arctic Ocean in the fashion of the *Jeannette* and, if luck favoured him, to float over the Pole. Frozen in about 79° N., the *Fram* drifted with the ice. Nansen and Johansen attempted a dash for the Pole over

the ice; they reached 86° 14' N. and were ultimately rescued by Jackson in Franz Josef Land. The *Fram*, under Sverdrup, drifted on, gained 85° 57' N., rounded the N.E. of Spitsbergen, and safely reached Norway. In 1899 Sverdrup took the *Fram* west of Greenland and explored Jones Sound. In the same year the duke of the Abruzzi's expedition sailed for Franz Josef Land, and Cagni reached 86° 34' N. by sledge in 1901. In 1897 a most risky attempt to gain the Pole by balloon was made by Andrée from Spitsbergen; no trace of this abortive attempt, beyond three message buoys dropped on the first day of the journey, was found until 1930 when the remains of Andrée and his two fellow aeronauts were discovered at White Island near Franz Josef Land.

Robert E. Peary was the most persistent of the Arctic explorers. He commenced operations in 1886 by a journey on the Greenland ice-cap; in 1891-2 and 1893-6 he made journeys across N. Greenland; in 1898-1902 he explored Ellesmere Land, rounded the N. end of Greenland, reached 84° 17' N. These land journeys familiarised him with the Eskimos and ice conditions. He wintered his ship, the *Roosevelt*, in the Arctic Ocean in 1905, and gained 87° 86' N. He acquired valuable experience of the ice on the open ocean and established a record by bringing the *Roosevelt* safely home. In 1908 he took the *Roosevelt* to the earlier winter quarters, organized a thorough series of relay expeditions, gained the Pole on April 6, 1909, and found no land in sight and a deep sea below the ice-crust.

While Peary had been making his repeated attacks on the N. Pole, the Mylius-Erichsen expedition, greatest of all Danish Arctic ventures, explored Melville Bay and wintered at Cape York. Leaving Copenhagen in the sealer *Denmark* in June, 1906, with a strong scientific staff, Mylius-

Arctic Exploration. Map of the north polar regions, showing their relation to adjacent continents. The Arctic circle is marked by a dotted line

Erichsen led an inspired company to explore and observe a great part of unknown Greenland. Using over 100 sledge dogs, this expedition gave to the world a great store of scientific and geographical knowledge, but it suffered the loss of its leader and two companions through relying on the erroneous map of earlier explorers. Mylius-Erichsen was, through shortage of food, compelled to part company from his supporting sledge-party under Lieut. J. P. Koch, and sailed away, never to be seen again.

Koch's complete sledge journey was one of the finest ever made in the Arctic—1,400 m. in 88 days, 570 m. over undiscovered country. To the Mylius-Erichsen expedition we owe the credit of discovering and charting all the land beyond Bourbon Is., 130 m. N. of Cape Bismarck. The scientific results of this journey were of great value and interest, chief of which was completing the main outline of Greenland, and proving finally that it was an island. Many fossils were found amongst the collections made. On this expedition nearly 200 sledge and boat journeys were made.

Capt. Mikklesen, who in 1908 conducted a search for the relics of the dead explorers, brought home records that disproved the existence of the Peary Channel.

To Mikklesen, and his companion Iversen, may be attributed one of the most Homeric of Arctic journeys—600 m. with insufficient food, with first the leader suffering badly from scurvy, and then his companion falling a victim to the disease. Mikklesen and Iversen were alone for twenty-eight months out of the three years spent by their expedition in Greenland; their story was a most remarkable tale of heroism and sacrifice. Mikklesen made the first crossing of the inland ice-cap between Dove Bay and Danmark Fjord.

Exploration of Greenland

Greenland's glacial plateau has received great attention in recent years. Nansen's crossing of S. Greenland in 1888 and Peary's in the N. in 1892 were followed by more difficult and hazardous crossings by Rasmussen, 1912. The Swiss scientist, De Quervain, 1912, Koch, 1913, Rasmussen, 1916, Hoygaard, Rymill, and Scott, with various companions; all helped to prove that inland meteorological and magnetic stations at high altitudes could if necessary be established and maintained throughout the year in the Arctic, just as Antarctic explorers had proved this possibility in the cruel, white South. This Greenland plateau is a million sq. m. in area, or about five times the size of France, and as

high as 9,000 ft. A journey from N. to S. is about the same distance as from Copenhagen to the Sahara.

Russia has sent many expeditions into the Arctic-Siberian sector. Capt. Vilkitsky, with ice-breakers, attempting the N.E. passage, found islands in the new Siberian group, and in 1913 discovered extensive land, which he named Severnaya Zemlya or Northland, running in a S.E. to N.W. direction up to the 80° parallel and beyond. Vilkitsky was second to Nordenskjöld in making the N.E. passage from W. to E., but first to make it from E. to W.

Roald Amundsen, first to reach the S. Pole, resumed his Arctic explorations in the summer of 1918, when, sailing from Tromsø in his specially constructed ship *Maud*, and taking the N.E. passage as the shortest route from Norway, he passed Cape Chelyuskin and fixed its position on Sept. 9 as the most N. point of Asia, in 77° 44' N., 104° 17' E. The *Maud* wintered in the lee of two small islands, the only shelter available. Amundsen was nearly killed by a bear, and nearly suffocated by a stove later on. His heart was affected, and his lacerated arm troubled him until he obtained surgical aid three years later. The *Maud* broke free on Sept. 12, 1919, when two of her crew left to bring letters and news to Norway, a hazardous business in which they both perished. She made poor progress eastward in 1919, and after passing S. of the new Siberian Islands was forced to winter a second time at Ayun Island near Cape Shelasky. In Aug., 1920, she reached Nome in Alaska; four other men returned home, leaving Amundsen with only three companions to work the ship when he sailed for his projected drift across the Polar sea. All went well until the propeller broke near East Cape, when Amundsen was compelled to winter a third time at Cape Serolekamen. In the spring of 1921, five natives helped to sail the *Maud* to Seattle. Amundsen then turned to flying.

In June, 1922, however, he sailed in the *Maud* from Seattle, with provisions for seven years; but with unfavourable ice conditions at the beginning of the voyage, he handed over command of his expedition to Capt. Wisting, who conducted the Polar Drift. The *Maud* spent next winter in heavy pack, drifting steadily towards N.W., and reaching 74° N. and 170° E. by March 10. In June lat. 75° 30' was reached, and for another two months her track

nearly coincided with that of the Jeannette in 1879-80. After passing another winter S. of De Long Islands, she received in Feb., 1924, a message to abandon the voyage. Unfortunately the ship was again caught in the ice near the Bear Islands, and did not end her long voyage until Aug. 22, 1925. Sverdrup, who accompanied this expedition, contributed largely to the scientific results. Wisting failed to take advantage of the drift existing from N. of Bering Strait to the N.W. across the Arctic Basin.

In 1932 the Russian explorer Schmidt became the fourth man to make the N.E. passage—in the ice-breaker *Sibiriakov*—in the record time of nine weeks. From 1936 onwards, following Schmidt's further exploration in the ice-breaker *Chelyushkin*, new Russian commercial routes, internal and external, were opened up.

That modern Viking Amundsen, in May, 1925, made a flight to lat. 87° 43' N. With Riiser-Larsen as pilot, he flew with two Dornier flying boats from W. Spitsbergen. Lincoln Ellsworth joined him on May 23, after Amundsen had been compelled to come down in an open water lead since half his fuel had been expended. It was a hazardous business for lightly constructed seaplanes to descend among the ice floes, and one machine was wrecked. The two crews, six men in all, lived in the cabin of the undamaged machine until June 15, when, abandoning everything but the barest necessities, they returned. Amundsen reached the N. Cape, and his party was rescued thence by a Norwegian cutter.

Polar Flights

On May 9, 1926, the U.S. explorer, Richard Byrd, took off from King's Bay, flew to the Pole, encircled it, and returned to his base—all in 15 hours. Two days later Amundsen set out in the airship *Norge*, piloted by the Italian Nobile; they crossed the Pole, and landed in Alaska May 14.

Polar flights now became almost fashionable. Nobile, promoted general, took the dirigible airship *Italia* to the N. Pole in 1928, but she was wrecked over the pack ice. Six of her crew were killed, and Nobile himself injured. The valiant Amundsen, who took part in the search, lost his life when his Dornier came down in the sea.

Exploration by air having revolutionised Polar travelling, the names of some of the greatest Arctic explorers, like Rasmussen and Stefansson, are apt to fade

into the background of public memory, but to Rasmussen must be attributed the founding of the most northerly settlement in the world. It is on North Star Bay, in the N.W. part of Greenland, lat. 77° N. Rasmussen named it Thule. In his extensive sledge trips he found undulations similar to those on the Antarctic plateau, and used both igloos and tents in travelling with his dog teams, who for five or six days on end could average nearly 50 m. a day.

Students' Expeditions

The British did nothing in the Arctic for many years. Then in 1921 George Binney and young men from Oxford and Cambridge inaugurated a new school of British explorers, splendid types like Gino Watkins and Wordie—often classical scholars rather than scientists. They chartered little motor vessels and fearlessly faced the hazards and hardships of the North. Often they took to the air, sometimes they used motor boats, or even kayaks.

Germany has taken a small part in Arctic research. In July, 1930, Wagener established a plateau station, 240 m. E. of Kamarujuk, midway between the E. and W. coasts of Greenland, at a height of 9,700 ft. He lost his life attempting to reach the E. coast, where a station had been set up in Scoresby Sound. The expedition returned to Copenhagen in Nov., 1931.

The Arctic cruise of the German airship *Graf Zeppelin*, commanded by Hugo Eckener, was undertaken at the end of July, 1931, for geographical and scientific purposes. The airship passed over Severnaya Zemlya group of islands and the Taimyr Peninsula, Dickinson Island, and near Sverdrup Island, thence along Novaya Zemlya and back to Russia via Archangel. The air view of the Arctic, now for the first time properly photographed, revealed much that was unknown.

In 1928 Sir Hubert Wilkins, who served his Arctic apprenticeship with Stefansson, one of the greatest authorities on the Eskimos, and one of the greatest of Arctic travellers, made his famous flight across the Arctic regions from Point Barrow to Spitsbergen.

In May, 1937, a party of scientists led by Schmidt landed 15 m. from the N. Pole and stayed there until the ice floe on which they had camped drifted southwards. They were taken off by an ice-breaker in 1938.

The 80-ton motor patrol vessel of the Royal Canadian Mounted Police, *St. Roach*, completed the

N.W. passage from W. to E. in 1942, under Sgt. H. A. Larsen, a naturalised Canadian born in Norway. The expedition left Vancouver June 21, 1940, and reached Point Barrow on July 22; thence the *St. Roach* voyaged via Herschel Island, Cambridge Bay, and Walker Bay. Wintering at Victoria Island, she voyaged on in July, 1941, and spent a second winter at Pasley Bay. Finally the vessel worked and drifted through the ice and made the Hudson's Bay Company post at Fort Ross, which she left Sept. 2, 1942, to reach Battle Harbour Sept. 22: an epic achievement for such a lightly constructed vessel.

Over the Magnetic Pole

On May 10, 1945, a notable flight in Arctic regions was undertaken by the R.A.F. in a Lancaster aircraft, *Aries*, with the object of flying over the N. and the N. Magnetic Poles. The expedition was captained by Wing-Comdr. McKinley, with Wing-Comdr. McClure, R.C.A.F., as senior observer.

They flew from Reykjavik direct to the N. Pole and back; thence to Goose Bay in Labrador, from which course was laid to the Magnetic Pole, which was located in approximately 76° N., 101° W. Then from Whitehorse, Yukon, a non-stop flight of more than 4,000 m. was made across the N. Magnetic Pole again, and then right across Greenland and the N.E. coast of Iceland. The expedition's aims were to study air crew efficiency and navigational problems peculiar to polar flying; to examine the behaviour of compasses, radar installations, and automatic dead-reckoning gear; to collect meteorological information; and to study topography in the region of the Magnetic Pole. About 2,000 photographs were taken. This was the first time the Magnetic Pole was flown over. Its position was reported to be about 250 m. N.W. of its last presumed position, an observation confirmed in 1946.

flew over the North Pole, with Floyd Bennett as pilot; here is seen their Fokker monoplane starting from Spitsbergen. 5. Rescue ship Braganza caught in the ice floes during her search for Nobile after his ill-fated flight to the Pole in the dirigible Italia in 1928

ARCTIC EXPLORATION: DESOLATE REGIONS WHICH HAVE BEEN CONQUERED BY MAN
 Photos 1 and 2, from "The North Pole," by R. E. Peary, by permission of Messrs. Hodder & Stoughton

Arctic Ocean. Term applied generally to the waters N. of Europe, Asia, and America. These include the Greenland and Norwegian Seas between Greenland and Norway, the Barents Sea N. of Europe, the White Sea, the Kara Sea between Novaya Zemlya and Yamal Peninsula, and the Beaufort Sea N. of Alaska. It communicates with the Atlantic by Davis Strait, Denmark Strait, and the sea between Iceland and Norway. Its only connexion with the Pacific is by Bering Strait.

It is the best defined and smallest of all the oceans, but, except as regards the Greenland, Barents, and White Seas, is inadequately explored. The polar basin as far as is known has a maximum depth of 2,950 fathoms, which occurs on the Asiatic side of the North Pole; near the pole itself Peary failed to reach bottom with 1,500 fathoms of line. The floor rises steeply to a broad continental shelf with depths of less than 200 fathoms, and often less than 100 fathoms. On this broad shelf lie Spitsbergen, Franz Josef Land, Novaya Zemlya, Severnaya, Zernia, the New Siberia Islands, Wrangel Island, and the Canadian Arctic Archipelago. The Greenland Sea forms a second deep basin, cut off from the polar basin by a submarine ridge in about lat. 80° N. and from the North Atlantic by the Farøe-Icelandic ridge in about 300 fathoms. Baffin Bay and Davis Strait form a third basin, which is seldom over 300 fathoms in depth and is cut off from the polar basin by ridges within 50 to 100 fathoms below the surface. Bering Strait is about 30 fathoms deep.

The bottom deposits of the Arctic Ocean are mainly of terrigenous origin derived from numerous large rivers, the Pechora in Europe, the Ob, Yenisei, Lena, and Kolyma in Asia, and the Mackenzie in America. The salinity of the surface waters is low. Surface temperature has an annual range of only a few degrees, and is generally about 29° F., except in the eastern part of the Greenland Sea and in the Barents Sea, which are influenced by a branch of the warm North Atlantic drift. These two seas are the only parts of the ocean which are not blocked by ice in winter. About three-quarters of the inner polar basin remains permanently frozen, but navigation is possible in the summer months in the Greenland, Barents, and White Seas, along the N. coasts of Europe, Asia, and

Alaska and in Davis Strait and Baffin Bay. The U.S.S.R. has developed the navigation of the N.E. passage by using ice-breakers, aeroplanes, and radio ice and weather reports. The chief current besides the branch of the North Atlantic drift already mentioned seems to be a general drift across the pole from eastern Asia to Spitsbergen and Greenland. It was this drift that the Fram used in 1893-6, as did the Soviet North Pole expedition of 1937. Circular currents occur in the Greenland Sea. Cold currents pass down the E. and W. coasts of Greenland, carrying ice southwards, which is often a menace on the Atlantic trade routes. There is also a cold current of less importance through Bering Strait to the Pacific. The configuration of the floor of the Arctic Ocean prevents the deeper waters from reaching the Atlantic and Pacific Oceans. Animal life includes bowhead and finner whales, various seals, many kinds of fish, and a rich invertebrate fauna. Diatoms are often abundant enough to colour the surface waters green.

Arcturus or **ALPHA BOÖTIS** (Gr. *arktos*, bear; *ouros*, guard). Principal star in the constellation of Boötes, the Herdsman, and third brightest star in the northern sky. It has a very large proper motion, which in the space of 800 years carries it across a space in the sky equal to the apparent diameter of the moon. Yet it has a small parallax, and is therefore very distant, so that its speed of movement has been estimated at 84 m. a second, and its light is about a hundred times that of the sun. It is easily found, apart from its brightness. Starting from the pole star, the last star in the handle of the Plough leads straight to Arcturus.

Arcueil. Town of France, in the dept. of Seine, virtually a S. suburb of Paris. Its name is derived from Arcus Iulianus, a Roman aqueduct. Between 1613 and 1624 and again between 1868 and 1872 an aqueduct was built in connexion with the water supply of Paris, the two together reaching a height of 135 ft. The town has quarries and some manufactures.

Arculf (fl. c. 680). Frankish bishop. One of the earliest Christian travellers after the rise of Islam, he visited the Near East about 680, and later told his experiences to Adamnan, abbot of Iona in the Hebrides, from whose account the story was continued by Bede in his Ecclesiastical History.

Ardagh. Village of co. Limerick, Eire, 4 m. N. of Newcastle. In 1868 there was discovered here the sole surviving chalice of Celtic craftsmanship. Of the 8th or 9th century, this is a two-handled pedestalled cup, 7 ins. high, 9½ ins

Ardagh Chalice. Richly decorated vessel of 8th or 9th century Celtic work
Dublin Museum

across, composed of 354 pieces, silver (20½ oz.), bronze, gold, lead, enamel, glasse, amber, and mica. Its ornament includes scrollwork, filigree interlacings, together with the names of the twelve Apostles. Another Ardagh is in co. Longford.

Ardagh, Sir John Charles (1840-1907). British soldier. Born in co. Waterford, he was educated at Trinity College, Dublin, and the R.M.A., Woolwich. Foreign service took him to Egypt and the Sudan, 1882-7, and he was secretary to the viceroy of India, 1888-94. Specialising in intelligence work, he estimated before the Boer War that the British would require an army of 40,000 to defend their colonies or of 200,000 to conquer the Boers.

Ardalan or **ARDILAN.** Province of N.W. Persia also known as Kurdistan. It lies between Azerbaijan to the N. and Kermanshah to the S., and touches Iraq on the W. It is mountainous and has a severe winter, but the tablelands and the valleys provide good pasture. The pop. is mostly nomadic, though Sinneh, the chief town, has some 32,000.

Ardashir or **ARTAXERXES.** Name of three Persian kings of the Sassanid dynasty (A.D. 226-651). The first, the founder of the dynasty and regenerator of the empire, reigned from 226 to 241. He encouraged his countrymen to revolt against the Arsacidæ (Parthians), to whom Persia was then subject, and by a decisive victory restored his country's independence. During his reign there were conflicts with the Romans under Alexander Severus. Ardashir was a devout Zoroastrian, and the first Persian ruler to assume the title of King of Kings. Ardashir II and Ardashir III reigned from 379 to 383 and from 628 to 630 respectively.

Ardeatine Caves. These caves on the Appian Way near Rome, long used as a dumping place for city refuse, were the scene on March 23, 1944, of a massacre by German troops of 335 Italians in reprisal for the killing by a bomb of 32 German S.S. men in Rome. The victims were indiscriminately picked from the city streets and prisons, marched to the caves, and shot. Mines were exploded and the caves collapsed. The site is now a national monument. The two German generals responsible, von Mackensen and Maeltzer, were sentenced to death by a British military court in 1946, but this sentence was commuted to life imprisonment in 1947. A memorial to the victims in the form of a huge sepulchral stone was erected there in 1949.

Ardebil OR **ARDABIL.** Town of Persia, in Azerbaijan prov. Once a great city, it stands on the Kara Su, 100 m. N.E. of Tabriz. A place of pilgrimage, it is famous for hot mineral springs. Pop. 63,000.

Ardeche. Department of S.E. France. Bounded E. by the Rhône and named after its tributary, the Ardèche, it contains part of the ancient prov. of Languedoc and has an area of 2,144 sq. m. Situated in the Cévennes region, it has magnificent scenery. Its industries are mainly pastoral; the vine and the mulberry tree are largely grown, silkworms are reared, and there are some manufactures and mining undertakings. Privas is the capital. Pop. 254,598.

Ardee. A market town of co. Louth, Eire. On the Dee, 43 m. N.W. of Dublin by railway, it has a grain trade, distilleries, and tanneries, and manufactures baskets. Formerly the seat of a Carmelite friary, it has a 13th century castle, now the town hall. It received a charter in 1377, suffered much in the Irish and English wars, and was involved in the Sinn Féin rebellion of April, 1916. Market day, Tues. Pop. 2,368.

Arden, FOREST OF. A district of Warwickshire, England. To the N. of the Avon, it was formerly a much larger forest tract. It is still a well-wooded area, and is known as the woodland country, as distinct from the feldon or open country S. of the river. Shakespeare was well acquainted with the Forest of Arden, scene of most of *As You Like It*.

Ardennes. A range of hills in France, Belgium, and Luxembourg. It is the remains of a great forest which, extending

probably to the Rhine, is mentioned by Caesar and other early writers; today it is confined to the wooded heights on either side of the Meuse. The Belgian Ardennes, *i.e.* the woods to the E. and S. of Dinant, were a popular holiday resort. Game and wild animals are plentiful, and include the wild boar. Coal, iron, lead, and other minerals are worked.

Ardennes. A department of France. Bounded by Belgium and the departments of Aisne, Marne, and Meuse, it has an area of 2,027 sq. m. The rivers Aisne and Meuse flow through it, and are joined by the Canal des Ardennes. Mining, especially of slate, and agriculture are the chief industries. Part of the Argonne is herein. Mézières is the capital, other towns being Rocroi, Sedan, Rethel, and Charleville. Pop. 245,335.

Ardennes, FIGHTING IN THE. The Ardennes district figured in two important battles of the Second Great War. The first was the German break-through of May, 1940, opening move in the first battle of France. A German force of about 50 divisions had been marshalled, almost in full view of Allied observers across the frontiers, as French objections had prevented the bombing of enemy formations thus building up. Gen. (later F.-M.) von Rundstedt was in chief command of this large force, which after the break-through was charged with other important operations. Four German armies were included—under Gens. Kluge, Blaskowitz, Witzleben, and Bock. Guderian's two armoured corps were attached to the first two as a spearhead.

After crossing the Meuse and the Albert Canal (May 10–12), German armour and infantry pressed forward through the Ardennes. The region was thought to be impracticable terrain for armoured forces, and was therefore only lightly manned by French and Belgian troops. But by May 13 the enemy had reached the Meuse at a point west of Liège, and from Namur to Sedan German forces were within striking distance of the Meuse bridgeheads. The French 9th army (Gen. Corap) held the sector Namur-Mézières, which was virtually the hinge of the Allied line. Corap's troops were taking up positions when, on May 13, the Germans approached the Meuse. Across half a dozen bridges here, left undemolished by the French, the Germans poured, making a gap 50 m. wide in the Allied line.

On Corap's right was the French

2nd army, in front of Sedan. Early on May 13 the French here were driven back and their line was breached. Sedan was abandoned. Corap's army fell back in disorder. Its commander was dismissed on May 14. Gen. Giraud, appointed as his successor, was captured by the Germans on May 16 at La Capelle. By now, along the sector between Namur and Sedan, the battle had become open warfare. The German break-through had been complete, and in due course enforced a withdrawal of Allied troops in Belgium, and the defeats ending in the evacuation of Dunkirk (*q.v.*).

The Ardennes again became the scene of heavy fighting during the last German counter-offensive of the war (*see map*, p. 588). The region had been liberated by the U.S. 1st army in Sept., 1944. An Allied offensive, with a line-up along the Rhine as its objective, began in Nov. By mid-Dec. the U.S. 9th and 1st armies had advanced beyond Aachen to the left bank of the Roer river; the U.S. 3rd army had reached the Saar. But the line between these sectors was held very lightly. Once again too much reliance had been placed on the undoubted difficulty of the Ardennes country, then in the grip of winter, for on Dec. 16 Rundstedt began an attack from a line Monschau to Echternach. Under cover of fog, which had prevented air reconnaissance, he had assembled the 5th and 6th Panzer armies (ten armoured divs.) and 14 infantry divs., also a Panzer brigade which operated in U.S. equipment and caused confusion and panic in and immediately behind the U.S. front line.

Four U.S. divs. in the Eifel area met the first onslaught, slowing but not stopping it; a fifth held St. Vith for several days. But a breach was made in the Allied line which cut off the 1st and 9th armies from their group h.q. in Luxembourg. Gen. Eisenhower immediately ordered a cessation of attack to N. and S. and concentration of all possible forces in the danger zone, to prevent the Germans from widening the base of their assault. He also placed 1st and 9th armies temporarily under F.-M. Montgomery.

Airborne, armoured, and infantry units were moved up from reserve, the 101st U.S. airborne div. with armoured support being placed at the vital road junction of Bastogne, where it was surrounded by superior German forces on Dec. 21.

Ardennes. Map of the country affected by the last German counter-offensive, Dec., 1944. The shaded area indicates greatest extent of German penetration

The flanks of the breach at Monschau and Echternach were held, and the salient compressed from N. to S.; but penetration threatening the Meuse developed on a narrowing front, the Germans being aided by continuing fog until on Dec. 22 the weather improved, and Allied air forces began violent attacks on German rear communications. Relief by an armoured division of the 3rd army reached Bastogne on Dec. 26, on which day also the German drive, 45 m. wide at its base, and 60 m. deep, was stopped near Celles, within 4 m. of the river. The initiative then passing to the Allies, the 1st army attacked from the N. towards Houffalize on Jan. 3, 1945, the 3rd army from the S. towards the same place on Jan. 9. By Jan. 10 they were only 10 m. apart, and the Germans were beginning to withdraw from the tip of their salient. On the 16th they met, and on an unbroken front began to press the Germans eastward. The 1st army retook St. Vith on Jan. 27, and by the end of the month the Allied line was restored to what it had been before Rundstedt began his last counter-offensive.

Ardglass. Parish and town of co. Down, N. Ireland. Picturesquely situated amid hills at the head of a small bay, 6 m. S.E. of Downpatrick, it is served by a branch rly. line. It was at one time the second commercial town of Ulster, but its trade has greatly declined. Small vessels can enter the harbour, a station for the

herring fishing fleet. Ardglass has ruins of several old castles or forts, said to have been built as stores by an English trading company in the reign of Henry IV. Pop. 786.

Ardingly. Village of Sussex.

Ardnacrusha. Section of the huge power house of the Shannon power installation, near Limerick

England, 5 m. N. of Hayward's Heath. Here, dating from 1858, is one of the public schools founded by Canon Woodard. Otherwise the village history is dominated by memories of the Colepeper family, one of whom in 1590 built Wakehurst Place.

Ardlamont Mystery. Shooting fatality at Ardlamont, Argyllshire, Scotland, on Aug. 10, 1893. The victim was a youth named Hamborough, who was reading for the army with Alfred John Monson. Hamborough had recently insured his life for £20,000,

and assigned the policies to Mrs. Monson "for money received." At Monson's trial for murder, at Edinburgh, in Dec., the defence declared that he was aware that the assignment was void in Scots law, as made by a minor; and the verdict was "not proven." A man named Scott, summoned as a witness, was formally outlawed on failure to appear, the ban being later removed. On July 3, 1898, at the Old Bailey, London, Monson was sentenced to 5 years' penal servitude for conspiring to defraud the Norwich Union Life Insurance Society.

Ardlui. Village of Dumbartonshire, Scotland. It stands at the N. end of Loch Lomond, and has a railway station. It is also on the well-known motor road W. of the loch, and is a popular centre for boating, fishing, and mountain climbing, with Ben Vorlich (3,092 ft.) in the vicinity.

Ardnacrusha. Locality in co. Clare, Eire, 3 m. N. of Limerick across the Shannon. Here is the hydro-electric power-station in the scheme which harnesses the force of that river. The construction, carried out by the firm of Siemens-Schückert, was begun in 1925, and finished towards the end of 1929. Each of the three vertical turbines can develop 38,500 h.p.

Ardnamurchan. Parish of Argyllshire, Scotland. It forms the westernmost portion of the mainland, covers an area of 171 sq. m., and has a pop. of 1,137. The estate of Ardnamurchan is noted for its deer forests, beautiful rocky scenery, and salmon fish-

eries, and contains the ruins of Mingary Castle, the ancient seat of the MacIans, which was twice taken by James IV and was ravaged by the Macdonalds of Antrim, 1644. Ardnamurchan Point is the westernmost extremity of the mainland of Great Britain.

Ardoch. Parish and village of Perthshire, Scotland. It is 12 m. N.N.E. of Stirling, and has the best-preserved Roman camp in Great Britain. The camp measures 500 ft. long by 430 ft., has huge ramparts and deep ditches, and retains three of its four gates.

Ardrossan. Police burgh, seaport, and holiday resort of Ayrshire, Scotland. It is 30 m. S.W. of Glasgow by railway, and is a thriving town with a well-sheltered and accessible harbour, and commodious dock accommodation. Shipbuilding, engineering, oil storage, and fishing are the leading industries, and chemicals and coal the chief exports. The town owes its rise to the harbour. It was begun in 1806 by the 12th earl of Eglinton, and was to have been connected by a canal with Glasgow. The undertaking proved to be too ambitious and costly, and a few years before the death of the earl in 1819 the scheme was temporarily abandoned. The next earl carried on the work, and in 1833 the harbour, a much smaller one than originally planned, was completed, the total outlay having exceeded £200,000. Ardrossan has ruins of the castle of the Montgomeries, captured by Wallace, and razed by Cromwell. Pop. 8,675.

Ards Circuit. A motor-racing course near Belfast, Northern Ireland, used annually 1928-36 and from 1947 for the Tourist Trophy race organized by the Royal Automobile Club. The course is 13½ m. of ordinary roads specially closed for the occasion. The highest average speed at which the race over 30 laps was won was 78.01 m.p.h., by F. W. Dixon and C. J. P. Dodson, driving a Riley, 1936.

Ards Circuit. Motor-racing course near Belfast. One section borders Strangford Lough (shaded)

The record for one lap is 85.52 m.p.h., by L. Lebègue, driving a Delahaye in the same year.

Ardley. Urban dist. in the W. Riding of Yorkshire, England. It is 4 m. N.E. of Wakefield by the railway, has extensive collieries, and manufactures woollens and bricks. It is divided into East and West Ardley. Pop. 9,215.

Are (Lat. *area*, piece of level ground). French unit of superficial or land measure. It is a

square whose sides are each 10 metres long, thus containing 100 sq. metres, equal to 119.6 English sq. yards. Ten ares equal one decare, 100 ares one hectare.

Area. Numerical measure of superficial extent. If geometry, as its name implies, originated in the measurement of land, the concept of area was probably the primitive geometrical idea. The unit of area is naturally the square whose side is the unit of length, e.g. the square foot or the square yard. The idea of area is naturally applied in the first instance to a plane surface, but may be extended to curved surfaces, such as the cylinder, cone, and sphere. See Circle; Geometry; Sphere, etc.

Areca. Genus of lofty palms belonging to the family Palmae. Natives of the tropics, they have a crown of long, graceful leaves which are broken up into numerous slender leaflets in two rows. *A. catechu*, of India, produces the well-known betel-nuts and catechu. Areca nut is used as a vermifuge for dogs.

Arecibo. Town of Puerto Rico. It stands on the N. coast, 30 m. by rly. W. of San Juan, and exports coffee and sugar. Its harbour is an open roadstead. Pop. 11,000.

Arena (Latin, sand). A term specially applied to the sanded circular space reserved for gladiatorial combats in the centre of the ancient Roman amphitheatre. It is also used generally for any space or enclosure in which public contests are held, and figuratively for the scene of action of political or other struggles. The sand on these arenas was intended to prevent the combatants from slipping. See Amphitheatre; Circus.

Arenaceous Deposits (Latin *arena*, sand). Sedimentary rocks formed of relatively coarse detrital material. They are so called in contradistinction to argillaceous or clayey deposits, and include conglomerates, grits, sandstones, gravels, and sands.

Arenberg OR AREMBERG. Duchy of the Holy Roman Empire. It lay between Jülich and Cologne, to the west of the river Rhine. As a separate district Arenberg appeared in the 12th century or earlier. One of its lords was made a prince of the empire and another a duke. The Napoleonic cataclysm led to the disappearance of the duchy as a semi-independent state after the congress of Vienna. The title and valuable estates, however, were retained, and there was a duke of Arenberg in 1939.

Arenicola (Lat. *arena*, sand; *colere*, to inhabit). Generic name of the lob-worm. Common on all sandy shores, where its castings may be seen at low tide, this worm is used as bait.

Arenig Series. Lowest major subdivision of the Ordovician system of rocks. It is named after Mt. Arenig in N. Wales, where the rocks are well developed. It is

Areca catechu, the Indian palm which produces the betel-nut and catechu

composed mainly of grits and dark shales, which yield a highly characteristic fauna of graptolites and trilobites. Rocks of this age occur in Western Europe, Bohemia, the Eastern U.S.A., Canada, Australia, and New Zealand. In Britain the Arenig was a period of widespread volcanic activity.

Arensburg (Est. Kuressaare). Swedish and more familiar name of a fortified port of Estonia S.S.R. It stands on the S. coast of Oesel, in the Baltic Sea, has a large and deep harbour, and is an important commercial centre. It imports coal and skins, and exports timber. Arensburg became an Estonian town when Oesel was given up by Russia in 1919. By the pact of Sept. 28, 1939, the U.S.S.R. was allowed to establish a military base here. Captured by the Germans in 1941, Arensburg was retaken by the Russians Oct. 7, 1944.

Arensky, ANTON STEPANOVICH (1861-1906). Russian composer. Born at Novgorod, Aug. 11, 1861, he studied with Zikhe, and with Rimsky-Korsakov at the St. Petersburg conservatorium. In 1882 he became professor at Moscow conservatorium, and was director of music in the Imperial

Chapel, St. Petersburg, 1894-1901. He died in Finland, Feb. 25, 1906. His works include several operas.

Areois. Secret society formerly widespread in Polynesia. Mentioned by Captain Cook, and investigated by Ellis, this institution, fully developed in Tahiti and the Marquesas, extended to Hawaii and elsewhere. Tahiti had six lodges, adjacent islands six more, each with a grand master and seven or nine degrees, with distinctive tattooing. The initiate began by mastering the songs and dances. Membership was highly prized, and continued after death. Women held a communal position; infanticide, due to economic pressure, was characteristic of the general social custom of the time. The fraternity came in, as a puberty institution, with an immigrant people from the west, who practised sun-worship and were probably the megalithic builders. From a semi-sacred organization it degenerated into a professional dramatic troupe, long hostile to Christian missions, and now extinct. See Secret Societies.

Areopagitica. Prose tract by Milton. Further described as a speech for the liberty of unlicensed printing, it was published Nov. 24, 1644. It is doubtful whether Milton took the title from the oration of Isocrates, so named, or derived it from the Areopagus. It is regarded as one of the finest pieces of English prose ever written. There are good editions of the treatise by James Russell Lowell, 1890, J. W. Hales, 1898, C. E. Vaughan, 1900, and R. C. Jebb, 1918. See Milton, John.

Areopagus (Gr., Hill of Arēs). Hill in Athens, W. of the Acropolis, on which stood a temple to Arēs. It was the meeting-place of the famous council of the Areopagus, an assembly of elders drawn exclusively from the noble classes. Originally the governing body of Athens, its powers were limited by the constitution of Solon, later by that of Cleisthenes, and further reduced by Ephialtes in 462 B.C. Aeschylus, in his treatment of the story of Orestes, makes Orestes, when pursued by the Furies for the murder of his mother, appear before the Areopagus to submit his case to their judgement. It is a disputed point whether S. Paul delivered his speech (Acts 17) before the court itself, which was still in existence, or from the hill. See Athens.

Arequipa. Variant name of a volcanic mt. in the Peruvian Andes, known also as El Misti (*q.v.*).

Arequipa. A maritime department of S. Peru. Mountainous, with many fertile valleys, it has an area of 21,947 sq. m., produces cotton, wheat, rice, and sugar, and has valuable gold, silver, and borax deposits. Arequipa is the capital. Pop. 263,077.

Arequipa. A city of Peru. The capital of Arequipa department, and the third city of Peru, it is 107 m. by rly. N.N.E. of Molendo, its port, and stands on the Rio Chile, 7,750 ft. high, at the foot of El Misti volcano. It is the seat of a bishop, and possesses a handsome cathedral, several large churches, and a university. Its main industries are canning, brewing, and the making of candles, soap, and leather. It exports wool, borax, and gold and silver ores. It was founded in 1540 by Pizarro.

It has suffered severely from earthquakes, those in 1600 and 1868 causing great destruction and loss of life. Near are hot mineral springs and an observatory founded by Harvard university. Pop. 46,000.

Arēs. In Greek mythology, the god of war, identified by the Romans with the old Sabine deity Mars. Arēs was the son of Zeus and Hera, and the lover of Aphrodite, with whom he was detected in adultery by her husband Hephaestus (Vulcan). In the struggle between Zeus and the Titans he was kept prisoner in Hades for 15 months by the giants Otus and Ephialtes. During the Trojan War he sometimes took the field on behalf of the Trojans; on one occasion he was driven off, wounded and discomfited, by Athena and the Greek hero Diomedes. He had a temple on the Areopagus, where, according to the legend, he was tried on the charge of putting to death a son of Poseidon, but was acquitted. The original home of his worship is supposed by some to have been Thrace, by others Boeotia. See Mars; Mythology.

Aretaeus. Greek physician and writer on medicine. He probably lived in the 1st century A.D., and was the author of treatises, most of which are extant, on diseases and their remedies.

Arethusa. In Greek mythology, a nymph of Elis. While bathing she was seen and amorously pursued by the river god Alpheus. At her entreaty Artemis changed her into a fountain which disappeared underground, rising again in the island of Ortygia, near Syracuse in Sicily. Alpheus is said to have mingled his stream with that of Arethusa, and it was popu-

Arequipa. The plaza, or great square, of the third city of Peru, founded by Pizarro in 1540

larly supposed that anything thrown into the river came up again at Ortygia. Shelley tells the story in his poem *Arethusa*.

Arethusa, H.M.S. The first ship of this name was the French *Arethuse*, captured in the English Channel by H.M.S. *Venas* in 1759. The well-known 18th century song about the *Arethusa* describes a later action (1788) of the same ship. The fourth of the name, laid down as a 50-gun frigate and launched in 1849, took part in the Crimea campaign, and was handed over in 1874 to become a training ship. For many years she was moored in the Thames off Greenwich, Kent, where thousands of boys of the Shaftesbury Homes (*q.v.*) received their training. In 1932 she was condemned by the Admiralty as unfit for further service. A four-masted barque, *Peking*, built 1911, was purchased and converted by the Shaftesbury Homes and inaugurated as the *Arethusa* training ship in 1933, with a new berth on the Medway, opposite Chatham Dockyard. During the Second Great War the government took over the ship.

The sixth *Arethusa*, launched 1913, was the first of her type of fast, lightly armoured cruisers, specially designed to operate against hostile destroyers. She was badly damaged in the battle

of Heligoland Bight, Aug. 28, 1914. She played a prominent part in the Dogger Bank battle of Jan. 24, 1915, but on Feb. 11, 1916, returning to Harwich from a North Sea patrol, she struck a mine, and became a total wreck.

The seventh *Arethusa* was a cruiser, built Jan., 1933-Feb., 1935, at a cost of £1,251,161. She had a displacement of 5,220 tons, and carried a complement of 250. Her armament, which was adequate to deal with raiders of armed mercantile type, included six 6-in. and eight 4-in. guns. She took part in the Norwegian campaign in 1940, and was present at the capture of the Altmark (*q.v.*). In 1942 she bombarded Rhodes, but was torpedoed at the end of that year. Having undergone repairs, she joined in the bombardment of the Normandy coast on D-day, June 6, 1944.

Aretinian Syllables. Names for the notes of the musical scale. The six syllables, to which a seventh was added, were first used by Guido d'Arezzo in the 11th century. They were derived from the first syllables of the lines of a hymn to S. John which happened to begin on successive notes of the ascending scale. The six syllables were *Ut, Re, Mi, Fa, Sol, La*, and to these was added *Si* for the seventh note. The complete stanza and notes of the hymn may be seen in Grove's Dictionary of Music and Musicians. See Tonic Sol-Fa.

Aretino, PIETRO (1492-1556). An Italian poet and wit. Born at Arezzo, Tuscany, and patronised by the Medicis, the emperor Charles V, and Francis I of France, he achieved notoriety as the author of 16 exceedingly licentious sonnets (*Sonetti Lussuriosi*). Such fame as remains to him he derives

from his letters, five comedies, and a tragedy, *Orazia*. He spent his last years at Venice.

Arezzo. Province of Tuscany, Italy. Mainly mountainous, it extends across the Apennines, and has an area of 1,274 sq. m. It produces cereals, oil, wine, and mulberries, and manufactures leather, woollens, and hats. An earthquake on April 26, 1917, caused considerable damage, the village of Monterchi being entirely destroyed.

Arezzo. Town of Italy. The capital of Arezzo province and an episc. see, it stands near the junction of the rivers Arno and Chiana, 54 m. by rly. S.E. of Florence. The ancient *Arretium*, its walls were built in 1320 and rebuilt 1541-68, and its citadel, constructed in 1502, was demolished by the French in 1800. The Gothic cathedral, begun in 1277, contains many fine sculptures and the tombs of Gregory X and Tarlati di Pietramala, the warlike bishop

Arezzo, Italy. The 11th century church of S. Maria della Pieve

of Arezzo. The chief industries are pottery, and silk and cloth manufactures. One of the twelve Etruscan cities and an important military position, it was allied to Rome in 310 B.C., was sacked and repopled by Sulla, and suffered in the Ghibelline-Guelfic contests.

Occupied by the Germans after the Italian armistice of 1943, the town was subjected to frequent Allied air attacks as a key centre of communications. At the end of June, 1944, British troops of the 8th army approached the town from the S., but Arezzo was defended for three weeks against Allied attacks before capitulating, July 16. Damage was heavy, especially round the rly. station, but churches were relatively undamaged. Paintings and valuable

ceramics were lost when the museum was hit by a bomb. Three famous palaces, the Pretorio, Comunale, and Albergotti, suffered, also an ancient amphitheatre. Pop. 60,284.

Argaeus, MOUNT (Turk. *Arjish Dag*). Extinct volcano and the loftiest summit in Asia Minor. It has two craters and is regarded as 11,480 ft. high: one estimate makes it nearly 2,000 ft. higher. On a spur of the Taurus range, a few miles from Kaisariyeh (Caesarea), it has not erupted for many centuries.

Argali. Wild sheep of the Altai Mountains

Argali. Wild sheep found in the Altai Mts. and on the steppes of Siberia. It is about the size of a small donkey, and has magnificent, closely ribbed horns, which form almost a complete circle. It is pale brown in colour with a white face, and in winter a large ruff of white hair develops round the neck. The argali is found at an altitude of from 3,000 ft. to 4,000 ft., the flocks keeping to the same feeding-ground from year to year. The flesh makes good mutton.

Argall, SIR SAMUEL (c. 1535-1628). An English adventurer. He went to Virginia in 1609, and in 1612 he abducted the Indian princess Pocahontas, and held her a willing prisoner as a means to secure peace with the Indians. He was deputy governor and admiral of Virginia, 1617-19, and served in an expedition against Algiers 1620. He was knighted in 1622, after returning to England.

Argand, ARMÉ (1755-1803). Swiss physician and chemist. In 1784 he invented the Argand lamp, in which combustion was much improved by the use of a cylindrical wick and the admittance of air to the central tube from below. This doubled the area of wick in contact with the air. A glass chimney was added to improve the draught. When William Murdock (*q.v.*) introduced gas lighting, he adopted Argand's principle for the burners.

Argand Burner

Pietro Aretino, Italian poet and wit
Titian. Pitti Gallery, Florence

Argao. Town of the Philippine Islands. It stands on the E. coast of Cebu, 36 m. S.S.W. of Cebu town, and was founded in 1608. The locality produces rice and sugar. Pop. 35,400.

Argaum OR **ARGAON.** Town in Berar, India, 31 m. N. of Akola. It is notable for the battle fought Nov. 28. 1803, between the British under General Wellesley, afterwards the duke of Wellington, and the troops of the Mahratta chieftains. The issue was for some time in doubt, but after fierce fighting the Mahrattas abandoned their guns and fled. The name Argaum means the city of wells.

Argelander, FRIEDRICH WILHELM AUGUST (1799-1875). German astronomer. He was born at Memel, March 22, 1799, studied law in Königsberg, but was induced by Bessel to devote himself to astronomy. In 1820 he became assistant at the Königsberg Observatory, in 1823 director of the observatory at Abo, and in 1828 professor at Helsingfors, to which city the Abo Observatory was transferred. In 1837 he was nominated professor-director of the new observatory at

F. W. A. Argelander,
German astronomer

Bonn, where his chief work was carried out. His survey of the northern heavens, known as the Bonn Durchmusterung or B.D., was a complete survey of the northern heavens mapped out into zones, extending from the north pole to two degrees S. of the equator. Argelander died at Bonn, Feb. 17, 1875. See *Durchmusterung*.

Argens, JEAN BAPTISTE DE BOYER, MARQUIS D' (1704-71). French philosophical writer. Born at Aix, Provence, and disinherited by his father, he retired to Holland. His writings attracted the notice of Frederick the Great, who invited him to Prussia and made him his chamberlain and director of the Academy. After twenty years, d'Argens fell out of favour and returned to Provence, where he died. In philosophy he was a moderate sceptic. He denied the freedom of the will and the existence of a soul-substance.

Argensola, BARTOLOMÉ LEONARDO DE (1562-1631). Spanish poet and historian. Born at Barbastro, Aragon, Aug. 26, 1562, and educated at the university of Huesca, he became chaplain to Maria of Austria, widow of the emperor Maximilian II. Attached

later to the suite of the count of Lemos, viceroy of Naples, he returned to Spain in 1616 and was made a canon of Saragossa, where he died Feb. 4, 1631. He left a continuation of Zurita's *Annals of Aragon*, a history of the conquest of the Molucca Islands, letters and satires, and poems (*Rimas*) which, published in 1634 with those of his brother, Lupericio,

B. L. de Argensola,
Spanish poet
Print in Bibliothèque
Nationale, Paris

caused their authors to be hailed as the Horaces of Spain.

Argensola, LUPERCIO LEONARDO DE (1559-1613). Spanish poet and dramatist. Born at Barbastro, Dec. 14, 1559, and educated at the universities of Huesca and Saragossa, he became secretary to Maria of Austria, chamberlain to the Archduke Albert, and historiographer royal of Aragon. His three tragedies, *Filís* (now lost), *Isabella*, and *Alexandra*, were praised by Cervantes.

Argenson, MARC RENÉ DE VOYER, MARQUIS D' (1652-1721). French official. Born at Venice, the son of a distinguished French advocate, he went to Paris in 1683, and was appointed lieutenant-general of the Paris police, under Louis XIV, in 1697. He filled this post for 21 years. In 1718 he was made president of the council of finance, but had to resign in 1720 on the collapse of John Law (*q.v.*). He was then made inspector-general of the French police. He died May 8, 1721.

Argenson, RENÉ LOUIS DE VOYER DE PAULMY, MARQUIS D' (1694-1757). French statesman. Elder son of the above, in 1719 he was made councillor of state, and in 1744 member of the council of finance and foreign minister. The friend of Voltaire and the philosophers, he endeavoured unsuccessfully to establish a European alliance of nations. He retired into private life in 1747, and was henceforth occupied with literary pursuits. He died Jan. 26, 1757.

Argenson, MARC PIERRE DE VOYER DE PAULMY, COMTE D' (1696-1764). French statesman. Younger son of the lieutenant-general of police, he was made councillor of state in 1724 and minister of war in 1743. He introduced important army reforms, and was present at the French victory at Fontenoy in 1745. He subsequently remodelled the French army on

Prussian lines. In 1757 he was banished from Paris at the instigation of Madame de Pompadour. The great French Encyclopédie was dedicated to him. He died in Paris, Aug. 22, 1764.

Argenson, MARC RENÉ MARIE DE VOYER DE PAULMY, MARQUIS D' (1771-1842). French soldier and politician. Son of the marquis de Voyer and grandson of the minister of war, he entered the army as an officer in 1789; he enthusiastically supported the Revolution, and was for a time aide-de-camp to Lafayette. In 1809 he was made prefect of Deux-Nèthes (Antwerp), and helped to drive the English from Walcheren. He was deputy for Belfort during the Hundred Days, and in 1830 represented Strasbourg as an advanced Radical. He died Aug. 1, 1842.

Argent (Fr., silver). In heraldry, one of the two metals, silver, also represented by white. It is shown in drawings by a plain surface. See *Tincture*.

Argentan. Town of France, in the department of Orne. It stands on the Orne, 31 m. by rly. N.W. of Alençon. Industries include lace making and horse raising. During the battles of 1944 heavy fighting developed around Argentan, which was reached by U.S. forces on Aug. 14. A large force of Germans, almost encircled, was making its escape through the Falaise "gap" between Alençon and Falaise. The gap was closed by the Allies and Argentan was captured Aug. 20.

Argentario. Mountainous peninsula of Italy. Situated in the S. of Tuscany, it is projected into the sea by two narrow strips of land, enclosing a lagoon and a headland on which stands the town of Orbetello. Its highest summit reaches 2,085 ft.

Argentera. Mt. of N.W. Italy, called fully the Punta dell' Argentera. The loftiest peak of the Maritime Alps (10,880 ft.), it is in Piedmont, S.W. of Cuneo and N. of Nice. First ascended in 1879.

Argenteuil. Town of France, in the department of Seine-et-Oise. It stands on the Seine, 7 m. N.N.W. of Paris, of which it is a suburb, and is chiefly noted for asparagus. Ironware and watches are manufactured. In its church is a garment said to be the seamless coat of Christ. Pop. 59,314.

Argentièrre, COL DE L'. Pass in the Maritime Alps. It is on the road from Barcelonnette, France, to Cuneo, Italy, and was crossed by Francis I and his army in 1515. It is 6,545 ft. high.

ARGENTINA: A VARIED AND WEALTHY LAND

C. B. ARLOW, Managing Editor, Latin-American World

The physical features, the political constitution, the people, the social and industrial life, and the arts of this vast and comparatively new country are here described in detail. See the articles on Buenos Aires and other towns and cities of the republic. For later history see N.V.

The name Argentina (Lat. *argentum*, silver) was given to the country by its Spanish conquerors. They first called the great estuary by which they approached Argentina the Mar Dulce, fresh-water sea, then the Rio de Solis, after the Spanish navigator, and, finally, as it is named today, the Rio de la Plata, or silver river.

PHYSICAL DESCRIPTION. Argentina is the second largest republic of Latin America both in area and in population. It extends from latitude 21° 40' S. to latitude 55° 5' S. at Cape San Pio. From N. to S. its length is about 2,150 m. and at its broadest part it is 980 m. wide. Excluding the coast line of the estuary of the river Plate, Argentina has a coast line of some 1,600 m.

In area the Argentine republic takes seventh place among the countries of the world, ranking after the U.S.S.R., Canada, Brazil, the U.S.A., Australia, and China. Compared with Europe, the republic comprises as large a space as the combined areas of Great Britain, Eire, Poland, Spain, Germany, Holland, France, Switzerland, Italy, and Belgium.

On its N. frontier Argentina has boundaries with Bolivia and Paraguay, on the E. with Brazil and Uruguay. The Cordillera of the Andes, which extends the whole length of the Argentine republic, separates it from Chile. The Tierra del Fuego (Land of Fire), an island which forms the "toe" of the continent, is separated from the mainland by the straits of Magellan. Tierra del Fuego consists of the Isla Grande and a group of smaller islands. Argentina owns less than half this territory, the rest belonging to Chile, but it owns the small Isla de los Estados which lies off its S.E. tip. Furious gales blow

around these islands, which are frequently bitterly cold and snow-bound.

The republic has five main natural divisions: (a) the Andine, which is the eastern slope of the Cordillera of the Andes, the Pre-Cordillera in the N.W.; (b) the Chaco; (c) the Mesopotamian, in the fork of the Paraná and Uruguay rivers; (d) the Pampan, which extends in a fanlike formation for 300-400 m. from Argentina's capital, Buenos Aires; and (e) the Patagonian, or southern plateau.

Through these five natural divisions the republic has zones ranging from tropical in the tropic of Capricorn, through subtropical and temperate, to the Antarctic land of Tierra del Fuego.

Apart from the river Plate, the chief rivers are the Paraná (2,000 m.) and the Uruguay, which both flow into the Plate estuary.

The chief mountain range is the Andine, which combines the E. and W. Cordillera separating Argentina from Chile. The Misiones range is on the N.E. boundary. The central mountain group is the Sierras of Córdoba, and the southern range, including the Sierras of Ventana and Tandil, is in the S. of the Buenos Aires prov. Aconcagua mountain, in the

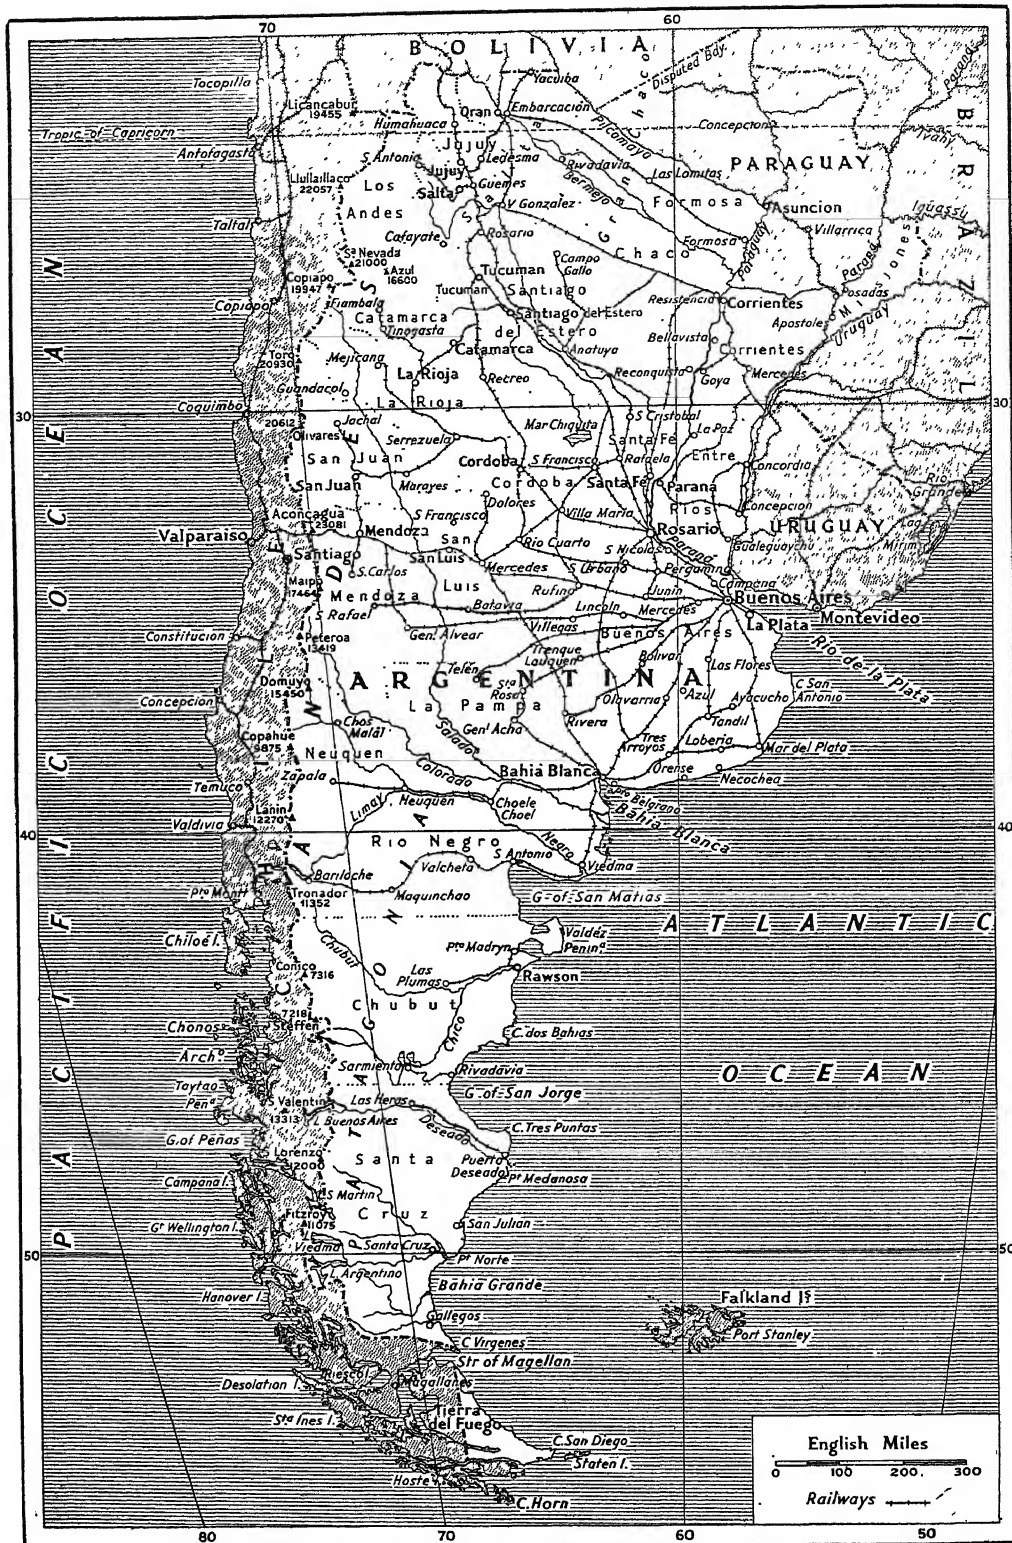

Andine range, with its 23,081 ft., is the highest in S. America.

The traveller by air from Argentina to Chile has an awe-inspiring journey across the Andine range. The mountains, snow-capped and majestic, stand out against the clear blue sky. At the frontier between the two republics on the Cumbre Pass is the gigantic Christus statue, which can be seen for miles. It was erected by the workers of the Argentine republic, and it bears the inscription: *Antes se reducirán a polvo estas montañas, que los pueblos de la Argentina y Chile rompan la paz que a los pies de Cristo Redentor juraron mantener* (Sooner shall these mountains crumble into dust than the peoples of Argentina and Chile break the peace which at the feet of Christ the Redeemer they have sworn to maintain).

In the Misiones region, near the junction of Argentina with Paraguay and Brazil, are the Iguazu waterfalls. The falls are part of the Iguazu river, which is a tributary of the Paraná, and they dash over a 200-ft. precipice on a frontage of about 2,600 yds. through some of the most beautiful scenery in the world. Virgin forest blazing with flowers and vegetation in the most vivid

ARGENTINA: MAP OF THE GREAT SOUTH AMERICAN REPUBLIC

colours, and countless butterflies. form their background.

The falls were first discovered by Alvar Núñez de Vaca as he travelled from Brazil to Asunción in Paraguay and he called them Salto de Santa María. In 1928 Argentina obtained possession of a large tract of land around the falls and this now constitutes the national park of the N.

POPULATION. A census taken in 1947 showed that the population was 16,104,929. The urban and rural pops. account respectively for 60 p.c. and 40 p.c. of the total. Of these 77.5 p.c. are Argentine citizens of European origin, 20 p.c. are foreigners (almost all Europeans), and 2.5 p.c. are of mixed European and native Indian blood. This last figure is gradually decreasing. The foreign-origin inhabitants are made up as follows:

Italians	930,000
Spaniards	830,000
Russians	94,000
Uruguayans	86,000
French	80,000
Turks	65,000
British	50,000
Germans	27,000
Other countries	460,000

The principal towns are the capital Buenos Aires; Rosario in Santa Fé prov., where agricultural produce of the northern and central provs. is shipped for export, being sent down the Paraná river to Buenos Aires for trans-shipment to larger vessels; and Córdoba, a centre of learning and culture.

The Argentinian is different from all other Latin Americans in many respects. The Indian, or *mestizo*, pop. is very small, Argentina having the largest white population in Latin America. All the Latin-American countries are nationalistic, but Argentina is probably the most markedly so. Even matchboxes and other domestic goods have patriotic slogans on them. There is an annual "Día de la bandera" (festival of the flag), a public holiday (June 20) on which all the people pay tribute to the blue and white Argentine flag.

In a continent where *mañana* (tomorrow) is the pivotal word the Argentinian stands out. He is a hard worker who lets nothing stop him in his efforts to get what he wants. He pays great attention to the power of money, but is generous when he has it. He is cultured, all his culture being derived from his European ancestry, French influence predominat-

ing. The Second Great War, however, had an effect on this. France and other European countries were for the most part cut off from Latin America, and where formerly the Argentinian would think of reading everything in French, he now reads his classics in Spanish and increasingly in English. The educated Argentine woman, not having entered into the business world to any notable extent, has more leisure in which to devote herself to the arts. The townswomen of Argentina followed French influence in dress, and today the women in Buenos Aires are among the smartest and best-dressed in the world.

It is the blood of the early European adventurers that has given Argentina its character. The Spanish conquerors never met the indigenous races of Latin America as their equals, and in the zones where the climate was most like Europe they soon overcame the natives. There was some intermarriage between the white conquerors and the copper-coloured natives, but in a very short time the half-breeds born from these marriages yielded pride of place to the pure white stock.

National Dishes

The Argentinian has a great zest for life, and with his nationalistic pride running high is always keen to know what the rest of the world is thinking of his country. A European visiting Argentina is struck by the excellence of the food, by the high standard of cooking, and by the large portions which are always served. As can be expected from so vast a land of agricultural products, butter and beef are a large part of the diet. A workman will have for his breakfast a *bife*, a delicious steak the size of his plate. *Puchero* is another national dish. To liken it to the English stew is misleading, for while it is a stew it is like no other in the world. It is served with every imaginable kind of vegetable, including both sweet and ordinary potatoes, and needs an enormous plate to hold it. A distinguished visitor to Argentina will be given an *asado criollo*, or peasant roast. *Asados* are generally given at the usual dining hour—10 p.m. or later. An animal is roasted whole on a spit in the open air, and on the bars which are put across the open fire are cooked the sausages and offal. Helping after helping is given the guests, and it is considered bad form to refuse to eat

any of the courses. Argentine wines are served during the *asado*, which goes on for several hours.

Away from cosmopolitan Buenos Aires is The Camp, or pampa, the treeless plain which stretches from the Atlantic coast to the Andes, and which in the early days was in the hands of the Indians. With the dispersal of the Indian the pampa was peopled by the *gauchos*, and it was not until the end of the 19th century that immigrants now coming into the country on a large scale gradually took it over and developed it into the wealthy agricultural region it is today. Its grain-growing and cattle-raising industries are now among the first in the world. Scientific methods have been adopted, and machinery now helps the farmer and the *estanciero* to get the maximum from the land. *Estancias* (ranches) stretch for miles, and some of their owners are very wealthy. About 75 p.c. of the *peones* or labourers now live on the *estancias* in modern workmen's dwelling-houses owned by their employers. Their rates of pay are government-controlled. Much of the land is owned by individual landowners, whose names, although they are all Argentine citizens, show their European ancestry.

COMMUNICATIONS, ETC. From the days of Pitt and Canning, Great Britain has helped Argentina to prosperity. British men were responsible for the building of the republic's rlys. and of the total rly. mileage more than half was, until 1948, British-owned. The first rly. was built in 1857. Britons built the roads of Argentina; and sold to her agricultural machinery, and the finest pedigree stock which was the basis of her flourishing meat trade.

The rly. systems are among the finest in Latin America. On Mar. 1, 1948, Argentina became sole owner of her whole rly. system, consisting of 18 rlys., amounting to a total track length of 26,568 m. Of these she purchased at a total overall cost of £8,707 per mile the 8 British-owned rlys., renaming them after national heroes, e.g. the Buenos Aires Great Southern rly. becoming the General Roca. Argentina had already purchased the 3 French-owned lines in 1947. Four of the largest systems, including the General Roca, have the broad gauge of 5 ft. 6 ins.; three other gauges are found in the rest of the rly. system. Although Argentina is 23 times the size of England, it is possible to travel to

all her large towns by rly., and there are good express services to neighbouring countries. A line from Salta to Antofagasta, Chile, begun 1922, was opened in 1948.

Water transport is considerable. Large steamers cross the river Plate to Uruguay and ply up the rivers Paraná and Uruguay to Asunción in Paraguay, where it is possible to trans-ship to a small vessel which goes on to Corumbá in Brazil. There are also services to Porto Mendes in Brazil via Puerto Aguirre on the Upper Paraná R. Much of the shipping is nationally owned.

Although there are good macadam and bitumen roads linking the capital with Mar del Plata (the Argentine "Brighton") and with Rosario and Córdoba, most of the roads leave much to be desired when it is necessary to get quickly from one town to another. However, new national roads (part of the 1942-47 plan) have helped to speed motor transport between the various provinces. The four main roads making up that part of the Pan-American Highway (g.v.) in Argentina were opened to traffic in 1942.

Air Communications

Pan-American Airways operates services to Uruguay, Brazil, and all countries on the east coast as far north as Miami, U.S.A.; and two services to Chile and all countries on the west coast to Miami. British Overseas Airways Corporation, which connects Buenos Aires with London, also extends to Santiago in Chile. Air France has a line from Paris to Santiago.

Numerous air lines serve Argentina internally; originating as private companies, they were nationalised May 5, 1949. The F.A.M.A. (Flota Aerea Mercante Argentina), also nationalised, connects Buenos Aires with London. Other Argentine services operate to and from the chief cities of Uruguay.

Argentina's ports, the chief ones being Buenos Aires, Rosario, and Bahia Blanca, handle the cargoes of about 65,000 ships every year.

Transport within the towns is by tramway and a small type of motor bus called a *colectivo* and holding about a dozen passengers. Argentina had been one of the few Latin-American countries to keep traffic on the left of the road, but in 1945 *cambio de mano*, or right-hand driving, was enforced.

An efficient telephone system is run by the government, the automatic system being installed in the larger towns. The cable com-

panies, run by private enterprise, are the Western Telegraph Company and the All America Cables. There are 42 radio stations which rely for their revenue on commercial broadcasting. The post office is state-controlled.

GOVERNMENT, ETC. Argentina has a written constitution, dating from 1853 and several times revised. A federal government rules the entire republic, but 14 provinces or states have their own autonomous governments: Buenos Aires, Santa Fé, Córdoba, Entre Rios, Corrientes, San Luis, Mendoza, San Juan, Tucumán, Santiago del Estero, La Rioja, Catamarca, Salta, and Jujuy. In addition there are nine national territories administered by governors appointed by the president, and these are under the direct control of the Federal government: El Chaco, La Pampa, Misiones, Chubut, Neuquén, Santa Cruz, Rio Negro, Tierra del Fuego, and Formosa, and the military zone of Comodoro Rivadavia (until 1946 part of Chubut).

Under the revised constitution of 1949 the president, who is elected for six years, became eligible for a second term (instead of one only), his election being by direct vote instead of as previously by an electoral college similar to that of the U.S.A.; the term of the 30 senators was reduced from nine to six years, that of the 158 representatives increased from four to six years, a part of both the chamber and the senate being elected every three years. The cabinet, chosen by the president, was increased from eight members to 20.

The seat of the federal government is in Buenos Aires.

There is a supreme court and subsidiary tribunals in all the provinces. There is a civil code. The federal government decides questions of foreign affairs, defence, higher education, currency, customs, inter-provincial communications, trade, and postal services.

In any case involving foreigners, or where national laws may be invoked, the supreme court has jurisdiction. Although the commercial and penal civil codes are of national scope, in normal cases they are enforced by the provincial courts. The provinces are politically self-governing and possess legislative and judicial authority on all matters not covered by the federal government.

Roque Saenz Peña, a Conservative president elected in 1910, reformed the election laws, extended the suffrage to all men over 21,

and brought in the secret ballot. Women were enfranchised Sept. 9, 1947.

Illiteracy steadily decreased with the introduction of free and compulsory primary education (which is also secular), 22 p.c. of voters being illiterate in 1930 compared with 35 p.c. in 1916. There are some 15,000 primary and 1,000 secondary schools, the first ranging from large well furnished schools in the towns to small wooden buildings in the country districts. In 1946 there were nearly a quarter of a million pupils attending secondary schools, staffed by 28,360 teachers. The oldest university, founded in 1613, is at Córdoba. Other universities are at Buenos Aires, Tucumán, La Plata, plus the national universities of El Litoral and Cuyo. These universities have earned high standing in Latin America and are well endowed with up-to-date laboratories and specialised libraries. There are also schools for industrial training, arts and crafts, commercial training, rural economy, and for teachers. Other institutes exist in the large towns where advanced instruction is given in the fine arts, decorative arts, and music. The ministry of agriculture has provided a number of rural schools where practical agriculture is taught. The school children all wear the same uniform; a white overall covers their suits and dresses, and at leaving hours they throng the streets looking like a young army.

System of Finance

The financial structure is controlled by the Central Bank which, while free from government control (the government cannot demand loans amounting to more than 10 per cent of the average national budget receipts for the previous three years), is legally obliged to act as a centralising institution for all the financial affairs of the nation. The monetary system, by virtue of a law of 1881, is based on the *peso oro* or gold dollar of 1.6129 grams of a standard of 9/10 of fine gold. This *peso oro* is divided into 100 *centavos*. Depreciation and fluctuation of the notes representing the *peso oro* led to the law of 1899, under which the value of the notes in circulation was fixed at 44 *centavos* of the *peso oro*, and thus a system of exchange was established at this rate of 44 to 100 for delivery of gold against notes and vice versa. For domestic transactions, therefore, the paper dollar is legal. At the 1946

1. Herd from a sheep-run being driven through a boarded lane into the sheep train. 2. Wool wagons in Chubut. 3. Cattle on the pampa. 4. Inspecting meat for export in a frigorifico. 5. Packing grapes for export.

rate of exchange, sixteen paper dollars equalled £1 sterling.

RELIGION. Argentina is a Roman Catholic country, but there is complete freedom of religion, churches of other denominations being allowed. The government, although giving financial help to the church, does not interfere with its religious instruction. Most of the priests are of Spanish or Italian origin. Religious festivals are celebrated as national holidays. During the carnival (Shrove Tuesday) the main streets in the capital and large towns are hung with coloured lights, and young people wear fancy dress.

PRODUCTS. Argentina, with rich soil and verdant pasturelands, has as her chief industries agriculture and cattle-raising. More than 90 p.c. of her exports are of agricultural or animal origin, and these industries provide the livelihood of about 70 p.c. of the people. Of her 697,000,000 acres of land, 272,000,000 acres are suitable for agriculture and stock-raising, 200,000,000 acres of arable land are especially suitable for grain-growing, 125,000,000 acres are hills and woodlands, and 100,000,000 acres are unproductive land. This latter figure includes the built-up areas of towns.

Although much of the land which could be made suitable for grain-growing has not yet been cultivated, Argentina is none the less the chief exporter of maize and linseed in the world. In production of maize she is, however, second to the U.S.A., but of linseed she produces four-fifths of the world's supply. The grain-growing districts are the plains of the central and eastern regions, stretching in a crescent for about 600 m. from Santa Fé in the N. to Bahia Blanca in the S.

Varieties of Maize

Argentine maize is used for feeding cattle, horses, poultry, and pigs, also for industrial purposes. To a much smaller extent it is used for human consumption. Flint maize, which is exported, is sub-divided into three categories: cinquantine maize, a small-grain seed used for feeding birds; yellow maize, used in producing cornflour for human consumption in some countries; and red maize, which is exported to the British market as "yellow plate maize," to be used for stockfeeding and industrial purposes. It is used in the production of alcohol, whisky, and glucose.

Exports of linseed account for about 13 p.c. of the republic's

total exports, and in normal years 1,650,000 tons, accounting for nine-tenths of her total crop, are shipped. The seed is crushed, linseed cakes being used for cattle-feeding, and the linseed oil going into use in industry.

Owing to changing weather conditions and the wide area in which it grows, Argentine wheat is difficult to classify. The acreage planted with wheat fluctuates more than for any other grain crops. In 1929, 23,000,000 acres of wheat were planted, but with the fall in prices due to the world depression of 1930-31 less and less was grown until in 1935-36 only 14,000,000 acres were planted. Since that time the wheat acreage planted has averaged 18,000,000. About half the republic's oats crop, grown in the south of the Buenos Aires prov., is exported. This is about 400,000 tons, mainly used for animal fodder.

An invisible export is the alfalfa plant, which grows in the humid pampa districts, and provides a great part of the cattle food. About 15,000,000 acres grow it to the exclusion of any other crop, and it is generally cut about six times a year.

Livestock and Meat Industries

Argentina is the world's leading producer of beef; some 90 p.c. of her production is consumed at home. From original British pedigree stock, Argentina has gradually increased her cattle until today it is estimated she has more than 32,000,000 head of cattle. Livestock breeders visit every British cattle show, and always buy the best stock for shipment to Argentina. Thus the quality of meat is kept at the highest standard. In Buenos Aires each year is held the Palermo cattle show at which all the rich *estancieros* (ranch owners) bid for the first-class cattle exhibited. The meat industry is now a highly scientific one and animals are graded and classified from the moment of their birth up to the time they are shipped as beef. Breeding farms are used where all the cows are served by purebred bulls. After birth the calves are sent to fattening farms, which are generally situated in the alfalfa growing districts. Only steers are used for export to Great Britain, and they are first sent for fattening to the best pasturelands. The *frigorificos*, or packing houses, buy their steers direct from the *estancias* when they are about twenty months old. The average weight of the steer

is below 1,100 lb., the maximum export weight.

The beef is exported in three forms, chilled, frozen, and tinned. The chilled beef is brought to England in refrigerated ships and is kept just above freezing point so that it will keep fresh but will not freeze hard. It should be eaten within 40 days from the day of killing. The frozen beef is generally of a cheaper quality, and will keep an indefinite period, for it comes to England frozen solid. The tinned meat is the variety known as corned beef, and all processes in its making, including sterilisation with the tins hermetically sealed, take place in the *frigorifico*. During the Second Great War the Argentine *frigorificos* sent millions of tins of special meat and dehydrated meat for the armed forces in Europe and the Far East. The ten largest *frigorificos* in Argentina, which are state-controlled, are capable of slaughtering 5,000 steers, 10,000 sheep, and 1,000 pigs in an eight-hour day.

Among the world's sheep-breeding countries Argentina stands third, coming after Australia and the U.S.A. This gives her a large and important wool-exporting industry, about 300,000,000 lb. annually. Merino, fine crossbred, and medium crossbred are the main types exported. The U.S.A. is the republic's best customer for wool, although some European countries also import it. Her enormous livestock industry makes Argentina one of the chief hide-exporting countries in the world. Most of the hides are part-salted and dried before export, and the tanning is generally done in the country importing them.

Dairy Products

The dairy industry, although not started until the end of the 19th century, is of considerable size. Butter and eggs are exported to Europe and to the U.S.A., but all the cheese produced is consumed within the republic. Lactic casein, a by-product of butter-making, is used in the manufacture of gum and for paper glazing. Argentina is the world's chief exporter of this. Before the Second Great War Germany was her chief customer, but now Great Britain comes first.

The fruit-growing district of Bahia Blanca has developed rapidly, and with the aid of an up-to-date method of packing, grading, and refrigeration, combined with the excellent growing qualities of the soil, Argentina has found an

increasing market in Europe. Apples, pears, and grapes are the principal fruits exported, Brazil being her first customer, with Great Britain second.

Wines of the Country

Wine making in the Mendoza district is an industry that has been rapidly improved. The Argentine vintners called in French experts for advice. Although some brands are excellent when drunk in Argentina, they are not at the stage where they will "carry" altogether satisfactorily, but wines have been added to the country's list of exports.

Other products are sugar cane (annual production 433,000 tons), pea-nut oil, tobacco, and yerba maté. The latter is a beverage which can be likened to green tea, but it has a recognizable flavour of its own. It is drunk by every one on the *estancias*, and is sucked through a silver or cane tube called a *bombilla* from a small, narrow-necked gourd.

Mineral resources are poor. The only one exploited, and then in small quantities, is petroleum, found in Comodoro Rivadavia and Neuquén in the S., Mendoza in the W. of the central region, and Salta in the N.

INDUSTRIES. During the Second Great War Argentina's manufacturing industries grew enormously, and now the country is self-sufficient in many of the consumer goods she previously imported from Europe and the U.S.A. Production of confectionery has grown and is first-class. Progress in the glass industry has been phenomenal, and factories now make window-glass, all of which was imported before 1939. The production and quality of glass household goods and ornaments have been markedly improved. Shoe factories, soap-making and toilet goods, turnery, electrical fittings, cardboard boxmaking, pneumatic tyres, paper-making, and tanning have become flourishing national industries. Yet Argentina is to some extent an importing nation. During the first six months of 1945 the total value of her imports, in paper pesos, was 466,984,715. Total tonnage imported in that period was 1,855,930, as compared with 2,863,256 tons exported, to the value of 988,354,066 paper pesos.

HISTORY. Before the conquest of Argentina by the Spaniards in the 16th century the Indian tribes, the Diaguites or Calchaquis, lived in stone villages and depended on agriculture for their existence.

The high culture of the Incas did not reach Argentina except for a small part of the N.W. territory, where the tribes are now extinct. The tribes of the wooded Chaco—the present-day land of the republic's Indian population—lived by hunting and fishing. The tribes that lived on the southern pampa hunted the wild llama in small independent parties. It is believed in some quarters that these Indians superseded a people of a higher culture, and this theory is given weight by paintings showing ritualistic and hunting scenes in bright colours which were found in caves in the Patagonian district of Puerto Gallegos. These later Indians were a tall, well-built people and they quickly learned to ride the horses which the Spaniards brought with them to the country. Despite frequent wars with the Spaniards, for many years these tribes roamed the southern part of the country and it was not until the year 1881 that the Spaniards finally drove them from the country and opened Patagonia to white settlers.

In 1515 the Spanish sailor Juan Diaz de Solis entered the river Plate and anchored off a small island which he called Martín García after one of his officers. De Solis was killed by the Indians and his expedition returned to Spain. In 1519 a Portuguese adventurer, Ferdinand Magellan, working for the Spanish crown, sailed up the Plate, hoping to find that it opened into the Pacific. He soon decided, however, that this was not so, and, retracing his way, he went southward on the journey down the coast of S. America. It was from this expedition that the straits of Magellan took their name.

Sixteenth Century Explorers

Sebastian Cabot left Spain in 1526 with the intention of following the journey taken by de Solis in 1515, but instead of anchoring at Martín García he continued up the river Paraná. The Indians greeted this expedition with pleasure, showering gifts on its members. Cabot, however, after quarrelling with Diego García, a member of the ill-fated de Solis expedition, who had followed him to the river Plate, returned to Spain after leaving a small settlement called Espíritu Santo. But soon after he left its members were massacred by the Indians, and it was nine years later, in 1535, that the King of Spain arranged with Pedro de Mendoza, a Spanish nobleman, for another expedition

to go out under his leadership with the object of obtaining a permanent Spanish colony on the lands of the Plate. This he did, and he was the man who gave the Argentine capital its present name. Santa María de los Buenos Aires (S. Mary of the Good Winds), after the patroness of sailors. After a few months trouble broke out with the Indians and the settlement had to be abandoned.

Rise of the Republic

Argentina first broke away from Spanish control in 1810 and began her independence movement. On July 9, 1816, after much fighting, the formal declaration of independence was made at Tucumán.

Among many notable presidents, Bernardino Rivadavia, president in 1826, did much to further the republic's development; he founded banks, a currency system, and schools, and established commercial treaties with the U.K. During his presidency Argentina went to the aid of Uruguay in a three-year war to push the Brazilians back from the River Plate territory. This war was successful.

The first constitutional president of the republic (constitution signed May 1, 1853) was Gen. Bartolomé Mitre; he was followed by Domingo Faustino Sarmiento. Under the guidance of these two statesmen the republic made great progress. There was then a period of internal troubles which ended with the subduing of the Indian population by Col. Roca, minister of war, who afterwards became president. It was during his regime that British capital poured into the republic. Since then Argentina, like most new countries, has had turbulent times, but the republic's material progress has been phenomenal.

During the Second Great War Argentina was the subject of world-wide comment because of her neutrality, coupled with the emergence of an authoritarian regime. Although most of the comment was adverse, there was a school of thought which contended that by not joining the United Nations Argentina was better able to supply the enormous amount of foodstuffs she sent to Europe and the East.

Traditionally, the two main political parties are Radicals and Conservatives. But these were overwhelmed in the establishment of dictatorships (see N.V.).

LANGUAGE AND LITERATURE. Like the rest of Latin America, except Brazil where the language is Portuguese, the people of

Argentina speak Spanish. But naturally in a continent the size of Latin America, there are many variations in the types of Spanish spoken, and the Argentine variety, judged by Castilian standard, is poor. Argentina is notable for its pronunciation of the "ll." In Spain and in the more northern Latin-American countries, for instance, the pronunciation of the word for street, *calle*, is "cahye," whereas in Argentina it is pronounced "cahje." As is to be expected in a land where the population is made up of all European races, many words not used in any other Latin-American republic have crept by common usage into the Argentine variety of Spanish.

Poets and Novelists

Argentine literature has been prolific and varied, and all aspects of Argentine life have provided subjects for writers. Outstanding names in its literature and intellectual life during the past hundred years are: Esteban Echeverría (1805-1851), a romantic poet whose greatest work was *La Cautiva*, 1837; José Mármot (1818-1881), author of the famous novel *Amalia*; Bartolomé Mitre (1821-1906), journalist (founder of the daily newspaper *La Nación*) and poet of nature, and also one of the leading historians of S. America; Juan Bautista Alberdi (1810-1884), diplomat, journalist, and prolific writer of prose; Domingo Faustino Sarmiento, statesman, educator, poet, and author of *Facundo*, a famous socio-political biography of the lieutenant of the dictator Rosas; José Hernández (1834-1886), who wrote *Martin Fierro*, the great book of primitive *gaucho* (cowboy) life in Argentina, its place in Argentine literature being almost comparable to those of the Bible and Shakespeare; Estanislao del Campo (1835-1880), who wrote a famous burlesque poem, *Fausto*, in *gaucho* dialect; and Ruben Dario (1867-1916), famous as a poet throughout Latin America, who spent most of his life in Argentina, though born in Nicaragua.

In the 20th century the best-known Argentine novelist is Hugo Wast (Gustavo Martínez Zuvirria), whose popular novels have been translated into many languages. The greatest poet, essayist, and publicist was Leopoldo Lugones. A novelist and historian who has been honoured by foreign universities and whose works have been translated into many languages is Ricardo Rojas. A poetess of outstanding merit was Alfonsina

Storni. An Argentine academy of letters, founded 1921, has a membership limited to twenty.

The two newspapers *La Prensa* and *La Nación* compare favourably with any in the world. *La Prensa*, known for its high literary and cultural standards, is still owned by the family of the founder, José C. Paz, who started it in 1869. *La Nación*, a paper with a strong Catholic policy, was founded in 1870 by Bartolomé Mitre (q.v.), president 1862-68, and is still controlled by the Mitre family.

Music. During the 19th century native music was mostly confined to folk dances, including the *pericón*, a native country dance, and the tango. However, the ever-growing number of European musicians who have visited Argentina have helped to create a local school of music. The best known composers are Julian Aguirre (d. 1935) and Alberto Williams (b. 1862), the "grand old man" of Argentine music.

Jefferson, 1926; The River Plate Republics, W. E. Browning, 1928; A History of the Argentine Republic, F. A. Kirkpatrick, 1931; Gauchos and Tom-toms, B. M. Wallenstein, 1932; A Tentative Bibliography of Belles-Lettres of the Argentine Republic, A. L. Coester, 1933; Argentine Tango, P. Guedalla, 1933; History of Argentina, R. Levene (trans. W. S. Robertson), 1937; Argentine Meat and the British Market, S. G. Hanson, 1938; The International Economic Position of Argentina, V. L. Phelps, 1938; River Plate Personalities, W. J. Lamb, 1939; Introduction to Argentina, A. W. Weddell, 1939; The Way Southward, A. F. Tschiffely, 1940; Voice from the Wilderness, R. W. Thompson, 1940; The Argentine Republic, Y. F. Rennie, 1945.

Argentina, LA (1890-1936). Spanish-American dancer, whose real name was Antonia Merée. Born in Buenos Aires, Sept. 4, 1890, she went to Spain at the age of two with her parents, who became members of the company of the Madrid Royal Opera House.

Argentina, Spanish dancer famed for the precision of her footwork and spirited playing of the castanets

Argentina joined the company at the age of five. At eleven she was a première danseuse. Later, moving to Paris, she became internationally famous. Her performances of Spanish dances and her playing of the castanets were unrivalled. She toured Europe and America appearing regularly in London from 1931, where her *Danse Rituelle du Feu* became specially popular. She died at Bayonne, July 18, 1936.

Argentine Pass.

Depression in the Rocky Mts. In the state of Colorado, U.S.A., not far from Denver, it is just over 13,000 ft. in height, and is among the highest wagon roads in the world.

Argentite. One of the principal ores of silver. It is the source from which much of the silver is obtained in the mines of Germany, Bohemia, Hungary, Mexico, and Nevada. A sulphide, it has a composition of about 86.5 p.c. silver and 13.5 sulphur. It is always found combined with other sulphides, particularly those of copper and lead. See Silver.

Argentoratium. Latin name for Strasbourg. It was used by the early printers. Most of the books printed at Strasbourg in the 15th, 16th, and 17th centuries bear the impress *Argentoratium*. See Strasbourg.

Argesul, ARGESH, ARJISH, OR ARJESHU. River of Rumania. Rising in the Transylvanian Alps, it flows for 150 m. S. and S.E. to the Danube below Oltenitsa.

Argesul, BATTLE OF THE. Battle fought Nov. 30-Dec. 3, 1916, between the Austro-Germans under Falkenhayn and Mackensen and the Rumanians under Avarescu. It resulted in a heavy defeat for the Rumanians and the evacuation by them of their capital Bukarest, which was occupied by Mackensen on Dec. 6. See Rumania.

Arghana Maden. Town of Turkey, in Elazig vilayet. On the river Tigris, 50 m. N.W. of Diarbekir, it has an old and very rich copper mine.

Argives (Greek *Argeioi*; Lat. *Argivi*). Inhabitants of Argos in Greece. Homer uses the term for the Greeks in general. See Argos.

Argob. Hebrew name for the district containing threescore cities ruled by Og king of Bashan (Deut. 3; 1 Kings 4). Called by the Greeks Trachonitis (Luke 3), it is usually identified with the modern El Lejah. Described as an ocean of basaltic rocks and boulders, it is studded with deserted towns and ancient villages. See Palestine.

Argol. Crude acid potassium tartrate deposited from wine. When grape juice ferments the acid potassium tartrate ($\text{KHC}_4\text{H}_4\text{O}_6$), which it contains naturally, is deposited because it is less soluble in the alcohol which results from the fermentation process. Argol is deposited as a crystalline crust on the sides of the vat, and when this is recrystallised it is known as tartar; from this, by further purification, cream of tartar is obtained.

Argol occurs in commerce as red argol and white argol, according as it is deposited from red or white grapes. From argol tartaric acid ($\text{H}_2\text{C}_4\text{H}_4\text{O}_6$) is made by neutralising it with whiting and afterwards boiling with calcium sulphate. This forms calcium tartrate and potassium sulphate. The latter is separated out by crystallisation and the calcium tartrate treated with sulphuric acid.

Argolis. A district of ancient Greece. Occupying the N.E. part of Peloponnesus, bordering the Gulf of Aegina or the Saronic Gulf, and the Argolicus Sinus or Gulf of Nauplia, it was the territory surrounding Argos. It became part of the Roman prov. of Achaea in 146 B.C. It has many legendary associations, including that of the Lernean Marsh, where Hercules slew the Hydra. Argolis with Corinthia now forms a nome or department of modern Greece. Its capital is Nauplia. Pop. 190,184.

Argon (Gr. *argos*, inert). One of the gases which go to make up the atmosphere. It exists in the proportion of nearly 1 p.c. of air.

At the meeting of the British Association in 1882 Lord Rayleigh mentioned that he had begun a research on the densities of hydrogen and oxygen, and in the experiments he found that the density of nitrogen varies according as it is prepared from the atmosphere or from ammonia. In 1893 chemists were asked to make suggestions to account for this difference. Sir William Ramsay took up the work and adopted the method, devised by Cavendish nearly a century before, of removing the oxygen from air by means of an electric discharge. He also called attention to a remark by Cavendish that there ap-

peared to be a small amount of nitrogen differing from the rest in that it could not be reduced to nitrous acid. He devised a method of removing the nitrogen from air by employing magnesium metal and an electric current and in this way collected a fairly large amount of the residue. Tested by the spectrum method of analysis, the residue gave a different spectrum from that of nitrogen. This proved that a new gas had been discovered, and it was named argon, and the fact published at the meeting of the British Association in 1894.

Argon is an inert gas, and attempts to make it combine with other elements have failed. Sir James Dewar has liquefied and solidified it. Argon is now prepared with comparative ease from the air, provided it is not required in a state of absolute purity. It is of commercial use in filling the bulbs of the tungsten electric lamps, for which purpose it is better than nitrogen. When argon is used lamps can be run at a higher temperature, greater efficiency, and less waste.

Argonaut. Cuttle fish of the genus *Argonauta*. The beautifully ribbed, translucent shell is secreted

Argonaut, or paper nautilus. The upper figure shows the animal swimming

by the flat expansions of two of the arms, or tentacles, of the animal, and it is not attached in any way to the body. Its object is to serve as a receptacle for the eggs. The argonaut is common in the tropic seas: one species, the paper nautilus, inhabits the Mediterranean.

Argonauts (Gr., sailors of the Argos). In Greek mythology, the heroes who, under the leadership of Jason, sailed to Aea or Colchis, on the Black Sea, in search of the Golden Fleece. They were so called from the name of the 50-oared ship Argos which was built by Argos,

Jason was the son of Aeson, who had been deprived of the kingship of Iolous in Thessaly by his half-brother Pelias. To get rid of Jason, Pelias suggested to him that he should fetch the Golden Fleece, which hung in the sacred grove of Mars at Colchis.

Aeetes, king of Colchis, agreed to surrender the Fleece to Jason provided he tamed two fire-breathing oxen with feet of brass, and with them ploughed a two-acre field. He was then to sow the teeth of a dragon, which would produce a crop of armed men, who had all to be destroyed. Finally, he had to kill the dragon guarding the Fleece.

By the help of the magic powers of Medea, the king's daughter, who fell in love with him, Jason succeeded in fulfilling all the conditions, obtained the prize, and started home, taking with him Medea and her young brother Absyrus. They were pursued by Aeetes, but Medea delayed the pursuit by murdering her brother and scattering his limbs in the sea, so that the father would have to pick them up for burial. Zeus in rage sent a storm: the ship declared that the expedition must visit Circe in Ausonia before it could be purified. After evading the fatal allurements of the Sirens, and escaping the perils of Scylla and Charybdis, the voyagers eventually returned to Iolous.

The voyage of the Argonauts is the subject of a Greek poem by Apollonius of Rhodes and of a Latin adaptation by Valerius Flaccus, and is described in Kingsley's *The Heroes*. See Jason; Medea.

Argo Navis or **THE SHIP ARGO**.

One of the southern constellations, most of which lies below the English horizon. It is so vast that, for convenience of reference, it has been subdivided into four minor groups: Pyxis, the compass; Vela, the sails; Puppis, the stern; and Carina, the keel. It contains 15 stars brighter than the third magnitude, among them Canopus, which is next in brightness to Sirius. See Constellations.

Argonne. District in E. France, known from its wooded character as the forest of Argonne. It covers part of the departments of Ardennes and Meuse, and lies between Toul and Mézières, being a stretch of high ground between the basins of the Meuse and the Aisne. About 10 m. wide from east to west and 40 m. long from north to south, it is densely covered with undergrowth and intersected with ravines.

Argonne, CAMPAIGNS IN THE. Series of operations in the First Great War. The Argonne owed its strategic importance to the fact that a successful advance through it by the Germans would have turned Châlons and Verdun and rendered the French front on the Meuse untenable.

The German Crown Prince with the 5th German army passed

Argonne. Map of the forested area through which the Germans menaced Verdun in 1914 and 1915, and through which the French and Americans drove back the invaders in the closing stages of the First Great War

through the Argonne in the first advance of Aug.-Sept., 1914, and by him Varennes was many times taken and relinquished. During the winter the two entrenched forces were in close contact parted by only a few yards of almost impenetrable bush, barbed wire, and concealed machine-gun posts. In Jan., 1915, the French failed in an effort to storm Bourguilles. In Feb. a fierce struggle opened for the strongly fortified village of Vauquois half of which was captured by the French.

In June, 1915, the German staff determined to make a thrust through the Argonne with about 80,000 men. French positions were heavily bombarded with gas-shells, and between June 20 and July 2 a series of assaults was delivered. About mid-July the battles ended in a virtual stalemate, the French holding all the vital positions.

In the autumn of 1918 Foch, as supreme Allied commander, resolved to clear the Argonne. His force included 22 U.S. divisions with a total strength of 631,000 men (though only 3 divisions had taken part in previous operations): together with 4 French divisions comprising 138,000 troops, including artillery. On the German side 46 divisions were employed.

The U.S. attack opened on Sept. 26 on a front of 18 m. Close cooperation of artillery could not be given, the U.S. staff having put its main trust in telephones and the lines being cut by German artillery fire. Other difficulties hampering the Americans were the lack of roads and light railways: and, as always, the mud. By Oct. 4 the advance totalled only 7 m. But the Germans were at no time strong enough to counter-attack, and on Oct. 29 Marwitz, the German commander, fell back on the W. bank of the Meuse and blew up his ammunition dumps. By Nov. 2 the whole Argonne

region was cleared and an advance of 16 m. accomplished. American casualties in the battle numbered 115,529, including 15,599 killed. French casualties were 7,000.

Argos. City of ancient Greece. In Argolis, 3 m. inland from the head of the Gulf of Nauplia, and said to be the oldest city of Greece, it became the nucleus of a kingdom, with Mycenae as its capital. From being the predominant state, it fell in the 7th century B.C. under the influence of Sparta, but remained independent until conquered by the Romans in 146 B.C. Many remains have been excavated, including those of the Heraeum or temple of Hera, which contained a gold and ivory statue of the goddess. The modern Argos a flourishing town and a junction on the rly. from Corinth to Tripolis, has remains of its cyclopean walls and rock-hewn amphitheatre. Pop. 10,000.

Argostoli. City and seaport of the Ionian Islands, Greece. The ancient Kephallenia and the capital of Kephallonia Island, it stands on the E. shore of the Gulf of Argostoli, and has a good harbour and a naval school. It has a shipbuilding industry, exports currants, wine, and oil. Its mills are driven by sea-water flowing through an artificial cut. Pop. 8,293.

Argosy. Term used, generally figuratively, in the sense of a richly laden ship. Though popularly connected with the vessel Argo in which Jason bore off the Golden Fleece (see Argonauts), the word was said in the 17th century to be derived from Aragouse, a corruption of Ragozie, i.e., a ship from the wealthy port, Ragusa.

Argot. French term for slang. It is applied to the colloquial language of general society; the special vocabulary of a class community, profession, or calling. and—the earliest meaning—the jargon of thieves, rogues, and vagabonds. French slang dates

back to the 14th or 15th century, and may have originated among thieves, among the gipsies just appearing, among students, or in the motley gatherings at the great medieval French fairs. The 15th century vagabond-poet François Villon, was the first to use slang in literature, and some of his poems are written entirely in argot.

Argument (Latin *arguere*, to prove). That part of a proof on which rests its validity or power of convincing. The term is often used in the sense of argumentation (demonstration of the proof of something). Arguments may be demonstrative, based upon absolute, necessary truths; or dialectic, based upon relative, contingent propositions, which cannot produce conviction. The *argumentum ad hominem* (to the man) is an argument addressed directly to an opponent, based on his own previous actions or admissions. *A priori* arguments have their origin in reason, a *posteriori* are deduced from experience.

Argun. River of Asia. It rises in the W. of Manchuria and flows mainly N. between that country and Siberia, and unites with the Shilka at Ust-Stryelka to form the Amur. Its length is about 500 m.

Argus. In Greek mythology a being with 100 eyes, of which only two slept at a time. Hera appointed him guardian of Io, whom Zeus had changed into a heifer, but all his eyes were lulled to sleep by the lyre of Hermes. Hera thereupon put his eyes on the tail of a peacock, the bird sacred to her. Argus was also the name of the dog of Ulysses, who died from joy when his master returned after an absence of 20 years.

Argus Pheasant. Species of pheasant found in Malaya and Sumatra. It is notable for the extra-

Argus Pheasant, bird of beautiful plumage. It is a native of Malaysia

ordinary length of the tail feathers and for the beautiful, eye-like spots on its plumage.

Argyle, PEARL (1910-47). British dancer. Born at Johannesburg, Nov. 7, 1910, she studied dancing under Marie Rambert in London. From 1930 to 1931 she danced in three seasons of ballet with Karavina at the Lyric Theatre, Ham-

Pearl Argyle. British dancer, member of several famous ballet companies

mersmith, and appeared in C. B. Cochran's *Helen* at the Adelphi Theatre, 1932. Her performances in *Carnaval*, *Aurora's Wedding*, and *L'Après-midi d'un Faune* reached a brilliant level at the Mercury Theatre in 1934. In 1935 she joined the Sadler's Wells company. She died Jan. 28, 1947.

Argyll, EARL AND DUKE OF. Scottish titles borne since 1457 and 1701 respectively by the family of Campbell. Duncan Campbell of Loch Awe was a lord of Scotland about 1400; his grandson Colin was 1st earl. Archibald, 2nd earl, was killed at Flodden. Archibald, son of the 9th earl, recovered the titles and estates after the Revolution of 1688, and for helping William III was rewarded in 1701 with a dukedom. John, the 2nd duke, served at Malplaquet. John the 5th duke, the second husband of Elizabeth Gunning (*q.v.*), was made a baron of Great Britain in 1766. The 8th and 9th dukes are noticed separately below. In 1949 the titles and estates passed to the 11th duke, Ian (b. 1903), who succeeded a cousin.

The duke is hereditary master of the royal household in Scotland, keeper of the great seal of Scotland, admiral of the western isles, and keeper of the castles of Carrick, Dunoon, and Dunstaffnage. His chief seat is Inveraray Castle. The eldest son is usually known as the marquess of Lorne, and the dukedom has been since 1892 a peerage of the United Kingdom. Readers of Macaulay's *History*, Scott's *Legend of Montrose*, and Stevenson's *Catriona* will know of the power once wielded by the dukes in the W. Highlands.

Argyll, ARCHIBALD CAMPBELL, MARQUESS OF (c. 1604-61). Scottish statesman. Known as Lord Lorne, he began as a young man to administer the estates of his Roman Catholic father. In 1638 he became the 8th earl: and with the quarrel between Charles I and the Covenanters coming to a head, both sides were anxious to secure his aid. A dour Presbyterian, Argyll acted as a military leader of the Covenanters in 1639. Though made a marquess by the king, in the Civil War he took up arms against Montrose and the Royalists, who defeated him at Inverlochy, Feb. 2, 1645. He fled to England, but returned to power and associated himself with Cromwell. After the execution of the king, he changed sides again, and crowned Charles II at Scone in 1651. Commonwealth soldiers marched on Inveraray and after a siege the marquess submitted. Found guilty of treason by the Restoration parliament, he was beheaded in Edinburgh, May 27, 1661.

Argyll, ARCHIBALD CAMPBELL, 9TH EARL OF (d. 1685). Scottish soldier. Eldest son of the above marquess, he fought at Dunbar for Charles II, but submitted to Cromwell in 1655. On refusing to renounce allegiance to the Stuarts he was imprisoned. Released at the Restoration, he was warmly received by Charles, and in 1663 the title of earl and the estates of his father were given back. Through protesting at the harshness employed against the Covenanters, 1671, he fell into disfavour, and in 1681 was tried for treason. After a travesty of justice Argyll was condemned, but escaped from prison to Holland. There he met Monmouth and agreed on the proposed invasion of Britain. He landed in Scotland, but the cause failed. Taken prisoner, he was beheaded in Edinburgh, June 30, 1685, under the sentence of 1681.

Argyll, GEORGE DOUGLAS CAMPBELL, 8TH DUKE OF (1823-1900). British statesman and writer. Born April 30, 1823, he succeeded to the title in 1847 and came quickly into prominence in

George Douglas Campbell, 8th Duke of Argyll

the House of Lords. In 1853 he was made lord privy seal under Aberdeen, and from 1855-58 was postmaster-general. In the Whig ministry of 1859-66 he was again lord

privy seal, and was secretary for India, 1868-74. In 1880 Gladstone made him lord privy seal, but he resigned next year, disapproving of the Irish land bill. Later he bitterly opposed Gladstone's Home Rule measure, but the estrangement was healed when both appeared in public on behalf of the Armenians. The duke died April 24, 1900. He wrote *The Reign of Law*, 1867; *The Eastern Question*, 1879; *Our Responsibilities for Turkey*, 1896. *Concull* Autobiography and Memoirs, 1906.

Argyll, JOHN DOUGLAS SUTHERLAND CAMPBELL, 9TH DUKE OF (1845-1914). British politician. He was educated at Eton, St. Andrews, and Trinity College, Cambridge, and was long known as the marquess of Lorne. In 1871 he married the Princess Louise, fourth daughter of Queen Victoria, and from 1878 to 1883 was governor-general of Canada. In 1868-78 he was Liberal M.P. for Argyllshire and in 1885-1900 Liberal Unionist M.P. for S. Manchester. He succeeded to the title and estates in 1900, and died May 2, 1914.

Argyll and Sutherland Highlanders. Kilted regiment, a union of the old 91st (Argyllshire Highlanders) and the 93rd (Sutherland Highlanders). The former was raised in 1794 by the duke of Argyll, and the latter by the earl of Sutherland in 1800. The old 91st specially distinguished itself in the Peninsular War, and formed part of the rearguard at Corunna. The 93rd won renown at the Alma and Balaklava. A detachment of the 91st was on board the *Birkenhead* when she was wrecked in 1852. The regiment bore an honourable part in quelling the Indian Mutiny, and in the S. African and the two Great Wars. A battalion formed the rearguard for the withdrawal to Singapore from Malaya, 1942. Other battalions served in Tunisia, notably at Longstop Ridge, April, 1943, and with the B.L.A., crossing the Rhine with the Highland division (*q.v.*).

Argyll Rooms. Fashionable London pleasure resort in the early part of the 19th century. Originally a large house in Little Argyll Street, London, W., it was bought by a Colonel Greville and converted into a place of public entertainment, where masquerades, balls

A. and S. Highlanders' badge

Argyllshire. Map of the westernmost county of Scotland. Ardnamurchan Point in this county is the most westerly portion of the mainland of Britain. The county is cut up by many lochs and bays into peninsulas and islands

and concerts took place. Rebuilt by John Nash, the premises were burnt down while in the occupation of M. Chabert, known as "the fire king," Feb. 5-6, 1830.

Argyllshire. Western maritime and second largest co. of Scotland.

It includes most islands of the Inner Hebrides, the principal being Mull, Islay, Jura, Tiree, Coll, Lismore, Colonsay, and the small and picturesque islands of Iona and Staffa. Its greatest length is 114 m., extreme breadth 55 m., and

area 3,110 sq. m. The co. is served by the Scottish Region of British Railways, and by the Crinan Canal, which connects Loch Fyne with the Sound of Jura. The coast measures more than 2,000 m. and is broken by

many sea-lochs (Linnhe, Fyne, Moidart, Sunart, Long) and land projections (Ardnamurchan, Morven, Kintyre).

The surface is generally rugged and mountainous (Bidean nam Bian 3,766 ft., Ben Cruachan 3,689 ft., Stob Ghabhar 3,565 ft., Ben Ime 3,318 ft., Ben More 3,169 ft.), with low-lying coast districts. Loch Awe is the largest lake, and the chief streams, short, rapid, and unnavigable, are the Orchy and Awe. Sheep and cattle rearing and herring and salmon fishing mainly engage industrial attention less than 10 p.c. of the land being under cultivation. Slate is quarried at Easdale and Ballachulish, coal is worked near Campbeltown, and granite and limestone are also found. Strontian was formerly noted for its lead mines. In Islay and at Campbeltown there are whisky distilleries, and Kinlochleven has a large aluminium works. Inveraray is the county town, and Campbeltown, Dunoon, Oban, Lochgilphead, and Tobermory are next in importance. There is one member of Parliament. Pop. 63,014.

Argyrokastro (Albanian, GJINOKASTER). Town of Albania. Called Ergeri or Ergi by the Turks when it formed part of the vilayet of Janina, it is an important centre of N. Epirus. It lies about 50 m. N.W. of Janina, on the E. declivity of the Acroceraunian Mts. on a tributary of the Vijose. It is noted for its snuff. It was occupied by the Greeks in 1916, and later by the Italians. During the Italo-Greek war (1940-41) the town became the main Italian forward base in South Albania, but was captured by the Greeks on Dec. 8, 1940. But they withdrew when Greece was invaded by the Germans in April, 1941; and only in Dec., 1944, when the Germans abandoned their hold upon Albania, was Argyrokastro freed. Pop. 10,836, mostly Greeks.

Ariadne. In Greek mythology, the daughter of Minos, king of Crete. Theseus, on his arrival in Crete with the tribute of young men and maidens to be devoured by the Minotaur, was shown by Ariadne how to find his way out of the labyrinth, the monster's dwelling-place, by means of a ball of thread. He took Ariadne away with him, but deserted her on the island of Naxos while she slept. Here the god Dionysus (Bacchus) took her to wife, and set her crown among the stars; or took her away by force from Theseus when they landed. In Homer, Ariadne was killed by Artemis on her arrival at

Naxos; in another account, she slew herself when abandoned by Theseus. Ariadne was a nature goddess, whose desertion by Theseus and marriage to Dionysus may symbolise the death and revival of vegetation in winter and spring respectively.

Aria Form. Term applied to music constructed after the formula A-B-A. A represents one section more or less complete in itself, sometimes repeated; B is a new section, for contrast; and a recapitulation of A, entire or modified, completes the aria. This form, in embryo, is found in popular airs such as "Charlie is my darling."

Ariana or **ARYANA**. Ancient division of Asia. In the widest sense it comprised the territory peopled by Aryans lying between the Tigris on the W. and the Indus on the E.

Arianism. Name given to the doctrine, maintained by Arius in the 4th century, denying that Christ was equal to or was of the same substance with God the Father. The doctrine may be traced to the teaching of Paul of Samosata, but was first systematised by Arius, a priest of Alexandria, and Athanasius was its great opponent.

The controversy had become acute by 323, and in 325 the Council of Nicaea condemned Arius and formulated the earliest published declaration of the Catholic Faith—the Nicene Creed, in which the decision of the Council is to be found, with a few verbal differences, down to the words "in the Holy Ghost." All the bishops but two subscribed to the decision. Eusebius of Nicomedia subscribed, but altered the (Greek) word *homo-ousion* = of one substance with, into *homo-i-ousion* = of a similar substance. Words of anathema were added to the declaration.

But Arianism was not extinguished. It was in the ascendant even under Constantius, the son of Constantine and Valens (353-378), but, Theodosius I declaring for Athanasianism, the second great council of the Church, held at Constantinople, 381, restored the authority of its predecessor of 325. Divided among themselves, the Arians declined in numbers and influence within the Roman empire. Meanwhile, however, the heresy spread among the West Goths, whose adoption of Arianism was one of the conditions of their settlement in Thrace; the East Goths in Italy, the Vandals in Africa, the Suevi in Spain, the Burgundians in Gaul,

and the Lombards in Upper Italy, until its fate was sealed by the triumph of the Franks under Clovis, who was baptized at Reims in 496. It reappeared in Europe in the 16th century in Poland, and in England from Henry VIII to James I there were executions for Arianism. Today it may be traced in the forms of Unitarianism, Socinianism, and Deism. Arianism was not compatible with the doctrines of the Trinity and the divinity of Christ. See Arius; Athanasius.

Ariano di Puglia. Town and episcopal see of Italy, in Avellino province. It stands among the Apennines, 24 m. by rly. E. of Benevento, and has sulphur mines, marble quarries, and earthenware manufactures. Many of the people live in rock caves. Pop. 8,500.

Arica. Northernmost seaport of Chile. In Tarapaca prov., 39 m. by rly. S. of Tacna in Peru, it is the terminus of the rly. across the Andes to La Paz, of which it is chief port of entry. Taken by Chile from Peru in 1880, it was long the subject of dispute, but Chilean possession was amicably confirmed, on the arbitration of the U.S., by an agreement at Lima, 1929. Exports include copper, silver, gold, iron, salt, sulphur, guano, borax. Pop. 13,140.

Arichat. Seaport of Nova Scotia, Canada. The capital of Richmond county, and the seat of a Roman Catholic bishop, it stands on the S. side of Madame Island, and is served by the Cape Breton Rly. It has a deep harbour, fisheries, and a canning industry.

Aricia. One of the oldest cities of Latium, standing on the Appian Way, 16 m. S.E. of Rome. Opposing Rome, it was conquered by C. Maenius in 338 B.C., being subsequently granted full rights of citizenship. The modern town of Ariccia lies to the N.

Ariège. A department of S. France. It is bordered on the S. by the Pyrenees, of which it includes some of the highest peaks, and is watered by the Ariège and the Salat. Agriculture, the cultivation of the vine, and the mining of iron and other minerals are the chief industries. Foix is the capital. The area is 1,392 sq. m. Pop. 155,134.

Ariel. Dainty sprite who waits on Prospero's commands in Shakespeare's comedy *The Tempest*. Although the name is of Hebrew origin, Ariel is the delicate, gossamer-winged fairy of English folk tales. Throughout the play Ariel voices a longing for freedom and at last is restored to

the liberty of the unchartered elements. Shakespeare gives Ariel three exquisite fairy songs: Come unto these yellow sands, Full fathom five thy father lies, and Where the bee sucks, there suck I. In Milton's *Paradise Lost* (vi, 371) Ariel is one of the fallen angels, and in Pope's *Rape of the Lock* a sort of fairy lady's-maid to Belinda. See *Tempest*, The.

Ariel. Man of Moab whose two sons were slain by Benaiah, son of Jehoiada (2 Sam. 23: 1 Chron. 11.

Ariel casts a spell at the bidding of Prospero. Dennis Hutchinson as Shakespeare's dainty sprite in a Stratford-on-Avon production of *The Tempest*, 1938

R.V.). The name occurs on the Moabite stone in allusion to an altar, is used as the name of a man in Ezra 8, and applied symbolically to Jerusalem in Isaiah 29, and in the Hebrew of Ezek. 43 to the altar of burnt offerings. The word means lion, or altar, of God.

Aries (Lat., ram). One of the twelve signs of the Zodiac. Through it the sun passes on its annual round, and it was associated in Greek mythology with the voyage of the Argonauts in search of the Golden Fleece. Aries is an important but small constellation close below the greater W that lies beneath the smaller W of Cassiopeia's Chair. It can also be found by following the stars which mark the belt of Andromeda. The only stars in the constellation—which are usually known by their Arabic names—are the three on the Ram's head. Alpha is known as Hamal, which is Arabic for Ram, and Beta and Gamma bear the names Sheratin, the two signs, and Mesartin, the two attendants. The "first point of Aries" is the point of the heavens at which the sun annually crosses the Equator at the vernal equinox. Owing to the precession of the equinoxes, this point is now actually in the constellation Pisces, but is still conventionally called the first point of Aries. See *Zodiac*; *Precession*.

Arietta (Ital., little aria). In music, a short and less important

aria, frequently without definite second and third sections. See *Aria*.

Aril (late Latin *arillus*, dried grape). Fleshy coating to certain seeds, arising from the placenta. The best examples are found in the "mace" that encompasses the nutmeg, and the orange-coloured wrapping of the seed that helps to make opened seed-vessels of the spindle-tree so conspicuous.

Arimaspi. Mythical people of Scythia. They are referred to by Herodotus (iv, 13, 27) as dwelling to the E. of the Caspian Sea. Pausanias describes them as all one-eyed men from birth, constantly at war with the griffins guarding the gold of the river Arimaspius, probably in the Altai district of Russia. Aeschylus makes them inhabitants of Africa. Cf. Milton, *Paradise Lost*, ii, 943: The Arimaspi, who by stealth Had from his [the griffin's] waketul custody purloined The guarded gold

Aries, or the Ram, one of the twelve signs of the Zodiac

edition (Ferrara, 1532) the poem appeared in an enlarged form and assumed its final proportions. His other writings include five comedies and some graceful sonnets.

After serving the cardinal faithfully for 14 years Ariosto was dismissed without further reward, but soon after joined the household of the cardinal's brother Alfonso, duke of Este. In 1522 the poet undertook, with success, to quell a rebellion in the Garfagnana province, of which he later became governor, but after three years returned to Ferrara. He died June 6, 1533, and was buried in the Church of San Benedetto, Ferrara, where a handsome monument was erected to his memory. Eng. translations of the *Orlando*: Sir J. Harington, 1591; T. H. Croker, 1755; W. Huggins, 1757; J. Hoole, 1773-83; W. S. Rose, 1823-31. See *The King of Court Poets*, E. G. Gardner, 1906; *Life and Genius of Ariosto*, J. S. Nicholson, 1914.

Ludovico Ariosto
Portrait by Tizian

Ariovistus. A German chief, mentioned in Caesar's Gallic War. In 60 B.C. he crossed the Rhine with his followers to help the Sequani against the Aedui, whom he defeated. He then invaded Gaul and took some territory from the Sequani. After refusing a conference with Caesar, whose assistance was invoked by the Aedui, Ariovistus was driven back across the Rhine by the Romans in 58 B.C.

Arisaig. District of Inverness-shire, Scotland. It lies between Lochs Ailort and Morar, and is partly covered by a deer forest. The village of Arisaig is 34 m. N.W. of Fort William, on a branch of the L.N.E.R.

Arish, EL. Harbour of Egypt. It stands on the Mediterranean, near the boundary between the Sinai Peninsula and Palestine, and is on the caravan route from

Arish. View of the Egyptian town as seen from the S.E. From here in the First Great War the British constructed a railway into Palestine

Beersheba to Egypt. It was taken by Napoleon in 1799 and during the First Great War was occupied by the Turks, from whom it was captured by the British on Dec. 21, 1916. The advance of the British troops was facilitated by the construction of a rly. to this point, since extended over the Palestine border and as far as Haifa.

Arista, MARIANO (1802-1855). Mexican general. Born at San Luis Potosí, July 26, 1802, in 1846 he took command of the Mexican army of the north in the war with the U.S.A., but, being defeated at Palo Alto (May 8) and Resaca de la Palma (May 9), he was recalled. War minister in 1848, he was president of Mexico in 1851-53, and resigning, was banished to Europe. He died at sea, Aug. 7, 1855.

Aristaeus. In Greek mythology, son of Apollo and the nymph Cyrene. He was the protector of flocks and herds, of shepherds, and of vine and olive plantations. In Virgil's *Georgics* (iv) he is connected with the story of Orpheus and Eurydice (*q.v.*).

Aristagoras (d. 497 B.C.). Tyrant of Miletus in Caria. He persuaded Darius, king of Persia, to aid him in an attack on Naxos, but the expedition miscarried. Fearing the wrath of Darius, who hoped to obtain possession of the island, Aristagoras stirred up the Greek cities of Asia Minor to revolt against Persia. Having obtained aid from the Athenians, the combined forces marched on Sardes, which was captured and burnt. Unable to hold the city, the Greeks, deserted by the Athenians, were forced to retreat to the coast, and their cities passed again under Persian rule. Aristagoras fled to Thrace, where he was killed shortly afterwards while fighting against the wild tribes of the country.

Aristarchus of Samothrace (c. 220-145 B.C.). An Alexandrian grammarian and critic. He was a pupil of the grammarian Aristo-

phanes of Byzantium at Alexandria, where he founded a critical and grammatical school and superintended the education of the children of Ptolemy VI Philometor. When his pupil, Ptolemy Physcon, who had usurped the throne, began to persecute men of learning, Aristarchus fled to Cyprus, where he is said to have starved himself to death.

He devoted his labours to the explanation and restoration of the text of the most important Greek poets. His great work was his recension of the *Iliad* and *Odyssey*, which is the basis of all subsequent texts. In this he made use of critical marks to indicate spurious or interpolated passages.

Aristarchus of Samos. Greek astronomer, who lived in the third century B.C. He is said to have been the first to state that the earth moved round the sun.

Aristeas (c. 550 B.C.). Greek poet. A native of the island of Proconnesus. His poem, *Arimaspeia*, contained an account of his travels on the north coast of the Black Sea and of the *Arimaspi* (*q.v.*) and other similarly fabulous peoples.

Aristeides OR **ARISTIDES** (c. 550-467 B.C.). An Athenian general and statesman, surnamed the Just. After the first Persian War, in which he fought with distinction at Marathon, he opposed the policy of Themistocles, who regarded the creation of a fleet as the best bulwark against Persian aggression. The differences between them became so acute that in 483 ostracism (*q.v.*) was resorted to, as a result of which Aristeides had to go into exile. He did good service, however, in the second Persian War, with a force raised by himself privately, and in 479 commanded the Athenians at the battle of Plataea. When, owing to the arrogance of Pausanias, the states of Greece, which had formerly

looked to Sparta as their leader, transferred their allegiance to Athens, and the Delian league was formed, Aristeides was chosen to organize the league, and to determine the contribution of each state. In domestic politics though an aristocrat by birth, Aristeides, recognizing that the spirit of the times demanded it, was responsible for the further democratisation of the Athenian state. He improved the political status of the Thetes, the fourth and lowest class of citizens, and was in favour of admitting all classes to the archonship. In 467 he died in such poverty that there was not enough money to pay for his funeral.

Aristeides OR **ARISTIDES** (fl. 360-330 B.C.). Greek painter. A native of Thebes, he excelled in the rendering of expression and emotion, though his colouring is said to have been rather harsh. His most famous picture represented a mother suckling her child though mortally wounded, her face depicting her anguish lest the infant should draw blood instead of milk. Attalus, king of Pergamus, paid 100 talents (£20,000) for one of his pictures.

Aristeides OR **ARISTIDES** (1st century B.C.). Greek writer. He was the author of *Milesiaca*, scenes of Milesian life, which, translated into Latin, was very popular among the Romans.

Aristeides OR **ARISTIDES**, **PUBLIUS AELIUS** (c. A.D. 129-189). A Greek rhetorician, born in Mysia. Trained by the most famous rhetoricians and literary men, he travelled much, lecturing from place to place. The citizens of Smyrna owed to him the rebuilding of their city after its devastation by an earthquake, the result of an appeal to his friend, the emperor Marcus Aurelius. Aristeides' extant works consist of two treatises on rhetoric and a number of speeches.

Aristippus (c. 430-360 B.C.). Greek philosopher. A native of Cyrene, he was the founder of a school of philosophy, hence called Cyrenaic. He taught that happiness was to be found in the enjoyment of the present, to the neglect of all considerations of the past or the future, but that for the truest enjoyment of what lay to hand the cultivation of wisdom was essential. The doctrines of Epicurus were a development of this teaching. Aristippus was one of the pupils of Socrates and was the first to seek payment for his teaching. See Cyrenaics.

Aristochin. Tasteless form of quinine. Chemically carbonylquinine, it is made by acting on quinine with phosgene gas. See Quinine.

Aristocracy (Greek *aristos*, best; *kratos*, government). Term meaning originally the rule of the best men. To-day, however it is used in a somewhat different sense, meaning not a system of government, but a class of men and women distinguished from their fellows by superior birth or position. By an extension such terms as aristocracy of intellect and aristocracy of wealth are used.

In its older sense the word was used by Aristotle to define one of three forms of good government. He contrasted aristocracy with oligarchy; both mean the rule of the few, but in one case the few are the best men, those who rule solely with regard to the public welfare, and in the other case they are not. Government by an aristocracy has been fairly common in the history of the world, although perhaps it would be more correct to describe most of such governments as oligarchies; they were certainly the rule of the few, but it is questionable whether they were the rule of the best. Some of the city states of ancient Greece, especially Sparta, perhaps enjoyed

the nearest approach to real aristocratic government known, but that of Venice was an oligarchy. An aristocratic government may be also the rule of a single man provided that man is the best man—for instance, the philosopher king of Plato's Republic. To-day the antithesis in the popular mind is between aristocracy and democracy, government by the many against government by the few. See Government; State.

Aristogeiton OR ARISTOGITON Friend of Harmodius. With him he conspired to assassinate the tyrant Hippias and his brother Hipparchus at Athens in 514 B.C. See Harmodius.

Aristolochia (Gr. *aristos*, best; *locheia*, childbirth). Large genus of shrubs and perennial herbs. It includes about 250 species, chiefly natives of tropical regions, especially S. America. Birthwort (*A. clematitis*) is European, and has been long naturalised about ruins in England, owing to its former use in medicine. It has heart-shaped leaves and yellow flowers.

Dutchman's Pipe (*A. siphon*) is a N. American climbing shrub,

with yellow-brown flowers the shape of which has suggested the popular name Snake-root (*A. serpentaria*) has a reputation as a cure for snake-bites in America, and other species of these plants have similar virtues.

Aristolochiaceae. Natural order of shrubs and herbs. They have irregular flowers consisting of a dull-coloured calyx with six stamens and a solitary pistil. The

lower part of the flower is inflated, and this portion in some species acts as a trap for flies, which are made use of as agents in cross-fertilisation. The two principal genera are *Aristolochia* (Birthwort) and *Asarum* (Asarabacca).

Aristophanes (c. 445–385 B.C.). Athenian comic dramatist. It is doubtful whether he was an Athenian citizen, and little is known of his private life. Fifty-four comedies in all were attributed to him, 11 of which survive. His first comedy, *The Banqueters*, was produced in 427 B.C., and the second edition of the *Plutus* in 388. He was conservative in his ideas, the Athens of the Persian Wars being his golden age. The newer Athens was distasteful to him; he disliked the growth of democracy and the rationalistic attitude towards religion and morals associated with the Sophists.

His earlier comedies, such as *The Knights*, *The Clouds*, and *The Wasps*, contain most violent personal attacks upon those who in his eyes stood for the tendencies he deplored. The demagogue Cleon and the philosopher Socrates, whom he unjustly identified with the Sophists, were particularly obnoxious to him. His attacks upon Cleon brought upon him the enmity of the latter, who made an unsuccessful attempt in the law courts to call in question the citizenship of Aristophanes. However, he appears to have learned caution, for his plays during the next period of his dramatic career, such as *The Birds* and *The Frogs*,

Aristolochia. A. siphon. or Dutchman's pipe are credited with similar virtues.

Aristolochiaceae, Asarum Europaeum

Aristides accosted by a peasant who, not knowing him, wished him to write the name of Aristides as one to be ostracised—because he was tired of hearing him called *The Just*. See p. 607.

in the second of which Euripides is held up to ridicule, were much less outspoken, while in his last personal satire almost disappeared.

Aristophanes,
Greek dramatist
Capitol, Rome

the Old Comedy as contrasted with the Middle and the New.

Many comedies derived their names from the creatures which the chorus were dressed up to represent, e.g. *The Wasps*, *The Birds*, *The Frogs*. Aristophanes is the chief representative of what was known as the Old Comedy as contrasted with the Middle and the New.

In spite of his strong political convictions, Aristophanes lacks any constructive notions of his own. He is primarily a comedian. Though many of his allusions are unintelligible owing to our ignorance of contemporary conditions, his work can be appreciated and enjoyed by the modern reader. His humour is irresistible and his wit unfailingly brilliant. Not only was he a supreme comic genius; for beauty and delicate fancy some of his lyrical passages challenge comparison with those of Shakespeare. There is a spirited English verse translation by B. B. Rogers, Loeb Classical Lib., 1924. See *Greece, Literature, Drama; Comedy*. Consult *Aristophanes, a Study*, Gilbert Murray, 1933.

for his province, and by dint of sheer assimilative capacity, coupled with scientific insight, presents to the world a veritable encyclopedia of science, learning and philosophy.

Most of the works ascribed to Aristotle have perished. Among the lost books are letters, speeches, poems, philosophical dialogues, treatises on national festivals and dramatic contests, and manuals of natural history and rhetoric. It is on these lost works that Aristotle's fame as an accomplished stylist was founded. What has survived are not his highly finished literary efforts, but lectures and treatises of a technical and academic order. Intermediate between the two classes is *The Constitution of Athens*, one of 158 similar surveys published in 1891 from a papyrus found in Egypt. Altogether the extant works, though forming not more than a fifth of the total output, serve to indicate the amazing range of the author, in virtue of which Dante might well salute the Stagirate as the "master of those who know."

The Theory of Teleology

The large portion of the *corpus* occupied by works on natural science and natural history, now covered by the special sciences of astronomy and the like, suffers from the limitations of all early research. Even so the three works, *The History of Animals*, *On the Parts of Animals*, and *On the Generation of Animals*, have elicited from the greatest scientists unstinted praise. Of crucial importance is the theory of teleology, expounded most fully in *De Anima*. There Aristotle asserts that not only human life, but animal and plant life also, are dominated by a soul dwelling in every creature, preserving the material body from decay and determining its growth towards completion. This principle, appearing at its highest in man as mind, is the form, and efficient cause, and end of the physical organism, and by this principle Aristotle was able to explain organic life and growth everywhere as a development from the merely potential to the actual. Such a point of view anticipates modern inquiries into purposive forms of life, and links up with evolutionary ideas in general. Again, as a master of classification and an acute observer, Aristotle reveals prodigious ability in this sphere.

Of the six works collected by a later hand in the *Organon*, the *Prior Analytics* shaped once for all the doctrine of the syllogism, while the *Posterior Analytics* expounded the nature of exact or

ARISTOTLE: THE FATHER OF LEARNING

T. Callander, Former Prof. of Greek, Queen's Univ., Canada

This sketch of the life and work of the great Greek scholar is a necessary preliminary to the study of many of the great branches of learning. See Ethics; Logic; Metaphysics; Philosophy, etc.

Aristotle, the Greek philosopher (384-322 B.C.), was born at Stagira in Macedonia. His father Nicomachus was physician to Amyntas II, grandfather of Alexander the Great. In 367 Aristotle went to Athens and spent 17 years in association with Plato. Several years of adventure in Mysia followed, including a romantic marriage. In 343 he was called to Macedonia by Philip to undertake the education of his son, then a boy of fourteen. A college was built, and for seven years, with interruptions, the profoundest intellect of the age was occupied with the training of the supreme man of action. When Alexander, in 334, passed into Asia "to subdue the world," Aristotle returned to Athens, founded his Peripatetic School at the Lyceum, and there, supported by gifts from his royal friend, lived for the next twelve years absorbed in lecturing and scientific research. In 323 death removed his protector and, mindful of the fate of Socrates, he retired to Euboea to spend the last months of his life in peace, declaring that Athens must not sin a second time against philosophy.

Aristotle and Plato

Platonism forms the background of Aristotle's thought. Like Plato, he views the universe as a system of particular things capable of being grouped according to kinds or species, each endowed with a nature that can be known. This nature is for Aristotle, as for Plato, not particular but universal, but the tendency in the master to affirm the superior reality of

universals or ideas against the multitude of particulars is modified in the pupil by his strong scientific and biological leanings. In Aristotle the conviction that ideas have no existence apart from

Aristotle, Greek philosopher who took all knowledge for his province
Statue in Spada Palace, Rome

things leads him to wage war against the supra-sensual ideas of the Platonists, while it stimulated his passion for exact and comprehensive observation. In every department of scientific inquiry he seeks to determine the facts, to register and classify the results, disposing of them in such a way that they reveal their true character and form the materials out of which higher generalisations may emerge. In such a spirit he takes the whole circle of knowledge

demonstrative science. On these rests the fame of Aristotle as the inventor of formal or, if the importance of the syllogism be accentuated, deductive logic. It was as a rival to the *Organon* that Bacon wrote his *Novum Organum*, thus earning the title of the inventor of inductive logic. Bacon professes to supply a theory or method of scientific discovery, whereas Aristotle, although he explicitly subordinates his theory of the syllogism to the wider problem of the nature of scientific inquiry, lays too much stress relatively on the form in which the results of discovery are set forth.

Aristotle's Poetics and Rhetoric

The *Poetics* not merely contains valuable information about the origin of tragedy, it lays the foundation of modern aesthetic. Unlike Plato, Aristotle makes the imitative character of poetry and art no reproach against their claim to be a valuable function of life, but rests upon that character the special capacity of all the arts to achieve their proper ends. That end is, in each case, the worthy employment of leisure, or true recreation, which is further defined in connexion with tragedy as the purgation of the emotions. By a flash of genius he divines the serious function of high art, and leaves to future criticism the task of developing the fertile suggestion thus thrown off. From the suggestion of idealising imitation the theory of the symbolic in art has evolved. In this difficult region Aristotle again is the starting-point for later investigation.

The same talents, combined with his sure and cultured taste, have made his three books on *Rhetoric* a classic. The main theme is oratory, treated as the art of producing conviction by persuasive speech. There are admirable sections on the emotions and how to control them, and on types of character, besides much refined criticism of diction and figurative speech. The fruits of his omnivorous reading are lavishly used and, if his neglect of lyric poetry throughout argues undue intellectualism in his mental make-up, he leaves a deep impression of broad and quick artistic sympathies.

In the *Ethics* and the *Politics* Aristotle analyses the Hellenic moral and political order, pronouncing it, with reservations, good. The supreme end is happiness, defined as an activity of the soul in accordance with virtue in a sufficiently long life. The external conditions of happiness having been briefly sketched, the *Ethics* pro-

ceeds to elaborate the morality of the Hellenic citizen, concluding with an attempt to bring the inner life so described into relation with the world of affairs. In opposition to the Stoics, Aristotle contended that external goods, environment generally, are not indifferent. Not negation but subordination is his maxim here. At the highest the good life will make every good thing serve its purpose. On the other hand he allows large scope to the capacity of virtue to rise superior even to hostile surroundings. In the *Politics*, while still remote from the Christian view which approves hardship as a condition for the promotion of virtue, he makes the striking concession to the good life that it may make a noble use of poverty and disease itself.

True to his governing principle of the mean, he rejects all extreme social and political programmes. He defends the family, and even justifies slavery in cases where the free citizen is of a superior race; he rejects communism and prefers aristocracy to either extreme of monarchy or democracy. A mixed constitution is best of all, and is most secure against civil strife, the bane of the Hellenic state. His plan of education is conceived in the most liberal spirit, and does full justice to the claims of disinterested culture as well as to the more obvious practical needs.

Among essays in the higher logic the *Metaphysics* is almost without a rival. Its subject is Being, not of a particular kind, but Being as such. How the universe of our experience, composed of a multitude of individuals and species, exposed to constant change, can form the subject of one science is a problem. In face of the difficulty Aristotle is assured that the Being or Essence of which every thing is a manifestation does present a proper object for treatment by a supreme science, which he calls first philosophy. This Being is alleged to be the only thing possessing reality by itself, and to it all other forms of being are referred.

The Immanence of Ideas

Thus, in spite of his emphatic denial of the independent existence of universals, and despite the prior reality which he claims for the individual, he recurs to the theory of Being or Essence as the first cause of every particular existence. In the particular he discerns, on a last analysis, four causes—material, formal, efficient, and final, but these are precisely what in combination constitute the object, converting the potential existence into the actual thing. As the appropriate

object of our highest knowledge this first essence is that which is most real: it is apprehended by mind, and ultimately is identified by Aristotle with God. Thus the gain marked by Anaxagoras when he introduced the conception of mind into cosmological theory, a gain extended by Socrates and Plato, was consolidated by Aristotle's doctrine of the immanence of ideas.

Bibliography. Editions of the Greek text by I. Bekker, 1831-70, and another in the Teubner series of Greek and Latin classics. There is a French translation by Barthélemy-Sainte-Hilaire, 33 vols., 1837-92, and an Oxford English translation of some of the more scientific works. Editions and translations of the more commonly read works are: (1) *Ethics*, ed. A. Grant, 1884, J. Burnet, 1900; trans. F. H. Peters, 1881, J. E. C. Welldon, 1892; (2) *Poetics*, text and trans., S. H. Butcher, 1902, trans. and commentary, I. Bywater, 1909; (3) *Politics*, ed. W. L. Newman, 1887-1902; trans. J. E. C. Welldon, 1883, B. Jowett, 1905; (4) *Rhetoric*, ed. E. M. Cope and J. E. Sandys, 1877; trans. J. E. C. Welldon, 1886, R. C. Jebb, 1909; (5) *The Constitution of Athens*, ed. J. E. Sandys, 1912; trans. F. G. Kenyon, 1891. Consult also Aristotle, G. Grote, 1872; *Outlines of the Philosophy of Aristotle*, E. Wallace, 1880; Aristotle and the Earlier Peripatetics, E. Zeller, 1897; *On the History of the ... Aristotelian Writings...*, R. Shute, 1888; *Political Thought of Plato and Aristotle*, E. Barker, 1906; Aristotle, W. D. Ross, 1923; Aristotle, G. R. G. Mure, 1932; Aristotle, W. Jaeger (trans. 1934).

Arita, HACHIRO (b. 1884). Japanese diplomat. He was ambassador to Belgium, 1934-36, then to China. From March, 1936, to Jan., 1937, he was foreign minister in the Hirota government, returning to the same office in Oct., 1938, in the Konoye government, when he was responsible for the Japanese part in the Anti-Comintern Pact (*q.v.*). He retained his post in the Hiranuma administration of Jan. to Sept., 1939, and returned for a few months in 1940, serving under Yonai, who was superseded by Konoye in July, 1940, when Arita was replaced by Matsuoka (*q.v.*).

Arithmetic (Greek *arithmos*, number). The science of numbers. The primitive operation of arithmetic is counting; the process of addition affords a rapid and convenient method of counting, while the inverse operation, subtraction, may be regarded as a short method of counting backwards. Multiplication is a contracted form of addition, and division a contracted form of subtraction. Addition.

subtraction, multiplication, and division make up the four fundamental rules of arithmetic. The concept of fractions is based on that of division. Complicated arithmetical calculations have been greatly simplified by the invention of logarithms.

Arithmetic, by its simplification of the operation of counting and the derived process of measurement, gives us a firm grip on the real physical world and reduces our vague ideas of number and quantity to precise form. Its cardinal importance in commerce, government, war, and science, and in the business of life generally, needs no emphasising.

The progress of arithmetic was long hampered by the lack of a suitable notation. The number which in the present Arabic system of notation is written 888 was written by letters in the Greek and DCCCLXXXVIII in the Roman system. The inconvenience of the Roman notation for arithmetical work is here obvious at first sight; the advantage of the Arabic system over the Greek lies in the fact that while in the latter one letter stands for eight hundred, another for eighty, and yet another for eight, the symbol 8 can signify eight or eighty or eight hundred according to position. The symbol 0 is of decisive importance in the Arabic system as a means of discriminating between two numbers like 88 and 808. This simple idea of ascribing values to the symbols dependent on their relative positions has produced a system which combines the economy in the number of fundamental symbols of the Roman system with the compactness of the Greek, and adds to these qualities a flexibility all its own. The medieval invention of decimals to represent fractions (e.g. $1\frac{7}{10}$ for $1\frac{7}{10}$) has put the finishing touch to the Arabic system. See Cube Root; Decimals; Indices; Logarithms, etc.

ARIUS or **ARIEUS** (c. 256-336). Originator of Arianism, a disruptive heresy in the Christian Church. Born in Libya, he was educated under Lucian of Antioch, and after being ordained deacon was excommunicated by Peter, bishop of Alexandria, for supporting Meletius, bishop of Lycopolis, who had apostatised during the Diocletian persecution and wished to resume his bishopric. On Peter's death, 311, Achillas, the next bishop of Alexandria, reconciled Arius to the Church and ordained him to the priesthood,

placing him in charge of an important church in Alexandria. Alexander, who succeeded Achillas, regarded Arius favourably, and it was not until about 318 that the Arian controversy seriously disturbed the peace of the Church.

Alexander having declared the doctrines of the Trinity and of the divinity of Christ in the accustomed form of the Catholic Church, Arius detected in this statement an attack on the unity of God, and affirmed that Christ was created by God out of nothing. The obvious conclusion of this doctrine was that Christ, not being co-eternal and consubstantial with God the Father, was ranked as a demigod. A council of bishops excommunicated Arius at Alexandria in 321, and he retired to Palestine, appealing to Eusebius, bishop of Nicomedia. Eusebius took up his cause and collected a number of bishops to annul the excommunication. This was done at Bithynia in 323.

The controversy was now so acute that the emperor Constantine summoned a general council to decide the question. The council, which met at Nicaea, 325, decided against Arius. Excommunicated on refusing to accept the definition of Nicaea, Arius retired to Illyricum. He succeeded later in gaining the sympathy of Constantine and in 328 was allowed to leave Illyricum. Two years later, he satisfied the emperor as to his belief and Athanasius, then bishop of Alexandria, was ordered to receive him into his diocese. Athanasius on refusing was exiled, 335, but the return of Arius to Alexandria was followed by disturbances, and in 336 he departed to Constantinople, where he died suddenly. Constantine had then ordered Alexander, bishop of Constantinople, to admit Arius to communion.

Of the work of Arius in verse and prose known as *Thaleia*, or *The Banquet*, and addressed to Eusebius, only fragments are extant. See *Arianism*.

Arizona. Western state of the U.S.A., bounded N. by Utah, E. by New Mexico, S. by Mexico, W. chiefly by the Colorado river. It is 400 m. long, 335 m. broad, and covers 113,909 sq. miles. The

Colorado traverses a plateau from 6,000 to 8,000 ft. high in the N.W.; towards the centre are the Mogollon mts.; between these regions the San Francisco mts. reach 12,565 ft., while most of the surface is over 5,000 ft. In the S.W. is much desert, but deep valleys separate the short mountain ranges, and good crops are raised by irrigation in the Gila, Salt, Casa Grande, and Yuma valleys.

Arizona. Stewart Mountain Dam, one of a series built to serve the Salt River federal reclamation scheme

There are many cañons, the Grand Cañon of the Colorado being a wonder of the world, 217 m. long, up to 18 m. across, and over a mile deep. Petrified forests and the Painted Desert of the Navajo Indians are great scenic marvels. Boulder Dam and six other huge hydraulic works are in the state. Mining is the chief industry; Arizona is the leading state for copper, and with gold, silver, lead, and zinc, the mineral products were valued in 1940 at over £16,000,000. Horse and cattle rearing have made the Arizona cowboy famous. There are 2,271 m. of rly. and 3,825 m. of highway.

The state senate has 19 members and its house of representatives 58; the chamber meets biennially. Two senators and two representatives are returned to Congress. Phoenix is the capital city, and Tucson the seat of the university opened in 1891. There are 14 counties. Arizona was settled by Spaniards in 1732 and was part of Mexico until 1848, when it was mostly acquired by the U.S.A. Rounded off by the Gadsden Purchase of 1853, organized as a territory in 1863, it became the youngest state of the Union, Feb. 14, 1912. Pop. in 1940, 499,261, of whom 55,076 were Indians.

Bibliography. The Resources of Arizona, P. Hamilton, 1881; Arizona and New Mexico, H. H. Bancroft, 1887; Antiquities of the Upper Gila and Salt River Valleys in Arizona and New Mexico, W. Hough, 1907; Pioneer Days in Arizona, F. C. Lockwood, 1932.

Arjish OR ARGESH. River of Rumania, also called the Argesul (*g.r.*).

Arjish Dag. Turkish name of an extinct volcano in Asia Minor, also known as Mt. Argæus. See Argæus, Mount.

Ark OF NOAH. The contemporaries of Noah, the son of Lamech (Gen. 5, 28), who was called a just man (6, 9), are described in the O.T. as having become so degraded and vicious that God determined to destroy the whole generation by a great flood or deluge. He decided, however, to spare Noah, his wife, his three sons and their wives. Noah, therefore, was instructed to construct an ark which should serve as a kind of ship, in which he and his family and a certain number of every kind of animal could take refuge (Gen. 6, 14-21).

Thus the Ark of Noah seems to be thought of as a flat-bottomed vessel. It was to be made of gopher wood, perhaps cedar or cypress, to be provided with rooms (Heb., nests) for the men and animals, and to be smeared within and without with pitch (Gen. 6, 14). It was to be in three storeys, and to have a light (Heb. *tschar*, either a window or a roof) and a door (*v. 16*). The measurements are given as follows: 300 cubits long, 50 cubits broad, and 30 cubits high (*v. 15*). If, as seems likely, a cubit is here equivalent to 1½ ft., these figures would represent 450 × 75 × 45 ft.

Ark OF THE COVENANT. Sacred chest of shittim or acacia wood, made by the Israelites according to the command of the Lord as given to Moses (Ex. 25). Called the Ark of the Covenant in Josh. 3; Ark of the Covenant of the Lord, Num. 10; Ark of the Covenant of God, Judg. 20; Ark of the Testimony, Ex. 25; Ark of God, 1 Sam. 3; Ark of God of Israel, 1 Sam. 5; and Ark of the Lord God, 1 Kings 2, it contained the Tables of the Law and was placed in the most holy place of the Tabernacle and of the first Temple. It was the most solemn emblem of the Jewish faith, and the waters of the Jordan divided at its approach (Josh. 3). After being set up at Gilgal, the Ark was removed to Shiloh, and later fell into the hands of the Philistines, who returned it with gifts (1 Sam. 4-7). Its final resting-place was Jerusalem, where it was placed in the Temple (1 Kings 8; 1 Chron. 15). It is believed to have been destroyed when the Temple was burnt by the Babylonians. Despite Jer. 3, 16, there is a Jewish tradition that it will be restored at the coming

of the Messiah. Monuments have been found in Egypt containing representations of sacred chests resembling the Hebrew ark. The word ark as applied to the Ark of the Covenant is from a Hebrew root different from that used to define the ark of Noah.

Arkaig. A lake in Inverness-shire, Scotland. It is 10 m. N. of Fort William, 12 m. long, and nearly one m. wide.

Arkansas. River of the U.S.A. Rising in central Colorado, it flows E. and S.E., through the Royal George cañon, traverses Kansas, Oklahoma, and Arkansas, and joins the Mississippi at Napoleon. Next to the Missouri, it is the largest tributary of the Mississippi. Its chief affluents are the Cimarron and Canadian rivers, its drainage area is about 187,000 sq. m., and it is about 2,000 m. long.

Arkansas. S. central state of the U.S.A., bounded N. by Missouri, E. by Tennessee and Mississippi, S. by Louisiana, W. by Texas and Oklahoma. It is 250 m. long, 175 to 275 m. broad, and covers 53,102 sq. m. The surface is swampy and well wooded to the E., where the Mississippi river forms a natural boundary, hilly in the N.W. and W., and centrally and S. an undulating tract. Navigable rivers include the Arkansas, Red, White, Washita, and S. Francis. Serious floods have occurred, a fifth of the state being inundated in 1927.

Of the gainfully employed, over half are in agriculture. Cotton brings half the income from farm products, and in 1940 the state output was second to that of Texas. Arkansas yields a fifth of the nation's rice. Maize and livestock are important. Two-thirds of the land area is forest, Ouachita and Ozark being national forests. Arkansas has the only diamonds in N. America and nearly all the nation's bauxite (23 p.c. of the world's). Industrial products include lumber, cotton seed oil, cake, meal, linters; and refined petroleum, 24,000,000 gallons being yielded in 1939 where none was worked in 1921. There are 4,537 m. of rly., 9,483 m. of roads.

The state senate has 35 members and its house of representatives 100; the chamber meets biennially. Two senators and seven representatives are returned to Congress. Little Rock is the capital and Fayetteville the seat of the university founded in 1871. There are 75 counties.

De Soto in 1541 was the first European to arrive, but Arkansas

was not settled until 1686. Acquired from France in 1803, organized as a territory in 1819, it joined the Union on June 15, 1836. A State Planning Board was set up in 1935. Pop. in 1940, 1,949,387, of whom 482,578 were negroes. William Grant Still, the negro composer, was a native. Pron. Ar'-kansaw.

Arkite. Nitroglycerine safety explosive permitted for use in Britain. A second variety known as Arkite No. 2 was introduced to pass the more stringent Rotherham test for safety explosives, the compositions being shown below:—

Ingredients.	Arkite	Arkite No. 2
Nitroglycerine ..	52.5	32.0
Nitrocellulose ..	3.0	1.0
Potassium nitrate ..	22.0	27.0
Chalk ..	0.5	—
Wood meal ..	7.0	10.0
Ammonium oxalate ..	15.0	30.0

Arkite No. 2 passed the test with a charge of 40 oz. The nitrocellulose is dissolved in the nitroglycerine, forming a thin jelly, which is mixed with the other dry ingredients in an incorporator of the type used for making blasting gelatine. The chalk neutralises any acid evolved on storage the wood meal retains the jelly, and the ammonium oxalate is employed to reduce the temperature of the flame.

Arklet. Small lake of Stirling-shire, Scotland. Its water has been raised 22 ft. by means of a dam 1,050 ft. long, and is conducted by a tunnel into Loch Katrine, whence it is conveyed to Glasgow.

Arklow. Market town and seaport of co. Wicklow, Eire. It stands at the mouth of the Avoca, 49 m. S. of Dublin by rly. It has herring fisheries and oyster beds, manufactures explosives, and is largely engaged in the shipment of copper and lead obtained from the neighbouring mines. Traces remain of the castle of the Ormondes, which was razed by Cromwell in 1649. Arklow was captured by the British in 1281, and was the scene of battles in 1316 and 1331. During the insurrection of 1798 the rebels sustained a heavy defeat near Arklow Bridge.

Arkose. Arenaceous deposit formed mainly of felspathic and other waste produced by the denudation of igneous rocks, especially of granite. It may be compact and cemented, or friable, and it occurs interstratified with the normal sediments of many geological formations.

Ark Royal, H.M.S. British aircraft carrier (22,000 tons), completed in 1938. The Ark Royal

was the third ship of her name in naval annals. The first was built at Deptford for Sir Walter Raleigh in 1587. She became the flagship of Lord Howard of Effingham and took part in the destruction of the

Ark Royal. Three warships of this name: top, the largest ship (800 tons) of Queen Elizabeth's navy; centre, original seaplane carrier, 1914; bottom, sinking of the third Ark Royal, Nov., 1941. See also p. 193
Bottom photo, British Official, Crown copyright

Spanish Armada. The name was revived in 1914 when the Admiralty chose it for the first seaplane carrier. The third Ark Royal became almost a legend during the Second Great War. Germany claimed to have destroyed her off Norway by bombing attack in Sept., 1939, and several times afterwards. This famous ship took part in the hunt for the Admiral Graf Spee (*q.v.*) in the S. Atlantic and later served as a base for aircraft engaged in the Norwegian campaign of 1940. She was at Oran in action against the French fleet, July, 1940; in the Mediterranean against the Italian fleet, July 9, off Sardinia, Nov. 27, when her aircraft delivered a torpedo attack on Italian battleships. She also took part in an attack on Genoa, Feb. 9, 1941; and the German battleship Bismarck was successfully attacked in the Atlantic by her aircraft on May 26, 1941. On Nov. 13, 1941, she was torpedoed by a German submarine in the Mediterranean not far from Gibraltar, whither

she was returning from a cruise. It was hoped to get her safely into harbour, but while in tow she took a list and sank, 14 hours after having been hit. Out of a complement of 1,600, only one man was lost. One of the best-known ships in the Royal Navy and built at a cost of £2,330,000, the Ark Royal took three years

and three months to complete; she sailed 205,000 miles and had been engaged in 32 war operations.

The building of a fourth Ark Royal, a larger aircraft carrier, was begun at Birkenhead in 1944.

Arkwright, Sir RICHARD (1732-92). Inventor of the machinery which made possible the great cotton industry of today. Born at Preston, Lancashire, Dec. 23, 1732, of humble parentage, he was apprenticed to a barber, and, having learned his trade, started in business in Bolton. He was fairly successful as a barber, and added to his income by dealing in human hair, those being the days when wigs were generally worn.

While he travelled about the country for the purpose of buying hair, Arkwright became interested in the slow and clumsy processes

then employed for spinning and weaving cotton. He himself had little or no mechanical knowledge, but he sought out those who had, and, forsaking hairdressing, turned his attention to the design and construction of a spinning machine. With the help of John Kay and John Smalley, one was put together at Preston, and when it was perfected Arkwright obtained a patent and took it to Nottingham, where he built a factory and began to spin cotton. Soon, however, the need of water-power induced him to transfer his business to Cromford, in Derbyshire. This was in 1771, and Arkwright's position was now made. His invention quickly proved its utility, and the industry went ahead by leaps and bounds, especially after the duty on cotton goods had been reduced.

The third and last period of Arkwright's life was harassed by numerous law-suits, which he was compelled to bring in order to protect his patents, and by the destruction by rioters of his mill at Chorley. In the courts the main case was decided against him in 1785, and the patents were cancelled, but even this blow did not seriously retard the prosperity of his undertakings. In 1790 he introduced steam-power into one of his factories. In 1786 Arkwright was knighted, and before his death, Aug. 3, 1792, he had begun to build the castle at Willersley, Derbyshire, where his descendants have since resided.

Arlberg OR ADLERSBERG. Branch of the Rhaetian Alps, Austria, on the border-line of Tirol and Vorarlberg. The Arlberg Pass, 5,890 ft., is a carriage road and connects Stuben with St. Anton. The Arlberg rly. tunnel, constructed 1880-83, is 6½ m. long and ascends to a height of 4,300 ft.

Sir R. Arkwright,
British inventor

Arkwright's spinning machine, the original one made by him in 1769

Arlen, Michael (b. 1895). British novelist. Born at Rustchuk in Bulgaria, of Armenian parents, his name was Dikran Kouyoumdjian, which he changed by deed poll in 1922, becoming a naturalised British subject. He was educated at Malvern College. Arlen wrote popular novels and

Michael Arlen,
British novelist

short stories dealing with the life of Mayfair; best known were *The Green Hat* and *These Charming People*, later dramatised.

Arles. Town of S.E. France, in the department of Bouches-du-Rhône. Standing on the Rhône, 53 m. by rly. N.W. of Marseilles, it is connected by canal with the Mediterranean. Arles has a little shipping, and flour, silk, hat, and shipbuilding industries, and is also a market for local produce. The 7th century Romanesque church of S. Trophimus, once a cathedral, was restored about 1870, but retains some of its early features. Other notable buildings include the 17th century hôtel de ville and the museums, all on or near the Place de la République.

Arles, the ancient Arelate, was an important place in Roman times, and even earlier, its most flourishing period being in the 4th and 5th centuries, when the emperors resided here. An episcopal see from the 1st century until 1790, its bishop was the primate of Gaul, and several important church councils were held in the city. Roman remains include the ruins of an immense amphitheatre, an imperial palace, a theatre, baths, a cemetery, a forum, and an aqueduct. In the 10th century it was the capital of the kingdom of Arles or Burgundy. In 1032 this was joined to Germany, and for a time Arles was an imperial free city. Then, as part of the district known as Provence, it passed by marriage to the house of Anjou and so to the crown of France. See Burgundy.

In the Second Great War, bridges over the Rhône at Arles were the targets for U.S. heavy bombers on July 17, 1944, and on Aug. 25 the city was liberated by French troops fighting with the Allied forces. Pop. 32,485.

Arles (Latin *arria*, earnest money). Term in Scots law. It

has the same meaning as the English word earnest—i.e. something given to bind a bargain.

Arlington, Henry Bennet, Earl of (1618–85). An English politician. He was educated at Westminster and Christ Church, Oxford, joined the Royalists at the outbreak of the Civil War, and in 1658 went to Madrid as Charles's agent. At the skirmish at Andover he received a wound on his nose, the scar of which remained visible for the remainder of his life. After the Restoration he was made keeper of the privy purse and in 1662 secretary of state. He was raised to the peerage in 1663, was a member of the Cabal ministry, and in 1674 was unsuccessfully impeached as the "conduit-pipe" of Charles's policy and resigned the office of secretary of state for that of lord chamberlain. He died July 28, 1685, and was buried at Euston, Suffolk. His policy was directed to making the Crown absolute, and to freeing the ministers of the Crown from responsibility to Parliament. Arlington Street, London, is built on the site of Goring House, where he resided. Consult *Life*, V. Barbour, 1917.

Arlington National Cemetery. Burial ground of United States soldiers. Originally part of the estate of the Lee family, it covers an area of some 400 acres in Virginia, on the banks of the Potomac, facing Washington, D.C. The fine mansion was formerly the home of Robert E. Lee (*q.v.*). On his departure to the American Civil War in 1861, it was occupied by Federal soldiers, and later it was used as a military hospital. In 1864 the first soldier was buried there, a Confederate who had died in the hospital. Since then the bodies of more than 25,000 U.S. soldiers, slain in every war in which the U.S. has taken part, have been laid there. A granite sarcophagus covers the bones of 2,000 unknown soldiers gathered mainly from the Civil War battle-

field of Bull Run, and there is also the tomb of the Unknown Soldier, a great block of marble bearing a tribute to the unidentified American dead in the First Great War. A memorial amphitheatre adjoining was dedicated in 1920. The British field-marshal, Sir John Dill, is buried here.

Arliss, George (1868–1946). British actor. Born in London, April 10. 1868, the son of William Andrews, printer and publisher, he adopted Arliss as his stage name. His first stage appearance was at the Elephant and Castle Theatre, Sept. 18, 1886, in *Vidocq*, the French Jonathan Wild, and he subsequently played a variety of parts there. His first West End part was at Terry's Theatre, Jan. 21, 1890, and in the same year he appeared with Mrs. Patrick Campbell at the Royalty Theatre in Mr. and Mrs. Daventry. Travelling to America with Mrs. Campbell in 1901, he remained in the U.S.A. for 22 years, playing a wide range of parts. His film career, which made his name and appearance familiar to millions of people, began in 1920, and he became popularly identified with many of his most famous rôles, e.g. *Disraeli*, *Voltaire*, *Rothschild*, *Richelieu*, and *Wellington*. He died Feb. 5, 1946. Consult *George Arliss* by Himself, 1940.

Arlon. A town in Belgium, capital of the prov. of Luxembourg. It stands on a hill, 17 m. by rly. N.W. of the city of Luxembourg. The ancient Orolaunum, and at one time in the duchy of Luxembourg, it was seized by the French, who made it a fortress about 1670. Pop. 11,634.

George Arliss,
British actor

Arlington memorial amphitheatre, in America's national cemetery. Close by is the grave of an Unknown Soldier killed in the First Great War

Arm (Greek *harmos*, shoulder joint). Limb extending from the shoulder of the human body to the hand.

The bones consist of: the *humerus*, or upper arm bone, which articulates at the shoulder joint with the *scapula* or shoulder blade; and the bones of the forearm, the *radius* and *ulna*, articulating with the *humerus* above to form the elbow joint, and with the carpal bones of the hand below to form the wrist joint, though the *ulna* is separated from the wrist bones by a fibro-cartilage. When the hand is held with the thumb pointing outwards away from the body, the *radius* and *ulna* are then parallel to the position which is known as supination, the *radius* being the outer. When, however, the hand is turned round so that the back of the hand points forwards and the thumb inwards to the body, the *radius* rides over the *ulna* into the position known as pronation

fingers; and a group of flexors of the hand and fingers which bend the hand forwards and close the fingers.

The main arteries are: the axillary artery; the brachial artery, which can be felt pulsating on the inner side of the arm just beneath the shoulder, and by pressure upon which hæmorrhage from the lower part of the arm can be controlled; the ulnar artery; and the radial artery, which, just before it reaches the wrist, forms the well-known pulse. The superficial veins of the arm are the radial, ulnar, median, basilic, and cephalic; the deep veins accompany the arteries of the same names.

The principal nerves are the circumflex, the cutaneous, the musculo-cutaneous, the median, the musculo-spiral, the ulnar, and the radial. Pressure on the ulnar nerve in the elbow gives rise to the sensation popularly described as being due to the "funny bone."

Arm. Front of the arm, forearm, and hand, with the bones outlined and the course of the most important nerves and arteries marked

The more important muscles are: the *deltoid*, attached above to the collar bone and shoulder blade and below to the upper part of the *humerus*, which raises the arm from the side and also assists backwards and forwards movement of the arm; the *biceps*, which is attached above to the *scapula* and below to the upper part of the *radius*, forming the principal muscle which raises the arm at the shoulder joint and bends the elbow; the *brachialis anticus*, attached to the lower part of the *humerus* and the upper part of the *ulna*, also bending the elbow; the *triceps*, forming most of the muscular part of the back of the arm, being attached above to the *scapula*, in the centre to the *humerus*, and below to the *ulna*, and acting mainly by straightening the elbow; the *pronator radii teres*, arising from the *humerus* and *ulna* and passing into the *radius*; the *supinator longus*, passing between the *humerus* and the *radius*; a group of extensors of the hand and fingers, which bend the hand backwards and open the

Fracture of the shaft of the *humerus* is usually due to direct violence, but sometimes to some severe muscular effort, such as throwing a cricket-ball or clutching at a support to prevent a fall. Fracture of the tip of the elbow or olecranon process is not uncommon. The two bones of the forearm are more frequently broken together than is either the *ulna* or *radius* alone. Fracture of the lower end of the *radius*, known as "Colles' fracture," is a frequent accident, most often due to putting out the hand to break a fall.

Armada or **ARMADO**. Spanish word meaning originally any armed force. It was applied then to a fleet, and especially to the fleet sent against England by Spain in 1588, which was known as the Great or Spanish Armada.

In 1586, after many years of informal hostilities, England and Spain were at last openly at war, and an English army was officially supporting the revolt of the Netherlands. Philip II resolved on the early destruction of Eliza-

beth, and set about the preparation of a mighty fleet.

Delay was first imposed upon Philip by Sir Francis Drake's great raid in April, 1587, when he "singd the king of Spain's beard" by burning most of the shipping and stores in the harbour of Cadiz. The Armada was not ready to sail until the late autumn, and then the admiral, Santa Cruz, refused to face the storms of the Channel. Before winter was over Santa Cruz was dead, and the command of the expedition was assigned to a landsman, the duke of Medina Sidonia. So the fleet did not put out until the end of May, and then storms drove it back to port. It set sail finally on July 12, 1588, and on July 19 was sighted off the Scillies by an English scout. The number of ships in the Armada was between 127 and 130. The soldiers on board numbered about 20,000.

The English fleet had been ready in Feb. Of the 197 craft which took part in the operations a large proportion were quite small vessels, and the tonnage of the bigger ships was much less than that of the Spaniards. Only 50 were of more than 200 tons, while of the Spaniards 62 exceeded 300 tons. In the number of men and guns the Spaniards doubled the English; but the English ships were constructed to deliver broadsides, while the Spanish ships were not.

The bulk of the fleet was stationed at Plymouth; another squadron watched the E. end of the Channel in case of any attempted movement from the ports of the Netherlands on the part of Parma, whose army was waiting to be landed in England. Medina Sidonia's orders were to sail up Channel to the Netherlands ports and to embark or convoy Parma's army to the English shore.

On the news of the approach of the Spanish fleet, July 19, the English at Plymouth, under the command of Lord Howard of Effingham, whose principal subordinates were Drake, Hawkins, and Frobisher, made out to sea by night, crossing the course of the approaching Spaniards so as to secure the weather gage. Next morning the Spaniards appeared, sailing massed in the form of a crescent. The English, sailing in line ahead, passed them on the flank and rear, pouring in broadsides as they passed and suffering little damage themselves. Two

determined efforts were made to force a general engagement—the first, off Portland, July 23, failed; the second, off the Isle of Wight, July 25, was only partly successful.

The Spanish fleet still pushed up Channel, its mass unbroken, though the English gunnery had wrought heavy execution among the Spanish soldiers, had done serious damage to many of the ships, and had shaken the morale of the Spaniards without appreciable loss to itself. On the night of July 27 the Spaniards anchored in Calais Roads. On the next night fireships were drifted down upon them by the English, creating a panic. They cut their cables and fled helter-skelter N.E., and in the morning were scattered far and wide along the coast. The English fell upon their rear off Gravelines and sank or destroyed a number of ships. The Spaniards were quite unable to re-form; their last chance was destroyed by a gale bursting, and they headed N. with the English in pursuit. The fight off Gravelines, July 29, 1588, completely shattered the Armada and sealed its fate. The fleet was not utterly destroyed by the English because the English ammunition had run out and the English ships went back to the Channel. It was annihilated by the storms, which dashed the already battered and crippled vessels upon the coasts of Scotland and Ireland on their way home. It was perhaps fortunate that the untrained army which Elizabeth mustered at Tilbury was not called upon to join battle with the Spanish veterans on land. The commemorative medal bore the words *Dominus flavit et dissipati sunt*—the Lord blew and they were scattered.

The overthrow of the Armada signalled a maritime revolution. English seamen had always more than held their own in the narrow seas, but hitherto English fleets had not been matched with the more celebrated fleets of the Mediterranean States; it was only the English and Spanish sailors who knew before 1588 that in seamanship, in manoeuvring, and in gunnery the English were far superior to their adversaries. The great sea-fights had been won by ships which were floating castles crowded with soldiers. Drake and Hawkins taught Englishmen to use their ships themselves as instruments of war, not fighting in close masses in line abreast, but in line ahead, ship following ship and smashing the enemy's hulls

with broadsides, grappling only when the ship's guns had done their work. The conflict with the Armada displayed the new tactics on the grand scale, and placed England firmly at the head of the maritime nations.

Bibliography. State Papers Relating to the Defeat of the Spanish Armada, ed. Sir J. K. Laughton, 1894; Drake and the Tudor Navy, J. S. Corbett, 1898; Hakluyt's Voyages, one vol. edn., 1930.

Armadales. Police burgh and town of West Lothian, Scotland. It is 2½ m. W. of Bathgate by railway, and has large iron and steel foundries, and brickworks. Pop. 4,854.

Armadillo (Spanish diminutive of *armado*, armed). Mammal of the family Dasypodidae, included with

Armadillo. *Priodon gigas*, or the giant armadillo of South America

sloths and anteaters in the misleadingly named order Edentata (toothless). It is a burrowing animal, with powerful digging claws, and inhabits the forests and pampas of S. and Central America. The characteristic feature suggesting the name is the protection of the body by bony plates embedded in the skin, to which are attached external horny scales. This armature takes the form of two large shields, one covering the shoulders and anterior part of the back, the other the hind quarters. Between these are flexible girdles, protected by scales, which enable the armadillo to roll up like a hedgehog. The head, tail, and limbs are similarly protected by bony tubercles or rings. The

pichichiago or fairy armadillo is only 5 or 6 ins. in length; the priodon or giant armadillo measures 3 ft. from snout to base of tail, and the tail is about 20 ins. Armadillos feed mainly on ants, termites, beetles, and other insects, but they also eat snakes, snails, and carrion. Their flesh is esteemed as food by the natives.

Armageddon OR HAR-MAGEDON (Heb., mountain or mountain district of Megiddo). Scene of the battle between the forces of good and evil which, according to Rev. 16, is to precede the millennial reign of Christ on earth. It is usually identified with el Lejjun, the Legio of the Romans, on the W. edge of Esdraelon, but the suggestion has also been made that the site is that of Megiddo 10 m. from Jenin. It was the scene or near the scene of the defeat of the Canaanites by Barak (Judges 4), of the Midianites by Gideon (Judges 7), of the death of Saul in the Philistine invasion (1 Sam. 31), and of the death of Josiah in the Egyptian invasion (2 Kings 23; 2 Chron. 35). Possibly Magedon may be the name of a Sumerian deity of the lower world, who engaged in conflict with a rival deity on a hill afterwards called the hill of Magedon. In popular usage the name Armageddon is applied to a battle or campaign involving great slaughter. See Megiddo.

Armagh. Inland co. of Northern Ireland, smallest of the six. It has a greatest length N. to S.

Armagh. Map of the small inland county of Ulster

of 32 m., greatest breadth of 20 m., and an area of 489 sq. m. Hilly in the S. and S.E., where the highest summit, Slieve Gullion, reaches 1,893 ft., the surface is generally undulating while it recedes towards Lough Neagh (partly in the county), and mainly bogland in the N. Agriculture and linen manufacture are the chief industries. The salmon fisheries of the Bann and Blackwater, the chief rivers, are important. Oats and potatoes are grown, and cattle, sheep, and pigs are reared.

The railway traverses the county, while additional communication is afforded by canals. Armagh is the county town, and others are Lurgan (birthplace of G. W. Russell, poet and economist, better known as A.E.), Portadown, Bessbrook, and Tandragee. The county returns one member to the Imperial parliament at Westminster and four (representing separate constituencies) to the parliament of Northern Ireland. Armagh contains many relics of antiquity, among them being Danes Cast, a large defensive work in the S.E. on the co. Down border: Tyrone's Ditches, near Poyntzpass; and a number of cairns and tumuli. Pop. 112,029.

Armagh. City, market town, and co. town of Armagh, Northern Ireland. It is 35 m. S.W. of Belfast by railway. It is the seat of a Protestant archbishop (primate of all Ireland) and of a Roman Catholic archbishop (cardinal of all Ireland). There are two cathedrals and two archiepiscopal palaces. The Protestant cathedral, a 13th century cruciform edifice rebuilt in 1765, is supposed to occupy the site of the 5th century church of S. Patrick. The Roman Catholic cathedral, begun in 1840, was consecrated in 1873. Armagh is famous for its observatory, founded 1790. Linen weaving is the principal local industry. Market days, Tues., Wed., and Sat. Pop. 7,064.

Armagh, or Ard-magha, meaning high field, is of great antiquity, and in 448 was the meeting-place of a synod, an interesting relic of which is the Book of Armagh, now in Trinity College, Dublin. For many years the metropolis of Ireland, it was famed for its theological and literary college. Entered by Brian Boru, who is

buried here, in 1004, it again fell before Edward Bruce in 1315, and here Shane O'Neill met first with defeat and later with success.

Armagnacs. Name of a faction in France which came into existence about 1396. It was first known, from the name of its leader, as the Orlanist party, but later, under Bernard, count of Armagnac, it took a new name. In opposition to the Burgundians, the Armagnacs then became the national party of France, and remained so until the treaty of Arras in 1435. The name was afterwards given to bands of adventurers, also called Écorcheurs. The former prov. of Armagnac gives its name to a famous brandy.

Armament. General term for fighting apparatus. It is applied to munitions of war, naval, military, or air, and especially to the guns on aircraft or a man-of-war or coast forts; and to a military or naval force equipped for war. See Armour; Artillery.

Armatoles (mod. Gr., bearers of arms). Name given in the 16th century to bodies of rebellious Greeks who took service under their Turkish conquerors. In return for certain privileges and possessions, they undertook to protect their districts from the Klephts or mountain brigands. In the 18th century the Armatoles broke with the Turks, and they were last heard of in 1830 during the Greek war of independence.

Armature. (1) In a magnet system, the member attracted by the magnet poles. (2) In a dynamo or motor, the rotating member. In the electric bell the armature is a strip of soft iron, free to vibrate near the poles of the electro-magnet; at its end it carries the hammer which strikes the gong when the armature is caused to vibrate by the passage of an electric current through the magnet coils. The armature of a motor or dynamo comprises the shaft, on which is fixed the core (composed of laminations of thin mild steel so shaped as to provide

slots in which are wound the coils), and which carries at one end the commutator. The latter consists of copper segments, insulated from one another, and built up in the form of a cylinder. Each segment is permanently connected to one coil of the armature. The function of the commutator, with the brushes that bear upon it, is to change the direction of the currents in the armature winding. Thus, in a dynamo, the currents are caused to follow always the same direction in the external circuit: in a motor, the commutator acts so that the turning force is always in the same direction. See Dynamo; Generator; Motor.

Armavir. Town of Russia, in the Azov-Black Sea area. Founded 1848, it stands on the Kuban river, 40 m. W. of Stavropol, is a junction on the Caucasian Rly. and the starting-point of the rly. to Tuapse on the Black Sea. An important trading centre, it is also an oil-refining centre, being on the pipeline from the Maikop oilfield, 50 m. S.W. Captured by the Germans, Aug. 12, 1942, in their advance towards Maikop from Manych, it was retaken by Soviet troops on Jan. 23, 1943. Pop. 83,677.

Armed. In heraldry, any animal whose horns, tusks, teeth, beak, claws, or talons are of a different tincture to the body is said to be armed of that metal or colour.

Armed Liner. Vessel normally engaged in carrying passengers or cargo, but taken over by its Government in case of emergency and fitted out and commissioned as a regular unit of the national fighting force. It is to be distinguished from an armed merchantman and a privateer. International law recognizes the right of the merchant vessel to defensive armament; during the First Great War merchant ships of 3,500 to 7,000 tons carried two 4-7-in. guns, while vessels over 7,000 tons had two 6-in. guns. Some years before the outbreak of the Second Great War defence courses were arranged for training Merchant Navy officers in gunnery, etc., and for teaching seamen to be gunners. Later the D.E.M.S. (Defensively Equipped Merchant Ships—*q.v.*) organization was set up, with bases at home and abroad. The guns were manned by personnel of the Royal Maritime Regiment (*q.v.*). See also Auxiliary Cruiser.

Armed Neutrality. The name given to a league formed by most of the maritime powers in 1780.

Armagh city arms

Armature. How coils (shown as solid copper strips) are joined. Each coil joint may be connected to a commutator segment

At that time Great Britain was at war simultaneously with the American colonies, France, and Spain, and the object of the league was to resist the British doctrines of the rights of belligerents in their treatment of neutrals at sea—doctrines which told in favour of the power which enjoyed naval ascendancy. The prime mover was the tsaritsa, Catherine of Russia, who was joined by Denmark, Sweden, Holland, Prussia, Portugal, and Naples. The critical questions at issue were formulated in the demand of the neutrals that the declaration of a blockade should not be recognized unless the blockade was effective, and that all goods other than contraband of war carried in neutral vessels should be free from seizure; the high-handed methods by which Great Britain enforced the right of search being the fundamental cause of complaint. At the end of 1800, when Great Britain was left isolated in her struggle with France, the Armed Neutrality was revived as a league between the Baltic Powers by Tsar Paul I, but was dissolved some three months later after the battle of the Baltic and the death of the tsar.

Armenia. One of the Soviet Socialist Republics. It is bounded N. by Georgia, E. and S.W. by Azerbaijan, S.E. by Persia, W. by Turkey. The area is 11,945 sq. m. Proclaimed Nov. 29, 1920, the republic formed with Georgia and Azerbaijan the Transcaucasian Soviet Federal Socialist Republic from 1922 to 1936, in which year it achieved separate status. It scarcely coincides at all with the Armenia of history, some of which is now in Turkey. There are nine administrative districts, including those of Erivan, the capital, Echmiadzin, the old patriarchal

seat, and Leninakan, formerly Alexandropol. The pop. in 1939 was 1,281,600, a mixture of Armenians (85 p.c.), Russians, and Turco-Tatars.

The country is largely a plateau, between 6,000 and 8,000 ft. high, but includes volcanic mts. near Leninakan and round Lake Gokcha, Alagos reaching 13,236 ft. As the tablelands suit pastoral life, there are many shepherds and herdsmen, who lead a hardy life in a dry and rigorous climate. Agriculture thrives in the Aras valley on the S.W. border; the cultivated area is about 1,850 sq. miles, and cotton, tobacco, rice, fruits, and vines are widely grown. The principal irrigation work is the Shirak Lenin canal of 13 m. Hydro-electric power is in use. Other industries include copper and lead mining and camel breeding. A rly. serves the Aras valley and forks at Leninakan, W. to Kars in Turkey, E. to Tbilisi in Georgia; otherwise communications are primitive. There are 1,161 primary, 317 secondary, 9 higher, and 51 technical schools and colleges. A society exists for maintaining cultural relations with foreign countries, and a House of Culture of Soviet Armenia has been opened in Moscow.

In modern times until 1917–18 the term Armenia was given generally to the territory comprised within the six provinces of the Turkish empire in the E. half of Asia Minor known as the Armenian vilayets, and the S. part of Caucasia which by 1917 had mostly belonged to Russia for about 40 years and was governed by the viceroy of the Caucasus. To these Turkish and Russian districts was usually added the N.W. corner of the Persian province of Azerbaijan; the connecting link of all

three being physically Mt. Ararat. The oldest name of the country indeed was Ararat or Urardhu. The inhabitants called themselves Hais, after Haik, supposed to have been their first king; the Persian name for Armenia was Hajastan. According to some, the word Armenia is derived from Aram, the sixth king after Haik; the Medes spoke of Arminia, the Romans of Armenia Major and Armenia Minor, the former covering roughly the territory mentioned above and the latter being the province of Cilicia. Throughout history there was a considerable shifting of the boundaries of Armenia owing to the country being swept by Assyrians, Babylonians, Persians, Romans, Arabs, Turks, and Russians; but the people, who are of Indo-European stock, retained, like the Jews, their national characteristics.

Their language, as well as their religion, has had much to do with this. The Gregorian Church, though in some respects it resembles the Greek Church, has an individuality all its own. The classical form of

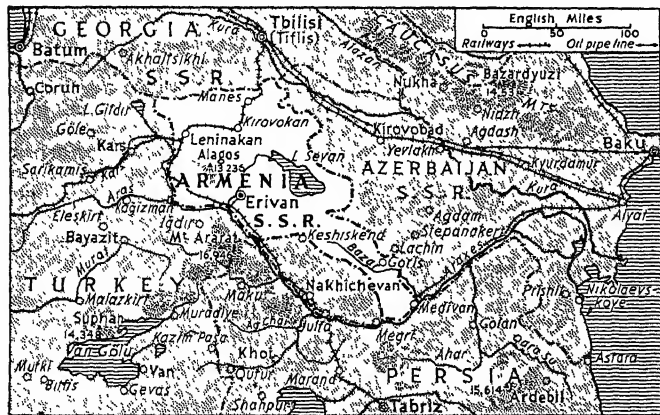

Ա Ռ Պ Դ Ե Զ Է Ը Թ Ժ Ի Լ Խ Դ Կ Զ Ղ Ժ
Մ Յ Ը Ը Ն Պ Պ Ձ Ռ Ս Վ Տ Ր Յ Ի Փ Բ Օ Ֆ

ա բ գ դ ե զ է լ խ ի կ զ ղ ճ
յ շ շ ո շ պ ղ ռ ս ս լ ռ ց ճ փ օ ֆ

Armenian alphabet as used in ordinary books. The characters were invented by Mesrob in the 5th century

the language was stereotyped by Mesrob and Sahak's translation of the Bible in the 5th century; the modern and much less pure form has adopted words from Turkish and other languages. The Armenians also have an alphabet peculiar to themselves, consisting of 38 letters, particularly strong in consonants. With such a broken record as a nation the Armenians have no outstanding literature; what exists is mostly concerned with history and theology, one of the chief works being a History of Armenia by Tchemochean, which was published in Vienna in 1784–86, and brings the story to the middle of the 18th century.

Ancient records show that Armenia was an organized state, with cities and armies, as far back as 600 B.C. Xenophon writes of an Armenian prince named Tigranes, who was the "right arm" of Cyrus the Great; and another Tigranes (95–55 B.C.), whose power alarmed the Romans, was conquered by them. But repeatedly, as Armenia lay across the highroad of vast human migrations E. to W. or W. to E., its independence was

Armenia. Map showing the boundaries of this republic of the U.S.S.R.

Armenia. Typical peasants of a suffering race. The men are herdsmen and live a rigorous life in the highlands

jeopardised or lost temporarily. In the 3rd and 4th centuries Armenia became Christian through the teaching of S. Gregory the Illuminator, the king Tiridates being baptized and many of his people with him. Gregory was the first catholikos, or ecclesiastical head, of the Armenian Church, which is often called after him the Gregorian Church, and his seat was at Echmiadzin. The occupant of this see has remained a leader, sometimes even politically, of Armenians all over the world.

Mahomedanism and the rise of the Caliphate were inimical to Armenia, and it fell a prey to the Persians and the Arabs, but in 885 Armenia Major had a strong native king in Ashod I, of the family of the Bagratides, and it was once more a prosperous country, with its capital at Ani between Echmiadzin and Kars. Gradually its power was sapped by internal strife, till in 1242 the Mongols conquered and devastated the land. During the Middle Ages the Armenians, as Christians, bore the brunt of numerous fierce struggles between Christian and Mahomedan armies. Armenia was the battleground of the Persians and the Turks from the 15th century up to the first quarter of the 19th century, the Turks getting the upper hand more and more in the conflict for its possession.

The Armenian Massacres

Up to the middle of the 19th century the Armenians formed a majority even in Turkish Armenia. When they had the opportunity they proved capable men, becoming the bankers and chief traders in their respective districts—for which the Turks hated them the more. During the reign of Abdul Hamid II (1876-1909) many thousands of Armenians were massacred, in spite of the efforts of the Great Powers. The people suffered

even more cruelly under the regime of the Young Turks in 1909, when 20,000 perished in the Adana massacres; and in 1915 Talaat Pasha and Enver Pasha, leaders of the Young Turks, made extermination of the Armenians a part of their policy, with the result that 800,000 died. During the First Great War the number of

Armenians was further reduced by the loss in action of many who volunteered for the Allies or were recruited by the Turks. In 1919 it was estimated that in all Turkish and Caucasian Armenia the Armenians numbered about 1,500,000, and that elsewhere there were about 500,000, numbers having settled in Persia, India, Austria, Italy, Egypt, France, Great Britain, and America.

Russian Influence

In 1827 Russia took from Persia nearly the whole of the S.E. part of Caucasus, and 50 years later deprived the Turks of the S.W. part. The first conquest gave her Erivan, the second Kars and Ardahan. All Caucasus came under Russian rule; the election of the catholikos was made subject to the approval of the tsars. From 1914 the E. side of the six vilayets and Armenian Caucasus were the theatre of campaigns, and Armenian towns like Van and Bitlis were depopulated and left in ruins, while cities like Erzerum were partially destroyed. In 1916 the Russians conquered Turkish Armenia and brought some relief to the wretched inhabitants, but after the Russian Revolution and the withdrawal of

that country's forces, the Turks came back. Under the Treaty of Brest-Litovsk the Turks advanced in 1918 into S. Caucasus, and, despite the heroic resistance of the Armenians under Andranik and Nazarbekian, stormed Kars. Meanwhile the whole Caucasus was in a ferment, and one outcome was the establish-

ment of the Armenian republic. In Nov., 1918, the Turks retired under compulsion from the British, while the Armenians were still trying to hold them back, as well as their co-religionists and allies the Tartars.

In 1919 the Armenian delegates submitted to the diplomats at Paris a map with large boundaries including a Black Sea coastline; but the Powers rejected this demand. In May, 1920, Soviet Russia reappeared in Transcaucasia, and in Aug. the Treaty of Sévres recognized the independence of Armenia. See Ardahan; Erivan; Kars; Turkey. Consult Armenia and the Byzantine Empire, S. Der Nersessian, 1945.

Armenian Church. Christianity, which was introduced at an early date, was established in Armenia in the latter part of the 3rd century by S. Gregory the Illuminator, who became patriarch. Armenia was thus the first country to make Christianity the state religion. In the 5th century the Bible was translated from the Greek text into Armenian by Mesrob and others. The Church has been subject to several persecutions, and has been divided over the monophysite heresy and over the question of its relations with Rome. From the 14th century the old Armenian or Gregorian Church, with its close affinity in forms and polity to the Greek Orthodox Church, ceased completely to be in communion with Rome, and became exclusively nationalist. Its numbers are estimated at about 3,000,000. Its head or catholikos is always a monk. Legend makes the apostle S. Thaddaeus its founder. The monastic rule is that of S. Basil.

Armentières. Town of France, in the department of Nord. On the river Lys, 20 m. by rly. N. of Lens, it manufactures cloth and table linen, and trades in grain.

Armentières. Street of this pleasant French town, showing the Church of S. Vaast in the background

Photo, A. J. Insall

In the battle zone for all but a few weeks of the First Great War it was held by the British despite furious German attacks on the Ypres-Armentières line Oct.-Nov., 1914, and continued in their possession until on April 12, 1918, they evacuated it in the final German offensive for the Channel ports. It was reoccupied by the Allies in Oct., 1918. The town, known throughout the British army as Armenteurs, as in the vulgar army song, *Mademoiselle from Armenteurs*, was seriously damaged by continued artillery fire. During the Second Great War it lay in that part of France occupied by the Germans in 1940, until liberated by the British 2nd army on Sept. 6, 1944. Pop. 22,704.

Armes Parlantes. Armorial bearings with charges making punning allusion to the bearer's name. See Allusive Arms.

Armfelt, GUSTAV MAURITZ (1757-1814). Swedish general. He was born in Finland, and became the confidant of Gustavus III of Sweden. In 1802 he was sent as ambassador to Vienna by Gustavus IV. He commanded the Swedish troops in Pomerania, 1805-7, and on the Norwegian frontier, 1808. After the deposition of Gustavus in 1809, Armfelt took service under Alexander I of Russia and became the first governor-general of Finland. He died at Tsarskoe Selo (now Pushkin), Aug. 19, 1814.

Armidade. Town of New South Wales, Australia, in Sandon county. It is 313 m. by rly. N. of Sydney, and stands on the New England tableland 3,314 ft. high. The industries include pastoral and agricultural pursuits and the working of alluvial gold, antimony, and wolfram. Pop. 7,320.

Armilla. Latin name for a bracelet, used as an archaeological term in English. See Bracelet.

Armillary Sphere. Skeleton celestial globe made up of circular metal hoops representing the equator, the ecliptic, the tropics, the arctic and antarctic circles, and colures. It revolves on an axis and has a circumscribing wooden horizon. It was used until the 16th century for instruction in astronomy.

Arminianism. Doctrine of man's free will and salvation by faith. Taught by Jacobus Arminius

in opposition to the dogma of predestination to eternal salvation or eternal punishment taught by the extreme Calvinists, it gave rise to bitter controversy in Holland in the first half of the 17th century.

Immediately after the death of Arminius in 1609, his followers, of whom Simon Episcopius became the chief, addressed a remonstrance of five points to the States-General, hence their name of Remonstrants. Conferences were held at The Hague in 1610 and at Delft in 1613, without producing harmony. The States-General issued a decree to enforce toleration and suppress controversy, but the decree was ignored. Political differences added to the bitterness of the feud. Then the synod of Dort was convened. It sat from Nov. 13, 1618, to April 30, 1619, but as it was composed entirely of extreme Calvinists, Arminianism was condemned, and its adherents were imprisoned or banished for refusing to subscribe to the finding of the synod. Persecution did not cease until about 1630. As the Dutch Calvinists took extreme views of the teaching of Calvin, so the Remonstrants exceeded the limits of the teaching of Arminius, many of them moving towards a broader theology. In England, Laud and Tillotson were identified with the teaching of Arminius, and the Calvinist-Arminian controversy had its English counterpart in the differences between the Methodism founded by John Wesley and the Calvinistic Methodism of George Whitefield.

Arminius (17 B.C.-A.D. 21). German national hero. He belonged to the tribe of the Cherusci and became an officer in the Roman army. In A.D. 9 he led a revolt of the Cherusci against their Roman governor, Quinctilius Varus, whom he utterly defeated in the almost impassable Teutoburg Forest. In A.D. 16 he was defeated by Germanicus, but the Romans were obliged to withdraw. He was eventually assassinated—a victim of internal dissension. There is a colossal monument to Arminius, completed in 1875, on the Grotenburg, near Detmold, and a statue of him at New Ulm, Minnesota, U.S.A. The modern form of the name is Hermann.

Arminius, JACOBUS (1560-1609). The Latinised name of Jacob Harmensen, or Hermanns, Dutch theologian. Born at Oudewater, S. Holland, he studied at Leiden and Geneva, where he attended the classes of Theodore Beza. Returning to Amsterdam about 1588 he was ordained minister, and

became prominent as an eloquent and earnest preacher. Selected to champion the Calvinistic dogma of predestination against a

Jacobus Arminius,
Dutch theologian

recently published work by a layman named Koornheert, his study of this work gradually changed his views, and he became a supporter of the doctrine of free will, maintaining that his position was not incompatible with membership of the Dutch Reformed church. Cited before the ecclesiastical courts, he successfully defended himself, and in 1603 was appointed to a chair in the university of Leiden. He was now bitterly attacked by his colleague Gomarus, and by most of the clergy, and his students were generally excluded from appointments. After six years at the university, Arminius died, Oct. 19, 1609, before the meeting of the synod which had been summoned to settle the controversy, his end being hastened by the persecution to which he was subjected. Calvinism has given way to Arminianism in most Protestant communities.

Armistice (Lat. *arma*, arms; *sistere*, to put a stop to). Agreement between two belligerents to suspend hostilities temporarily, either for some local reason, e.g. to bury the dead and succour the wounded, or as a preliminary to negotiations for peace. Sometimes it is called a truce, and on one occasion "cease fire for three hours" was the term employed.

An armistice applies only to the troops under the immediate command of the officers who agree to it. A neutral zone is fixed and a road is indicated by which all communications between the belligerents shall take place while the armistice is in force. Espionage is not prohibited, and often one side or the other will unwittingly disclose the defences or else reveal some unsuspected weakness. A general armistice requires the ratification of the governments. A partial armistice involves a considerable area or a large force, and it may become necessary through exhaustion of the troops in a certain theatre, or the outbreak of pestilence or other cause which a local armistice would not remove; such truce does not contemplate a negotiation for peace.

A most notable armistice was that signed between Germany and

the Allies in France, Nov. 11, 1918. It was renewed three times before the Allied peace terms were presented to the German delegates, May 7, 1919.

The terms of the Franco-German armistice of 1940 were signed on June 22 in the forest of Compiègne by Gen. Huntziger for France and Gen. Keitel for Germany. The Germans decreed that hostilities should not cease until six hours after the Italian government had notified them that the Franco-Italian armistice had also been concluded. Hostilities between France and Germany ceased at 12.25 a.m. on June 25. The Franco-Italian armistice was signed near Rome on that date by Gen. Huntziger for France and Marshal Badoglio for Italy. Hostilities between France and Italy officially ceased exactly ten minutes after those between France and Germany.

Other general armistices of the Second Great War included those between Russia and Finland at the close of the 1939-40 conflict; between the British and Vichy French in Madagascar, Nov. 5, 1942; and between the Allies and Italy, Sept. 3, 1943. The Bulgarian request for an armistice with the Allies followed 5½ hours after her receipt of the Russian declaration of war, Sept. 5, 1944. The terms were signed in Moscow, Oct. 28. Meanwhile Bulgaria had declared war on Germany, Sept. 8. Rumania, who had fought with Germany against Russia from 1941, sought an armistice with the Allies which was granted Aug. 23, 1944. One of the conditions being an immediate break with Germany, Rumania declared war on her former ally only two days later.

Armistice Day, POPPY DAY, OR REMEMBRANCE DAY. Nov. 11 was so called in commemoration of the signing on that date in 1918 of the armistice which ended hostilities in the First Great War. Observance of two minutes' silence in remembrance of those who fell in that war was held throughout the British Empire at 11 a.m. on Armistice Day every year from 1919 to 1938. After a break in the official ceremonial during the years of the Second Great War, it was resumed in 1945. The idea was said to have been suggested by King George V. The beginning and end of the silence was customarily announced in London by the firing of maroons such as were used in the earlier war as air raid warnings, but had

also unofficially announced the end of fighting at 11 a.m. on Nov. 11, 1918. The second anniversary, in 1920, was memorable for the entombment of the Unknown Warrior (*q.v.*) in Westminster Abbey and the unveiling by King George V of the Cenotaph (*q.v.*) in Whitehall. From 1921 the day came to be associated with the purchase and wearing of artificial Flanders poppies made by ex-servicemen of the British Legion (*q.v.*) in aid of Earl Haig's British Legion Appeal fund. Although the official observance of the two minutes' silence was discontinued during the Second Great War the poppies were sold every year. Between 1921 and 1946 the total sum thus raised was £14,298,500, including £986,000 in 1945. The British Legion's Festival of Empire and Remembrance was inaugurated on the evening of Nov. 11, 1929, at the Royal Albert Hall, London, and became a traditional and fitting climax to Armistice Day observance in London. It was attended annually by some 10,000 people.

In 1946 it was decided to observe a new Remembrance Day (*q.v.*), commemorating the fallen in both wars, to be held annually on the

Sunday before Nov. 11, unless either Nov. 11 or 12 is itself a Sunday.

Armorial Bearings. The arms or coat of arms of a grantee or his family, a feudal territory, or a corporate body. *See Arms; Coat of Arms; Heraldry.*

Armorica (Celtic, land by the sea). Old name for Brittany, which was at one time inhabited by the Armorici. It was given by the Romans. *See Brittany.*

Armorican Folding. Name applied to a system of folds that affected the rocks of N.W. Europe in Permo-Carboniferous times. The axes of these folds have, in the main, an E.-and-W. direction. The result of this folding is clearly shown by the trend of the rocks in N.W. France (Armorica), S.W. England, and in S. Wales.

Armorican Grits. Subdivision of the Ordovician rocks of France, underlying the Angers Slates, and of Arenig age. Composed mainly of yellow and brownish grits and quartzites similar to those which as pebbles make up a large proportion of the Triassic conglomerate of Budleigh Salterton, Devonshire, their fossils comprise a distinctive brachiopod and trilobite fauna.

ARMOUR: DEFENSIVE AND ORNAMENTAL

Charles Houliks, Curator, Tower of London Armouries, 1913-35

This account is a purely historical description of military armour.

It is followed by one on Naval Armour, while a further article deals with Armoured Vehicles. See also under Breastplate; Cuirass;

Helmet; Shield, etc.

The development of arms and armour may be said to have passed through two distinct cycles. With possibly a third in process of evolution at the present day. The first of these, begun in prehistoric times, culminated in the equipment of the Roman legionary, and the second reached from the Christian era to the end of the 18th century. It is impossible, with any degree of certainty, to discover the materials used by the Assyrians, Egyptians, or other oriental nations before the time of the Roman empire, but it is more than probable that they were similar to those used in Europe up to the 11th century, of which period there are pictorial and written records more or less exact in their descriptions of military equipment and operations.

Quilted fabrics or leather with applied plates of metal appear to be the favoured defences of oriental nations, and these survive even to the present day in localities where western civilization has not penetrated deeply.

The want of skill of the metal worker and the inadequate supply of his material precluded the elaborate fashioning of complete panoplies of steel or bronze, although the helmet appears to have been fashioned of metal at very early periods.

The Greek equipment consisted of a short bronze cuirass, this word (from Latin *coriaceus*, leathern) showing that the early defence was of leather. The helmet, as shown on sculptured monuments, was provided with a high crest, inconvenient to the wearer, but performing the double function of terrifying the enemy and giving a rallying-point to friends. The shield was generally circular, and, according to Homer, was composed of toughened leather and brass. The legs were protected by bronze greaves, which appear to have been sprung on to the leg and not fastened by straps. The Greek wore no defence upon his arms or round his loins, but trusted to his mobile shield in this respect. The weapons used were

the short sword, the axe, the javelin, the bow, and the sling, weapons which remained in favour with but little alteration in design from prehistoric times up to the 11th century, and with certain changes of form until the 17th.

The Roman equipment was similar, but far more practical, and was frequently made of iron instead of bronze. Where the Greek cuirass had been solid, composed of a back and breast plate, the Roman defence was composed of horizontal lames or strips of metal, which allowed greater ease of movement for the body. The helmet was smaller and with little or no crest, and the legs were undefended. All these improvements were obviously due to the extended operations of the disciplined array of the Roman legions as opposed to the individual combats of the Grecian warriors. It is one of those unsolved mysteries of archaeology that, with the defensive equipment advanced to this stage and with the increased skill of the metal worker, the Romans did not progress in the invention of armour until the fighting man was covered in cap-à-pie armour such as was evolved in Europe in the 14th century.

Armour of the 11th century

The answer is probably to be found in the fact that the strength of the Roman army lay in its infantry, while the medieval heavy-armed knight relied on the shock tactics of cavalry, and the full suit of armour could only be worn by the mounted man.

On the decline of the Roman Empire the evolution of armour ceased and the warrior of Europe went back to the leather and fabric defences of the Assyrian and Egyptian periods. The skilled craftsmen of middle Europe, however, were not content to confine their efforts to jewelry and church ornaments, but produced under Saxon and later under Norman rule some useful, albeit heavy, examples of the armourer's craft. An excellent illustration of the equipment of the 11th century is to be found in the Bayeux tapestry, where the knights are shown clad in quilted defences, probably with superimposed metal plates, and conical helmets furnished with nasals or nose-guards. The long shield at this period was also cumbersome and of little practical use to the mounted man. By degrees the armourer asserted himself, and by the end of the 13th century we find definite additions of plate armour, first on the knees, then on the arms and shins, and finally, by the end of the 14th century, the knight is completely encased in plate armour hinged or

jointed at knee and elbow and his head defended by a small steel cap or by the weighty helm which completely enveloped the head.

According to some authorities the intricate fabric of mail, formed of small rings of iron interlaced, dates back to Roman times, if not earlier; certainly its use in the East was common long before the 12th century, when we find it generally used in Europe. It was, apparently, easily made, for it is shown as the ordinary military equipment of the 14th century, and it had the advantage of covering the wearer from head to foot. Its grave disadvantage was its weight

With the introduction of plate armour the science of the armourer developed as well as his craftsmanship, and he is found endeavouring to provide, not only a solid unyielding defence, but also so to dispose the plates of his material that wherever possible they present a glancing surface to the opposing weapon. A careful study of armour will show that wherever the point of lance or blow of axe or sword was likely to fall the armour was fashioned to allow the weapon to slide off and thus minimise the effect of the blow. This was quite impossible in the case of mail or fabric defences, where the full force of the blow was always felt.

The Golden Age of armour may be placed in the middle of the 15th century, and the finest representation of the equipment of this period is the effigy of Richard Beauchamp, earl of Warwick, in S. Mary's Church, Warwick. Here are seen, in addition to the plate armour of the early 14th century, small plates known as "tassets" hanging from the "taces" or skirt of plate to protect the thigh, and upstanding neckguards to deflect the thrust of a lance from the neck.

Tournament or Jousting Armour

Absence of actual examples of armour of this period is explained by the fact that wrought metal was costly and fashions in armour, as in civilian dress, changed. It was therefore economical to remake armour to a new fashion, and it is thus solely due to the discarding of armour in the 16th and 17th centuries that specimens of those periods have been preserved.

In the 15th century the tournament was a firmly established sport in Europe. As civilization progressed this was practised more as a training for war and the armour was made heavier than that employed on the battlefield, where ease of movement was of equal importance with defence against attack. The principal weapon in the tournament or joust was the lance, and the jousting suit was frequently made so that the best protected position of the wearer was with his arm holding the lance in rest. The lance was invariably pointed across the horse's neck and the left was the side attacked. For this reason this side of jousting armour is heavier and thicker than the right side, and the front of the helm thicker than the top or back, where no blows would fall. Side by side with the development of the man's armour, the armour for the horse was increased until sometimes a complete suit weighed nearly 100 lb. The shield, which in the 13th century had become

Armour. Figure showing some of the names pertaining to the details of a complete suit

upon the shoulders, from which the whole fabric necessarily hung, and also the constricting of arm action by the creases formed when bending the arm. As a protection against the weapons in use it was probably adequate, but the fact that a heavy blow would drive the mail into the flesh necessitated the wearing of a thick padded under-dress which made the complete equipment heavy, hot, and inconvenient. In spite of this drawback, however, it was still retained in use with the addition of plates of metal until in the 15th century it was used only for a neck covering, for a skirt round the hips, and for gussets at the bend of arm and leg where it was difficult to employ plates.

smaller than the Norman pattern, became little more than a target in the 15th century, and disappeared entirely as a defence in the 16th century, except in some forms of tournament. This was but natural, for the whole body by this time had been protected and the movable defence was not needed, and, indeed, tended to hamper the wearer. Incidentally, heraldic devices on shield or surtout were a means of identifying the wearer when completely armed.

A suit of armour does not mean precisely the same as a suit of clothes, for the equipment made by the armourer to one design included not only the complete covering of the man for war, but also numerous additions and substitutions for jousting on horse and on foot. Several armours in the collection at the Tower of London take two or more figures to show the complete suit. The same collection, though small as compared with the splendid armouries of Madrid, Paris, Munich, and Vienna, possesses some notable examples of the armourer's craft, of which the simple yet well-nigh perfect armour made by Seusenhofer and presented to Henry VIII by Maximilian I ranks as the finest specimen of armour in existence. For sheer technical construction and ingenious contrivance the armour of Henry VIII made for fighting on foot, also preserved in the Tower, is a unique specimen. The armour of the foot soldier was lighter and rarely protected the legs, and even up to Elizabethan times the jack or brigandine, a body defence of small plates sewn between layers of canvas and faced with silk or velvet, was in high favour for light-armed troops, to whom mobility was of importance.

Introduction of Firearms

Up to the middle of the 16th century armour was designed to meet the same types of weapons as those employed from the earliest times, namely, the sword, lance, club, axe, and arrow, but with this difference, that by the 14th century the arrow shot from the English long-bow or from the cross-bow became a very deadly weapon, equal, if not superior, to the early and erratic musket ball. The lance also had become a more formidable weapon than the light javelin of former times. The proof or test of armour was, therefore, made with these weapons until the introduction of firearms in the 16th century. From this period up to the middle of the 17th century the contest was between the gunsmith perfecting his

weapon and the armourer providing a defence proof against the musket ball. To the end of the contest the armourer won, but in doing so he was obliged to increase the weight of his metal to such an extent that it became too cumbersome for the extended military operations of the period. Piece by piece the full suit of plate was discarded until in the wars of the Commonwealth only the cuirass and helmet remained, and by the 18th century only the ornamental gorget worn by officers.

Revivals in Modern Warfare

The First Great War led to a revival of the wearing of steel helmets by troops in the various theatres of operation, and most of the belligerent armies experimented with some form of armour partially covering the body. In the Second Great War numerous efforts were made to equip the soldier with a light body armour, but most attempts were defeated by the excessive weight and thickness of metal necessary to withstand the penetrating power of 20th century bullets. Certain troops serving in the Burma campaign were issued with so-called bullet-proof vests. These vests consisted of a light steel plating sandwiched between a fibrous material. They covered the chest, abdomen, and groin and afforded a certain measure of protection against small-arms fire, but they were too heavy and cumbersome for jungle warfare and were too fatiguing for men fighting in tropical conditions. Bullet-proof vests were also worn by U.S. troops in the invasion of France in 1944 and by bomber crews of the U.S.A.A.F.

For the study of arms and armour of the early periods the Bayeux tapestry and illuminated manuscripts are valuable guides up to the 14th century, and for later periods incised brasses and sculptured monuments, which have the advantage, in most cases, of being dated. In most armouries there are a few incomplete examples of the late 15th century, and for the 16th century the complete suit may be studied in detail in the collections in the Tower of London, the Wallace Collection, and the British Museum.

Armour, NAVAL. To protect ships of war by armour is by no means a modern idea. In the wars of ancient Greece, rope fenders were stretched along the sides of triremes to reduce liability to damage by ramming. Roman quinquiremes had specially stout bulwarks to protect the rowers; and the Byzantines employed leather screens to ward off Greek fire. The Norsemen were accustomed to hang their shields along the sides of their long ships to keep arrows off the rowers; and in certain instances iron sheathing was used by them for a similar purpose. This latter device was also employed by the Knights of S. John in warfare with the Turks in the 16th century.

Until almost the end of the sailing ship era line-of-battle ships were habitually built with sides nearly 2 ft. thick, usually sufficient to keep out the spherical shot fired by the old smooth-bore muzzle-loaders. After Trafalgar the forecastles of British ships of the line were redesigned with rounded bows of more solid structure than had before been customary, to give protection from raking fire ahead. About the same date Congreve, of rocket fame, proposed the construction of a floating battery armoured with iron plates, but his ideas were nearly half a century ahead of his contemporaries, and so won no favour.

Earliest Iron Plating

In 1824 the possibility of plating ships with iron was discussed in France, but was dismissed on the grounds that they would no longer be safe at sea with so much weight added. Thirty years later, during the Crimean War, unarmoured ships of the British and French navies suffered severe damage from shell fire in action with the Russian forts at Sevastopol. Napoleon III thereupon ordered his naval constructors to design floating batteries capable of withstanding attack by shell.

Five floating batteries of 1,575 tons, with wooden hulls protected by 4-in. iron plating, were accordingly built in France, and five similar vessels in British yards. Three of the former, the *Dévastation*, *Lave*, and *Tonnante*, reached the Black Sea in time for the

bombardment of Kinburn on Oct. 15, 1855. H.M.S. Glatton and Meteor, British counterparts, arrived a few days too late to share in their success.

So impressed were both governments that more floating batteries were put in hand. Three ordered by the Admiralty in Dec., 1856, were of a modified design, their hulls being of iron instead of wood. All these floating batteries suffered from a common defect: they were not seagoing ships.

To build seagoing ironclads was therefore the logical sequence. First to go afloat was the French Gloire, a wooden-hulled vessel of 5,618 tons, launched in Nov., 1859. She was surpassed by the iron-hulled Warrior, of 9,000 tons, launched for the Royal Navy in Dec., 1860. In 1946 this celebrated ship still existed as a hulk at Pembroke Dock.

Subsequent progress in ironclad design was largely concerned with varying methods of distributing armour, and improved processes of manufacture. In fact, progress took the form of a continual duel between the gun-makers and the armour manufacturers. Increases in the penetrative power of the gun were met by corresponding enhancement of the resisting qualities of armour. The extreme limit of thickness was reached in H.M.S. Inflexible (launched 1876), which had 24-in. iron side armour. Thenceforward improvements were sought in the direction of toughening the face of armour plates in preference to making any addition to their depth.

It was for the gun turrets of the Inflexible that compound armour (iron with a harder facing of steel) was given its first extensive trial. This in turn was superseded within 20 years by steel armour, toughened by the Harvey method. Within a still shorter period the Krupp method of hardening the face of the armour plate came into favour; this is still in general use, with minor improvements.

At times side armour has been either confined to a small space along the waterline, leaving the ends unprotected, or distributed over an extensive area, with a corresponding diminution in thickness. During the period 1860-1890 ships' armaments were arranged on a variety of systems, e.g. on the broadside, in a central battery, in barbettes, or in turrets, with the object of affording the greatest possible protection to the weapons and their crews. In modern capital ships the guns

are mounted in turrets, and the armour belt extends from end to end, the maximum thickness being over the vital spaces amidships. Further protection is afforded internally by armoured bulkheads. As defence against plunging fire or bombing from the air, armoured decks of greater thickness than in the past are now regarded as an essential feature.

Armour plate is of two types: (a) surface-hardening, and (b) homogeneous. The steels used are the same in each, namely the nickel, nickel-chromium, and nickel - chromium - molybdenum steels. The division is based upon the heat-treatment given and the particular application. The surface-hardening type employs the steel in a condition possessing an extremely hard surface layer, as this has final resistance to the punching action of high velocity shells. The homogeneous type is manufactured by heat-treating the same steels to a homogeneous or uniform structure throughout, and the plate is then particularly suitable for resisting penetration.

Francis E. McMurtrie

Armour, GEORGE DENHOLM (1864-1949). British artist. Born in Scotland, Jan. 30, 1864, he was educated at St. Andrews. From 1880 to 1888 he studied painting at the Edinburgh School of Art and the Royal Scottish Academy, during which time he exhibited in various galleries. He subsequently went to London, where he worked as a painter and illustrator, becoming well known for his hunting jokes and drawings of horses and sporting life which regularly appeared in Punch and other periodicals. His finest work consisted of his illustrations to the books of Surtees. Armour's publications included Humour in the Sporting Field, 1928; Bridle and Brush, 1937. Died Feb. 17, 1949.

Armour, PHILIP DANFORTH (1832-1901). American merchant. He was born at Stockbridge, New York. Entering the provision business at Milwaukee, he moved to Chicago in 1870, becoming head of Armour & Co., long the world's largest firm of provision merchants. He founded and endowed the Armour Institute of Technology, Chicago, and died Jan. 6, 1901.

ARMoured VEHICLES IN WARFARE

Lieut.-Gen. Sir Giffard le Quesne Martel, K.C.B., D.S.O.

The mechanisation of armies has reintroduced the widespread use of armour on land as protection for vehicles used for the transport of men, supplies, and guns. Here is a comprehensive survey of armoured vehicles by the former commander of the Royal Armoured Corps. See also Amphibious Craft; Tank, etc.

From the earliest days there are examples of some form of armour being used on vehicles to give protection to the men and the weapons that were carried in the vehicle. With the invention of firearms, however, the weight of armour needed to give any measure of protection became so great that armoured vehicles were no longer used. At a later date the arrival of the internal combustion engine made it possible to adopt the use of armour on vehicles propelled by this means. Armoured cars appeared just before the First Great War. Even then the limited cross-country capability of wheels with solid or high-pressure pneumatic tires limited the scope of these cars in battle. Between the two Great Wars development of large low-pressure tires did much to remove this handicap and armoured vehicles played an important part in the Second Great War. The term tank applies to a machine on tracks which is armoured all round and can fight in and among the enemy (see Tank). Armoured vehicles not in

this category can best be described under various heads.

ARMoured FIGHTING VEHICLES (WHEELED). The main example in this class is the armoured car. In the early days these vehicles were generally constructed by taking a commercial car or lorry chassis and adding armour plates. Such vehicles were limited to very thin armour and only carried light weapons. Development progressed rapidly, and during the Second Great War in Europe British forces were provided with armoured cars which were specially designed and well equipped for their rôle.

Armoured cars are used mainly for long or medium distance reconnaissance. They must therefore possess high speed and a long circuit of action. Their duty is observation of the enemy, and their fighting capacity is limited to that which they need for their own protection and for breaking through a light enemy screen. The main types used by British forces were the Humber, Guy, and Daimler cars. The two former types were similar and equipped with a 15-mm

and a 7.9-mm. Besa machine-gun mounted coaxially in the turret. The Daimler cars which replaced most of the other types as the war proceeded were armed with a 2-pdr. gun and a 7.9-mm. Besa machine-gun mounted in the turret. All these cars carried armour 14 mm. thick on the vertical plates. There was little difference between these types as regards the remaining details in their specifications. They each carried a crew of three men, and the cars weighed approximately 6 tons. The circuit of action on the petrol carried was 200 miles. The Daimler had an engine developing 100 h.p. and a speed of 60 m.p.h. on roads. The other types had rather less powerful engines and slightly slower speeds. All three types had four-wheel drive and very large pneumatic tires and could travel almost anywhere across country, but they could not cross marshland or ditches. Every armoured car has a long-range wireless set for inter-communication.

The armoured cars used by the Allies and by the enemy were on much the same lines, but the Germans introduced an eight-wheeled armoured car. This vehicle had a remarkably good cross-country performance and could negotiate almost any natural obstacles except soft, marshy ground. The weapons used and the armour plate protection were similar to those on British cars.

Reconnaissance and Scout Cars

In addition to armoured cars the armies of all the nations used some form of light armoured vehicles. These were employed for scouting and for intercommunication, to take orders or liaison officers up to forward units. The two main types used by the British were the light Morris reconnaissance car and the Scout car. Both these types had four-wheel drive. The former had only 11-mm. armour protection, one Bren gun for protection, and limited cross-country capacity. It was used mainly for intercommunication, could carry four men, and was equipped with a wireless set. The Scout car had 30-mm. armour protection in front and 14-mm. on the sides. It was a small inconspicuous vehicle with exceptionally good cross-country capacity, and was used mainly for scouting. It carried a Bren gun and a Boys anti-tank rifle for protection.

SELF-PROPELLED GUNS. The armies of all nations had been concerned as to the best methods

of supporting tanks by artillery fire. When tanks advance rapidly the supporting artillery must be able to follow up over the same terrain. Moreover, the tanks can ignore small packets of enemy resistance as they advance. The artillery must therefore be supplied with some measure of armour protection to enable them to accompany the tanks or follow behind them. This gave rise to the idea of mounting artillery weapons on a tank chassis as early as 1923, when the Birch gun was introduced in the British Army. These vehicles became known as self-propelled guns.

Advent of Self-Propelled Guns

The U.S.A. produced the first type to be used by the Allies in the Second Great War. It was a 105-mm. gun howitzer mounted on the chassis of a Sherman tank, and was known as the Priest. It was used with great success in North Africa. A little later Britain produced a model with a 25-pr. field gun mounted on a Valentine tank chassis which was called the Bishop. This was also very successful in action. The Americans also used a lighter tank chassis to carry a 3-in. high-velocity gun known as the M10; the British adopted this chassis to carry the 17-pdr. anti-tank gun.

The Germans used a great variety of models of self-propelled guns. Many obsolescent types of tanks were stripped down and used for this purpose. The Russians mounted large calibre guns on the chassis of their K.V. tank to produce self-propelled guns.

CARRIERS. As soon as the tank appeared on the battlefield in 1916 a demand arose for vehicles of that nature which should carry men and their weapons into battle behind armour protection. They would then dismount and fight on foot in the ordinary way. This class of vehicle became known as a carrier. Before the end of the First Great War there were British tanks specially designed to carry a platoon of infantry behind armour protection. The chassis of the vehicle was similar to that of the existing fighting tanks, but the body was a long box surrounded with armour 12 mm. thick which would enable the infantry to be taken safely through belts of machine-gun fire up to the forward positions. The war ended before any large number of these tanks had been constructed or used.

A similar idea was used again in the Second Great War. The

Canadians constructed a tank known as the Ram which was very similar to the American Sherman tank. A considerable number of these machines were taken and fitted with a body to carry a section of infantry and their weapons. They became known as Kangaroos. They were organized in squadrons of four troops, each troop having three sections of three Kangaroos. The section carried a platoon of infantry and the troop carried a company. Hence the squadron of Kangaroos carried a battalion. These vehicles were used very successfully on several occasions in France in 1944. It had of course to be remembered that they were carriers and not tanks. The armour was only bullet proof and the men in the Kangaroo only had one machine-gun for defence while they were being carried.

Bren Carriers and their Role

By far the most successful carrier developed between the two wars was the Bren carrier. This was a small, inconspicuous, and very handy track vehicle designed by Sir John Carden in 1933. In effect it was a steel box with an open top, armoured with 10-mm. plate on the front and 7-mm. on the sides. It carried one machine-gun and a crew of three men. It used a Ford V 8 engine and could travel comfortably at 20 or 30 m.p.h. and accompany a column of motor transport. Every infantry battalion was equipped with 14 of these vehicles during the Second Great War. In mobile warfare they were used to give the riflemen the close support of machine-gun fire. In the approach the vehicles were proof against long-range small-arms fire. The crew occasionally fired the Bren gun on the move, but normally the machine was halted behind some natural cover and the gun was used from a stationary position. Bren carriers were of great value when covering a withdrawal as they could remain in position till the last moment. These machines were not small tanks and they could not be used to fight in and among the enemy. Their rôle was to carry forward the gun and the crew behind armour plate so that they could support the infantry by opening fire at close range. In defence Bren guns were sometimes dismounted and used on the ground.

The chassis of the Bren carrier was used for a number of additional purposes, and a type known as a universal carrier was designed to cover several of these rôles.

1. The Mark I Humber armoured vehicle. 2. Daimler, complete with anti-tank Besa gun. Later models were equipped with eight wheels independently sprung. 3. Morris Mark I light reconnaissance car used extensively in the Western Desert. 4. Bren gun carriers bringing up

supplies after a rapid advance in Italy. 5. Kangaroos negotiating rough ground during operations in Germany. 6. Fast scout cars manned by the Royal Armoured Corps, passing through a peaceful English village. 7. A heavy infantry tank moving across difficult country

Photo No 4, British Official Crown copyright reserved

Being very inconspicuous it was in constant use for scouting, especially with armoured units. For this purpose it was preferable to use an anti-tank rifle instead of a Bren gun: in the universal carrier either weapon could be mounted. These vehicles were also in continual use for carrying up supplies to forward units. In another design the chassis was used to carry six men, but with less armour and ammunition.

In 1942 the U.S.A. evolved a very useful armoured vehicle with four-wheel drive and a box body made up of 8-mm. armour plate. This carried a section of infantry and their weapons or an equivalent load in stores and weapons. The Germans used vehicles similar

to Allied carriers but did not employ them in great numbers.

AMPHIBIOUS LANDING VEHICLES. Most of the great campaigns of the Second Great War started with the difficult operation of an opposed landing on beaches held by the enemy. In addition, the Allies had on many occasions to cross wide rivers with the enemy in possession of the far bank. To overcome these difficulties many special types of amphibious landing vehicles, both wheeled and tracked, were developed and used with great success. The former and the earlier models of the latter were unarmoured, but towards the end of the war amphibious armoured and tracked vehicles were in action. They were known

as L.V.T.(A.), which initials denoted landing vehicles tracked and armoured. These vehicles could travel across country and then descend a steep bank and enter a river without any pause. They floated in the water and were propelled by the tracks. On reaching the far bank they could climb out unless the bank was unduly steep. Numbers of these vehicles, both armoured and unarmoured, were used to land men and weapons on the beaches or on the far bank in river crossings. In that way they provided immediate support to the troops that had landed. These vehicles were popularly called Buffaloes. A later model was fitted with a tank turret

so that close fire support could be brought to bear on the enemy as troops were landing. None of these vehicles could be classed as tanks. They were unsuitable for fighting amongst the enemy after landing, but they proved to be of the greatest value in this supporting rôle. One of these vehicles could carry a section of infantry with their weapons, or one 6-pdr. gun, or any similar load such as a Bren carrier.

MISCELLANEOUS TYPES. Bulldozers (*q.v.*) played an important part in the Second Great War. They were used in the forefront of the battle to clear a way for tanks or transport. It became clear that armoured bulldozers would be of great value and two types were designed. One type was developed by fitting the bulldozer gear on the front of a fighting tank and the other by fitting armour plate protection on a standard bulldozer. The former were used effectively on many occasions in the forefront of the battle to remove obstacles. It was difficult, however, for the driver in the tank to see exactly what he was doing; and in addition the engine clutch in a tank was overloaded for this work. Tank bulldozers were therefore only used when essential. Ordinary bulldozers fitted with armoured plates gave full protection to the driver only from small-arm fire at long range. This protection was, however, useful on many occasions.

Armoured trains have been used in the past to a small extent but as a railway line is so easily damaged, the value in protecting the train itself with armour is limited. They are now no longer

used, though Russia had a few on the eastern front in 1941.

Armourer (Fr. *armurier*). One skilled in the manufacture and care of weapons. A military armourer is a non-commissioned officer of the Royal Army Ordnance Corps who is attached to a unit of combatant troops for inspecting, repairing and maintaining in efficient order the small arms and any mechanism in their charge. The application for the attachment of an armourer to any unit is made to the officer commanding, R.A.O.C., Woolwich, and in cavalry regiments an assistant may be allotted to him; the latter receives no extra pay, but is excused regimental duties. An armourer may not be called upon to do any work requiring special instruction beyond that which he has received, and may do only such work as is laid down in the regulations.

A naval armourer is a skilled warrant officer who has charge of the rifles, cutlasses, and other small arms aboard a warship. His duties are similar to those of an armourer in the army, though he generally also acts as a blacksmith. He is provided with an assistant known as an armourer's mate. Naval armourers are distinguished by a sleeve badge consisting of crossed axe and hammer, with a horizontal cannon, an added star denoting the chief armourer.

An armourer in the Royal Air Force is trained to clean and maintain rifles, revolvers, machine-guns, cannon, and all automatic weapons, and also to synchronise gun sights. A bomb armourer is responsible for the installation, inspection, and maintenance of bombs and bomb gear other than bomb sights.

Armourers' and Brasiers' Company. City of London livery company, incorporated June 17,

Armourers' and Brasiers' Company Arms

1708. The Armourers' Company was incorporated about 1423 under the title of The Master and Wardens, Brothers and Sisters of the Fraternity of the Guild of St. George, of the men of the mystery of the Armourers of the City of London. The Brasiers appear to have been separately incorporated about 1479. The hall, in Coleman Street, E.C., was founded about 1450 and rebuilt 1840. It contains rare specimens of armour and old English plate. Make All Sure, the motto of the armourers, had reference to the proving of back and breast plates. In 1708, on incorporation of the brasiers, the additional motto, We Are One, was added. *Consult Some Account of the Armourers and Brasiers*, T. Morley, 1878.

Armoury (Old Fr. *armorerie*, It. and Span. *armera*). Apartment in which weapons or instruments of war were stored until required for service, repairs undertaken, or (modern) arms manufactured; also the contents of such a store-room.

In the Middle Ages every castle had its armoury. In England the laws enforced by Henry VII against livery and maintenance put an end to private armies. But in countries where the central government was weak, the feudal system survived, and many castles in central Europe have retained their historic armouries until modern times. That at Churburg in South Tyrol is the finest and most complete example of a castle armoury remaining in Europe, having descended in one family (Trapp) since the 14th century. The armoury at Wilton House (seat of Lord Pembroke), dating from the 16th century, survived in England until dispersed by sale in 1921 and 1923.

The arsenal at Graz in Styria is not a princely armoury, but a military arsenal or mobilisation store of the late 16th century, and one of the most complete and instructive of its kind. Before the establishment of a standing

Armoured Vehicles. Bulldozer surmounting the ruins in a French town during the Allied advance towards Orne 1944. It is armoured against possible snipers

Armoury. Portion of the armoury in the Tower of London. The first mounted figure displays the 16th century armour of the Earl of Leicester

army in England in 1660, armour for the national levy or militia was provided and kept at the common charge, and often stored for convenience in the parish churches. Some of this "town armour," can still be seen in the church of Mendlesham, Suffolk.

Arms. Military term, meaning (1) weapons of all kinds, exclusive of ammunition; (2) different kinds of fighting troops, e.g. infantry, cavalry, artillery, engineers. Duties connected with guards, etc., are described as duties under arms; bayonets and swords are termed side arms in English and *les armes blanches* in French.

The enormous variety of weapons extant in museums may be classified as firearms, cutting and thrusting weapons, and missiles. *See* Armour; Artillery; Rifle; Sword, etc.

Arms. Heraldic term, signifying the armorial bearings of those individuals or bodies entitled to display or "bear" them. They consist of shield with charges or devices, surmounted where requisite by helm and crest with mantling, flanked by supporters, and supplemented by a motto. Arms in the U.K. are granted by the College of Arms (*q.v.*). *See* Badge; Coat of Arms; Crest; Heraldry; Shield.

Arms and the Man. Burlesque romantic drama by Bernard Shaw. It was produced April 21, 1894, at the Avenue Theatre, London (*q.v.*). The period is immediately following the first Serbo-Bulgarian war, 1884, and the play derides the glorification of soldiering and war in the person of a Swiss mercenary who disliked both. The title was taken from the first line

of Virgil's *Aeneid* in Dryden's translation: *arma virumque cano*, arms and the man I sing. A notable revival was that of the Vic-Wells company at the New Theatre, London, 1944, with Ralph Richardson and Laurence Olivier in the leading parts. The *Chocolate Soldier (q.v.)* is a comic opera founded upon the play.

Armstrong, WILLIAM GEORGE ARMSTRONG, 1st BARON (1810-1900). British engineer and inventor. Born at Newcastle-on-Tyne, Nov. 26, 1810, Armstrong became a solicitor, but his real interests were scientific, and before 1841 he had published papers on engineering subjects. In 1846 he took out his first patent, and in 1847 established works at Elswick, near Newcastle, for the manufacture of hydraulic machinery.

During the Crimean war he turned his inventive genius to the making of guns. His own creation, the Armstrong gun, was taken up by the British government, and works were opened at Elswick under his management for the making of ordnance. Although in 1863 the government adopted a simpler style of gun, Armstrong continued to make improved versions of his own breech-loading type and its am-

munition, and in 1880 it was once more taken up by the government. In 1882 the Elswick works, amalgamated with the shipbuilding firm of Mitchell & Swan, was registered as a limited company and began to build warships. In 1897 it took over the Manchester engineering firm of Joseph Whitworth & Co. Under the name of Sir W. G. Armstrong Whitworth & Co., Ltd., the firm has since become famous as an engineering firm of wide interests, including steel works, engine works, shipbuilding, and the making of ordnance and aircraft.

Another of Armstrong's interests was the conservation of Britain's coal supply. He also spent much time upon research into the possibilities of electricity. In 1859 he was knighted, and in 1887 was made a peer. He died Dec. 27, 1900, at Cragside, Rothbury. His title became extinct, but his heir, his great-nephew W. H. A. F. Watson-Armstrong, was made Baron Armstrong in 1903, and was succeeded by his son (b. 1892) in 1941.

Armstrong, ANTHONY (b. 1897). Pen name of Anthony Armstrong Willis, British humorist and playwright. Born at Esquimaux, British Columbia, Jan. 2, 1897, he was educated at Uppingham and Trinity College, Cambridge. In 1924 he began to write for Punch, and in 1925, retiring from service with the Royal Engineers, became a regular contributor until 1933 over the initials A. A. In the Second Great War he joined the R.A.F.V.R., and founded Tee Emm, the R.A.F. Training Memorandum. He published various collections of humorous writings, from *Warriors at Ease* to *Prangmen Mess* and *Prune's Progress*, several humorous novels, and many thrillers. His most successful plays were *Full House*, 1930; *Orders* (with Ian Hay), 1932; and *Ten Minute Alibi*, 1933.

Armstrong, ARCHIBALD (d. 1672). Scottish jester at the courts of James I and Charles I. He was discharged from the king's service in 1637 for taunting Archbishop Laud with the hostile reception given to his liturgy at Stirling. He is chiefly remembered for his *Banquet of Jest*s and *Merry Tales*, 1630, repr. 1889.

Armstrong, MARTIN DONISTHORPE (b. 1882). English poet and novelist. Born at Newcastle-on-Tyne, he was educated at Charterhouse School and Pem-

Baron Armstrong,
British engineer
Royal Institution of
Civil Engineers

broke College, Cambridge. He produced several volumes of poems, collected in 1931, but it was as a novelist, and pre-eminently as a writer of short stories, that he made his reputation. His best-known books are *The Goat and Compasses*, 1925; *Saint Christopher's Day*, 1928; *Adrian Glynde*, 1930; *Lover's Leap*, 1932; *The Snake in the Grass*, 1938; *Simplicity Jones*, 1940; and *The Butterfly*, 1941. He edited a popular anthology, *The Major Pleasures of Life*, in 1934.

Armstrong, WILLIAM (b. 1882). British actor and producer. Born at Edinburgh, Nov. 30, 1882, he was educated at Edinburgh university and studied for the musical profession. He made his first appearance on the stage at the Stratford Memorial Theatre in 1908, and was stage manager for the Glasgow Repertory Theatre, 1910-12. Appointed producer to the Liverpool Repertory Theatre (*q.v.*) in 1922, he was made a director the following year, and under his administration the theatre became one of the most progressive theatrical ventures in the country. In 1945 he became associated with Sir Barry Jackson (*q.v.*).

Armstrong College. Educational establishment at Newcastle-on-Tyne, founded 1871, and since 1909 part of King's College in Durham University (*q.v.*).

Army. Word applied generally to a body of men fighting on land in some region or under a particular leader, *e.g.* Crimean Army, Wellington's Army. Technically an army is a formation composed of corps or divisions under an army commander. There are generally 3 or 4 corps in an army and a corps usually contains 3 or 4 divisions. The division is the smallest formation which normally exists composed of all arms, and is commanded by a general. With large forces armies are organized in army groups which come under the supreme commander. Air forces, except for the naval arm, normally form part of an army, as the effect of their work is on the ground, but in the British Empire the air forces form a separate service.

From the earliest days armies have consisted of two types of troops. There have been the mobile troops whose duty it was to push ahead, gain contact with the enemy, find his flanks, attack him whenever he was found to be weak, and carry out a pursuit. The other body has been the

slower moving, harder hitting troops whose duty it was to close with the enemy and hold or attack strong defences when necessary. In the days of Jenghiz Khan armies consisted mainly of mobile troops; his own army was almost entirely cavalry. On the other hand, in the First Great War, cavalry were useless in the face of modern machine-gun fire, and armies consisted mainly of infantry and the supporting arms used for the attack and defence of strong positions.

Today the mobile troops consist of armoured divisions equipped with fast tanks and of airborne troops and paratroops. The infantry for the heavier fighting are supported by slower but more heavily armoured tanks and artillery. Both these types of troops are equally important in modern war, and they both require full support from the air.

The value of an army depends on three main factors: the nature of the personnel, the state of the equipment, and the efficiency of the training. Without good personnel an army can achieve nothing. The men must be loyal, determined, brave, and tough. In addition to these qualities and their technical training, it is important that the men shall have officers under whom they will be proud to serve. Next in importance is the equipment, for without a proper supply of munitions the bravest men can achieve very little. The training depends on these first two factors. Without good men and suitable equipment for training, a high technique in war cannot be reached. An amateur army usually has a low technique and little chance against a highly trained professional army.

Continental Conscript Armies

Countries like France, Germany, and Russia have always maintained large conscript armies. The men have had to pass through a period of military training of a few years' duration, and have then been available to be called up when required on mobilisation. With such large numbers none of these nations was able to modernise the whole army before the Second Great War, owing to expense and lack of equipment. Large bodies of cavalry were retained in addition to the armoured forces in the mobile troops. Then the modern form of infantry division has motorised transport for the equipment and stores and has lorry or bus companies to transport the

men when necessary. In this way such a division can carry out a strategical approach march of 200 miles without difficulty. But again, owing to the cost and the short time available, only a limited number of the divisions of any of these armies had been modernised in this way. The remainder still had horse-drawn transport and the men marched on their feet. As a result the nature (and the efficiency) of the armies differed materially on the various fronts in the Second Great War.

In the early stages the Germans used a limited number of armoured divisions supported by motorised infantry divisions to overrun Poland and then France. In North Africa neither side could maintain armies greater than a few infantry divisions and four or five armoured divisions at the front, owing to the difficulty of supplying them with petrol and water across the desert. Both British and Germans therefore used very highly trained divisions fully supplied with every form of modern equipment.

German and Russian Armies

On the Russian front the Germans attacked initially with a highly equipped army of a moderate size. The Russian army was always a long way behind the other armies in technique and was quite unable to stand up to this highly trained modern army. As the Germans advanced the distances became greater, and the Germans had to use large numbers of divisions with horse-drawn transport. Against that reduced scale of modern equipment and technique the Russians were able, with their greatly superior numbers, to turn the tide and win the war on their front. In France and Germany on the western front the overwhelming air support which the British and U.S. armies received was a decisive factor in achieving final victory.

With the arrival of the atomic bomb, it is possible that the main work of armies may lie in police duties. The atomic bomb can hardly be used to enforce peace among frontier tribes, nor can it be used when the forces are in close contact. It seems likely that armies of the present type though of a limited size will be required for many duties. It is also possible that a counter may be found to the use of atomic bombs; a means of countering new weapons has usually been found in the past.

Lt.-Gen Sir G le Q Martel

THE BRITISH ARMY: HOW IT HAS GROWN

HON. SIR JOHN FORTESCUE, K.C.V.O., Author of *A History of the British Army*

This article by a writer who made the recording of the British Army's story his life's work reviews that story from Saxon times to the end of the 19th century. Another authority brings the account up to date in an article immediately following. See also the articles on the various corps and regiments under their own headings and under Artillery; Cavalry; Infantry; Strategy; Tactics; War, etc.

The military force of England in Saxon times was the nation in arms, military service being obligatory upon all free landowners between the ages of sixteen and sixty. Knight-service, introduced from the Continent by William the Conqueror, never took firm root in England: and the policy of the earlier kings was to foster the national militia, and to accept a pecuniary composition in lieu of the personal service of the feudal force. With the money thus gained contracts were made with men of position for the provision of a certain number of soldiers for a certain time, and thus came into being the professional soldier. Men regarded war as a profitable concern, involving risks indeed, but promising also large rewards from ransom or plunder. Hence they invested money in a military company as they might in a private man-of-war, holding command in it according to the amount of their venture. Such was the origin of the system of purchasing commissions which survived in England until 1870.

Broadly speaking, in the English medieval army, the wealthier class—the feudal force—supplied the cavalry, and the men of the national militia the infantry. But the English had taught their conquerors their ancient custom of always dismounting for battle, their lances being shortened to a convenient length for shock-action, while the militiamen, armed with the long bow, supplied missile action. By the combination of these two elements the victories of Crécy, Poitiers, and Agincourt were won, and the great traditions of English military prowess were established.

New Model of 1645

By the end of the 15th century civil strife and the introduction of fire-arms had weakened the organization of the national militia. Hitherto every man had been required to bring his own weapons to muster; but fire-arms were beyond the means of ordinary men, and the tendency was to shift the burden of providing weapons from the individual to the state. A feeble attempt was made under Philip and Mary to adapt the old militia statutes to the needs of the time.

Throughout the perilous years of Elizabeth the national force remained defective in both organization and armament. Englishmen

who had served with the most highly trained armies on the Continent diffused their knowledge at home by writing books, but could do little to further national military reform. Finally, in the first years of James I, a new Militia Act practically destroyed the old national force, though without impairing the obligation of all citizens to military service.

The Civil War showed that the entire military system of England was chaotic, and in 1645 the Parliament found a way out of its difficulties by creating the New Model professional army of about 24,000 men. The soldiers were to a great extent impressed men, but, being trained by English veterans from the schools of Holland and Sweden, soon became efficient. This army conquered the three kingdoms, and when supplemented later by a military constabulary, became under Oliver Cromwell the terror of Europe.

Nucleus of the Standing Army

With the Restoration the constabulary was swept away, and most of the New Model was disbanded. One regiment of foot, however, was saved, and a regiment of horse was formed by enlisting discharged troopers. These, together with a regiment of foot-guards and two troops of horse-guards, levied from among the king's adherents, made the nucleus of the present standing army. The militia was also reconstituted by a statute of 1663. It was to be provided and maintained, according to certain proportions fixed by the Act, by the owners of property in each county; but the numbers, being dependent on the wealth of the inhabitants, were never defined, and, owing to various defects, this militia soon ceased to be of the slightest military value. The sole and supreme command and government of both army and militia was vested in the sovereign.

The administration of the army was carried on for the next 150 years somewhat as follows. The sovereign, or the commander-in-chief, issued his orders through his Secretary at War, an official who, though at first a personal secretary, became under the house of Brunswick responsible to Parliament for the finance of the army. This functionary's office was called the War Office, and until the close of the 18th century never employed more than twenty clerks.

The army, for financial purposes, was divided into "guards and garrisons" and "regiments." Guards and garrisons signified the governors of certain fortresses, mostly on the coast, and the minute garrisons which, according to ancient practice, were inalienably attached thereto. Each regiment was the property of its colonel and a self-contained and independent unit. Every item of a regiment's cost, excepting the musket, bayonet, and a part of the equipment, which were provided by the Office of Ordnance, was defrayed from the regimental pay-list as the pay of real or fictitious men. The clothing was supplied by the colonel, who was authorised to stop 2d. a day from the pay of every man for the purpose, and to make a profit out of the transaction if he could. The balance of the soldier's pay, after deduction of other stoppages, was devoted to his subsistence. The colour and facings of the clothing were fixed by regulation, but in all other matters the colonel might follow his own fancy. He was equally at liberty, until 1784 or even later, to drill and train his men as he pleased. The regiment was everything, and within the regiment the colonel, saving the proprietary interest of his officers, was everything. The agent, the paymaster, the doctor, and the chaplain all began life as the colonel's servants. The agent was his accountant, and the agents, by doing all the accountants' work of the army, saved the War Office from the expense of keeping many clerks.

Colonels and Recruiting

Recruiting was entirely a regimental matter. The War Office fixed from time to time the amount of the levy-money, which included the bounty to be offered to recruits, but in time of peace went no farther. A soldier was supposed to be enlisted for life, and was generally kept in the ranks as long as he could stand, in order to save his captain's pocket. In time, however, the term of a man's "life" was accepted to be twenty-one years, after which he was eligible for a pension at Chelsea Hospital: and twenty-one years became the regular period under the conditions of long service. But there was nothing to prevent a colonel from enlisting men for a limited period, if he thought fit, though he did so at his own risk; and the 17th

Light Dragoons were actually raised upon these conditions in 1759. No particular recruiting districts were assigned to regiments until 1782, and recruits were gathered in the region of the regiment's quarters for the time being. Barracks were early introduced into Ireland, but, except at the Tower of London and one or two fortresses, there were no barracks in England until 1793, and the men were quartered in public-houses at a rate of payment fixed by the annual Mutiny Act.

Strength of the Early Regiments

The difficulty of collecting men together under such conditions was a serious bar to discipline, but in any case the enormous powers enjoyed by the colonel left a regiment very much at his mercy. No general had any great control over him, for he was proprietor as well as commander. Indeed, the colonel was commonly a general himself, for, until 1814, no general officer drew any pay as such, and unless a general were on the staff, or governor of a fortress, or colonel of a regiment, he received only the pay of his regimental rank and frequently did regimental duty. Very few regiments had more than one battalion, and very few battalions had, in time of peace, more than eight companies of from sixty to eighty men apiece, so that the proportion of independent proprietary commanders to the number of soldiers was excessive. Thus the initial difficulties of converting a mere assembly of battalions into an efficient army in the field were gigantic; but, on the other hand, the intensity of regimental feeling and regimental pride carried the British soldier triumphant through many perils.

Owing to the system of including every item of expenditure on the cavalry and infantry under the heading of regimental pay, the estimates submitted to Parliament by the War Office were very simple.

Parliament and the Army

The artillery and engineers were subject to the Board of Ordnance, which accordingly presented the estimates for their maintenance together with those for material of war. The artillery (first regimented in 1716) and the engineers were exempt from the purchase system and were clothed by the Board of Ordnance. The estimates drawn up by the War Office were known as the establishment; but until 1707 there were separate establishments for England and Scotland, and when these were merged into the British, there still remained until 1800 an independent establishment for Ireland. Each of the three kingdoms had its own commander-in-chief, War Office, and

Board of Ordnance; but the number of troops in Ireland was fixed by an Act of William and Mary, instead of fluctuating as in Great Britain. On the other hand, it was the custom to keep in Ireland a great many regiments at a very low strength; and, as provisions were cheaper, the rates of pay there were also lower. Hence the shifting of troops backward and forward across St. George's Channel caused much administrative and financial derangement.

Having once voted the military estimates, Parliament for many generations took little further interest in the expenditure of the money or the efficiency of the army. Indeed, but for the mutiny of the Royal Scots in 1689, which brought about the annual Act to prevent mutiny and desertion, there might never have been any legalised system of discipline at all. Both political parties loathed the very name of a standing army, and did their utmost to discourage it. The civil population also hated the red-coats, who represented the only efficient police in the country.

Unpopularity of Foreign Service

The discipline of the army, too, was severe, and sometimes arbitrary, hence the service was dishonoured and unpopular. Yet the army grew with the growth of the Empire, for new possessions involved new garrisons. These were abhorred by Parliament because they meant increased expenditure. Members were impatient of places where barracks must be built and provisions must be stored, because there were no public-houses where soldiers could be quartered and fed as at home. The troops, likewise, loathed foreign service; and, owing to the difficulty of relieving foreign garrisons, regiments were kept for twenty, thirty, and even sixty years unrelieved in foreign stations. In India the East India Company could only maintain its European regiments by enlistment for short periods, and was obliged to call in the help of the regular army as early as 1754.

Until 1794, when Pitt created a Secretary of State for War, the direction of a campaign fell to that one of the two secretaries of state within whose geographical district the scene of operations might lie; or, if the theatre of hostilities was wide enough to enter the district of both, then the war was conducted concurrently by both. The army being always weak and never ready, the first step was to increase its establishment by augmenting the bounty to recruits and by offering commissions to individuals to raise

new regiments. As this took time, and troops were needed at once, especially to man the fleet, the men of two or three battalions were commonly drafted into one, and the officers of the depleted corps were dispersed to raise the regiment anew. The troops generally took the field at first in want of everything necessary for an active campaign. In any case, horses and drivers for the artillery had to be hired, as well as wagons and horses for transport. All matters of transport and supply, being arranged by contracts, were under the control of a commissary from the Treasury, who might understand finance but knew nothing about transport. A general, therefore, had to improvise everything for the field and the initial waste and extravagance were appalling.

Maintenance of the Field Army

The difficulty of all difficulties, however, was to keep the ranks of the field army full. In Marlborough's time armies fought only in the summer, and sent their officers home in the winter to raise recruits for the next campaign. Even so it was a struggle to make good the casualties; and, when campaigns began to continue from year's end to year's end, the problem became more pressing. It was a favourite but unsatisfactory device of the 18th century to impress unemployed and masterless men; but in Queen Anne's time the need for men was so urgent that soldiers were enlisted for short terms. Unfortunately, the war outlasted the periods of service and the men claimed their discharge, so that matters were worse than ever.

Revival of the Old Militia

The elder Pitt fell back on the idea of raising men for rank—that is to say, of offering a commission and half pay to anyone who would bring in a given number of recruits—so many for an ensigncy, so many for a captaincy, and the like. Thus a great many new battalions were raised and drafted into the old regiments; but the system produced bad men and was in other ways most vicious and wasteful. On the other hand, Pitt in 1757 gave new life to the old militia. An Act was passed to train the entire male population of England to arms by passing a certain quota of each county, chosen by ballot, through the ranks of the militia every three years. The Act was not enforced until twenty years later, and was vitiated by allowing balloted men to provide substitutes.

During the American War the ballot was enforced, but the demand for substitutes gathered into the militia the recruits that should

have joined the army. Patriotic cities and individuals raised new regiments at their own expense, but the question was not how to raise regiments but how to keep their ranks filled in the field.

Work of Frederick, Duke of York

When the war of the French Revolution broke out in 1793 the younger Pitt failed conspicuously in grappling with the problem. He did create a militia in both Scotland and Ireland, where hitherto there had been none; but he did not prohibit substitution. Moreover, he permitted the men who should have served in the militia to evade service by becoming volunteers, and by raising men for rank and other unsound expedients reduced the whole army to chaos. In 1799 he was driven to bribe militiamen to enlist in the regulars. At last, after much confusion, Castlereagh, in 1806, restored order. He turned the militia into a recruiting depot for the army, maintaining the ballot though permitting substitution, but converted the volunteers into a local militia for home defence, equally recruited by ballot, but with substitution forbidden. By these shifts, which were on the point of breaking down when peace was concluded, the war was carried to a successful issue. All the efforts of Pitt and Castlereagh would have been vain, however, but for the work of

Frederick, duke of York, the commander-in-chief. Taking over the army in a hopeless state in 1795, the duke first reorganized the staff at headquarters and restored discipline. Later he added a second battalion to almost every regiment in the line, and laid down the principle that for every battalion abroad there should be one to feed it at home. He also put the medical service and chaplains' department into order, and founded the Staff College, the Royal Military Academy, and the Duke of York's School. No single man has ever done so much for the army as the duke, nor received so little credit for it.

Blunders of the Crimean Period

After Waterloo Parliament returned to its old railing against a standing army and allowed all the military forces to fall into decay. The army was reduced to a shadow, and the ballot for the militia was suspended year after year. In 1829, however, Parliament passed an Act to establish a national constabulary, being too inept to grasp that this also was a standing army; and thus the troops were relieved from police duty at home. The Crimean War saw all the old blunders of the 18th century repeated, and the nation began to think about reform of the army. As a beginning, the artillery and engineers were transferred from the command of the Board of Ordnance

to that of the commander-in-chief. A menace from France was, however, met by the old discredited expedient of raising masses of volunteers. In 1858 the Crown took over the sovereignty of India, and with it the control of all the East India Company's troops, both native and European.

Lord Cardwell's Reforms

In 1870, the year of the German triumph, Lord Cardwell introduced real reforms. The purchase system was abolished; the term of service for privates was reduced from twenty-one years to seven with the colours and five with the reserve; an additional battalion was given to the first twenty-five regiments of the line; and the remaining battalions were linked together in pairs to prepare them for fusion into single regiments. In 1881 this fusion was accomplished: the old numbers were swept away and territorial titles substituted for them.

All of this was good work. But the militia and volunteers still remained to be dealt with, and, except that a step forward was taken by affiliating them to the territorial regiments, no one seemed able or courageous enough to undertake the task. On the other hand, after two centuries of struggle, the control of transport and supply was wrested from the Treasury and handed over on a military basis to the newly created Army Service Corps.

THE MODERN BRITISH ARMY

Lt.-Gen. Sir Giffard Le Quesne Martel, K.C.B., D.S.O.

Here the story of the growth of the British Army is continued to include the period of the First and Second Great Wars. See Badges plate, and also under Airborne Forces; Artillery, Auxiliary Territorial Service, Commission; Infantry; Rank; Tank; Territorial Army; War Office, etc., and under the names of individual regiments and army services

It has been seen that the Cardwell reforms of 1870 concentrated mainly on establishing a system whereby our garrisons overseas were kept efficient and up to strength. Little was done to solve the problem of home defence or the provision of an expeditionary force. In 1906 R. B. (later Lord) Haldane took the military forces in hand. He started by creating an Imperial General Staff which should coordinate the military forces of the Empire. In the British army the regular troops continued under the Cardwell system with equal numbers of battalions at home and abroad. Lord Haldane, however, converted the Volunteers and the Militia into a new Territorial Force and a Special Reserve.

The regular army at home was responsible for producing an expeditionary force for warfare in any theatre of war. In addition it had to find drafts to maintain overseas garrisons at full strength. On mobilisation the regular army

at home was to be brought up to strength by reservists. Wastage during a campaign was to be made good from reserves, particularly from the Special Reserve.

The Territorial Force, formed from the Volunteers and the Yeomanry, was responsible for the defence of the home country, thereby freeing the regular army at home for service in any theatre. It is important to realize that the men of the Territorial Force were enlisted for home service only and were unpaid except when undergoing training in camp each year, a training that usually lasted 14 days. Enlistment for both Regular and Territorial bodies was on a voluntary basis.

Strength of the Army

Before the First Great War the position was reached that the expeditionary force formed from the regular army at home was composed of six divisions and one cavalry division. Each division consisted of three infantry brigades, each of four battalions; three

field artillery brigades, each of three batteries; one brigade of howitzer batteries; and one heavy battery. In addition there were two field companies of engineers, the divisional signals, the medical units, and the administrative troops. The cavalry division had four brigades each of three regiments of cavalry, two brigades of Royal Horse Artillery, and one field squadron of engineers. Preparations were also made to send out additional troops with the expeditionary force for the lines of communication and administrative services.

The Territorial Force was organized in 14 divisions, on the same establishment as the regular army except that they had four gun batteries instead of six. They also had 14 mixed mounted brigades.

The strength of the regular army, including those serving in India, was 255,000; behind them were 146,000 reservists who had served in the ranks, and a special reserve of 63,000. The normal term of service for regular soldiers was seven years with the colours and five in the reserve. The effective strength of the Territorial Force was 250,000.

During this period the soldier was paid 1s. 1d. a day, but this could be increased by proficiency pay, etc. The total cost of the

Specially drawn by Charles M. Sheldon from sketches by R. Simkin

whole army, including the Territorial force, in 1910-11 was £27,760,000.

Shortly after the South African war the post of commander-in-chief was abolished, and an Army Council was instituted. The country was divided into seven commands: Aldershot, Southern, Eastern, Northern, Scottish, Western, and Ireland. Of the expeditionary force, two divisions were located at Aldershot, two in Ireland, one in Southern Command on Salisbury Plain, and one in the Eastern Command.

The Imperial General Staff made considerable progress at this time in obtaining the agreement of the Dominions to use to a large extent the same organization and equipment as the British forces. This was an important step.

In view of the tension that was arising at that time in Europe and of British commitments due to the *entente* with France, this great work carried out by Haldane was of the highest national importance and urgency. There were naturally certain faults in the organization; but when the crisis arrived in 1914 the expeditionary force was mobilised without a hitch. The Territorial Force was also mobilised with great ease, and volunteered for service in any theatre of war.

The First Great War

The British Expeditionary Force sent to France in Aug., 1914, consisted of five divisions and one cavalry division, and numbered nearly 100,000 men. A sixth division joined them in Sept. Other infantry divisions were made up by bringing home troops from abroad and by other means. By the spring of 1915 there were eleven divisions of regular troops in the field. The first six and the 7th, 8th, 27th, and 28th were on the western front, the 29th was in Gallipoli.

Meanwhile the Territorial divisions had been hard at work training and preparing for war. A great deal of weeding out of unfit men had to be carried out, but large numbers of volunteers were pouring in each day to enlist. No plans had been made for a great expansion of the Territorials, and the organization could not cope with these vast numbers of recruits. Plans for filling up wastage in the field were inadequate. The special reserve was far too small to fill the needs of the regular divisions, and practically no reserve existed for the Territorials.

Lord Kitchener, now secretary of state for War, at once called

for 100,000 volunteers for the infantry as a start, and formed them into service battalions. These were attached to the various regiments and numbered consecutively after the Territorial battalions. Some regiments such as the Northumberland Fusiliers, had as many as 25 service battalions. These were known as the New Army or Kitchener's Army.

At the earliest possible moment they were made into divisions with the other arms. The New Army arose from a wonderful response by the nation's manhood to Lord Kitchener's demand for volunteers. The New Army divisions were numbered from 9 to 26. At a later date additional New Army divisions were numbered from 30 to 41. The 14 Territorial divisions were numbered 42 to 44 and 46 to 56; a new 2nd Wessex division being raised and numbered 45. The first of the Territorial divisions began to move to the front in the spring of 1915, and the first of the New Army divisions in the summer.

The great expansion called for a new higher organization. The divisions that went to France in the first expeditionary force were grouped into corps of two divisions each. At a later date a third division was added to each corps. Later still the corps were grouped into armies, and eventually there were five armies in France.

Conscription

So far the Army had been enlisted entirely from volunteers, and there was reluctance to introduce compulsory service. By the autumn of 1915, however, it became clear that in spite of the early success the voluntary system was not producing the necessary number of men. The government decided to give the system a last trial. Lord Derby introduced what was known as the Derby scheme. Men were invited to "attest" at once and to be called up at later dates in groups according to age, the unmarried men being expected to volunteer first. In June, 1916, it came to light that out of just over 2,000,000 available single men only half had volunteered. Over 1,500,000 married men had come forward, but many of these men were in "starred" occupations and could not be released, and many others were unfit. The voluntary system had in fact failed. On Jan. 24, 1916, the first Compulsory Service Act was passed. All single men between the ages of 18 and 41 were brought in as from March 2

of that year. This was followed by a similar measure for married men. In this way a satisfactory flow of recruits was provided until March, 1918, when very heavy casualties were incurred and a further Act was passed calling in men up to the age of 51.

As a result of these measures, it was found possible to maintain over 70 divisions in the field during 1917 and 1918. There was an even greater expansion in the artillery, which rose to a strength of just over 500,000 in all ranks. The 486 pieces of artillery which had been taken to France in 1914 had become 6,437 guns and howitzers by 1918. The number of those serving in the ranks of the British army during the First Great War (excluding Imperial troops) was 5,704,416. Imperial troops from overseas brought the total to 8,654,567.

The Women's Army Auxiliary Corps, later Queen Mary's Army Auxiliary Corps, began as the Women's Legion in 1915, and was intended as a corps of paid women to replace men owing to the shortage of man-power. Before the end of the war the "Waacs" had reached a strength of 56,000.

New Methods in Land Warfare

No great progress or changes in weapons had taken place in the British army between the South African and the First Great War. But an important innovation was the establishment of the Royal Flying Corps in 1912. This was an army establishment, the Royal Naval Air Service being formed to cooperate with the Navy. Aircraft were limited to reconnaissance in the early days of the war, and in fact this was their main function throughout the war. This work was of great value, but it became clear before the war had ended that in future warfare air forces would play an increasingly active part.

The German army was equipped in 1914 with a large proportion of machine guns, whereas the British had only two per infantry battalion. Apart from this, British equipment and organization were well suited to the opening stages of the war. A Machine Gun Corps was formed at an early date to remove the deficiency. But it was soon evident that trench warfare was setting in and that the power of the defence outstripped that of the offence. No attacks could be carried out without prodigious losses. All armies therefore proceeded to equip

1. Marching in "threes" the basis of the soldier's training is still the parade ground. 2. Infantryman's battle dress, 1940. 3. Royal Artillery in training with modern gun 4. Royal Engineers learning the art of

camouflage; at a distance of 10 yards they could not be detected. 5. Anti-tank gunners show how a gun is put in readiness for action. 6. Rehearsing a bayonet trench attack after pushing through scrub and wire

ARMY: SOME ASPECTS OF THE TRAINING OF TROOPS IN THE CRAFTS OF WAR

Technicians of all kinds are needed in the modern British army, and boys from the age of 14 are accepted for training. 1. Apprentices in a machine shop. 2. Learning how to use a drill. 3. Instruction on a slotting machine.

4. R.A.C. recruits study the internal combustion engine at an army school of tank training. 5 and 6. Apprentices at work on lathes. 7. And embryo M.T. craftsman changes the wheel of an army lorry

ARMY: TECHNICAL TRAINING FOR FUTURE HANDYMEN AND SPECIALISTS

1. Under the army education scheme art classes are available to both men and women of the army. 2. The training of army butchers includes microscopic examination of moulds. 3. Soldiers in a modern army mess. 4. Geography

lesson at an Army Educational Corps school. 5. Symphony orchestra of the Eastern Command. 6. Soldiers learning bricklaying at the trade training wing of the School of Military Engineering, South Eastern Command

ARMY - VARIED PURSUITS IN THE LIFE OF THE BRITISH SOLDIER OF TODAY

1. Physical exercises are a great aid to fitness, and today bulk largely in the preliminary training of the troops
2. Actino-therapy, or artificial sunlight, given at an army physical development centre, has proved of high value

in building up men who are below the A1 standard of fitness. 3. Recruits undergoing physical training at a northern depot. 4. Army P.T. instructor taking a sturdy pupil over the vaulting-horse at a gymnastic class

ARMY: HOW THE BRITISH SOLDIER ACQUIRES HIS PHYSICAL FITNESS

themselves with artillery on a far greater scale to blast a way through these defences. This did not prove a satisfactory solution. Not only was the enemy able to re-form his machine-gun belt behind the area thus attacked, but the effect of the shell fire on the ground was such that the attackers had great difficulty in bringing up supplies over this terrain.

The solution of the problem was eventually found in the use of tanks, which appeared on the battlefield in Sept., 1916. The new formation which was to man these weapons was originally known, for the purposes of secrecy, as the Heavy Branch Machine Gun Corps. After the weapons had been used in battle and there was no need for further secrecy it became the Tank Corps.

Transport, until after the South African war, had been wholly horse drawn, but by 1914 motor lorries had been introduced. They had solid tires, and were confined to use on main roads. Only the third line transport carrying supplies and ammunition in the first stage beyond a railhead could therefore use mechanical transport. In the forward areas nothing but horse transport was used. As the war progressed a great strain was placed on British shipping capacity in bringing from overseas all the fodder necessary for horses. Shipping space required for petrol was far less. Attempts were therefore made to extend the use of mechanical transport and tractors in the forward areas. Tractors could carry supplies over shell-torn ground that was impassable by horse transport. A great increase in the use of mechanical transport in the forward battle areas would have been seen had the war continued into 1919.

Chemical warfare, though it played a considerable part in the First Great War, had no great effect on the organization or employment of the armies generally.

Between the Wars

The armistice of 1918 was followed by the normal process of demobilisation. By Oct. 15, 1919, the strength of the army had fallen to 757,000. The annual army estimates for 1919-20 allowed for 400,000 men, the total cost of the army being 405 millions. The method of recruiting and the general form of the army organization gradually returned to much the same position as before 1914.

But it was clear that great changes would have to take place

in the shape of future armies. The value of utilising the power of the internal combustion engine rather than relying on the muscular power of man and horse had already been seen in the matter of transport. The tank was entirely dependent on engine power. Now that power was to be used to increase efficiency in a large number of other ways. Some interesting figures were prepared. For instance, an army which used nothing but mechanical transport for all purposes could move 10 m. every day and consume only one quarter of the tonnage in petrol compared with the weight of fodder required if the army used horse transport. Armies seldom move 10 m. a day over a long period; and, when halted, the mechanical transport uses no petrol, whereas horse transport demands constant forage.

Mechanisation also showed great saving in man power, the weapons being transported mechanically and not man-handled. The numbers of men required to work one weapon in various corps were as follows: field artillery, 14 men per field gun; machine gun corps, 6 men per gun; tank corps, 1.6 men per weapon in the tank. It was therefore certain that all armies in future would use a gradually increasing measure of mechanisation for the purposes of both transport and fighting.

Mobile and Heavy Forces

As regards the general organization of an army, it has always been recognized that armies contain two types of forces, for fulfilling two rôles. The first of these contains troops capable of pushing out ahead, gaining touch with the enemy, finding his flanks, attacking wherever the enemy is found to be weak, and pursuing him. The other type contains the slower-moving, harder-hitting troops whose duty it is to hold and attack strong defensive positions and secure the ground gained by the mobile troops. The former had always been light cavalry, the latter had been infantry assisted at times by heavy cavalry. The new power of mechanisation was now ready to assist the forces used in both rôles.

As a result of the progress made in mechanisation, the army had reached by 1939 the following position. The mobile rôle was to be carried out by armoured divisions. These contained all arms, and motorised transport was used throughout. They had two armoured brigades, each

containing three armoured regiments equipped with fast tanks having a long circuit of action but only a limited weight of armour. For the harder fighting rôle the infantry were to be assisted by tank brigades equipped with tanks which had less speed but heavier armour.

Motorisation had been adopted for every type of army transport. Not only did this greatly increase tactical efficiency, but it revolutionised all ideas about the strategic mobility of armies. With the introduction of motorised transport there were no men in the division who marched except the infantry, and a reserve of lorry companies was kept so that even they could be moved by mechanical transport when desirable. Either the armoured or the infantry division could then move 100 m. a day with ease.

But although plans had been progressive during the period between the wars, financial stringency had prevented any real progress being made in raising and equipping the forces. At the outbreak of war in 1939, there was only one armoured division in being, and that was only half equipped. Five regular divisions and one army tank brigade were more or less equipped, but some had received little training with this equipment. Moreover, under the peace-time voluntary recruiting system divisions at home were very much under establishment strength and the numbers had to be made up with half-trained men.

Hore-Belisha's Changes

The appointment of L. Hore-Belisha (*q.v.*) as secretary of state for war in 1937 put new heart into the army. For the first time the army was advertised and explained to the public. Recruiting increased. The Military Training Act of 1938 introduced compulsory service, 200,000 men being registered. They came into the training camps in July, 1939, and were known as militia men, in avoidance of the unpopular word conscript. The women's corps known as the Auxiliary Territorial Service (*q.v.*), popularly known as the A.T.S., was already in being, having been formed in Sept., 1938, at the time of the so-called Munich crisis.

In the summer of 1939, Hore-Belisha doubled the Territorial Army (renamed thus since 1921), and the numbers filled up rapidly with volunteers, but they were behind in training and

equipment. The first formations to be made from these forces were nine divisions, three motor divisions (which did not differ very materially from a normal division), and two armoured divisions. In addition five army tank brigades and seven mechanised divisional cavalry regiments were to be formed. These territorial forces were to supplement the one armoured and five regular divisions at the earliest possible moment, and others would follow when equipment became available and the men had been trained. There were, of course, other calls on these forces, such as the formation of anti-aircraft divisions.

Second Great War

The B.E.F. which moved to France in Sept., 1939, was initially composed of two corps, each of two regular divisions; and with the administration and line of communication troops it numbered 222,000 men. Although so little time had been available for training with this great quantity of new mechanised equipment, the advance up to the front from the base ports was carried out without a hitch. It consisted of a movement of about 150 m. to the assembly area, then a march of 250 m. to the forward area. These movements were carried out in two days with one intervening day for maintenance. A third corps arrived later, and the strength of the B.E.F. then consisted of five regular and five territorial divisions.

The armies of other great continental nations had been only partially motorised. The greater part still used horse-drawn transport and were not very different in form from the armies of 1919; but they all possessed a mechanised portion of their armies which made full use of armour and of motorised transport. The Germans had 8 fully trained and equipped armoured divisions and a number of motorised divisions to cooperate with them.

Army. The new walking-out dress (cavalry) proposed in 1946

The French had six divisions containing both armoured and motorised troops. The British had little armour, but the regular divisions were well trained and had full strategical mobility, their transport being entirely motorised.

The Germans kept their highly trained mechanised forces in hand ready to strike through to the heart of France. Our highly trained motorised forces should have been kept in hand to counter such a threat, but they were put in to hold trench lines and no use was made of their mobility. The success of the Germans in 1940 with the drive of their highly mobile armoured divisions, supported by motorised divisions to secure the ground gained, was a complete proof of the power of this modern type of army.

During 1941 the British army was at last built up on lines that the army itself had long desired. The main policy remained unchanged. There were to be eight armoured divisions as mobile troops, and more were to be raised at a later date. These divisions contained all arms of the service, but they were reorganized to contain one armoured and one infantry brigade. This proved to be a well-balanced formation, and the organization was retained till the end of the war. Little change was made in the infantry division, and there were ten divisions training at home. To support these divisions in close and heavy fighting, ten army tank brigades were raised. These were equipped with heavy tanks suitable for this rôle.

That this policy was sound was amply proved in the Middle East in 1941 and 1942. The mobile troops in the form of the armoured divisions carried out the greater part of the work, but heavy attacks had to be delivered at times with infantry formations supported by their heavy tanks. During this early period the British were driven back at times by enemy forces greatly superior in strength and better equipped. But towards the end of 1942 new British forces, well trained and equipped at home, began to arrive in the Middle East; and from that time they were never defeated.

An outstanding development of the Second Great War was the use of landing craft to enable all arms, including tanks, to land on beaches without any difficulty or delay. These developments enabled the British and U.S. armies to land successfully in N. Africa, Sicily, and Normandy, and

finally to cross the Rhine. (See Amphibious Craft, illus. p. 401.)

Another outstanding development was in the widespread use of wireless telephony. This was particularly marked in the work of the armoured units.

In the later stages good use was made of airborne forces.

Post War Changes

In 1946 tentative proposals were made for a radical regrouping of infantry into 15 corps based upon regimental, territorial, or traditional affinity, certain battalions being placed in "suspended animation" for 10-15 years. These proposals were modified in 1947 by substituting the retention of such battalions in skeleton form. At the same time, two special training battalions were formed to provide a pool of n.c.o.s for the infantry service battalions. Since Jan. 3, 1947, the Royal Military Academy, Woolwich, and the Royal Military College, Sandhurst, have been combined to form at Sandhurst the Royal Military Academy, through which officers for all branches now pass.

Army Air Corps. British army unit, formed Feb. 24, 1942, to simplify the administration of

Badge of the Army Air Corps

Army airborne units in such matters as equipment, training, records, pay, family allowances, etc. Previously these details had been controlled by the regiments from which airborne units were drawn. The first regiment brought within the scope of the A.A.C. was the Glider Pilot Regiment (q.v.), which had been formed in Dec., 1941. Eventually, the A.A.C. administered the Parachute Regiment (q.v.), comprising some 20 battalions; the Special Air Service Regiment (q.v.); the Special Raiding Squadron; and the Army Parachute Training Section. The cap badge of the A.A.C. consists of a laurel wreath surmounted by a crown, and within the wreath an eagle standing on the letters A.A.C.

Army Airfield Construction Group. British army unit, formed in 1942 from Royal Engineers and Pioneer Corps personnel for the building and maintenance of forward airfields. During the 1944 campaign in France, one unit covered 200 m. in one week and made 14 airfields fit for use.

Twenty airstrips and emergency aerodromes were built during the first two weeks of the campaign in Normandy.

Army and Air Force Act. Code of discipline for officers and men of the Army and Royal Air Force, and applicable to certain classes of civilians in respect of billeting, impressment of transport, etc. The Act was introduced in 1881 for only one year; and to make it operative it needs the sanction of another Act called the Army (Annual) Act, thus securing the constitutional principle of parliamentary control over the army. This annual Act lays down the number of troops to be maintained, and also amends the Army Act from time to time. The Army Act is divided into parts headed discipline, enlistment, billeting, saving provisions, definitions, etc. It is the authority for all that concerns courts-martial and courts of inquiry, and it enables the crown to make rules of procedure and regulations as to the persons to be invested with command over the forces. It was passed two years after the abolition of the Mutiny Act and Articles of War. It became the Army and Air Force Act in April, 1918, following the establishment of the R.A.F.

Army and Navy Club. Social club for officers of these two fighting services. It was established in London in 1838, and has about 2,600 members. The entrance fee is £15 and the annual subscription 14 guineas. It is familiarly called "The Rag." The clubhouse is in Pall Mall, London, S.W.

Army Blood Transfusion Service. British army unit, established 1939 as a result of experience reported in the Spanish civil war. As operated during the Second Great War, it had a base headquarters, advanced blood bank, and the field transfusion units which worked with advanced dressing stations. The blood, donated by civilian and Service volunteers, was supplied in three forms: stored blood, which can be kept for a month in a refrigerator; fluid plasma; and dried plasma. Both liquid and dehydrated blood were sent by air to all theatres of war and also dropped by parachute to isolated units. R.A.M.C. personnel of the Army Blood Transfusion Service worked with troops in forward battle areas. See Blood Transfusion.

Army Bureau of Current Affairs. Institution formed in Sept., 1941, under the direction

of W. E. Williams, director of the British Institute of Adult Education. The bureau's first weekly bulletin was issued Sept. 20. The bulletins were issued to units, and their contents formed a basis on which regimental officers were able to organize discussions. Each bulletin contained an article on some current topic, an outline brief for discussion groups, and a quiz. Every fortnight the bureau issued a map review, consisting of map and photographs dealing with a topic of the moment. There were also travelling exhibitions, panels of qualified lecturers, and an A.B.C.A. play unit which performed its own plays dealing with current affairs. The Army Council ordered one hour of training time weekly to be devoted to A.B.C.A. discussions. In April, 1946, the Army Bureau of Current Affairs became the Bureau of Current Affairs under the Carnegie Trust (*q.v.*).

Army Cadet Force. Organization for citizenship and pre-service training for boys between the ages of 14 and 18. The Junior Training Corps and the Senior Training Corps are not part of the Army Cadet Force, but are run in conjunction with boys' schools and administered directly from the War Office. The Army Cadet Force proper is directed through the county cadet committees, who, in turn, receive instructions from the War Office. (See Cadet.)

Founded towards the close of the 19th century, the Army Cadet Force had a chequered history until the Second Great War, when service in cadet units was much encouraged in certain schools for all boys of the requisite physical fitness. Units continued to be run in conjunction with the schools, but other units were in existence for boys who had left school. School and open units receive a grant of 15s. per cadet per annum, and the boys are provided with free uniform. Each unit is affiliated to the local regiment, and the boys must perform a specified number of drill hours per year and, where possible, a period of instruction in camp or at an army depot. During the Second Great War, an average of 100,000 boys attended camps each year.

Army Catering Corps. British army unit, formed May 12, 1941. Officers were all experts in cooking or dietetics, and drawn as far as possible from civilian catering establishments. Personnel underwent specialised training and had tests at a central school

Badge of Army Catering Corps

of army cookery, being then posted to units.

Army Council. Controlling body of the British army. Established in 1904, when the office of commander-in-chief was abolished, it is, in constitution, something like the Board of Admiralty. It consists usually of nine or ten members. The civilian members are the secretary for War, who acts as president, the under-secretary, and the financial secretary to the War Office. The military members include the chief of the Imperial General Staff, the quartermaster-general, the adjutant-general, the master-general of the ordnance, and the deputy chief of the Imperial General Staff.

Army Dental Corps, ROYAL. British army unit, formed in 1921 from R.A.M.C. personnel. Dental officers, assisted by surgery assistants and dental mechanics, provide routine inspection and treatment in mobile dental units. The prefix Royal was awarded to the corps in Dec., 1946.

Army Educational Corps, ROYAL. British army unit established in 1920 to replace the Corps of Army Schoolmasters formed in 1864. Recruits must possess university degrees or other recognized qualifications for teaching. All entrants, who are either enlisted direct from civil life or transferred from other units, are given three to six months' specialised training before qualifying as sergeant-instructors. Vocational training of men for discharge was a function of the corps until 1937, when the ministry of Labour became responsible, and the A.E.C. devoted itself to general education. The prefix Royal was awarded to the corps in Dec., 1946.

Army Film and Photographic Service. British army institution. The Army Film Unit was brought into being in Nov., 1940, in order (1) to provide cinematograph records for the War Office; (2) to publicise the British soldier; (3) to provide secret material for military intelligence. The unit covered the fire of London, Dec. 29, 1940, and the first commando raid on the Lofoten Islands.

In Nov., 1941, it was decided to increase the scope of the A.F.U.,

and the unit became known finally as the Army Film and Photographic Service. At its peak period, some 400 officers and men were serving the army with cameras — both cinematograph and still. A.F.P.U. personnel served in all theatres of operations, i.e. the Western Desert, North Africa, Sicily, Italy, Malta, France, Belgium, Holland, Germany, Burma, etc. and the unit produced such outstanding campaign films as *Vaagso*, *Desert Victory*, *George Cross Island*, *Eve of Battle*, *Left of the Line*, *Harbour Goes to France*, *Burma Victory*.

Army Fire Service. British army unit, developed from the fire-fighting units normally attached to military establishments.

Badge of
Army Fire Service

The Army Fire Service was reorganized and expanded during the Second Great War and placed under a lieutenant-colonel designated inspector of fire services. Recruits were mostly civilian firemen, but all were sent to a central school in N. England for training with equipment and vehicles specially designed for use in dock fires and in areas fired as a result of enemy action. Vehicles and fireboats enabled the Army Fire Service to cover all military operations overseas and to safeguard vast quantities of petrol, stores, and shipping at base. Units particularly distinguished themselves in North Africa and Italy and were amongst the first troops to land on the Normandy beaches in 1944. Every man underwent the normal infantry training course. The unit's shoulder badge consists of a round flash, 2½ ins. in diameter, with a red background, a blue ring, and a yellow star, and the words *Army Fire Service*.

Army Kinematography Service. British army institution, established under the War Office in Aug., 1940, to develop the use of sound films in the training of

Army Film and Photographic Service. Cameraman, accompanied by a bodyguard, recording a bombardment
Photo, British Official, Crown copyright reserved

troops. Over 1,000 films were produced during the Second Great War, and covered every aspect of military training. They showed the mechanism of artillery, and training in tank tactics. The theory and application of sighting for A.A. artillery was the subject of a series of films, as was the detection and immobilising of land mines and booby traps. A special series was produced for the instruction of the Home Guard, illustrating various methods of street fighting.

Army List. Document constituting legal evidence of the status and rank of officers of the army, including the Royal Marines. It also includes warrant officers of the rank of schoolmasters, master gunners, bandmasters, conductors, and the different classes of serjeant-major. The monthly army list is published at 5s. and is in common use; the quarterly list costs 6s. and is often called the birthday book, as it shows the ages of officers, the dates of their commissions, and promotions. From June, 1915, until early in 1919, and again from Sept., 1939, throughout the Second Great War, the Army List was regarded as a confidential document, its sale to the public being suspended.

Army Medical Corps, ROYAL. Information about this unit of the British Army will be found under Royal Army Medical Corps. The same applies to other army units honoured with the prefix Royal, before Dec., 1946, e.g. ARMY ORDINANCE CORPS; ARMY PAY CORPS; ARMY SERVICE CORPS; ARMY VETERINARY CORPS.

Army Physical Training Corps. British army unit, established at Oxford in 1860 as the Army Gymnastic Staff, and consisting of one officer and 12 other ranks. In 1906 the Gymnastic

Staff evolved the Army physical training system based upon Ling's Swedish drill. During the First Great War the staff was expanded to 2,000 officers and men, and in 1918 was renamed the Army Physical Training Staff. Between 1939 and 1945 it increased to 147 officers and 3,200 specialist instructors. It was created a corps in 1940. Personnel of the corps are responsible for training all arms of the service in physical exercises and give instruction in bayonet fighting and unarmed combat. They also train airborne, parachute, and commando troops, and organize teams for sports.

Army Pigeon Service. British army institution. It is administered by the Royal Corps of Signals for the transmission of messages where it is impossible or inadvisable to use radio. Pigeons were used during the siege of Paris in 1870, and during the First Great War on the western front and in Egypt and Iraq.

Each Army Pigeon Service unit is in control of an officer accustomed to handling pigeons in civil life, and most of the 250,000 birds used in the Second Great War were lent by fanciers for the duration of the war. They were used in all theatres in 1939-1945, and of the vast number of messages sent, only 5 p.c. failed to arrive. Carried in protective containers, pigeons were dropped with parachute troops and released with news of the landing or other operations. The first reports of the Dieppe raid, Aug. 19, 1942, reached Great Britain by a pigeon. Large numbers of birds were used by the R.A.F. and proved invaluable in bringing help to aircraft which crashed in lonely spots. *See Animal: Employment in Wartime.*

Army Plot. Name given to a proposal for bringing the English army from the north to London to aid the cause of Charles I. In May, 1641, England was excited, wild rumours were afloat, there was disorder in London, and the queen, Henrietta Maria, was suspected of asking aid from France. On May 5, therefore, in Parliament, Pym declared there was an Army Plot: the army was to be brought to London to threaten Parliament and French troops were to land at Portsmouth. This was an exaggeration. The matter had been discussed, but there was no definite scheme. Measures of protection were taken by the House of Commons and the plot came to nothing. A second Army Plot a little later also petered out. *See Charles I.*

Army Post Office. Unit of the Royal Engineers which establishes and maintains postal communication between Great Britain and the army and air forces abroad, and within the commands overseas. The first army postal service for British troops serving abroad was set up in 1706, when John Macky, packet agent at Dover, was commissioned by the War Office to organize better deliveries to and from the troops in Flanders. In 1854 an army postmaster was appointed to supervise military postal services in the Crimea. The first Army Post Office Corps to be recruited from military personnel accompanied the expeditionary force to Egypt in 1882: the unit was staffed by men from the Middlesex Post Office Rifle Volunteers.

An Army Post Office functioned throughout the Boer War (1899-1902), and proved so successful that postal personnel were placed in a special reserve of Royal Engineers (Postal). Called up and expanded in the war of 1914-1918, this reserve maintained base and field post offices in all theatres of military operations. It provided personnel for China (1923-1930) and in Palestine (1935-1937). In 1926 army postal personnel were reorganized as Special Supplementary Reserve R.E. (Postal) and recruiting restricted to Post Office employees. At the outbreak of the Second Great War the Army Post Office had a nucleus strength of 270 all ranks, and by 1945 had expanded to 7,000, including members of the A.T.S.

Military mail posted in the United Kingdom is concentrated at a central army postal depot, sorted for individual units, and

dispatched to the commands overseas. Command sorting centres then forward the mail to divisional and brigade field post offices for distribution. The larger field post offices provide all normal facilities such as the sale of stamps, the issuing and cashing of postal orders, and the registration of mail.

During the Second Great War 13,000,000 outgoing items of mail were handled each week by the Army Post Office. Air and surface mail services were maintained to all parts of the world where British forces were stationed. Letters were sent to Malta and the Dodecanese Islands by submarine and dropped by parachute to advanced formations in Burma.

Army Reserve. Trained soldiers allowed to quit the colours on condition of engaging to rejoin in time of national emergency. In the pre-war British army every soldier enlisted for 12 years, but as only a certain number of men can appear on the pay roll in any one year, according to the establishments sanctioned by Parliament in the Army (Annual) Act and the votes in Army Estimates, men who had completed about six years with the colours were granted a permanent furlough on half-pay for the remainder of the term, their places in the ranks being taken by recruits. This was called the short service system.

On Sept. 19, 1938, the War Office announced the formation of a special section of the Army Reserve for pensioner warrant officers and n.c.o.s. Enlistment in the new reserve was opened to ex-soldiers who had been discharged on pension. Approved candidates were re-enlisted for a year, with re-engagement

annually. In 1948 the formation of new emergency reserves for all three services was announced. These would consist of men with previous service in the Royal Navy, Army, and R.A.F., volunteering for immediate recall in an emergency. Personnel would not be liable for training in peace-time.

Army Survey Directorate. Branch of the Royal Engineers responsible for providing combat units with up-to-date maps of the enemy's territory, and dispositions of his artillery, troops, minefields, trenches, and defended localities. Mobile map-producing units accompany troops in the field. A mobile unit consists of a drawing office and printing press, surveyors, cartographers, and draughtsmen.

Three days before the battle of Alamein front line troops possessed maps showing every enemy gun position and minefield. Over 3,500,000 maps were printed by the Army Survey Directorate in Cairo for the invasion of Sicily, and the troops who went ashore in Normandy were provided with coloured maps of all the German coast defences. At home stations the Army Survey Directorate works in close conjunction with the Ordnance Survey (*q.v.*), and during the invasion threat in 1940 some millions of maps were issued of the localities likely to be the scene of fighting.

Army Welfare Services. British army institution. Controlled by a directorate at the War Office under the department of the adjutant general to the forces, Army Welfare Services are divided into three main branches: (1) general, which includes canteens, clubs, hostels, legal aid, and soldiers' personal problems; (2) entertainment, including plays and broadcasting; (3) army newspapers, the syndication of news services, and the supply to units of recreational books, periodicals, and newspapers.

All army welfare officers at home stations hold voluntary and unpaid appointments. A command welfare officer of the rank of colonel is appointed in every command and attached to the staff of the G.O.C.-in-C. He is assisted by an administrative staff and works in cooperation with the county and local army welfare officers appointed by the Territorial Army Associations in consultation with G.O.C.-in-C. commands. Local army welfare officers help soldiers and their families in their home towns. Army welfare officers overseas are paid.

Army Post Office. Members of the A.T.S. sorting parcels, etc., at an army postal depot in the Midlands during the Second Great War

Arnaud, HENRI (1641-1721). Leader of the Piedmont Waldenses. Born at Embrun, he studied at Basel and Geneva, and became pastor to the Vaudois at La Tour. On the expulsion of the Vaudois by Victor Amadeus of Savoy, Arnaud organized and commanded the military expedition, 1689, for their return from Switzerland, but from 1690-8 he cooperated with Victor Amadeus against the French. When Amadeus again turned against the Vaudois, 1698, Arnaud took refuge in Württemberg, and became pastor near Stuttgart. He visited England, 1707, and died at Schönenberg. He was author of the *History of the Glorious Return of the Waldenses to their Valleys*, 1710, Eng. trans. H. Dyke Acland, 1827. See *Waldenses*.

Arnaud, YVONNE (b. 1892). Anglo-French actress. Born at Bordeaux, Dec. 20, 1892, she

Yvonne Arnaud, Anglo-French actress

spent her early years in the study of music and gave piano recitals in Europe and America, being acclaimed as a youthful prodigy. She first appeared on the stage at the Adelphi Theatre, London, in 1911, in *The Quaker Girl*, and subsequently appeared in musical plays, farces, and comedies. In 1926 she scored a great success as Mrs. Pepys in *And So To Bed*. In 1928 she played Elizabeth in *By Candlelight*, and subsequently appeared in British films. One of her greatest successes was as Mrs. Frail in Congreve's *Love for Love* in 1943-44.

Arnauld, ANTOINE (1612-94). French theologian. The 20th child of a distinguished French lawyer of the same name, he was born in Paris, and studied law at the Sorbonne. This he abandoned for theology, and was ordained in 1641. Supporting Jansen, bishop of Ypres, he attacked the Jesuits, and his book on *Frequent Communion*, a practice he opposed save after very rigid preparation, at once provoked controversy.

When Jansen's work was condemned as Calvinistic by Rome, Arnauld denied that interpretation and the power of Rome to decide on questions of fact. The Jesuits took the opposite view and procured his exclusion from the Sorbonne in 1655. Arnauld made outward submission in 1664, but lived at Port-Royal and remained

Jansenist. In 1678 he retired to the Netherlands, and wrote in opposition to the Jesuits, the Protestants, and William of Orange. He died at Brussels, maintaining to the last that the Jansenists were misunderstood. His eldest brother, Robert Arnauld d'Andilly (1588-1674), lived as a layman at Port-Royal. He was a poet and the author of works on history and theology. Another brother was Henri Arnauld (1597-1692), bishop of Angers, who had a long struggle with the Jesuits.

Arnauld, JACQUELINE MARIE ANGÉLIQUE (1591-1661). Abbess of Port-Royal. Often known as

J. M. A. Arnauld, French abbess

Philippe de Champagne

Mère Angélique, she was the second daughter of the twenty children of the Paris advocate Antoine Arnauld. In 1599 she became a novice in the Cistercian convent of Port-Royal, near Versailles, and at the age of eleven was nominated abbess by her father. In 1608 she was moved by a sermon to restore the old discipline, which had become very relaxed. In 1623 she came under the influence of the Jansenist abbot of St. Cyran, du Vergier. After resigning to become head of a convent in Paris, she eventually returned to Port-Royal as prioress under her sister Agnes. Her niece, Angélique Arnauld (1624-84), became successively prioress and abbess of Port-Royal, and was chief author of the *Memoirs of Port-Royal*, 1742. See *Port-Royal*; consult also Angélique Arnauld, Abbess of Port-Royal. F. Martin, 1873.

Arnaut of MAREUIL. A French troubadour who flourished at the end of the 12th century. Born at Mareuil, in Périgord, he appeared with great success at the court of Raymond V, count of Toulouse, and subsequently settled at the court of William VIII, lord of Montpellier. His poems are simple in form and abound in delicate sentiments. Petrarch, comparing him with Arnaut Daniel, calls him "the less famous Arnaut," though this opinion was not shared by his fellow troubadours, and is not endorsed by later criticism. He is regarded as having introduced the salut, or amatory epistle, into Provençal poetry.

Arndt, ERNST MORITZ (1769-1860). German poet and patriot. Born in the island of Rügen and educated at Stralsund and

E. M. Arndt, German poet and patriot

the universities of Greifswald and Jena, he became professor of history at Greifswald in 1805. The son of a former serf, he first attracted attention by the publication in 1803 of an attack on serfdom in Pomerania and Rügen, which led to its abolition. After the battle of Jena, 1806, he was driven to seek asylum in Stockholm for his criticism of Napoleon in his *Spirit of the Time*, 1807, and in 1812 he went to Russia, where he was associated with Stein in organizing the coalition against Napoleon.

At this time Arndt wrote various songs and poems, including the famous *What is the German's fatherland?*, which helped largely to revive the spirit of nationalism in Germany. In 1818 Arndt was appointed professor of history at Bonn, but he was soon suspended for his outspoken liberal opinions, and from 1819 until 1840 lived in retirement. At the revolutionary movement of 1848 he was elected to the national assembly at Frankfurt, but retired the following year. He died at Bonn, Jan. 29, 1860. See *Life and Adventures of E. M. Arndt*, J. R. Seeley, 1879.

Arne, THOMAS AUGUSTINE (1710-78). British musician. He was born at King Street, Covent Garden, London, March 12, 1710, and

Thomas A. Arne, British musician

educated at Eton. His first composition was the music to Addison's opera *Fair Rosamond*, 1733. He was the composer of two oratorios, *Abel*, 1755, and *Judith*, 1761, of the music to Milton's *Comus*, 1738, and of many operas and operettas, in addition to the music for plays of Shakespeare and others. His *Rule Britannia*, in The

Masque of Alfred, 1740, and the Shakespearean songs, Under the greenwood tree; Blow, blow, thou winter wind; When daisies pied, and Where the bee sucks, are immortal contributions. Arne died March 5, 1778, and is buried in S. Paul's, Covent Garden, London. His sister Susannah (1714-66), Mrs. Cibber, was a famous contralto for whom Handel wrote many arias. Consult Doctor Arne, H. Langley, 1938.

Arnee. Native name for the long-horned Indian buffalo. It is found wild in many parts of India,

Arnee, or long-horned Indian buffalo

where it lives in swampy jungles, but is better known in the domesticated form, of which there are many breeds.

Arnemuiden. Town on Walcheren Island, Zeeland prov., Holland. It is 4 m. E. of Middelburg, at one end of the causeway connecting with Beveland. During the reconquest of Walcheren (*q.v.*) from the Germans late in 1944, the enemy commander broadcast on Nov. 4 a suggestion that Arne-muiden should be treated as an open town on account of the many German wounded in makeshift hospitals there. This was agreed to by the British commander, and R.A.M.C. personnel entered Arne-muiden under a white flag on Nov. 5 to seek out British wounded.

Arnhem or ARNHEM. Town of Holland, capital of Gelderland. It stands on the Rhine, 35 m. by rly. E. of Utrecht, is connected by tram with that city and Zutphen, and by steamer with Amsterdam, Rotterdam, Cologne, and other ports. It manufactured tobacco, cotton and woollen goods, paper, soap, furniture, and carriages. A well-built town, beautifully situated, it had fine old churches, a quaint town hall, and monuments to the dukes of Gelderland, all destroyed in the Second Great War. Sir Philip Sidney died here in 1586. The Roman Arenacum, it was often captured, destroyed, and refortified. The French took it in 1672 and 1795, and the Prussians in 1813. The officers who fled with the Kaiser at the end of the First Great War were interned here. Pop. 99,056.

ARNHEM: AIRBORNE EXPEDITION, 1944

Eric Phillips, War Correspondent, N.W. Europe, 1944-45

This article describes the great Allied attempt in Sept., 1944, to turn the Siegfried Line with the help of airborne forces, and explains how and why it met with only very limited success, despite a resistance that has added a further page to the long story of British courage and endurance. See Europe, Liberation of

At Arnhem in Sept., 1944, the British 1st airborne division performed a memorable feat of arms, fighting for nine days and eight sleepless nights against heavy German odds in an effort to keep a footing in the town until reinforced by the British 2nd army. All attempts to reach them with adequate ground support were unavailing and in the end the remnants were withdrawn across the Lower Rhine. Thus they failed, though magnificently, in their primary object; but to make a just estimate of what they did it is necessary to consider the whole operation of which their task was part.

By the second week of Sept. the thrusts of the 2nd army over the Seine and Somme to Brussels and Antwerp, thence N.E. to Holland, had uncovered a dazzling strategic prospect. It was the possibility of reaching the Zuyder Zee: thus cutting off the German forces in western Holland and at the same time getting into position to turn the right of the Siegfried Line and invade Germany north of the Ruhr. Gen. Eisenhower made the bold decision to attempt it.

Three wide rivers were the main obstacles to the 2nd army's progress: the Meuse, which in Holland becomes the Maas; the Waal, or main lower branch of the German Rhine, and the Lower Rhine itself. To secure, in advance of the ground troops, the main axis of the thrust through Eindhoven, and especially the bridges carrying the road across the rivers at Grave, Nijmegen, and Arnhem, an Allied triple airborne operation was planned. The British veteran 1st div. with the Polish parachute brigade, and the U.S. 82nd and 101st airborne divs. were detailed, and to the British and Polish fell the task of seizing the bridge and town of Arnhem, the most northerly objective. It was calculated that the airborne troops after landing could hold their positions

for 48 hours pending the arrival of ground forces with the heavier support weapons.

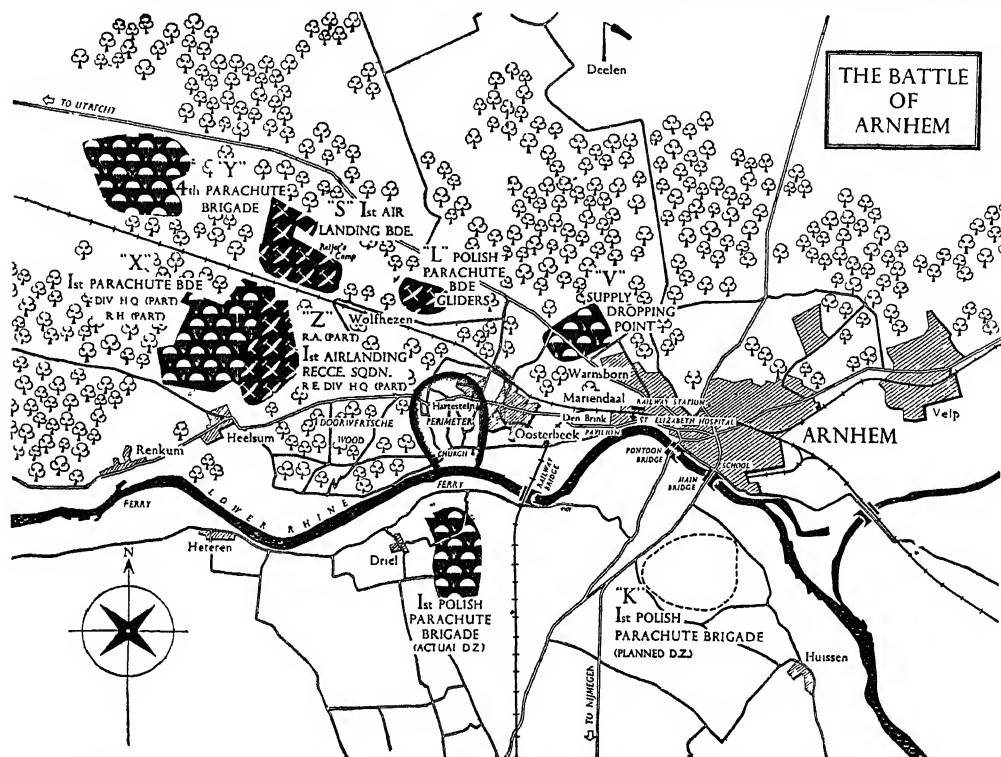

Of the British div., commanded by Maj.-Gen. Urquhart, the total number airborne has been officially stated as 10,095, including 1,126 glider pilots. As it was not possible to take them all in one lift, the commander decided to put down about two-thirds on the first day and the remainder in the morning of the next. The intention was that by the end of the second day there should be a defensive perimeter embracing Arnhem, and a reserve of airborne troops at the south end of the bridge.

The first lift took off from England in the forenoon of Sunday, Sept. 17, and the drops and landings N.W. of Arnhem were almost completely successful. But after that, things went awry for the attack. The Germans reacted at once and strongly, and soon there were armoured cars and tanks and guns, including 88-mm. and self-propelled guns, mortars and flame-throwers, as well as the usual infantry weapons, in action against the less heavily armed British troops.

The parachute brigade moving towards the bridge sorely missed, in the confused struggle that developed, the help they might have had from the glider-borne battalions, whose necessary first duty was to stand guard over the landing zones till the second lift arrived. That second lift next day

Arnhem. Three British paratroopers bombard German positions with a 3-in. mortar

Arnhem. Plan showing the dropping and landing zones chosen for the airborne operations round Arnhem

Reproduced by permission from "By Air to Battle," H.M. Stationery Office, Crown copyright

came several hours late, its start having been delayed by bad weather. One parachute battalion reached the bridge, and held it for nearly four days, but in conditions which hourly became more desperate. The rate of casualties in the division generally was such that the planned perimeter could not be established, and this failure led to a tragically fruitless display of heroism by the R.A.F. A dropping zone for supplies by air had been fixed beforehand, but was never in fact controlled by the British. Nor did the R.A.F. receive signals sent asking them to drop their loads in another area. Pilots, therefore, believing they were giving vital aid to their comrades, flew their machines in succession into extremely heavy A.A. fire only to let the supplies fall among the enemy.

The groups into which the division was split just fought on, with no chance to sleep, their food and ammunition running out, and little more than their own indomitable spirit to keep them at their single task now of killing Germans. They fell back into a shrinking perimeter west of Oosterbeek. From there most of the survivors withdrew across the

river in assault boats during the night of Sept. 25-26. They left behind them 7,605 killed, wounded, and missing, including the medical staffs who chose to stay.

Attempts had been made to reinforce them across the river: very gallant and partly successful, but too small in scale to be effective. An early one was made by about 250 Polish parachutists who had dropped S. of the bridge. Later, about the same number of the Dorsetshires from the 43rd Wessex div. ran the gauntlet up from Nijmegen in trucks and amphibious "ducks" with stores and ammunition, and after great effort and loss got over in some force in boats. Meanwhile, the Guards' armoured units leading the 2nd army strove furiously to reach Arnhem but could not, because their only approach was a causeway running largely above flat fields on soft ground. No tank could leave the road and not be bogged; yet those on it were sitting targets for German gunners on high ground overlooking it. The road was constantly swept by fire and cut by enemy battle groups with tanks, and to keep up supplies was impossible.

The achievement of the men of Arnhem was in forcing the enemy to use all his available troops and resources there, which they destroyed or otherwise prevented from moving by the shortest route to reinforce the Germans opposing the Allied troops at the great bridge of Nijmegen. Their battle and sacrifice helped more than they knew in the success of the U.S. airborne divisions at Nijmegen and Grave, whom the Guards were able to support quickly. The operation as a whole stopped the enemy from fortifying two of the three river lines, and enabled the 2nd army to jump over 50 m. towards the German frontier and lodge itself in what the Germans had imagined would be their own winter positions.

Arnhem Land (OR ARNHEIM). District in the Northern Territory, Australia. It lies between the Gulf of Carpentaria and Anson Bay, and is the extreme N. portion of the territory. It was named after the ship of the Dutch navigator who discovered it in 1618.

Arnica. Dried root or flowers of *Arnica montana*, a plant which grows in middle and southern

Europe. Tincture of arnica is a popular application for the relief of bruises and sprains.

Arnim, ELISABETH OR BETTINA VON (1785-1859). German writer. Born at Frankfort-on-Main, April

4, 1785, daughter of the Maximiliane who had been beloved by Goethe when young, and a sister of the romantic writer Clemens Brentano, she first met

Elisabeth von Arnim, German writer

Goethe in 1807, and fell violently in love with him. But her passion was not returned, and in 1811 Goethe broke off the friendship owing to Bettina's rudeness to his wife. In the same year she married Ludwig von Arnim, the poet and novelist. Her famous Correspondence of Goethe with a Child, 1835, though founded on fact, contains much fiction. She died in Berlin, Jan. 20, 1859.

Arnim, ELIZABETH MARY, COUNTESS VON. This British novelist, author of Elizabeth and her German Garden, is noticed in full under Russell, Mary.

Arnim, HANS GEORG VON (1581-1641). German soldier. Born in Brandenburg, after serving with the Swedes, 1613, and later with the Poles, he became a field-marshal under Wallenstein in the Thirty Years' War. He afterwards went over to the other side, held a command under Gustavus Adolphus at Breitenfeld, 1631, and acted as intermediary in the negotiations between John George, elector of Saxony, and Wallenstein, 1634. Accused of plotting against Sweden in 1637, he was taken to Stockholm as a prisoner, but escaped to Hamburg in 1638. His last years were spent in fighting for the Germans against the French and Swedes.

Arnim, JURGEN SIXT VON (b. 1889). German soldier. He was born at Erndorf, Silesia, April 4, 1889, and entered the army at an early age. In the First Great War he served with distinction, and after Germany's defeat in 1918 he was one of the few officers to retain a high position in his country's skeleton army. A typical Prussian militarist, he showed outstanding ability, and became one of Germany's leading anti-tank specialists. In the Second Great War his technical knowledge was used to advantage in the North Africa campaigns, and it was he who was responsible for construct-

ing the Alamein defences during the crucial stage of the desert fighting in 1942. Appointed c.-in-c. of Axis forces landed in Tunisia 1942-43, he successfully held up the Allied advance on Tunis. As Rommel had left Africa before his retreating forces joined von Arnim's on April 13 (*see* Tunisia, Battle of), von Arnim then assumed command of all Axis troops in Africa until his final defeat a month later. He and his quarter-million men made no attempt at a "Dunkirk." He himself surrendered May 12 near Enfidaville to the c.o. of the 2nd Gurkhas, and reached England as a prisoner of war four days later. He was released after the end of the war and sent to Germany.

Arno. A river of Italy. The ancient Arnus, it rises on Monte Falterona, in the Apennines, flows swiftly S. nearly to Arezzo, curves N.W. and then W., passing through Florence, to the Mediterranean 7½ m. below Pisa. Often in flood, it brings down much alluvium, which has caused the sea to recede some 5 m. within the past 2,000 years. It is 150 m. long and navigable by barge to Florence.

During the summer of 1944 the Arno and its valley were the scene of fierce fighting as the Germans retreated slowly up the peninsula, stubbornly contesting every strong-point. The Allied 8th army took Arezzo on July 16, pushing on next day to cross the Arno at two points. They advanced up the valley, while American troops of the 5th army fought their way to reach the Arno canal near Leghorn (July 21). Though Allied formations were at the outskirts of Florence by Aug. 4, the city was not liberated until the 22nd. Meanwhile, on Aug. 10, Allied troops reached the Arno from Montelupo to a point 3 miles E. of Florence. Early in Sept. the 5th army crossed the Arno, and a general Allied advance began towards the Gothic Line (*q.v.*).

Arno, PETER (b. 1902). American cartoonist. He was born on Jan. 8, 1902, and was educated at Yale university. He became subsequently well known for his satirical drawings which appeared in the New Yorker, Ballyhoo, and other American magazines. His cartoons, which satirised the foibles of the day, re-

vealed a sophisticated sense of humour, and exhibitions of his work in New York, Paris, and London made him internationally famous. Many of Arno's drawings were collected into volumes; the best known were Parade, 1931; Circus, 1933; For Members Only, 1937; Cartoon Review, 1943; The Man in the Shower, 1945.

Arnold. Urban district and market town of Nottinghamshire, England. It is 4 m. N.E. of Nottingham and has lace and hosiery factories. The church of S. Mary, partly Norman but chiefly Early English, is supposed to have been built in the 12th century; it has a 15th century tower, and was partly restored in 1868 and 1877. Market day, Sat. Pop. 14,470.

Arnold of BRESCIA (c. 1100-55). Italian monk and reformer. Of noble descent, he studied at Paris, possibly under Abélard (*q.v.*). Becoming a canon regular, on his return to Italy he attacked the clergy for holding property and, banished by Pope Innocent, went back to France. He was condemned by the Council of Sens, 1140, on the instigation of S. Bernard, for holding the opinions of Abélard, and retired to Zurich. Thence, in 1143, he proceeded to Rome, where a republic had been set up, and at once attacked the papacy, the episcopate, and the monastic orders for their temporal possessions. On the accession of Pope Adrian IV in 1154 Rome was threatened with an interdict, and Arnold fled to the Campagna. He was brought back to Rome, June, 1155, and hanged.

Arnold, SIDNEY ARNOLD, 1ST BARON (1878-1945). English politician. Son of a Manchester stockbroker, he was born Jan. 13, 1878, and educated at Manchester grammar school. For many years he was a member of the Manchester stock exchange. Liberal M.P. for Holmfirth, West Riding, 1912-21, he joined the Labour party in 1922, and in 1924 was made a peer on his appointment as under-secretary for the Colonies in the MacDonald administration. Paymaster-general in the second Labour govt., he resigned from the party in 1938 owing to his disagreement with its policy of resisting the fascist dictatorships by going, if necessary, to war. He died Aug. 3, 1945, leaving no heir.

Arnold, BENEDICT (1741-1801). American general. Born at Norwich, Connecticut, Jan. 14, 1741, he joined the American army in the War of Independence, fought at Ticonderoga and Quebec, and

Peter Arno, American cartoonist

reached the rank of major-general. In 1777 he was greatly aggrieved by the promotion of five inferiors over his head. He fought, however, at Ridgefield and Saratoga, and was commander of Philadelphia, 1778, and later of West Point, 1780. He then entered into negotiations with the British, through John André, for the betrayal of West Point. André was taken and hanged, but Arnold made his way to the British lines, received a command in the British army, and fought against the Americans. He sailed for England in 1782, and died in London, June 14, 1801.

Bibliography. Lives, J. Sparks, 1838, and L. N. Arnold, 1880; Arnold's Expedition to Quebec, J. Codman, 1901; Arnold's March from Cambridge to Quebec, with a Reprint of Arnold's Journal, J. H. Smith, 1903.

Arnold, Sir Edwin (1832-1904). British poet and journalist. Born at Gravesend, June 10, 1832, he was educated at King's College, London, and University College, Oxford. After spending five years in India as principal of the Government College at Poona, he joined the staff of *The Daily Telegraph* in 1861, and was connected with that journal for the rest of his life. His reputation as a poet rests on *The Light of Asia*, 1879, an epic dealing in florid blank verse with the life of Buddha. Although it failed to commend itself to the best critics, it enjoyed great vogue. *Seas and Lands*, 1891, is a record of travel. He died March 24, 1904.

Arnold, Matthew (1822-88). British poet, critic, and educationist. He was born at Laleham-on-Thames, Dec. 24, 1822, eldest son of Thomas Arnold of Rugby, and educated at Winchester, Rugby, and Balliol College, Oxford. He was Newdigate prizeman in 1843, became fellow of Oriel 1845, and from 1847 to 1851 was private secretary to Lord Lansdowne, president of the council, by whom in 1851 he was appointed inspector of schools. He held this post for over 30 years, retiring in 1883, and from 1857 to 1867 was professor of poetry at Oxford. In 1883 and 1886 he lectured in America. He died suddenly at Liverpool, April 15, 1888, and was buried at Laleham-on-Thames.

As school inspector Arnold left valuable reports on the educational systems of France, Germany,

and Holland, 1861-5. His Oxford lectures *On Translating Homer*, 1861-2, advocated the English hexameter as an equivalent for the Homeric rhythm. His lectures *On the Study of Celtic Literature*, 1867, gave marked impetus to the subject, while his *Essays in Criticism*, 1865-88, ensured his position as a critic. *Culture and Anarchy*, 1869, *S. Paul and Protestantism*, 1870, *Literature and Dogma*, 1873, *God and the Bible*, 1875, and *Last Essays on Church and Religion*, 1877, raised discussions in all sections of church life. Not Christianity, but the common conception of it, was the subject of his criticism. He edited selections from Johnson, Byron, Wordsworth, and Burke.

Arnold's first Poems, including *The Strayed Reveller*, 1849, and the volume with *Empedocles on Etna*, 1852, were anonymous. His next volume of poems was issued in 1853 under his own name, with a preface that heralded his fame as a critic. His more noteworthy poems, in addition to the two already mentioned, are *Thyrsis*, a monody on his friend Clough and one of the outstanding elegies in the language; *Sohrab and Rustum*, *Mycerinus*, *Tristram and Iseult*,

The Forsaken Merman, *Rugby Chapel*, *Requiescat*, *The Scholar Gipsy*, *Stanzas From the Grand Chartreuse*, *Westminster Abbey*, *Heine's Grave*, and some beautiful sonnets, including one on *Shakespeare*. His *Merope* is a play after the Greek manner.

Influenced by Wordsworth, Clough, Goethe, and Senancour, Arnold consistently opposed Victorian smugness and what he called philistinism; he pleaded for classic ideals, restraint, a standard of mind instead of material comfort. He regarded France as superior to Britain in mentality and Germany as Britain's superior in practical affairs. His prose, often beautiful, as in the preface to *Essays in Criticism*, sometimes bantering, as in *Friendship's Garland*, 1871, is consistently dignified, calm, lucid, and felicitous. His poetry, usually meditative, is classic in form and spirit; by it his name will be best remembered.

Bibliography. *Appreciations*, G. E. B. Saintsbury, 1899; G. W. E. Russell, 1904; *Hugh Kingsmill*, 1931; L. Trilling, 1939; *Letters*, 1848-88, ed. G. W. E. Russell, 1895; *Note-books*, with a preface by the Hon. Mrs. Armine Wodehouse, 1902; *Bibliography*, ed. and compiled by T. B. Smart, 1892.

THOMAS ARNOLD: EDUCATIONIST

Sir Michael Sadler, Master of University Coll., Oxford, 1923-34

The life and work of the re-founder, as he may be called, of the public school system of England is here outlined. See also Education; School; University; William of Wykeham; and the separate articles on the great public schools

Thomas Arnold was born June 13, 1795, at Cowes, Isle of Wight. He was educated at Winchester and at Winchester (1807-11), whence he went to Corpus Christi College, Oxford, where he came under the influence of the writings of S. T. Coleridge and Wordsworth. He was elected fellow of Oriel College in 1815 and was ordained in 1818. He married Mary Penrose in 1820 and lived at Laleham-on-Thames between 1819 and 1828, taking private pupils.

Headmaster of Rugby

In 1828 he was elected headmaster of Rugby school, at a time when public opinion was largely adverse to public school education, which had remained too impervious to the new religious and social ideals of the age. Chosen professor of modern history at Oxford in 1841, he held this office with his headmastership. He died suddenly at Rugby, June 12, 1842.

Arnold's written works were mainly religious and historical, but he also published in numerous periodicals articles on social and educational questions. He wrote

A History of Rome, 1838-43, and *A History of the Later Roman Commonwealth*, 1845. He also edited *Thucydides*. A six volume edition of his *Sermons*. rev. Mrs. W. E. Forster, appeared in 1878.

Arnold's Educational Ideals

Arnold defined the aim of education as a union of moral and intellectual excellence. Education must, therefore, in his view have a religious basis; and upon a foundation of liberal culture must prepare for subsequent professional and civic duties, but without premature specialisation. Education in a public school was better for most boys than private tuition. The moral dangers of school life were aggravated in boarding schools, which, however, as a historic and characteristic part of English higher education, should be preserved on account of the value of their traditions, but needed a new moral impulse and internal reform. In such reform the personality of the teacher would be the prime force.

Next in importance to the personality of the teacher was a good

Matthew Arnold
Painting by G. F. Watts

moral tone in the school community, the social influence of which was valuable in the formation of character. Such a tone might be promoted by skilful organization of school life; by the careful selection of pupils and the withdrawal of those whose influence was unsuitable; by entrusting responsibilities in self-government to the different categories of boys, graded according to age and standing; by personal guidance from the masters; and by a wise system of rewards and punishments. The other necessary factors in a good education were a well-planned curriculum, aiming at the creation of a desire for knowledge and at the imparting of a right point of view, and the use of methods of instruction which stimulated mental activity, trained the power of self-expression, and adjusted themselves to the individual needs of different temperaments and types of mind. A national system of education should consist of grades of schools, according to the main social groups in the national life. But this grading, which, in his view, should be in three layers, was hurtful if class prejudice impaired the sense of mutual obligation to the collective interests and life of the nation.

Arnold won over to the support of the public school system the new upper middle class which, especially in the north of England, had become wealthy through industrial and commercial prosperity. His success at Rugby led to the establishment of a number of new boarding schools on the model of the older public schools. He was instrumental in raising the age of entrance to the public schools, in encouraging the growth of preparatory schools, and in deferring the age of entrance to the older universities. He broadened the idea of classical education and, by the general direction of his influence rather than by actual precept, gave new prestige to history, English literature, and mathemat-

ics in the public school curriculum. His influence strengthened the school of thought which inclines to undenominational Christian teaching as the basis upon which religious instruction may be retained in schools attended by pupils drawn from a variety of religious bodies. He won for the headmasters of the public schools greater freedom from interference on the part of governing bodies, and in some degree

Thomas Arnold, English educational reformer

Bust by Boehm in Temple Speech Room, Rugby

vindicated the political independence of the teaching profession.

Arnold increased the prestige of the great endowed schools and strengthened their position against any intrusive form of control by the state. Unintentionally on his part, his success retarded the effective reorganization of English secondary education upon a local basis, as he made it customary, in circles in which another practice had been usual, for boys to be sent away from home to distant schools. His single-handedness in the moral reform of the public schools was inadvertently exaggerated by Stanley, in ignorance

of the full facts of the case, and the effects of Arnold's personal influence upon the mind and outlook of a sensitive boy were seriously questioned by many competent observers; but, when all is said, Arnold stands out as the most heroic figure in English secondary education in modern times.

Bibliography. Life and Correspondence of Thomas Arnold, A. P. Stanley, 12th ed., 1881; Arnold of Rugby, J. J. Findlay, 1897; Eminent Victorians, Lytton Strachey, 1918.

Arnold-Forster, HUGH OAKLEY (1855-1909). British politician. Born at Dawlish, Devon, Aug. 19, 1855, he was the grandson of Thomas Arnold. Left an orphan in 1859, he was adopted by W. E. Forster (*q.v.*), his uncle by marriage. He joined the publishing firm of Cassell and wrote several school text-books. Lib. Unionist M.P. for W. Belfast, 1892-1906, and Unionist M.P. for Croydon, 1906-9, he was secretary to the Admiralty, 1900-3, and secretary for war, 1903-6. He died in London, March 12, 1909.

Arnoldi, WILHELM (1798-1864). German prelate. Born at Baden, he studied at Trèves, and having been ordained, was attached to the cathedral there. In 1839 he was chosen bishop, but not until 1842 did the authorities allow him to take up his office.

Arnoldson, KLAS PONTUS (1844-1916). Swedish pacifist. Born at Göteborg, Oct. 27, 1844, he was largely self-educated, and became a worker on the state railways. By 1882 he had secured a reputation as a writer on rationalist philosophy and was elected to the Riksdag, where he became an advocate of the permanent neutrality of the Scandinavian countries, religious tolerance, and the rights of women. He founded the Swedish Society for Peace and Arbitration and was awarded the Nobel Peace Prize in 1908, devoting the money to the cause of peace. He died at Stockholm, Feb. 20, 1916.

Arnould, MADELEINE SOPHIE (1744-1802). French singer. Born in Paris, she first appeared in public at the Grand Opera House,

Sophie Arnould, French beauty and wit, who was a popular opera singer
J. B. Greuze, Wallace Collection

Thomas Arnold. The old schoolhouse at Rugby

Paris, Dec. 15, 1757, and until her retirement, in 1778, was one of the most popular opera singers. She was the first to play the title-part in Gluck's *Iphigeneia in Aulis*. A beauty and a wit, her salon was the resort of distinguished writers. Many of her witty sayings are preserved in the collection known as *Arnouldiana*.

Arnsberg. Town of Germany, in the former prov. of Westphalia, on the river Ruhr, 44 m. S.E. of Münster. It was the capital of the district, had breweries and distilleries, and manufactured paper and railway materials. In the 13th century it had a Benedictine abbey and a castle, ruins of which still remain. After being for over 400 years part of the electorate of Cologne, Arnsberg passed to Hesse in 1802 and to Prussia in 1815. Pop. pre-war, 11,791.

Arnstadt. Town of Germany, in Schwarzburg-Sondershausen. It is pleasantly situated on the Gera, 12 m. S. of Erfurt, and is one of the oldest towns of the district. It has a fine 12th century church, the remains of a castle, a 16th century town hall, and a school founded as a Latin school in the Middle Ages. It manufactured beer, gloves, and porcelain. Overrun by U.S. forces in April, 1945, it lay in the Russian zone of occupation after Germany's surrender. Pop. pre-war, 21,693.

Aroa. Town of Venezuela, in Yaracuy province. It stands on the river Aroa, 50 m. by rly. S.W. of Tucacas, and is a copper-mining centre. The river flows for about 100 m., generally E. by N., to the Gulf of Triste.

Arolla. Village and mt. resort of Switzerland, in the canton of Valais. Near the Arolla Glacier, at the head of the S.W. branch of the Val d'Herens, it is four hours by mule-path from Evolena. Its alt. is 6,570 ft.

Aromatic Compounds. Group of organic chemical substances which includes the benzene (C_6H_6) derivatives. Kekulé in 1865 was the first to adopt the term "aromatic," because the members of the group possessed pleasant odours. The group has since been enlarged to include substances analogous in chemical behaviour, but without pleasant odour. The greatest source of aromatic compounds is coal tar. The benzene derivatives have a nucleus of six carbon atoms and a characteristic stability. Nitro compounds and sulphuric acid derivatives are formed by direct

action of nitric acid and sulphuric acid respectively. The other great group of organic substances is the aliphatic or fatty compounds, these being looked upon as derivatives of methane (CH_4). Aliphatic compounds are distinguished by containing open carbon chains in contrast to the closed chains or rings of the aromatic series.

Aroostook. River of North America. It rises in Maine, and flows 140 m. N.E. to the St. John river, New Brunswick, Canada. It was concerned in the long N.E. boundary dispute between the U.S.A. and Great Britain, settled in 1842 by the Ashburton Treaty. It gives its name to a co. of Maine.

Aros. Negro tribe dwelling W. of the Cross river in S. Nigeria. Their funeral customs suggest early Egyptian influence. Human sacrifice at the bidding of a powerful juju deity and domestic slavery were practised until the tribe, the most intelligent and vigorous of the Ibo race, submitted to British control in 1902.

Arosa. A summer and winter resort of Switzerland, in canton Grisons. It is 19 m. by rly. E. of Coir, in the Schanfigg valley. Surrounded by pine-woods, it is 5,900 ft. high and is a favourite resort for consumptives.

Arpad OR ARPHAD. A city of Syria, N.W. of Aleppo (2 Kings 18 and 19; Isaiah 10, 36, 37; Jer. 49). The modern Tell Erfud, the original city was destroyed by Tiglath-pileser III about 740 B.C.

Arpad OR ANDREW (d. 907). Founder of the Magyar monarchy. Little is known of him beyond his appearance with his hordes in 896 and his conquest of the country afterwards named Hungary about 906. On his death his son succeeded him as duke of Hungary, and the Arpad dynasty lasted until 1301. Arpad's Monument, overlooking Brasso, was erected in 1896 to commemorate the 1,000th anniversary of the founding of Hungary.

Arpent OR ARPINE. French land measure, corresponding approximately to the English acre. There were various forms, e.g. the royal, common, and Paris arpent. It is still used in Louisiana, U.S.A., and in the French districts of Canada. The word appears in Domesday as *arpendus* and comes from *arepennis*, the Latinised form of a Gallic term used in measuring.

Arpino. Town of Italy, in Naples province. Situated at an alt. of 1,475 ft., midway between Rome and Naples it is 88 m.

by rly. S.E. of Rome. An old Volscian city, the ancient Arpinum, it retains much of its walls, gateways, and round towers. Near were born Vipsanius Agrippa, Marius, and Cicero. It manufactures parchment and leather, and has marble quarries. Wide damage and loss of life were caused by an earthquake in Jan., 1915.

The town was captured from the German occupying force by New Zealand troops of the 8th army on May 30, 1944. Well-known landmarks escaped damage, though one section of the Cyclopean wall was hit. The contents of the museum were saved with the exception of the coin collection, which the Germans looted.

Arqua Petrarca. A village of Italy, in Padua province. It lies among the Euganean Hills, 3 m. N.E. of Este. Here Petrarch lived his last four years, hence the name. His house remains and his tomb of red marble stands in front of the church. Near, on the Lago della Costa, are remains of a lacustrine village.

Arquebus OR HARQUEBUS. An early form of firearm. It appeared in the 15th century soon

Arquebus. The lower one is an early form, with a brass barrel in a wooden stock. The upper (time of Henry VIII) has the recess for bullets in the side of the stock shown open

after the discovery of gunpowder, and varied in size from a cannon to a musket. It was carried by the soldiers, but in the field was supported on a rest. The name itself is probably derived from two German words meaning a hook gun, the hook being made to fasten the weapon to its carriage or rest. The original form was known as the *arquebus à croc*.

The earliest arquebus was merely a small cannon fired by matchcord or tinder; but a 16th century Italian, Filippo Strozzi, made great improvements, and in his time it was effective up to 400 paces. It was the chief infantry weapon in the battles of the earlier part of the 16th century, Pavia for instance, but in the 17th was supplanted by the musket. Arquebuses of calibre, i.e. with a uniform bore, became the calivers of the English army. In the time of

Elizabeth, when the Spaniards were threatening England, a corps of arquebusiers was formed. See Artillery; Musket.

Arquerite. Native amalgam of silver. It is found in the mines of Arqueros (whence the name), in the prov. of Coquimbo, Chile, and is a source of silver. Its composition is said to be silver 86.63 p.c. and mercury 13.37 p.c. See Silver.

Arracacia esculenta. Perennial herb of the order Umbelliferae. It has a tuberous root con-

Arracacia esculenta, showing below barren flower, fertile flower, and fruit

sisting of several carrot-like lobes. The plant is not unlike the common hemlock (*Conium maculatum*), to which it is related botanically. It is cultivated as a food plant in the mountainous parts of northern S. America, and the boiled tubers are considered to have a flavour which suggests both parsnip and sweet chestnut.

Arrack or **RAKI** (Arab. *araq*, juice). Name of any locally made spirituous liquor in the E. Indies, especially that distilled from palm toddy, from rice or molasses fermented with palm-juice, or from flowers of the mahwa tree. Usually imperfectly prepared, it is an inferior but potent, injurious spirit, containing from about 53 to 75 p.c. of alcohol.

Arrah. Principality of Bihar province, India, capital of Shahabad district. It is 33 m. by rly. W. of Patna, and connected by canal with the Ganges. In 1857 twelve British with only fifty Sikhs held here two buildings for eight days against 2,000 sepoys and several thousand armed natives, until relieved by Eyre. Pop. 40,769.

Arraignment (late Lat. *arra-tionare*, to call to account). English legal term. It means bringing a prisoner who has been indicted, or found guilty on a coroner's inquisition, before the court which is to try him. The accused must be brought to the bar of the court, or placed in the dock. The charge is read or explained to him by the clerk, and he is asked to plead guilty or not guilty. A prisoner is not allowed to be arraigned in fetters, unless on apprehension of violence or attempted escape. Where the indictment also charges the prisoner with having been previously convicted of felony, this must not be mentioned on the arraignment, for fear of prejudicing the prisoner on his trial for his present offence. See Trial.

Arran. Largest island in the Firth of Clyde, Scotland. It forms part of Buteshire, is 20 m. long, from 8 m. to 11 m. broad, and has an area of 165 sq. m. The N. and N.W. are rugged and picturesque, intersected by narrow glens of great beauty, with many conical mts., the highest being Goat Fell, 2,866 ft. Farther S. the land is less elevated, undulating, and largely under cultivation. Of several good bays, Lamlash, on the S.E., is one of the finest natural harbours in the British Isles. Others are Brodick Bay and Whiting Bay on the E., and Loch Ranza, N.W.

Next to agriculture, cattle and sheep rearing and fishing are the chief industries. Many of the coast villages are favoured as holiday resorts. The castle of Brodick, the chief village, was long a seat of the dukes of Hamilton, to whom most of the island belonged. On the death of the 12th duke in 1895 it passed to his daughter, the marchioness of Graham. Kildonan Castle is a ruin of the 14th century. Among other antiquities are the ruins of Loch Ranza Castle, stone circles, and monoliths. For many years occupied by Norse raiders, Arran was annexed to Scotland in 1266, and here Robert Bruce took refuge in 1306. Pop. 4,500.

Arran, EARL OF. Scottish title, held by several famous men, and now a secondary one of the duke of Hamilton; also an Irish title held since 1762 by the family of Gore.

In 1467 James III. of Scotland gave the title of earl of Arran to Thomas Boyd, and in 1503 it was revived for James Hamilton, a kinsman and friend of James IV. Until his death in 1529 this earl was prominent in all the troubles of the time, fighting both on land and sea against England, and more than once engaged in civil war and faction fights.

His son, the 2nd earl, figures largely in Scottish history during the reign of Mary. In 1542 he was declared protector of the kingdom and heir presumptive to the throne: he held the former position until 1554. After this followed exile in France, imprisonment alternating with authority in Scotland, and before his death on Jan. 22, 1575, a period of rebellion against James VI. By the French king Arran was made duke of Châtellerauld; he is the ancestor of the dukes of Abercorn.

His son James, the 3rd earl, was spoken of as a likely husband for either Mary of Scotland or Elizabeth of England. A Protestant leader, for a few years he was deprived of his title, which was held from 1581 to 1586 by James Stewart. From about 1568 until his death in 1609, Arran was wholly or partially insane. The title

Arran. Glen Sannox, from the bridge. The glen, remarkable for its Alpine-like grandeur, is 5 miles north of Brodick

descended to his nephew James, marquess of Hamilton, the father of the first duke of Hamilton.

James Hamilton, 2nd Earl of Arran. C. Ketel, Hamilton Coll. See Hamilton.

The Irish title earl of Arran, taken from the Aran or Arran Islands, was granted in 1762 to Arthur Gore, Viscount Sudley. His descendant, the 6th and present earl, sits in the House of Lords as Baron Sudley.

Arran. Variant spelling of the name of three islands in Galway Bay, better known as the Aran Islands (*q.v.*).

Arrangement. In music, the translation of a composition for voices or instruments other than those for which it was originally designed. Examples are pianoforte music arranged for organ or orchestra or military band; orchestral music translated for organ or pianoforte; songs transcribed and elaborated into pianoforte solos.

The practice has been sanctioned by many great composers, who have made, or commissioned others to make, transcriptions of their own works. Notable cases are Bach's concertos for harpsichord or violin, and his transcriptions of Vivaldi's concertos; Handel's frequent rewriting of airs, intended for one kind of voice, for another voice with new setting of the accompaniments; Liszt's, Grieg's, and Brahms's rearrangements of their own works, and Liszt's resetting of songs as pianoforte solos.

An important class of arrangements differing in intention from the above includes the transcriptions of orchestral overtures, symphonies, and works of similar calibre for pianoforte solo or duet. These arrangements are the equivalent of line engravings of pictures, and their educative value cannot be overestimated.

A more popular use of the term is met with the adaptation of music to suit the requirements of dance rhythm or the limitations of a dance orchestra. Arrangements are also made of new dance tunes of which the composer may be able to supply only the air. The arranger adds suitable harmonies. In films a musical arrangement is an adaptation recorded on the sound track of appropriate new or old music to synchronise and point the changing moods or scenes of the film.

Arras. Tapestry fabric woven in colours with figures and scenes, so called from the city of Arras, N. France. During the 14th and 15th centuries the tapestries of Arras were so famous that the name *arras* was used in England as the general term for tapestry wall-hangings. The *arras* was often hung a considerable distance from the wall, thus providing a lurking-place for eavesdroppers. Polonius, in Shakespeare's *Hamlet*, was stabbed while hiding behind the *arras*. See *Tapestry*.

Arras. City and episc. see of N. France. The capital of the depart-

ment of Pas-de-Calais, it stands on the river Scarpe, 38 m. by rly. N.E. of Amiens. Its 16th century town hall, which was a richly decorated building with a belfry 240 ft. high, and its cathedral, begun in 1755 to replace the old abbey church of S. Vaast, were laid in ruins during the First Great War, as were the tall gabled houses with arcades which surrounded the *Petite Place* and *Grande Place*. The public library had 40,000 volumes. Little survives of Vauban's fortifications. The city was rebuilt and largely restored during the years between the wars. Manufactures include hosiery, agricultural implements, pottery, and china. One of the busiest corn-markets in the country, Arras trades largely in locally grown beet, sugar, grain, and chicory. The making of tapestry, for which the city was once famous, is no longer carried on. The ancient *Nemetacum* or *Nemetocenna*, and the chief town of the *Atrebatas*, Arras, a corruption of a later form *Atrabate*, subsequently became the capital of the province of Artois. After being under the dominion of Burgundy, Flanders, and the Hapsburgs, it passed to France in 1659. In 1477, under Louis XI of France, it was peopled with Frenchmen and renamed *Franchise*. Robespierre was born here. Pop. 29,490.

FIRST GREAT WAR. At the junction of five rlys. only 50 m. from the Channel, Arras was of high strategic importance in the First Great War, and the Germans made a bold bid for its capture in Sept., 1914. German cavalry captured it on Sept. 1, the infantry arriving on Sept. 6; but they were unable to hold it. From Sept. 18, when French cavalry reached Arras, the city remained in Allied hands throughout the war, the British taking over the town early in 1916 as part of their extended zone of operations.

For long Arras was the northern pivot of the western battle line. The German lines were only 2 m. E. of the city, and at some points in the suburbs the rival trenches almost joined. There was fighting for possession of the city in Oct., 1914, when the Germans in a vain attempt to envelop Arras secured the dominating height of Vimy Ridge, 475 ft., to the N.E. On the S.W. slopes they built a tangle of trenches, concrete machine-gun posts, and underground galleries known as the Labyrinth. This was about 2½ m. long and just over 2 m. N. of Arras. In June and July, 1915, the French gradu-

ally cleared the labyrinth in severe hand-to-hand fighting. It was then, as the Germans fell back, that they constantly shelled Arras, reducing the cathedral to a wreck. But a threatening German salient had been flattened out as a result of this French attack.

Probably the most important of the five battles of Arras was the offensive launched by the British in the spring of 1917 in accordance with the general plan of campaign settled between the Allies (see *Aisne, Second Battle of*). Sir D. Haig hoped to transfer his offensive to Flanders later, to recover Ostend and Zeebrugge, and it was clear that the seizure of Vimy Ridge would insure him against any counter-offensive at Arras. The German positions there were now of enormous strength, heavily entrenched with cement and steel-armoured blockhouses, machine-gun posts, and belts of wire that were sometimes 100 yds. in depth. Before the attack new rlys. and roads had to be constructed, and to facilitate a secret concentration of troops and supplies in Arras itself a vast system of underground shelters and tunnels was devised. Three divisions, totalling some 50,000 men, were assembled underground for the battle.

Canadians at Vimy

The attack opened on Easter Monday, April 9, on an 18-m. front. The total force employed was 28 divisions, *i.e.* about 450,000 men. They included 4 Canadian divisions. Within eight hours the whole of Vimy Ridge was cleared as far N. as Hill 145, where the German defence works were most formidable. Squalls of sleet and snow then intervened to hamper the movement of guns, but on the following day the Canadians cleared the last part of the Ridge, which the German garrison had been ordered to hold to the death because of its vital importance. Total British captures during the battle: prisoners, 19,500; guns, 257 (98 heavy); machine-guns, 404. The front was advanced 5 m., and Arras, from being one of the weakest points of the Allied line, became one of the strongest. British losses were 146,000 killed, wounded, and missing. German losses could not have been lighter.

In March, 1918, the Germans intended a break-through of the Allied line at Arras. They began by thrusting against the flank, but the British fell back in order after inflicting some losses. Ludendorff therefore opened a direct assault

on Arras and the heights commanding it. This opened March 28, after a bombardment of extreme violence. The Germans advanced in six lines almost shoulder to shoulder N. of the Scarpe and broke through the British outpost line, but their progress was stopped by the determination of infantry and machine-gun men and by the efforts of the artillery. During the night the British line was withdrawn some miles and all subsequent attempts to penetrate it were foiled. The battle exhausted at least 15

German divisions. They displayed the utmost courage, but their tactics were generally condemned as unsound by British commanders and later by their own staff.

The final battle of Arras opened Aug. 26, 1918, when the British 1st army was set to capture the Drocourt-Quéant line and the German rlys. running S.W. and S. from Douai. The British force employed was 10 divisions. The Germans had 13, supported by works of such extraordinary strength as to be reputedly impregnable. By the end of Aug. severe fighting had brought the British in front of the Drocourt line. On Sept. 2 the Canadian corps, supported by 40 tanks, with armoured cars, swept into the trenches, tunnels, and dug-outs of the German defence and completely shattered all resistance. The British burst into a triangle of works where the Hindenburg line joined the Drocourt line at

Arras, France. British line of retreat from Arras, 1940, when German superiority in numbers made withdrawal imperative

By courtesy of "The Daily Telegraph"

Quéant. The whole section of Scarpe to Quéant was in British hands by noon the same day, the defending troops being mostly killed or captured. Germany kept silence about this defeat.

SECOND GREAT WAR. From Oct., 1939, to May, 1940, the rear H.Q. of the British Expeditionary Force (g.v.) was at Habareq, 8 m. from Arras, and the garrison H.Q. was at the Palais S. Vaast. Thus the city was a nerve centre of the B.E.F. throughout the winter lull. As the German offensive of May, 1940, was developing, the British troops there, chiefly Welsh Guards, commanded by Maj.-Gen. R. L. Petre, faced heavy German onslaughts from May 18 to May 24. Violent fighting raged in the district as the Germans widened the breach between the Franco-British armies in N. France and the Allied forces in W. Belgium. The garrison H.Q. was desperately defended by British troops: but

by the end of May the Germans were driving through the "Arras gap" and British and French forces were falling back rapidly towards the Channel ports.

As a city of German-occupied France, 1940-44, Arras was repeatedly bombed by R.A.F. and U.S.A.A.F. planes, great damage being caused to rly. communications. The city was liberated by the British 2nd army, Sept. 1, 1944, during the great Allied drive through France.

Arras, TREATY OF. In 1414, during the Hundred Years' War between England and France, the peace between the Armagnacs and the Burgundians was signed at Arras. In 1435, also during the Hundred Years' War, a congress met at Arras with the object of making peace. Its main purpose was not achieved, for England refused to accept the French offer of Normandy and Guienne, but in Sept. the duke of Burgundy, hitherto the ally of England, came to terms with France. In 1482 Louis XI of France entered into an arrangement at Arras with the people of Flanders. See Hundred Years' War.

Arrastra. Machine used in Mexico and S. America for the fine grinding of the complex silver ores which occur in those regions. It is a very simple, often roughly built, but most efficient device. Its working parts consist of a vertical shaft fixed in the centre of a floor or bed about 12 ft. in diameter, so paved with stones (usually porphyry) as to leave no interstices. This shaft carries projecting from it two or four arms, at least one of which projects beyond the edge of the floor. From these arms depend stones, weighing from 100 lb. to 200 lb., resting on the paved floor. Mules are harnessed to the projecting arm, and the stones are dragged round on the floor, grinding the crushed ore to the required fineness. See Silver.

Arrebo, ANDERS CHRISTENSEN (1587-1637). Danish poet. He was born at Aeroskjøbing, and was bishop of Trondhjem 1618-22. His *Hexameron*, a poem in six books on the six days of creation, while modelled on Du Bartas's *La Semaine* (The Week), has striking elements of originality and power. Arrebo, who is sometimes styled the father of Danish poetry, made a metrical translation of the Psalms.

Arrest (Lat. *ad*, to; *restare*, to remain). In English law, when a person is compelled, by a restraint on his bodily liberty, to attend before a court of justice,

Arras. The Palais Saint Vaast, rebuilt after its destruction in the First Great War, was the British Garrison H.Q. in the operations of 1939-40

or to fulfil a legal obligation, he is said to be arrested. With few exceptions, there is now no arrest in England apart from criminal cases. A person accused of any crime may be arrested on a warrant under the hand and seal of a justice of the peace, before whom sworn information of the alleged crime has been laid. Judges of the High Court have also power to issue warrants.

It was established in the middle of the 18th century that a general warrant is void, i.e. the warrant must state the specific crime with which the person to be arrested is charged. The warrant may be entrusted to the police generally, or may be addressed to a named person—e.g. a soldier—who is not a constable.

Concerning arrest without warrant, it is lawful for anyone who sees a felony or breach of the peace committed to arrest the offender. A constable may arrest on reasonable suspicion of felony, or on reasonable grounds to prevent a felony or riot or other breach of the peace being committed, offenders who refuse name and address, and certain other classes of offenders. Arrest of a ship is a process of the Admiralty court, when a claim is made against the ship, whereby the ship (with cargo and freight if any) is placed under charge of the marshal of the court until trial of the action, or until it is released on the owner finding bail to answer the claim. See Warrant.

Arrestment. Process of the law of Scotland. By it the goods of a debtor are arrested in the hands of anyone who holds them, until the debtor has given his creditor caution or security to the value of the debt or claim in the value of the arrested goods. Arrestment *jurisdictionis fundandae causae* is where the goods of a foreigner, situated in Scotland, are arrested, in order to compel him to come into the Scottish courts. This process was used by Parnell when he brought an action for libel in Scotland against The Times. It is alluded to by Bailie Nicol Jarvie in Scott's Rob Roy.

Arrhenius, SVANTE AUGUST (1859–1927). Swedish chemist. He was born Feb. 19, 1859, at Schloss Wijk, near Upsala, and studied at Upsala, Stockholm, and elsewhere. In 1895 he became professor at Stockholm University.

Arrhenius made a special study of electrolysis, and suggested that electrolytic action is not confined to the chemical relations with which it had been hitherto chiefly associated, but may be found in

atmospheric phenomena. In a series of lectures delivered at California University he applied the methods of physical chemistry to the study of toxins and antitoxins. In *Worlds in the Making*, translated by H. Borns, 1908, he suggests that life is diffused in the form of spores, which may traverse space for ages until they are destroyed, as by the heat of an incandescent star, or find a place for development on some planet. He died Oct. 2, 1927.

Arria (d. A.D. 42). Noble Roman lady, wife of Caecina Paetus. When her husband was ordered to commit suicide and hesitated, Arria seized the dagger, drove it into her own breast, and handed it to him with the words "Paetus, it does not hurt."

Arriaga, MANOEL JOSÉ DE (1839–1917). The first president of the Portuguese republic. Born at Horta, in the Azores, he was educated at Coimbra University. After qualifying as a lawyer, he practised for many years with success at Lisbon. Early professing republican convictions, he was deputy for Funchal, 1882–4, and for Lisbon, 1890–2. He was elected first president of the Portuguese republic Aug. 24, 1911, on the retirement of the provisional president, Dr. Braga, and resigned May 28, 1915. He died March 5, 1917. He received a doctorate of laws from Coimbra University, and was noted as a lawyer, a poet, and a writer on politics and economics.

Arrianus, FLAVIUS, OR ARRIAN (c. A.D. 100–180). Greek historian. Born at Nicomedia in Bithynia, he lived for some time at Nicopolis in Epirus, where he studied under the Stoic Epictetus. In 124 the emperor Hadrian bestowed upon him the Roman citizenship. In 136, while prefect of Cappadocia, he signally defeated the Alani. Under Antoninus Pius, Arrianus was consul in 146; but four years later he retired to his native town and devoted his leisure to literary work. His chief works are the *Philosophical Lectures* of his master Epictetus in eight books, four of which are extant; the *Encheiridion* Epictetou, a handbook of the ethical philosophy of Epictetus, still extant; and the *Anabasis Alexandrou*, almost complete, a history of the campaigns of Alexander the Great, based on contemporary narratives.

Arris (Latin *arista*, fish-bone). Term used by builders and joiners for a raised edge or line formed by the juncture of any two sides of a wood or stone body, which together make an external angle. The raised edges that separate the

flutings in a Doric column are describable as arrises.

Arroba (Arab. *arrub'*, from *al*, the; *rub'*, fourth part). Spanish and Portuguese weight and measure. As a weight it is used in Mexico and Spanish America, being equivalent in Argentina, Mexico, and elsewhere to 25·30 lb. avoirdupois or thereabouts. In Brazil, where it was borrowed from Portugal, it is equivalent to 32·38 lb. As a liquid measure it is used in Spain, Portugal, and Spanish America.

Arrochar. Village of Dumbartonshire, Scotland. It stands at the head of the narrow Loch Long, and shares a railway station with Tarbet on Loch Lomond, 1½ m. E. It is a centre for rock-climbing on Ben Arthur. Pop. 670.

Arrol, SIR WILLIAM (1839–1913). British engineer. Born Feb. 13, 1839, in Renfrewshire, he was apprenticed as an engineer and in 1868 founded the firm of Wm. Arrol & Co. This firm was responsible for the reconstructed Tay Bridge (1882–87), Forth and Tower Bridges. Arrol was knighted in 1890, sat in parliament as Liberal Unionist for S. Ayrshire 1895–1906, and died Feb. 20, 1913.

Arromanches. Village of Calvados, France, 6 m. N.N.E. of Bayeux, with a small harbour and a 12th cent. church. Offshore is the Tête du Calvados, a great reef, on which many ships of the Armada were wrecked, 1588. At Arromanches, Mulberry (*q.v.*) harbour was built in 1944. Monuments commemorating the Allied landings here were erected on a strip of land near the beach given by the French govt. to the U.K. and the U.S.A. in 1946.

Arrondissement (Fr. *arrondir*, to make round). French term for a local government district. See France, p. 3511; Paris, p. 6341.

Arrow. Projectile fired from both the long bow and the cross-bow, referred to in the Bible as "artillery." In the Whitehall Museum, London, are some arrows used by the Crusaders in the

12th century. Made with a light, straight shaft of wood, they are fitted with feathers at the neck, the object being to steady the flight by imparting a rotary movement to the projectile, a principle

Arrises in a Doric column

adopted by the makers of modern firearms. The arrow-head was of hard wood, flint, iron, or steel, and often barbed, and some arrows had heads of ivory. Harold was slain by an arrow at Hastings in 1066, and the Chinese army used arrows in the war of 1860. Arrows were carried in a quiver sometimes elaborately ornamented. Poisoned arrows are still used by savages in fighting and hunting. *See* Archery.

Arrowhead (*Sagittaria sagittifolia*). Aquatic perennial herb, a native of Europe and N. Asia. It has large leaves shaped like an arrow-head, some floating, some erect above the water. The flowers are white, $\frac{1}{2}$ in. across, some with stamens only, others with pistils only. The plant hibernates in the form of small round tubers in the mud of ponds and ditches.

Arrow-head. Apex of a slender missile implement, especially when of material different from the shaft. Bone points and chipped flint heads, chisel-edged or leaf-shaped, attest the use in Palaeolithic Europe of primitive missiles hurled by hand, and afterwards by throwing-sticks. Used primarily in the chase, arrow-heads passed through leaf-shaped, lozenge-shaped and triangular forms to tanged, and ultimately to tanged and barbed flints, which were rarely polished. Employed during the early metal ages as weapons of war, they were displaced in some localities by copper, bronze, and iron forms. Chert and other hard stones were utilised, obsidian being characteristic of the Aegean, Japan, and Mexico. Stone arrow-heads are still made by some primitive peoples.

Arrow Incident. THE. Seizure of a ship, which led to war between Great Britain and China. On Oct. 8, 1856, the Arrow, a lorcha or ship rigged for service in Chinese

Arrowhead. Flowering shoots and arrow-shaped leaves

waters, was lying off Canton, when a mandarin came on board and arrested her crew as pirates. The justification was that, Canton being closed to foreigners, the Arrow could only enter by virtue of a permit, which had expired in the previous Sept. The captain of the Arrow was an Englishman, but her owner and part of her crew were Chinese, and the evidence as to whether or not she was flying the British flag was conflicting.

As the Chinese refused the demands of Britain for reparation, Canton was bombarded, and by way of reprisal British property was destroyed. On Dec. 28, 1857, China still refusing Britain's demands, Canton was again bombarded, and occupied. The treaty of Tientsin, June 26, 1858, ended the affair. *See* China: History.

Arrow Paradox. One of the arguments used by the Greek philosopher Zeno of Elea to prove the unreality of motion. An arrow in flight is really at rest, since at every moment it is only in one given place, and therefore can never reach its end.

Arrowrock Dam. U.S. irrigation dam, once the highest in the world. Completed 1915, it holds back the waters of the river Boise, Idaho, for the purpose of irrigating 200,000 acres of fertile land by means of about 1,000 miles of canals. The dam is 354 ft. high and 1,100 ft. across. A railway 17 m. in length was built to connect with the nearest railway at Barberton. Alfalfa, clover, cereals, and potatoes are the chief crops of the irrigated area.

Arrowroot (*Maranta arundinacea*). A perennial herb of the family *Marantaceae*. It is a native of tropical America, and is largely cultivated in the W. Indies. From its tuberous rootstocks a very pure starch is obtained by pulping in water, the sediment being washed and dried. Dissolved in boiling water it is converted into a fine jelly as a food for invalids. Other species of related plants are cultivated for the same purpose, while inferior or spurious arrowroot is obtained from the tubers of several plants of other orders, e.g. English arrowroot from the potato, and Portland arrowroot from the corms of the common cuckoo-pint. *See* illus., col. 1.

Arroyo Molinos. A village of Spain, in Estremadura. It lies 40 m. N.E. of Badajoz, and was the scene, Oct. 28, 1811, of Lord Hill's victory over the French.

Arru Islands. Variant spelling of the name of a group of islands in Indonesia, known also as Aru (*q.v.*) Islands.

Arsaces. The founder of the Parthian empire. A Scythian by birth, he induced the Parthians

Arsaces. Portrait on the obverse (left) of this tetradrachm, struck one century after his death
British Museum

to revolt from the Seleucid Antiochus II about 250 B.C. Under his descendants the empire which he founded ultimately extended from Bactria to the Euphrates. Among his descendants, who were called Arsacidae, were Mithradates, Phraates, and Artabanus.

Arsamas or ARZAMAS. Town of Russia, in Gorky government. It stands at the union of the Techa and Arsha rivers, 75 m. by rly. S.S.W. of Gorky. It has several churches and is an active commercial centre, with tanneries, flour-mills, foundries, and oil. Its school of painting was formerly famous.

Arsenal (Arab. *dār assānā'ah*, from *dār*, house or place of; *al*, the; *sānā'ah*, mechanical industry). Establishment designed or utilised for the manufacture, repair, receipt, storage, and issue of arms, ammunition, and other stores employed in warfare by

Arrowroot. A plant of tropical America, from the tuberous roots of which is obtained starch food arrowroot

Arsenal. 1. Gun barrel being shaped in an hydraulic press. 2. Giant gun on lifting-gear. 3. A Bofors gun barrel is fitted to main assembly. 4. Naval guns ready for dispatch. 5. Travelling crane capable of lifting 130 tons

the military and naval forces of a country—the modern equivalent of the medieval armoury.

An arsenal should be capable of meeting all the demands made on it by the fighting forces for the supply and repair of *matériel*, but for some years, in the great countries at least, the requirements have been so varied and extensive that it has been necessary for the regular arsenals to be supplemented by the work of private firms undertaken on contract. In Great Britain the names of such firms as Vickers, Cammell Laird, Armstrong Whitworth, Beardmore, are household words in this connexion. The Royal arsenals, however, must be a nucleus of the whole system and are supplemented by the royal ordnance factories for the manufacture of guns, carriages, small arms, and ammunition.

The position of an arsenal is governed chiefly by strategic and partly by economic conditions. It must necessarily be thoroughly protected from attack and defended as strongly as a fortress, but it is inadvisable to place it in a fortified locality. It should be sufficiently near the scene of probable operations to minimise

supply difficulties, yet away from short-range air attack, and for the same reason at least partially underground. The principal British arsenal is now in North Wales, the famous Woolwich Arsenal and its huge war-time successor at Chorley (Lancs) now being used for breaking-down rather than manufacture. All came under the direction of the ministry of Supply during the Second Great War. For purely naval matters there are large depots attached to the principal dockyards, such as Portsmouth, Plymouth, and Chatham.

Arsenal. Name of an English football club founded in 1888 as Royal Arsenal Football Club, which name was changed in 1891 to Woolwich Arsenal, and in 1913 to Arsenal on transfer to Highbury. The ground and registered offices are at Arsenal Stadium, London, N.5. Under the management of Herbert Chapman (d. 1934) and George Allison, the club set out on a highly commercial policy of paying large sums for outstanding players with other clubs and building a team of "stars" to provide the best possible entertainment. Its rewards for this outlay were the winning of the Football

League championship in 1931, 1933, 1934, 1935, 1938, 1948; and the Football Association Cup in 1930 and 1936.

Arsenic (Gr. *arsenikon*, yellow orpiment). This elementary chemical substance (symbol, As) is classed as a semi-metal because, although it possesses the physical properties of a metal, such as lustre, and conducts electricity, it is incapable of forming a base with oxygen. The name arsenic properly belongs to the element, but in popular language the term "arsenic," sometimes distinguished as "white arsenic," is applied to arsenious oxide (As_2O_3).

Compounds of arsenic were known to the ancients. Aristotle refers to orpiment and realgar, and what Olympiodorus (5th century A.D.) terms "white alum" is, from the method of making, clearly white arsenic. Metallic arsenic is definitely mentioned by Albertus Magnus (d. 1280), and Geo. Brandt (1694–1768) showed the connexion between white arsenic and the metal.

Metallic arsenic occurs in the free state in nature at Zimeoff in Siberia, in Central Europe, Borneo, and New Haven in the

U.S.A. It occurs in combination in many ores and minerals.

Metallic arsenic is a steel-grey substance, which darkens on exposure to air, and when strongly heated gives off a lemon-yellow vapour and a garlic odour. It is generally prepared from native arsenic, or by heating arsenical iron in earthenware tubes. It is chiefly used as a constituent of alloys, e.g. with lead for producing hard shot. The two oxides of arsenic are arsenious oxide, known as "white arsenic" or "flowers of arsenic," and arsenic pentoxide (As_2O_5).

White arsenic is obtained as a by-product from the roasting of certain minerals associated with metallic ores. The Oxland and Hocking calciner, largely used in the United Kingdom, consists of a wrought-iron tube about 30 ft. long, and when lined with brickwork has an internal diameter of from 4 to 6 ft. The tube is set at an inclination which varies according to the kind of ore that is being worked, and is made to revolve once in from four to eight minutes. The ore, dried and crushed, is fed in at the upper end of the tube and the revolution of the cylinder exposes it to the action of the hot blast from the furnace at the lower end. The arsenic is volatilised by the heat and the spent ore passes out through an opening at the lower end of the tube. Many tons of ore are so dealt with every day.

Arsenic appears in commerce as a heavy white powder and also in a vitreous form known as arsenic glass, which is prepared by volatilisation under slight pressure. Arsenic is used in the aniline dye industry as a reducing agent: for fixing aniline blues in calico printing; in the manufacture of pigments, such as Scheele's green and Paris green; as a constituent of fireworks; as a weed-killer, rat-poison, fly-poison, and sheep-dip; in the manufacture of glass to remove colour caused by traces of iron; in the enamelling of metals; and in medicine as a febrifuge and an alterative.

Arsenic pentoxide is prepared from white arsenic by the action of oxidising agents such as nitric acid, and is used in the manufacture of rosaniline and in calico printing.

Arsenic forms with sulphur three different sulphides, of which realgar and orpiment are the chief. Realgar or arsenic disulphide (As_2S_2) occurs native. It is prepared artificially by heating together arsenic pyrites and sulphur pyrites, the sulphur being present in the finished product to the ex-

tent of about 25 p.c. Realgar is used in tanning and was formerly employed as a red pigment. Indian fire, used for signalling, is a mixture of 2 parts of realgar, 7 of sulphur, and 24 of nitre.

Orpiment or arsenic trisulphide (As_2S_3) is a lemon-yellow substance occurring in nature but usually made by subliming a mixture of two parts of white arsenic and one part of sulphur.

Arsenic combines with hydrogen to form arseniuretted hydrogen or arsine (AsH_3), a very poisonous gas which burns with a pale blue flame. Arsenic chloride (AsCl_3) or butter of arsenic is a very poisonous liquid giving off fumes. Arsenic bromide (AsBr_3) and arsenic iodide (AsI_3) are used to a small extent in medicine. Arsenic forms a number of compounds with organic radicals.

ARSENIC AS A POISON. Poisoning has occurred from the fine dust given off by wallpapers containing arsenical pigments; the burning of coke containing arsenic; accidental taking of sheep-dip, weed-killer, rat-paste, etc.; and the application of arsenical soaps and cosmetics to the skin.

Arsenic is placed in Part I of the Poisons List, so cannot be sold except under restrictions.

Arsenic, ORES OF. Arsenic is mainly obtained from arsenical pyrites, iron sulpharsenide. This ore usually occurs associated with quartz in veins and masses with the ores of lead, copper, and tin, generally in metamorphic schists and sometimes in serpentine. Of more limited importance are the sulphides, realgar and orpiment.

Arsenic and Old Lace. A comedy in three acts by Joseph Kesselring. One of the most successful comedies within modern times, this hilarious study of the nefarious practices of two eccentric maiden ladies was produced at the Fulton Theatre, New York, in Jan., 1941. On Dec. 23, 1942, it was produced at the Strand Theatre, London, where it ran for 1,396 performances; Lillian Braithwaite and Mary Jerrold played the chief parts. An American film was made in 1944.

Arsenides. Name given by chemists to primary combinations of arsenium with another element or an organic radical. The arsenides are analogous to the sulphides formed by sulphur, the chemical resemblance between the elements arsenium and sulphur being shown in this way. Metallic arsenides occur in nature, the arsenic being

combined with cobalt, nickel, or iron. These arsenides form important sources of arsenic. Zinc arsenide is made by heating zinc and arsenic together in a closed crucible. By decomposing the zinc arsenide thus formed with diluted sulphuric acid, the poisonous gas, hydrogen arsenide or arseniuretted hydrogen, is obtained.

Arsenopyrite OR MISPICKEL.

Iron sulpharsenide (FeAsS), occurring in orthorhombic lozenge-shaped crystals, irregular grains or massive; colour, tin-white with metallic lustre. It is a common gangue mineral in tin, copper, nickel, lead, and silver ores, also in gold-bearing veins. Occasionally it is useful as a source of arsenic.

Arsinoë. Name of several Egyptian princesses. (1) Daughter of Ptolemy Soter, wife of Lysimachus, king of Thrace, and after his death of her brother Ptolemy Philadelphus. (2)

Daughter of Lysimachus and wife of Ptolemy Philadelphus. Convicted of conspiring against her husband, she was banished. (3)

Daughter of Ptolemy Auletes, and queen of Egypt (47 B.C.), put to death at Miletus by Mark Antony. Arsinoë is also the name of cities in Egypt and Cyprus, founded in honour of the above or other princesses. See Ptolemy.

Arsis (Greek *airein*, to raise). Metrical term, formerly used for the unaccented as opposed to the accented part (thesis) of a foot. Today the meaning is reversed.

Arson (Lat. *ardere*, to burn). In English law, the wilful and malicious burning of the dwelling-house of another, or place of worship, or public building, or building belonging to any railway, dock, or harbour. It is a felony and is usually punishable by penal servitude, in serious cases for life. Arson also covers the act of setting fire to coal mines, and crops, whether standing or stacked; and to any vessel, whether one of the king's ships or a merchantman. In Scotland arson is known as fire-raising. The penalty for arson in Anglo-Saxon times was death.

Arsphenamine. Arsenical compound introduced into medicine in 1910 by Ehrlich, symbol $\text{C}_{12}\text{H}_{14}\text{O}_2\text{Cl}_2\text{As}_2$. It is also known as salvarsan, and is used in the treatment of protozoal diseases.

Ars Poetica (Lat., the poetic art). A short didactic poem by the Roman poet Horace, also known as the Epistle to the Pisos. It is largely a dissertation on dramatic poetry and abounds in illuminating literary criticism pithily expressed.

ART: IN ITS MAIN ASPECTS AND VARIED FORMS

C. H. COLLINS BAKER, Keeper and Secretary of the National Gallery, 1914-1932

This article and the one on Modern Art which follows immediately are intended to show the changing functions and historic development of the plastic arts as a whole. The subject is further dealt with in articles on special aspects or kinds of art, e.g. Aesthetics; Drawing; Painting; Sculpture; and under the names of individual artists and various countries

By art is meant the human expression of spiritual (as opposed to material) consciousness or perception. In this definition is included any creative achievement expressing man's imagination or translating his emotion. By just the amount that even a bad picture expresses more than photography can express, that picture is art. On the other hand, though imagination of a high order may guide an engineer, a scientist, or soldier to his achievement, yet that achievement, in so far as it is the expression of exact science or the result of mathematical calculation, would not be covered by the definition. Art may be said to be concerned with what is undemonstrable by mechanical or scientific proof and deduction; it ranges from the crudest imagination, e.g. Bushmen drawings, to the vast flights of a Gothic cathedral, a Beethoven, a Rembrandt, a Michelangelo, or Shakespeare.

Art's Earliest Function

Art is one of the characteristic instincts and manifestations of man; though no date can be assigned to the first appearance of artistic expression, it is chiefly on such expression that our knowledge of primeval man is based. Recent criticism has argued that art originally was "talismanic" and utilitarian; that therefore the desire of artistic expression was not innate in man. But while it is not improbable that the earliest function of art was to model and scratch rude images, the possession of which should facilitate hunting or avert attack, yet the remarkable if gradual development of Palaeolithic art convincingly suggests that the desire of art for art's sake was none the less natural to man. Indeed, were it otherwise, artistic expression would wait on rather than fly ahead of popular taste. The earliest known relics of prehistoric sculpture and drawings are calculated to belong to the Mousterian and Aurignacian periods. But their actual date cannot be even approximately ascertained. The best Palaeolithic art, assigned to the Magdalenian era, is represented by the cave drawings and paintings at Altamira and Font de Gaume, etc., which exhibit a surprising freedom and mastery of line in realistic renderings of boars, wolves, bison, etc.

The earliest date assigned to prehistoric Egyptian art is 8000

B.C.; between 5500 and 4000 B.C. the greatest time of Egyptian art was born and had passed over. The renaissance under the XII dynasty, the general decline after the XVIII and XIX dynasties, and the gradual merging into Roman art are the points marking the course of Egyptian art from 3400 B.C. to the Christian era. Its function was almost entirely religious, its purpose the furnishing of the tombs to equip the dead for their future life. Assyrian art (finest period c. 900 B.C.) is famous for its bas-reliefs of the wars and sports of the Assyrian kings. A development of Babylonian and Assyrian art was Old Persian art, in which Greek and Egyptian influences are also felt.

The greatest manifestation of ancient art is Greek, of which the remote origins were Phoenician and Western Asiatic; in its beginnings it borrowed from Egyptian conventions. Again generally in the service of religion, its highest pitch was reached in the 5th century B.C., at Athens, where sculpture at least attained a majesty and technical perfection never again equalled. Greek art declined from the great Hellenic period to the Hellenistic (2nd century B.C.) and thence to the Greco-Roman, to which most of the so-called antique statues belong. Barely a trace of the great period of Greek painting exists; but its greatness is inferred from the peculiar excellence of the vases (best period, the group of Euphronios, d. 450 B.C.), which must reflect the spirit of the more important mural paintings. The outstanding names of Greek sculpture are Myron (first half of 5th century, athletic statues), Pheidias (whose masterpiece the Athena Parthenos was dedicated 438 B.C.), Polycleitos (of the next generation, maker of athletic and religious figures), Praxiteles (first half of 4th century, who introduced the lyric element into Greek sculpture), Scopas, the most modern and passionate of the Greeks (middle of 4th century), and Lysippus; the last of the great masters, the model of the Hellenistic period.

Periods of Ancient Art

Succeeding manifestations of ancient art are Roman art, the outcome of Greek and Etruscan, specially notable for its superb engineering quality of architecture and for its portrait busts; Byzan-

tine art (best periods between A.D. 330 and 700, and between 867 and 1200), in which Hellenistic tradition blends with Arabic and Persian; and Arab art, in which Chinese, Byzantine, Coptic, and Persian influences mingle with Syrian. Chinese art, which to Far Eastern painting was as Grecian art to European, dates possibly from 2700 B.C.; its greatest periods, the Tang and Sung, are A.D. 618-905 and 960-1280, in which Buddhist ideals are expressed most perfectly. From Chinese roots were sprung the arts of Tibet and medieval Persia (best period 15th century). The greatest era of Japanese art were the 9th to 14th centuries, when a time of decadence set in, and the Chinese Renaissance period, which reached its height in the middle of the 15th century with the Ashikaga period. Japanese art in its inception and its great renaissance emerged direct from Chinese.

Modern European Art and Religion

In the West, Gothic art, sprung from Byzantine and Romanesque, and soaring to its height in the 11th to 13th centuries, is the richest, most mystic, and most imaginative manifestation of Christianity. Following on the great period of Gothic architecture, painting, and sculpture, pictorial art is found definitely outgrowing the old Byzantine feeling. By the close of the 13th century in Italy the Renaissance was established; about the same time, it should be noted, a noble school of mural painting flourished at Westminster. In France and the Netherlands a purely national Renaissance was at its best early in the 15th century.

In modern European art, as for convenience is designated the art of the 14th century and onwards, religion at first played a very large part. The sole function of painting and sculpture was to make graphic and to commemorate the incidents and characters of sacred history. Very rarely was a work of art, before the 16th century, commissioned or executed save as a contribution to the Christian faith, though doubtless the artists felt artistic emotion unalloyed for in their contracts and unsuspected by their patrons. A reservation in the case of portraiture has to be made. Only exceptionally, and in certain local schools, were pagan themes or subjects of contemporary life depicted. This

1. Lion hunt of Ashurbanipal (Assyrian). 2 and 3 Seated and mounted figures from the Parthenon frieze (Greek) 4. Fowling scene (ancient Egyptian). 5. Figure from the Elgin marbles (Greek). 6. Sixth century mosaic from

ART: FROM ASSYRIAN SCULPTURE TO ITALIAN RENAISSANCE MASTERPIECES

general statement applies to Italian and northern art alike. At this early date, moreover, the schools preserved their national individuality, and variously illustrated the Bible story with a conviction and intensity never again equalled.

At this time, again, the format of pictorial art was exclusively ecclesiastical, *e.g.* wall-paintings, missal illuminations, shrine and altar pieces, for public churches and private chapels. This state of art lasted, roughly, until the close of the 15th century, when artists found fresh outlets for their interest in the writings of the humanists and in the beauty of the world outside religious themes. Now Romantic art made its appearance and a constant delight in painting scenes of everyday life; now also the distinctive nationality of the schools was broken down, Italian influence flowing out to paralyse northern art.

During the 16th century in Italy mastery of design, monumental decoration, and noble draughtsmanship reached a pitch never again approached; it seems as if in that direction man's artistic quest was satisfied for good. In the same period the earlier technique of tempera, which in Flanders had been superseded in the first quarter of the 15th century, was entirely replaced by oil painting.

From the 14th to the 17th Century

Summing up these two great periods—from the 14th to the last half of the 16th century—is seen the dawn of the Renaissance: the perfection of European religious painting, and the last word, perhaps, in vast schemes of wall decoration and in the science of drawing and painting, as well as portraiture at heights not since regained. Technically, there is first of all tempera painting, then a mixture of tempera, this being some kind of varnish and oil painting, and finally pure oil painting.

Socially the Church at first appears as sole patron of art; then in northern countries came the rise and supremacy of the guilds, the nobles and rich merchants buying pictures for their home enjoyment. Ethically the distinct phases of thought are witnessed when (1) intense conviction produced the highest interpretation of Christianity; (2) such conviction ebbs and is replaced by wider interests and more purely artistic aims. The cardinal names of this period are Giotto, Masaccio, Van Eyck, Donatello, Bellini, Mantegna, and Verrocchio; Giorgione and Titian, Raphael and Michelangelo, Leonardo, Holbein, and Dürer.

From this brief summary, it is

apparent that genre and landscape painting remained to occupy artists' attention. Though these had already received casual treatment, their development came in the 17th century, when the Dutch and Flemish masters, regaining their national individuality, produced an incomparable series of domestic scenes and sea and landscape pieces. The Dutchmen, the French master Claude, and Rubens, the great Fleming, were together the source of all later developments of landscape painting.

Portraiture and Landscape

Nearly all that was vital in art during the 17th century was produced in Flanders and Holland, whence the influence on portraiture of Rubens, Van Dyck, and Rembrandt spread far and wide. Contemporary with them in Spain was Velazquez, the effect of whose genius upon recent painting has been fertile. Other outstanding names for this period are Vermeer, Terborch, Steen; Brouwer, Teniers, and Metsu; Ruysdael, Hobbema, and Van de Velde.

But if genre painting had reached its consummation in the 17th century, landscape was yet in its infancy. In Venice, early in the 18th century, arose the special art of Canaletto and Guardi, while in England the field was being prepared by a line of water-colour painters. Late in that century and on into the 19th, England displayed an unexampled genius for landscape, gathering up the fruits of the older schools, and revealing to the world the unsuspected store of material in out-of-doors nature. From England inspiration was drawn by the 19th century French schools, the Barbizon (Corot, Rousseau, etc.) and Impressionist (Monet, Pissarro, Sisley, etc.), which in turn contributed fresh revelations of the qualities of light and air, and moulded most of recent landscape painting. The great names claiming recognition here are Crome, Cotman, Constable, and Turner.

Watteau's Influence on French Art

What these men did for landscape painting, in demonstrating that nature herself was more profitable than academic formulae, was being done for subject pictures at about the same time by successive movements in France. In the 18th century the battle raged between the followers of the "grand style" (for example, Le Brun, Mignard, etc.), whose creed was that for first-class art only historical painting was possible, and on the other side the painters of genre. Watteau, seeking inspiration for his romantic *poésie* in

contemporary life, revolutionised the conception of French art.

Hogarth, working 1728–1764, in England, had less effect, since there in the 18th century the principal need was portraiture, splendidly supplied by Reynolds, Gainsborough, Romney, and Raeburn. But at about the close of the 18th century in France the discovery by antiquarian research of Greco-Roman art gave classic painting a new turn, which synchronised with the new ideas promulgated by the Revolution. J. L. David and Ingres were the great exponents of this neo-Classical school. Then, early in the 19th century, the Romantic artists (*e.g.* Delacroix, 1798–1863), whose subjects were culled from modern poetry or history, overthrew the Classicists. They in turn were superseded by the so-called Realists (*e.g.* Courbet, Millet, Manet, and Degas), whose theme was the actuality of modern life, its poverty, its vice, its ugliness—in short, its unglamoured truth. The great sculptor of this period is Rodin. Between the Realists and the Academics the battle still continues, the one side fighting for its conception of Truth, the other for its conception of Ideal Beauty.

The Sense of Colour Value

The ultimate effect of the most recent movements, ramifications of so-called Post-impressionism, can hardly be assessed yet; their present result has been to stimulate a sense of colour value. But they may be seen, in the long run, to have been the rudiment of a vital movement. Most of the older European nations have made their special contribution to the plastic arts; it remains for the Slav peoples to show their individuality. The Second Great War's political aftermath smothered, at least temporarily, any development of artistic possibilities.

Necessarily, the above remarks are restricted to a summary of the largest aspects and manifestations of art, leaving aside the numerous crafts (metal work, pottery, textiles, etc.), all of which in their best periods and styles are art of a high order. Speaking generally, the Eastern races have excelled in those crafts which for the utmost perfection depend on qualities of colour and texture. The rugs of Ferahan and Hamadan, the porcelain of the Ming and Kang-hi periods seem to be unapproachable in Europe.

ART: CONTEMPORARY DEVELOPMENTS

Michael Ayrton, Artist and Art Critic

This article places in their historical perspective such movements as post-impressionism, cubism, vorticism, dadaism, surrealism, etc., which are also dealt with under their own headings

What is known as "modern art," a catchpenny phrase, may be considered as the product of a period extending over approximately fifty years, dating from the full maturity of the post-impressionists and continuing ever since then with rapid actions, reactions, and developments. In actual fact the progression and continuity of the visual arts has gone on, subject to change, but logically, for a thousand years or longer. The term modern or—worse—modernistic is generally applied to forms of art which are not easily understood rather than those which are contemporary; and there are two main reasons why a good deal of contemporary art is not fully comprehensible to the majority. First, we are too near to our own times to be able to see properly the artist's vision of these times. Secondly, the beneficial weeding-out of the dross which is effected automatically over the centuries has not had time to take place in the art of our own day.

There is, however, one very important influence, that of photography, which since the late 19th century has had a more powerful effect on painting than any invention since that of oil paint. It rang the death knell of pictorial realism in painting, and it almost destroyed the profession of portrait painting. Popular photography also became an accepted visual criterion of belief—the image which, supposedly accurate because it was mechanical, serves to show superficially what things look like, for very little money. It became necessary in the 1900s for the painter to depart from the impossible competition set up by this mechanical contrivance; and the main trends during the 20th century have been concerned with the creation of a separate truth, a pictorial truth as opposed to immediate truth to nature.

It must not be imagined that the artist turned his back on nature; but he found it necessary after several hundred years of realistic painting to pursue a new search into natural form.

The course of the visual arts remained as before in the two separate but not irreconcilable streams called "classical" and "romantic," but the actual appearance of pictures changed radically, as it did with the advent of realism during the Italian Renaissance. To define classical and romantic is not easy, but it will serve to say that by classical is meant a purely pictorial and formal approach, concerned primarily with the project and its presentation, whereas romantic implies the subordination of these technical and visual qualities to the expression of an emotion or idea. All painting and sculpture contain both these aspects, but, in some, one approach dominates the other.

Along the classical stream has gone cubism, the product of Paul Cézanne's (*q.v.*) painstaking and profound study of the nature of form, and those several by-products of cubism, vorticism, constructivism, and abstraction, all of which are analytical. Parallel with, and reacting against, this placid stream, runs the tumultuous torrent of romanticism, concerned with the particular rather than the general, and stemming in the immediate past from the powerful and sometimes violent visual expression of Vincent van Gogh (*q.v.*) and Paul Gauguin (*q.v.*). These two great artists of the late 19th century provoked fauvism and expressionism, and were also to some extent responsible for those most violent romantic movements which followed the First Great War, dadaism and surrealism, the leaders of which extolled madness as a creative force.

Each of these streams has put forth tributaries and rivulets which join the two main currents, so that rarely does one find artists exclusively preoccupied with either—indeed, certain of the greatest figures on the contemporary scene combine many trends in their work, *e.g.* Pablo Picasso (*q.v.*), probably the most versatile innovator of the age.

The satellite arts during the present decade have closely fol-

lowed the progress of the major arts. In many cases the finest examples of book illustration, theatre design, textile design, and the graphic arts have been the work of the major artists themselves. At the other end of the scale debasement has followed all too rapidly at the hands of fashion. The best sculpture of twenty years ago appears in crude and garbled imitation as the tailor's dummy of today. The cubist experiments of 1920 are now repeated, shockingly transformed, in the interior decoration of new super-cinemas. Even at its best, applied design almost invariably follows several steps behind the innovations of the two principal visual arts.

Two individuals, neither of whom was an artist, require special mention as being responsible for greatly raising the standard of subsidiary arts: Ambroise Vollard, a picture dealer of genius who turned to publishing illustrated books and was responsible for the flower of 20th century French book production, and Serge Diaghilev (*q.v.*), the famous impresario whose Russian ballet has become a legend and who employed, to design the settings for his productions, the finest artists of Paris. The international fame of Picasso, Henri Matisse, Georges Rouault, and others owes much to these two great middlemen.

Sculpture has pursued a development akin to painting. The influences current in both arts are not wholly dependent on the medium, though the results differ according to the specific problems inherent in paint and stone. Auguste Rodin (*q.v.*) continued the romantic line in his bronzes, and Aristide Maillol (1861-1945) the classic tradition in stone. Constantine Brancusi (b. 1876) may be described as the most potent formal innovator, to be reckoned on a level with Picasso.

In sculpture, as in painting, there have been, and are, artists concerned with cubism, vorticism, constructivism, and the other aforementioned groups.

For a hundred years Paris was the crucible of all trends in the visual arts, though some of the greatest exponents of later years were not French. But since the 1930s it has become clear that this great artistic virility has begun to flag, and that one must look elsewhere for continuance of the European tradition. Evidence suggests that England is the country destined to undertake this task for several generations.

1. Still life, by the French painter Georges Braque.
2. Devastation; coloured drawing by Graham Sutherland. 3. Girl; direct carving from a block of Ancaster stone, by Henry Moore. 4. Nude, by Pablo Picasso,

Spanish painter. 5. Madonna and Child; high relief by Ivan Meštrović (Yugoslavia). 6. Low-relief carving from a series, now in Westminster Cathedral, depicting the Stations of the Cross, by Eric Gill

ART: PREHISTORIC AND PRIMITIVE

E. G. Harmer, *Writer on Archaeology*

Here the author is concerned with the sculpture, painting, and engraving of Palaeolithic Europe and the arts of design as developed among living peoples of early culture. See also Bronze Age; Iron Age; Man; Ornament; Pottery, etc.

At the end of the Mousterian period, which closed the Lower Palaeolithic Age, the rude Neanderthal race ceased to exist in Europe. They were followed by other immigrants from the S. and E., one of whom, the Cro-magnon race, developed, during the early or Aurignacian period of the Upper Palaeolithic Age, a primitive artistic expression of form, colour, and line. At the outset their interest was apparently arrested by the occasional likeness of worn or fractured stones and bones to animal forms, a likeness which they found could be heightened by artificial aid. Thus the earliest objects of art may be regarded as sculpture, and were followed by carvings in low relief.

From these the step was gradual to the incision of figures in stiff, cumbrous profile, and the drawing of them in black or red silhouette upon cave walls and rock surfaces. Later on, uncouth statuettes of the human form were produced, and probably covered with paint, as in archaic Greece and negro Africa. The preference for the female figure in the maternal condition (*e.g.* the limestone Venus of Willendorf and the ivory Venus of Brassempouy) suggests the emergence of religious art. It was, however, the world of useful animal life that was chosen for the most vigorous effort after accurate portraiture.

Work of the Cave Men

After the Solutrian period, during which a distinct race, with little aptitude for fine art, brought westward a skilful stonework, there followed the important Magdalenian period. The growing dominance of man over the vast herds of food-animals among which he lived now ensured a material comfort, and this afforded the still-developing Cro-magnon race time for the arts of pleasure and the practice of ritual religion. The only English example yet found is a horse's head on bone from the Robin Hood cave in Derbyshire (British Museum). But in the Dordogne basin, along the Pyrenean foothills, and in N. Spain more than thirty prehistoric caves have been found, which not only contain many engraved objects and figurines, but are often adorned on wall and ceiling with a realistic series of figures and composite scenes. These are handled at first

in flat tint, but afterwards in brilliant polychrome fresco. The finest of these mural paintings are at Altamira and Font de Gaume. Bisons, mammoths, horses, reindeer are depicted in profusion and with amazing fidelity, and the fact that these drawings portray in many instances animals long since extinct in Europe helps to determine their indubitable age.

Prehistoric Quest for Beauty

The human figures—especially seventy at Alpera—afford invaluable evidence of the style of women's dress, personal ornament, weapons and dwellings, together with ceremonial masks and dancing. The finger mutilations with a sacrificial motive (Gargas) have persisted to modern times. The paint palettes, ochre tubes, burins, and unfinished works attest the technical methods employed; an engraved stone lamp of Eskimo type suggests the means adopted for the lighting of these subterranean corridors. During the Azilian period, which intervened before the Neolithic immigration, Magdalenian art degenerated into stylised forms that travelled along the path towards conventional symbolism which was retaken by other races in later times.

The interest of this prehistoric school lies in the evidence it affords how far the quest for beauty is a primal impulse of the human mind. No attempt is here made to trace it through the Neolithic age, when weaving and pottery introduced new decorative media, into the Ages of Bronze and Iron, the threshold of the modern world. In turning to the art of living savagery, it is to be noted that the wall outlines of human hands in Australia, the animal paintings of the Bushman, the engraved walrus ivory of the Eskimo, virtually impose the acknowledgment of their hereditary relationship to European prehistory. So also many aspects of Aztec and Inca art demand the admission of immigrant influences ultimately traceable to the dissemination of Mediterranean culture over the world's ocean routes by Phœnician mariners. Throughout all ages art tends to flourish or to be reborn under the impulse of new racial contacts. This is why Malay art is poor and unprogressive, whereas Polynesia, under Melanesian influence, developed a virile technique of its own.

The material of the artist is conditioned by his environment. Pottery and statuary cannot develop where clay and stone are not available, nor can mural painting flourish on a coral atoll. Moreover, human portraiture is repugnant to the animistic mind, and where wooden statuary is found, *e.g.* in negro Africa, in Easter Island, and in aboriginal America, it almost invariably concerns itself with the representation of the divine. Painting, again, is much less practised from the aesthetic point of view than for its magico-religious uses, as in ceremonial masks and shields.

Thus the arts of design tend in primitive cultures to evolve in the direction of decoration, and reach a high standard of attractiveness in such forms as Pueblo Indian pottery, Polynesian bark-cloth, and Maori wood-carving. The principles of decorative art, as developed in savagery, have been laid down by Haddon in connexion with New Guinea. Animal forms tend to be reproduced under the animistic impulses which are connected with totemism and sympathetic magic.

Savagery and Symbolism

Plant forms are religious rather than decorative in origin—the vine leaf as symbolising wine, the lotus as symbolising the energy of reproduction. By the normal processes of decay designs thus motivated become conventional symbols, until at length a serpent or lightning, a human figure or a bird's head, may become a zigzag, a woman's apron or a bat may become a triangle. The simpler geometric forms, such as the circle, cross, spiral, meander, are the debris of complex designs rather than their primitive foundation. Just as the cable and tooth ornaments of bronze implements recall the lashings of their stone precursors, and the interlacings of Greek or American pottery the basketry which gave rise to it, so the floral borders of Hellenic or Indian frescoes owe their origin in many cases to the tufted tassels, weighted against the wind, which fringed the textile hangings of earlier dwellings. When art comes to be employed for recording events and conveying information, it passes into picture-writing, and ultimately reaches the alphabetic symbolism of written history.

Surviving from the Stone Age, and discovered in 1879 in a cave since named Altamira, these two vividly depicted bison form part of a great ceiling fresco painted in gleaming red, black, and yellow, by

Magdalenian huntsmen-artists. Wherever possible, advantage was taken of the contours of the rock to bring out salient features, while emphasis was given to important lines with a graving tool. See page 345

ART, PRIMITIVE: DRAWINGS FROM THE CAVE OF ALTAMIRA IN SPAIN

From Breuil, Capitan and Cartailhac, "La Caverne d'Altamira"

1. Decorated Egyptian pots of about 7000 B.C. 2. Vessel on which is the earliest representation of fighting. 3. Deer and bison from the drawings in the Altamira cave (see p. 345). 4. Fighting scene depicted on an early Egyptian tomb. 5. Earliest representation of boats taken

from Egyptian pottery. 6 to 9, and 11 to 22, are from engravings on bone and stone and scratching, on rock, mostly discovered in France, 19 and 20 being from Dordogne. 10. Group of neolithic pottery showing various kinds of predynastic Egyptian decoration

ART OF PREHISTORIC MAN FROM PICTURED CAVE AND EARLIEST POTTERY

Arta (anc. *Ambracia*). Town of Greece, in the prov. of Arta. It stands on the river Arta, 7 m. from its mouth, and 40 m. S. of Janina. The river is here crossed by a bridge, formerly a neutral zone between Turkey and Greece. The town has a Byzantine castle, an archiepiscopal palace, a 9th century and other churches, and several mosques. It manufactures woollens, cottons, leather, and embroidery, and trades in cattle wine, and grain.

In ancient times Ambracia was the chief town of Epirus. Colonised about 660 B.C. from Corinth, it became the capital of the kings of Epirus, was taken and sacked by the Romans in 189, and sank into insignificance after the foundation of Nicopolis in 31 by Augustus, who transferred a large number of its inhabitants to the new city. In 1449 it came under Turkish rule, and remained so until its cession to Greece in 1807. Pop. 7,468. The prov. or nome of Arta covers an area of 395 sq. m. Pop. 62,462.

Arta, GULF OF. Inlet of the Ionian Sea, on the N.W. coast of Greece. The ancient Sinus Ambracius, it is almost land-locked, and measures 25 m. in length and 10 m. in extreme breadth. The Arta or Arachthus river, which empties into the gulf, is 60 m. long, and was formerly the boundary of Greece and Turkey. See Actium.

Artaxerxes. Name of three Persian kings: (1) A. Longimanus (long-handed), 464-424 B.C., third son of Xerxes I. He was a successful and energetic ruler, and is generally supposed to be the Biblical Ahasuerus of Ezra and Nehemiah. (2) A. Mnemon (so called from his wonderful memory), 404-358, was a son of Darius II Nothus. The revolt of his younger brother Cyrus, who was defeated and slain at the battle of Cunaxa, 401, is described in the Anabasis of Xenophon, who took part in it with the Greek mercenaries in support of Cyrus. His life was written by Plutarch. (3) A. Ochus, 358-338, son of Artaxerxes Mnemon. He put nearly all his family to death, and was a weak and cruel despot, entirely under the influence of the Egyptian eunuch Bagoas, by whom he was put to death while campaigning in Egypt.

Artemis. In Greek mythology a goddess identified by the Romans with Diana. The reputed daughter of Zeus and Leto, she was born in the island of Delos with her twin brother Apollo. In Greek literature she is usually associated with hunting and like her brother, is

Artemis, Greek goddess; identified by the Romans with Diana
British Museum

represented with bow and arrows. In earliest times she appears to have been regarded as a nature goddess. She was often called the virgin goddess. At the same time she was specially worshipped by women as presiding over childbirth. She was often confounded with Selene or the Moon and her brother with Helios or the Sun.

Diana or Artemis of the Ephesians, mentioned in the Bible (Acts 19), had more of the attributes of an eastern goddess. The statue of her which was said to have fallen from heaven represented a somewhat uncouth-looking woman with many breasts, the whole conception being foreign to the Greek idea. The worship of Artemis is reminiscent of human sacrifice, notably on the shores of the Black Sea and in the grove of Nemus on the Alban hills. Consult *The Golden Bough*, J. G. Frazer, abr. edn. 1922.

Artemisia. In botany, a genus of plants belonging to the family Compositae, including the familiar southernwood (*Artemisia abrotanum*, old man, or lad's love), and the wormwood from which absinthe is made. There are four British species: *A. campestris*, field southernwood; *A. vulgaris*, common mugwort; *A. absinthium*, common wormwood; and *A. maritima*, sea wormwood. Several species yield santonin, a vermifuge.

Artemisia (d. 350 B.C.). Wife and sister of Mausolus, king of Caria. Her sorrow for the death of her husband was so great that she is said to have mixed his ashes with what she drank. The Mausoleum which she erected at Halicarnassus to his memory was one of the seven wonders of the ancient world; and from it has come the word mausoleum, to denote a magnificent tomb. Another Artemisia, queen of Halicarnassus, fought on the side of Xerxes at Salamis (480 B.C.).

Arteriosclerosis (Gr. *artēra*, artery, *sclerosis* hardening). The term covers four distinct arterial conditions. (1) the result of chronic inflammation; (2) atheroma, where calcification takes place in the inner coat of the artery; (3) degeneration of the middle coat of the artery with deposit of lime salt in rings; (4) hypertrophy of the muscle of the artery. All these changes result in a narrowing of the lumen, affecting the blood supply of the organs. Sclerotic arteries do not readily respond to any extra demand made on them. Failure of the vessels to carry sufficient blood under stress may cause cramp in the legs or angina of effort in the heart.

A degree of arteriosclerosis is normal to advancing age by reason of chemical and constitutional changes. Thickening of the arteries of the brain impairs memory and lessens flexibility of mind, and the condition contributes to loss of weight, weakness and fatigability. The victim will have the arteries of the temples thickened and prominent. Invariably present is a raised pulse pressure. Treatment is aimed at the removal of any toxic or other cause. Often, however, the outlook depends on whether the forces of repair can balance the forces of degeneration.

Artery (Gr. *airein*, to raise). Vessel which conveys blood from the heart to another part of the body. The main artery of the body, the aorta, which springs from the left ventricle of the heart, conveys arterial blood through its branches to all parts of the body. The pulmonary artery conveys venous blood from the right side of the heart to the lungs. In structure the wall of an artery consists of three coats (1) the external coat or *tunica adventitia*, the strongest and toughest part, formed mainly of areolar tissue; (2) the middle coat or *tunica media*, composed of muscular and elastic fibres with some areolar tissue; and (3) the internal coat or *tunica intima*, formed of elastic tissue.

Artesian Well. A small-diameter well sunk with a boring or drilling apparatus into water or oil-bearing strata from which the liquid rises by its own pressure to the top. Such wells are so called as they are said to have been first sunk at Artois, in France, though known in ancient Egypt.

Artesian Well. Geological conditions favourable for water supply from an artesian borehole

Artevelde, JACOB VAN (c. 1290-1345). A Flemish popular leader. He was born at Ghent and according to tradition was a brewer. In 1337, when the import of English wool for the Flemish weaving industry was stopped by the opening of the Hundred Years' War, he headed a movement against Louis, count of Flanders, a supporter of France, banded together the Flemish towns, and made a commercial treaty with England. He was designated captain-general of Ghent, and by 1340 the whole of the Netherlands had joined the federation. His despotic government and his suggested deposition of the count of Flanders in favour of the Black Prince provoked a popular rising, in which he was killed by the mob, July 24, 1345.

A bronze statue was erected in Ghent in 1863. *Consult* James and Philip van Atevelde, W. J. Ashley, 1883.

Artevelde, PHILIP VAN (c. 1340-82). Flemish soldier. A son of Jacob van Artevelde, he did not become known until 1381, when the burghers of Ghent revolted against their lord, the count of Flanders. They then selected him as their leader and in a short time he had driven the count from practically all Flanders. The count appealed to the king of France, Charles VI,

who led a large army to his succour. This met the forces of Artevelde at Roosebeke, Nov. 27, 1382, and defeated them with heavy loss, the killed including their leader. His life is the subject of a drama by Sir Henry Taylor, 1834.

Artful Dodger, THE. Nickname of John Dawkins, a character in Dickens's novel, *Oliver Twist*. A precocious young London pick-pocket, the most promising pupil of the old Jew, Fagin, he introduces *Oliver Twist* to Fagin. His career is ended by transportation.

Arthritis (Gr., disease of the joint). The term denotes a change taking place in the structure of a joint and leading to loss of its movement. This change may be caused by injury, acute

fevers, venereal disease, tuberculosis, or gout, and may occur without known cause at the climacteric. A septic focus, such as a dead tooth or an infected tonsil, may be the predisposing factor. A family history of arthritis is common. The disease is not hereditary, but the tendency for joints to be affected, when a person is subjected to an exciting infective cause, is inherited. Dietetic errors were once thought to have a bearing on arthritis. Now it is realized that metabolic error plays no part. A diet deficient in vitamins, however, predisposes to infective conditions and to arthritis. Rheumatoid arthritis and osteoarthritis, two common non-specific forms, are probably due to an infection not uniform in origin. *See* Gout; Rheumatism.

Arthropoda (Gr. *arthron*, joint. *pous*, foot). One of the great phyla into which the Invertebrates are divided. The name means jointed-footed—one of the distinguishing features of the group, which includes the spiders, mites, insects, centipedes, and crustaceans. All have a body formed of rings which mark its division into segments more or less clearly according to the degree to which these segments have become fused. The limbs belong properly one pair to each segment, but they may be suppressed in some segments, and greatly modified to comply with various functional requirements, e.g. those of sense

JACOB VAN ARTEVELDE ACCLAIMED AS POPULAR LEADER IN 14TH CENTURY FLANDERS

Painting by G. Van der Meulen in Ghent Museum

feeding, and respiration, in addition to locomotion. The body and limbs are covered by a cuticle of an organic substance called chitin. Muscles are attached internally, and the chitin remains thin at the joints. This allows movement. The moulting of the cuticle at intervals allows growth to take place intermittently. The nervous system is ventral, but with a dorsal anterior "brain." Reproduction is usually sexual and oviparous. There is generally a metamorphosis, perhaps several. Many arthropods are active, and the development of flight in the insects is important in the dispersal of that class. There are important examples of parasitism in ticks, mites, fleas, etc. Social life has become highly developed in some insects. Most fossil arthropods are crustaceans, in which are included the trilobites.

Arthur. Masculine Christian name meaning high. It is Celtic in origin and has long been common in England and Wales. The rare feminine form is *Arthurene*.

Arthur. British king or chief. There is no contemporary mention of him, but he occupies a large place in the hinterland of history where it merges in myth and romance. His name first occurs as that of a military leader in *The History of the Britons* by Nennius, ascribed to the close of the 8th century. There he is said to have been twelve times chosen as commander of the British kings against the Saxons, and to have been as often victorious. This account is quite compatible with there having been a British leader of this name. It was after battle with his nephew Mordred in 542 that Arthur, mortally wounded, passed to the island of Avalon.

A popular belief that Arthur did not die, but would return when needed, connects his story with that of other national heroes. In William of Malmesbury's *De Gestis Regum* (1142) it is stated that the ancient ballads said that Arthur would come back. In *The Chronicle of Roger of Wendover* it is recorded under date 1191 that his grave had been found at Glastonbury, and a sarcophagus with a leaden cross inscribed: Here lies Arthur king of the Britons, buried in the island of Avalon. The chronicler adds that Glastonbury was surrounded by marshes and called the island of Avalon.

The earliest detailed account of Arthur is in the *Historia Regum Britanniae* of Geoffrey of Monmouth, 1147. That Geoffrey's work, which he describes as a

Arthropoda. The general structure is shown in these photographs of the Lobster and (above) a Brazilian species of Ant (*Eciton hamatum*)—the body composed of segments and the limbs and other appendages all jointed

translation of a very ancient book in the British tongue, is romance rather than reliable history is so plain that it may be responsible for the common belief as to Arthur being an entirely mythical person. Geoffrey's history contains much of the legendary story of Arthur, as the son of Uther Pendragon, the friend of Merlin, the conqueror of all enemies, and the founder of a court of chivalrous knights. Here is found the earliest ascertained foundation of much of the Arthurian legend. Yet it has been established that the legend was known earlier than the time in which Geoffrey wrote, so his share is probably rather that of one who embroidered than of one who invented.

The Arthur of the romantic tales, the blameless king who established

the knights of the Round Table, and has come to be regarded as the finest flower of chivalry, is by some authorities supposed to have been a Continental figure, adopted into British tradition after the Norman conquest, while others look upon it as a British romance carried to France, where it inspired many writers. The knightly king of chivalry, Arthur of the Round Table, became definitely established in literature as a British figure of romance by the compilation of the *Morte d'Arthur*, completed 1469 or 1470 by Sir Thomas Malory, and it is this romance figure which is celebrated by Tennyson in *The Idylls of the King*. See Malory; *Morte d'Arthur*; Round Table.

Bibliography. *The Life of King Arthur*, J. Ritson, 1825; *Arthurian Localities*, J. S. Stuart-Glennie, 1869; *Studies in the Arthurian Legend*, J. Rhys, 1891; *King Arthur and His Knights*, J. L. Weston, 1899; *Arthurian Material in the Chronicles*, R. H. Fletcher, 1906; *King Arthur in History and Legend*, W. Lewis Jones, 1911; *Evolution of the Arthurian Romance*, J. D. Bruse, 1923-4.

Arthur (1187-1203). Duke of Brittany. Born March 29, 1187, he was the son of Geoffrey, the fourth son of Henry II of England. Arthur's claim to succeed Richard Cœur de Lion was superior to that of John, the fifth son of Henry II. From his mother, Constance, he inherited Brittany, and on Richard I's death, 1199, the nobles of Maine and Anjou refused to recognize John, and declared Arthur king of England. Arthur himself never claimed the throne of England, but was invested with Normandy, Brittany, and other lands in France by Philip Augustus of France. Against John's overlordship of these lands the nobles rebelled, and Arthur was declared their chief.

In 1202 Arthur was captured by John at Mirebeau, in Poitou, placed in the custody of Hubert de Burgh, and in 1203 removed to Rouen, where he was murdered, either by John himself or by his orders. In Shakespeare's *King John*, John is represented as ordering Hubert to have the young prince's eyes put out—a command he refuses to obey, while Arthur, a boy, decides his own fate by leaping from the walls of Northampton Castle.

Arthur, PRINCE (1486-1502). Eldest son of Henry VII of England. Born at Winchester, Sept. 19, 1486, he was early destined for diplomatic reasons to be the husband of Catherine of Aragon, daughter of Ferdinand

and Isabella of Spain. Catherine came to England, and the marriage took place in S. Paul's Cathedral, Nov. 14, 1501. Arthur died at Ludlow, April 2, 1502.

Arthur, CHESTER ALAN (1830-86). President of the U.S.A. Born at Fairfield, Vermont, Oct. 5

Chester A. Arthur

1830, he was the son of an Irish Baptist minister. He successfully practised law and during the Civil War served as inspector-general and quartermaster-general of New York State. Appointed collector of customs for the port of New York in 1871, he was dismissed in 1878 for opposition to civil service reform. Elected vice-president on the republican ticket in 1881, he became automatically president on the death of Garfield, holding office 1881-5. His presidency was marked by the passing of the Tariff Act 1883, and by a law prohibiting polygamy in the territories. He failed to obtain presidential nomination in 1884, and died in New York City, Nov. 18, 1886.

Arthur, SIR GEORGE COMPTON ARCHIBALD (1860-1946). British soldier and biographer. Born April 30, 1860, and educated at Eton and Christ Church, Oxford, he was gazetted in 1880 to the 2nd Life Guards and saw service in Egypt and South Africa. Private secretary to Lord Kitchener, 1914-1916, he wrote that soldier's biography in 1920; also the lives of Wolseley, 1924 (with Sir F. Maurice), and Haig, 1928. Studies of Queen Alexandra, 1934, Queen Mary, 1935, and Seven Heirs Apparent, 1937, showed his knowledge of English court life. He died Jan. 14, 1946.

Sir George Arthur,
British author

Arthur of Connaught, PRINCE (1883-1938). Member of the British royal family. Only son of the 1st duke of Connaught (*q.v.*), he was born at Windsor, Jan. 13, 1883, and was christened Arthur Frederick Patrick Albert. Educated at Eton, he was in 1901 commissioned in the 7th Hussars, and saw action in South Africa. In the First Great War he was attached to the staff of the British

C.-in-C., and served for some time in France. Having been entrusted with various diplomatic missions he was made governor-general of South Africa, 1920-24. He was a fellow

of the Royal Society and president or chairman of several London hospitals. In 1913 he married his cousin Alexandra, duchess of Fife. He died before his father, on Sept. 12, 1938, so that his only son, long known as the earl of Macduff, became in 1942 the 2nd duke of Connaught (*q.v.*).

Arthur's Seat. Hill in Scotland. It overlooks Edinburgh and is an irregular and picturesque basaltic eminence, 822 ft high, in shape like a lion couchant. From the summit, said to be named after King Arthur, an unrivalled view is obtained of the city and its surroundings. At its base is the palace of Holyrood, and close by are the Salisbury Crags, a crescent-shaped escarpment ranging between 60 ft. and 70 ft. in height. See Edinburgh.

Artichoke (Arab. *al kharshuf*). Name of two distinct edible vegetables, the globe artichoke (*Cynara scolymus*) and the Jerusalem (*Helianthus tuberosus*) artichoke (*Helianthus tuberosus*). Globe artichoke is propagated by planting seeds in spring, and transferring them in the second year to permanent groups in soil well broken up and manured with coal ashes or seaweed. The edible portion is the leaves or scales of the flower heads, which are produced from June to August.

Jerusalem artichoke is the more popular. It was introduced from America, and is prepared and grown similarly to the potato. The best soil is one of dry loam, with a top dressing of leaf mould. It is one of the most easily cultivated vegetables, needing only a little loosening of the soil after planting, and the pinching out of the tops of the plants before they flower, so as to increase the size of

the roots. In appearance the root resembles a turnip in colour, and a sweetened swede turnip in flavour. Cultivation in Britain has been greatly neglected. Jerusalem artichokes yield easily a hundred gallons of tubers per acre, and in addition to being an excellent article of food for human beings, are the best feed for milch cows that can be devised. Frosts do not check them, and they are immune from insect pests. See Market Gardening.

Article (Latin *articulus*, small limb). Part of speech preceding a noun to mark it definite (the man) or indefinite (a man). The definite article of modern European languages is the demonstrative pronoun used in a weak-

Arthur's Seat, famous hill near Edinburgh, as seen from St. Leonard's Gate
Valentine

ened sense (French *le*, Italian *il*, Spanish *el*, Latin *ille*). The indefinite article is derived from the numeral of unity (English *an*, Fr. *un*, Lat. *unus*). They generally precede, but in some languages, such as Rumanian and the Scandinavian group, follow the noun they qualify. Greek (ancient and modern), Hebrew, and Arabic have the definite article; Sanskrit, Latin, Russian, Persian, and Turkish have neither.

Artichoke. Two heads of the globe artichoke and (above) tubers of the Jerusalem artichoke

Articles of Association. Rules and regulations drawn up for the conduct of a limited liability company. Under English law they deal with the number, qualifications, and remuneration of directors, payment of dividends, matters affecting capital, and the general conditions of management and organization. The articles must be prepared when the company is formed, circulated among those interested, and a copy deposited with the registrar of joint-stock companies. They must observe the conditions laid down in the company's memorandum of association, be signed by those who subscribe to that memorandum, but, subject to this condition, can be altered by resolution of the shareholders. A stamp duty is payable on them. The Companies Acts of 1862 and later dates provide a model set of articles which may be adopted wholly or in part. See Company Law.

Articles of War. Code of discipline. They were drawn up for the British army in the 15th century or earlier, for the period of a war, when the troops were ordinarily subject only to the law of the land, *i.e.* before the passing of the first Mutiny Act in 1689. Power to make articles of war is still reserved to the crown. During British rule in India the Indian army was subject to articles of war made by the government of India. Down to 1878 Articles of War together with the Mutiny Act constituted the military law, but in 1879 both these codes were superseded by the Army Discipline and Regulation Act, and this in turn was replaced in 1881 by the present code.

Artificer. In the British navy, a highly skilled tradesman of the engineer, ordnance, electrical, or naval aviation branches. There are two methods of entry, the first as an artificer apprentice, aged 15 to 16, in which case the training is entirely naval; the second is to join direct as a 5th or acting 4th class artificer, this being determined by age, after serving a recognized full apprenticeship in an outside engineering firm and passing a trade test. A limited number of artificer apprentices who distinguish themselves in work and recreation and are likely to make good officers are selected each half year for entrance to the Royal Naval Engineering College, Keyham, as cadet (E). Pay ranges from 7s. 6d. a day (acting 4th class) to 12s. 6d. a day (chief rate) and there are opportunities

for rising to warrant and commissioned rank.

Artificial Flowers. Articles manufactured chiefly for the ornamentation of ladies' wearing apparel, and for making wreaths and crosses. They have been used for various other purposes, such as the decoration of tables, and as emblems or tokens in connexion with charitable organizations.

The materials chiefly used in the manufacture are cambrics, jacquets, and other fine varieties of calico, muslin, velvet, small feathers, crêpe, gauze, and various yarns and threads. The leaves are stamped from green and yellow taffeta, etc., and with the petals and sepals are goffered to the required shape. Buds are made of taffeta stuffed with cotton-wool, while the stalks are fashioned in wire and covered with green or other coloured materials. Blown glass, brass, and mother-of-pearl are also employed, while wax is also used. Mourning wreaths for tombs are constructed of enamelled iron, pottery ware, and like materials.

The chief makers for many years were French, although British, Dutch, and Belgian workers were proficient in this art. About 1900 the Germans and Austrians began to interest themselves in the trade, and entered upon the exploitation of the English and other markets. In England, manufacture is not confined to any particular locality, charitable institutions generally falling back upon this craft for the employment of the infirm or disabled. An outstanding example is the poppy made by disabled ex-servicemen and sold on the day before Remembrance Day.

Artificial Gem Stones. Imitations of precious natural stones. Artificial gem stones, as distinct from synthetic gem stones (*q.v.*), which have chemically the same composition as the stone imitated, have been made from the earliest times. The pastes used by the ancient Egyptians both for beads and for scarabs were coloured after the manner of lapis lazuli and turquoise, and had the opacity of these stones.

Modern artificial gem stones consist of a hard and brilliant glass coloured in manufacture to represent the real gem. Imitation diamonds are frequently made from strass, a variety of glass prepared by fusing a mixture of powdered quartz, red lead, and potassium carbonate with small amounts of arsenic and borax. The addition of thallium when

fusing the mixture yields a paste resembling the diamond in optical properties. The various precious coloured stones are made from strass by the addition of the appropriate colours during fusing: cobalt oxide gives blue; copper or gold salts, red; and copper or chromium oxide, green. The distinctive blue of the sapphire is obtained by the addition of small quantities of titanic oxide (rutile) and magnetic oxide of iron.

Jargoon, a transparent variety of zircon, is frequently used to imitate diamonds, being painted on the back with a luminous paint to make it more brilliant.

Natural rubies and emeralds are both composed of a natural crystallised oxide of aluminium called corundum. In its natural state, corundum is transparent and plentiful, and has no value as a precious stone; it is only when traces of iron or titanium are present in the crystals that they have the rich colour that gives them value as gems. Iron colours the corundum red, as in the ruby; and titanium is responsible for the blue of the blue emerald. By means of a double blow-pipe, one tube of which plays a flame on to a piece of pure corundum, while the other sprays the heated corundum with powdered chromium, an artificial ruby is built up. The chromium is deposited in layers on the corundum, and although the resultant "ruby" passes superficial tests, its artificial origin is betrayed by microscopic examination, which reveals striations, the curves of which correspond to the layers of chromium blown on to the corundum; but processes have been developed which eliminate even these markings.

Many of the larger and more expensive artificial gem stones consist of an upper and lower layer of genuine stone with an intermediate layer of suitably coloured glass.

Artificial Insemination. Any method other than by sexual intercourse of introducing the seminal fluid into the female generative passages. It is now frequently employed in raising the quality of stock, as the seminal fluid of a good sire can travel long distances in a suitable medium at a suitable temperature. Artificial insemination has been used in both Europe and the U.S.A. for human procreation, but many complicated medical, legal, and religious considerations bear upon the practice. See Reproduction.

ARTIFICIAL LIMBS: USE & APPEARANCE

A. A. Atkinson, M.B., Ch.B.

The writer, who is medical director of the Ministry of Pensions limb-fitting service at Roehampton, London, describes modern developments in the construction and fitting of artificial limbs of all kinds. See also articles on Amputation • Surgery.

In Great Britain before 1914, the manufacture of artificial limbs was a comparatively small industry, the limbs were too heavy, the design was not good, and fitting to the stump and body was haphazard. In the First Great War 41,000 British servicemen lost limbs (this number does not include Dominion or Colonial troops). The state was faced with the problem of providing limbs for this number of patients, and British limbmakers were unable to meet the demand. Accordingly, Roehampton House was purchased by a committee from funds subscribed publicly. The committee invited limb-making firms in America to establish branches at Roehampton, and the ministry of Pensions, when it was formed, to make use of the centre for ex-servicemen who had lost limbs in the war. The ministry established experimental and research workshops to effect improvements in the design of artificial limbs. Valuable improvements were made by a private British firm which had manufactured the first light metal leg, and were then producing a small number, but not sufficient to meet the requirements of the large number of disabled ex-servicemen for whom limbs were supplied in duplicate, and renewed when necessary.

Natural Appearance

The modern articulated artificial leg can be made to resemble closely the shape of the natural limb. It has joints designed to permit free natural movements. Owing to the shape and free movements, it is often difficult, where one leg has been lost, for an observer to perceive any difference between the natural and the artificial leg. In many cases of double below-knee amputations it is equally difficult to detect the fact that the patient is walking with two artificial legs. In high thigh amputations the disability is more obvious. The function of the lower limb is mainly locomotion; and this can be restored to a remarkable extent by an artificial leg that has been correctly fitted.

Persons who have undergone an amputation above the knee have walked from London to Brighton

or climbed to the top of Snowdon; these are exceptional examples, and patients are not encouraged to emulate these feats, but they are encouraged to engage in a variety of games and sports, and to take plenty of exercise.

The correct alignment of the component parts of the leg to each other, to the stump, and to the body as a whole, is a subject of great importance. If the socket is not of the proper size and shape it is uncomfortable, and if the alignment is wrong the patient will walk badly, and put undue strain on parts which are likely to break. Certain parts of the leg, e.g. joints, may be of standard pattern, but there is no standard size or shape of socket. Each one has to be specially made to fit the individual, and the alignment also has to be adjusted to individual requirements. It is agreed that for both use and comfort a leg of good design which has been badly fitted is worse than a leg of poor design which has been correctly fitted.

Construction of Artificial Legs

Artificial legs should be constructed from the lightest available materials, and yet should be strong enough to take the weight of the body and the strains imposed on them. They should have sufficient margin of safety in strength to stand up to unusual stress and strain. The material which is most popular in this country for the shell of the limb is duralumin. Some limbs for amputations below the knee are mainly constructed from willow, while others for amputation at the ankle joint are made from leather with reinforcing steel strips. The type or pattern of the leg depends to a great extent on the site of amputation.

For amputations at or near the hip joint, where there is little or no stump, a saucer- or dish-shaped socket is made to enclose the buttock and part of the pelvis on the side of the amputation. The socket is attached to the thigh piece by a hip joint which can be kept in a fixed position in walking or standing, and unlocked by the patient when he wishes to sit down. The socket is securely strapped to the pelvis. Apart from the socket and hip

joint, the remainder of the leg conforms to that now to be described for an above-knee amputation.

In this amputation the stump is fitted into an accurately shaped socket in the thigh piece which articulates with the shin piece, and the shin piece articulates with the foot, which has a jointed toe piece. The leg is usually attached to the body of the patient by means of a pelvic band; between the pelvic band and the top of the socket there is a hip joint.

Both the design and position of artificial joints are of great importance. When an artificial joint is superimposed on an existing natural joint, the axis of both joints should be in the same line. In the leg now being described the hip joint permits flexion, extension, adduction, abduction, and rotation. In this amputation the natural knee joint has been removed, and in order to permit free movement in walking and stability when standing, the position of the joint is placed just behind the centre of the knee piece. If it is placed at or in front of the centre the knee tends to shoot forward or flex when weight is put on the leg. If it is placed too far back the knee does not flex easily in walking. The ankle joint is placed vertically in line with the middle of the leg and permits about 30° of flexion and extension movement; lateral movement can be provided for, but is usually considered to be unnecessary. The toe joint is placed just in front of the instep, and in the same position as the corresponding joint in the human foot.

Movements made at the ankle and toe joints are controlled by pieces of rubber which by compression and expansion give an elastic or resilient action in walking. The knee joint has a spindle which passes through the knee piece; this part is set in ball bearings. An adjustable friction brake is also incorporated in order to control movements as well as to prevent an excessive amount of flexion in walking.

Amputation through Knee Joint

It has been observed that for amputations above the knee the artificial leg, with the exception of the foot, is usually made of light metal. Where the amputation is made through the knee joint the lower end of the stump is usually more bulky than the normal size of the limb higher up; this makes it difficult to insert the stump into a well

fitting metal socket and so the socket is usually made of leather with an opening down the front which can be laced or unlaced when the leg is being put on or taken off. The knee joint suitable for above-knee amputation cannot be used, as it would damage the lower end of the stump or, if placed at a lower level, would make the shin so short as to be unsightly in the sitting position. Lateral joints are, therefore, placed on the sides of the knee piece: this increases the width of the knee to a considerable extent. The shin piece and foot are similar to that described earlier for amputations above the knee. The leg is suspended to the body either by a pelvic band or by shoulder braces.

Amputation Below the Knee

For amputations below the knee, the artificial leg is attached to the body mainly by a thigh corset made of leather, which opens down the front and is laced to the thigh when the leg is put on. Shoulder or waist suspenders are also used. Lateral knee joints are fixed above to the thigh corset, and below to the socket. The position of these joints is important. The centre of movement of the human knee joint changes its position in flexion and extension of the knee, and it is difficult to design an artificial knee joint which will follow the centre of movement of the human knee. Considerable success has, however, been obtained from a polycentric knee joint made at Roehampton. When an artificial joint with a fixed centre of movement is used the optimum position for it is at the junction of the anterior two-thirds and the posterior third of the knee, and on a level with the tubercles of the femur. When a metal leg is used the socket is made from leather blocked on a cast of the stump; the cast has, however, to be built up by a skilled craftsman and shaped to remove pressure from prominent bones or tender parts of the stump. The leather socket is contained in the hollow metal shin piece. The foot is made of willow. A number of patients prefer the wooden below-knee leg in which the socket and shin are made of willow. The socket is carved out by a highly skilled wood worker.

The limb or appliance for amputation at the ankle joint is somewhat bulky round the ankle, since it has to enclose the bulbous end of the stump; it must also be of

strong construction. To admit the end of the stump the socket is made of blocked leather reinforced with steel supports; it has a gaiter which, when the stump is in position, permits the appliance to be laced securely on the stump. The lower end of the stump rests on a cushioned platform, thus permitting end bearing. This is the great and indeed the only advantage claimed for what is called the Syme amputation, after the name of the surgeon who originated the technique of the operation. An ankle joint is placed beneath the platform. It should be noted that this amputation is unpopular with women patients who do not like the ugly appearance of the artificial ankle; they prefer to have the amputation at a higher level, and use the artificial limb described for a below-knee amputation which has a natural shape.

Natural Appearance of Arms

The modern artificial arm can, within certain limits, be made to resemble the shape of the natural arm. Some patients prefer to have a light dummy or shell arm with simple joints, called a dress arm; it is used mainly to restore appearance. Other types used for manual work are heavier and have more complicated joints, and mechanism, designed to actuate various movements: in these arms the hand is often more for appearance than use, for it can be detached at the wrist and appliances substituted for work. The function of the arm and hand is to make many movements, to grasp and hold heavy and light articles: the ability of the fingers to make complicated manipulations depends largely on the sense of touch.

Even the most ingenious mechanical fingers devoid of this sense and of control from the brain cannot restore the function of the lost hand. Nevertheless artificial substitutes can be provided which are useful for many purposes. The type of arm suitable for a particular patient depends on the site of amputation, and his occupation.

After amputation at the shoulder joint, the artificial arm is not of much value for manual work, as there is no stump to control movements. An arm can, however, be suspended to the shoulder and is capable of carrying a coat or attaché case. A dress arm is used to fill the sleeve and restore appearance. After amputation through the upper arm, there is generally a useful stump on to

which the socket of the artificial arm can be fitted. The socket articulates at the elbow joint with the forearm and the latter with a hand which is usually detachable. The arm is attached to the shoulders by straps of webbing which pass across the back; a loop is attached to the opposite shoulder. Some movements of the arm can be made by the stump; other movements, such as flexion and extension of the forearm, are made by cords or thongs which pass from the elbow joint to the shoulder straps; when the shoulders are moved forward tension is put on the cords which move the forearm. The hand can be detached at the wrist and replaced by tools or appliances used in any particular occupation. The forearm is often bisected at a higher level; the lower part can be detached and replaced by tools closer to the end of the stump, which increases the power which can be applied to the tools. Rotation movements can be made at the bisected joints.

Incidentally, the disablement caused by an amputation in the upper arm is very much greater than where the elbow joint has been saved, and there is, moreover, a useful below-elbow stump.

For Amputation Below Elbow

Most of the arms used after amputation below the elbow are attached to the upper arm by means of a lacing leather corset, or a strap. The elbow joint may be made of leather side straps connecting the corset to the socket, or the side straps may be steel with a box or other type of metal joint. The stump fits into a socket which may be bisected just below the end of the stump or at the wrist as described for amputations above the elbow. Where the wrist has been saved, the useful movements of pronation and supination (*i.e.* turning of the hand so that the palm faces up or down) are usually preserved; and although it is undoubtedly somewhat difficult to fit the stump into a socket of neat appearance, this can be done.

Men who have had both hands blown off, and at the same time lost their vision by explosion of bombs and mines, present serious problems to the surgeon, the limb-makers, and to St. Dunstan's. A remarkable characteristic of these patients is that usually they are cheerful and consider that life is still attractive. Many of them are emphatic that they wish to appear normal, and for that purpose they are provided

with artificial hands. They are also provided with arm appliances specially designed to meet their individual requirements. The artificial hand can be attached to the forearm by a gauntlet which is secured by a zip-fastener. The hand is attached to the gauntlet by two flat metal strips which are inserted into slots in the gauntlet. The hand can be detached and the various specialised appliances substituted.

Fingers and Thumbs

Hands are often a disappointment to patients who have not visualised the limitations. A strong and light hand of natural appearance is made from certus glue and muslin. Usually the thumb only is movable, with a spring which will hold light articles between it and the index finger. The fingers are fixed in a half closed position, and are useful for carrying articles, *e.g.* a small suit-case. Other hands also used for appearance have the joints of the fingers articulated so that they may be set in any desired position of flexion. These are not of much use for working purposes. Several types of mechanical hands are in use. When they are used by experts a wonderful performance can be given; most patients find that these hands are too heavy for comfort, and require too much force to operate the mechanism; the digits have articulated joints, and mechanism which enables them to be closed and opened. The motive force is supplied by movements of the upper arm or shoulders from which thongs or cables pass to the mechanism in the hand.

Because of the limitations of the artificial hand for manual work, appliances for use in place of the hand have been devised. The old type of hook is still used for some work, but many more useful appliances have been devised for particular occupations, *e.g.* the electrician has quick grip pliers, the carpenter has tool holders, the gardener has spade grips. Many of these are in the form of specially designed vices: they enable a more firm grip to be taken of the tool or other article than is possible with artificial fingers.

At Roehampton and at limb fitting centres in the provinces, classes of instruction teach patients how to make the best use of their artificial limbs. It is important that adequate instruction be given to the patient immediately after the limb has been supplied, and before bad habits are acquired.

Artificial Respiration. Method of restoring respiration to the asphyxiated. In chronic cases a breathing machine may be used; in acute cases, such as drowning or suffocation by gas, there is not a moment to lose. After one minute without oxygen, consciousness is lost; after two minutes respiration ceases and vasomotor failure follows. The heart muscle is extremely susceptible to absence of oxygen, and the flow of blood to the organs ceases rapidly, this ending in death.

Schafer's method should be started at once. The patient should be turned on his face, the mouth being cleared of mucus. The operator kneeling over him should place his palms in the lumbar region of the patient's body, alternately applying and relaxing pressure. This should follow the rhythm of breathing, each movement taking about five seconds to complete. The application of pressure drives up the abdominal organs against the diaphragm and causes expiration of air from the lungs. Relaxation of pressure allows the organs to return to place, followed by the diaphragm, thus causing inspiration of air. A variant is known as Sylvester's method.

A third method proved its value in the Second Great War. Eve's method requires some sort of stretcher balanced on a fulcrum, such as might be improvised by a door balanced on a barrel. (Schafer's method must be started while this is arranged.) The patient is rocked at an angle of 45°, four seconds head down, three seconds

feet down; the mechanics of the abdominal organs and the diaphragm are the same as in Schäfer's method. In the head down phase

Artificial Respiration. Eve's method designed to promote blood flow

blood drains out of the legs and abdomen into the heart, and the flow of arterial blood to the head is facilitated.

Artificial Silk. Material having in varying degree the qualities—sheen, lustre, strength, etc.—of natural or “spun” silk. Cellulose (*q.v.*) derived from wood, cotton, or similar natural materials is treated chemically and physically to render it soluble and viscous; it is then squirted through a small orifice to produce a continuous filament which, after further treatment, can be spun into yarn. In a similar process the viscous material is drawn into a fine thread. The name rayon (*q.v.*) has come into use in Great Britain for artificial silk in general. Besides natural cellulose certain synthetic substances are used for producing textile materials of this class. See Nylon; Silk; Viscose.

Artigas. Extreme N. department of Uruguay. Its area is 4,390 sq. m.; it is bounded W. by the Uruguay river and E. by Brazil, and is traversed by two rlys. From its extensive forests quebracho (*q.v.*) is obtained. Artigas is the capital. Pop. 55,748.

Artigas, José GERVASIO (1764–1850). Protagonist of Uruguay in the revolutionary period. Born at Montevideo, June 19, 1764, he was descended from a family of the first Spanish settlers. In the revolution of 1810 Artigas took a prominent part, and soon became the rallying point of all his countrymen, who were resolved to be freed equally of the Spanish and the Portuguese yoke. His life was one long struggle for the independence of his native state. He died in Paraguay, Sept. 23, 1850, after an exile of thirty years. His remains lie in a tomb in the cemetery of Montevideo, and his name is honoured through out the republic of which he was the pioneer. See Uruguay: History.

Artificial Respiration. In Schafer's method the ribs are alternately compressed from behind (2) and released (1), this last causing chest expansion

ARTILLERY: GUNS AND ACCESSORIES

Lieut.-Col. C. E. Tumber, T.D., R.A.

An account of the several ways in which artillery is used in offensive and defensive warfare, including a description of typical light and heavy guns. See also Anti-Aircraft Weapons; Breech Mechanism; Guns, Naval; and under Ammunition; Armoured Vehicles; Rocket Gun; Royal Artillery; Strategy; Tactics; Tank, etc.

In modern armies the artillery consists of units equipped with heavy weapons capable of firing at distant targets. The instruments provided differ with the nature of the target to be engaged, and are classified according to the function they perform, e.g. rangefinder, plotter, predictor. Both wireless and line telephony are used to transmit orders and reports so that a large number of guns can be centrally controlled when necessary. Mobile units have sufficient vehicles to tow the guns and carry personnel, instruments, ammunition, and stores. Static units hold the necessary stocks of ammunition in a dump or magazine.

The basis of organization is the gun detachment, or number of men required to operate one gun in action, which varies from two or three up to 15 or more. Tactical and technical considerations then determine the number of guns which should normally be employed as a unit, together with the instruments, ammunition, communications, and transport required.

Three Types of Artillery

The type of target to be engaged has such a great influence that British artillery is broadly divided into the three groups, field, anti-aircraft (A.A.), and coast. The artillery regiment (normally commanded by a lt.-col.) is equipped and trained to deal with targets of a given type. It is divided into batteries, which are further subdivided into troops or sections. In mobile regiments the troop is usually the smallest self-contained fire unit. The typical example is a troop of 25-pounder field guns. The four guns are spread over a frontage of about 100 yds., but are individually sited and camouflaged. The gun position officer (G.P.O.) passes orders through a microphone connected to a loud-speaker at each gun. For safety the guns are kept out of sight of the enemy, and a separate observation post (O.P.) is therefore established. The troop commander is usually the observing officer and passes back his orders to the G.P.O. by wireless or telephone line. The transport consists of vehicles which tow the guns, carry ammunition, G.P.O.'s equipment, O.P. equipment, rations, etc.

Two such troops constitute a battery, and the battery command post is connected to each G.P.O. by wireless or line. In addition the two G.P.O.s are connected by a separate link line.

The three batteries forming a regiment are similarly linked. In an emergency individual guns can engage targets with their own sights, and each post is organized for all-round defence.

The normal object of field artillery is to assist in a land battle, primarily by direct support of the infantry. Examples of ordinary targets are enemy known to be forming up for attack, concentrations of transport, mortars, and of installations generally.

For destruction, accurate shooting is necessary, but it is sometimes required merely to hamper the enemy and prevent effective use of his weapons. For this purpose intensive neutralising fire for a comparatively short critical period, or a smoke screen, may be sufficient. Concentrations produced by a large number of guns shooting into a limited area have often been effective.

The rôles assigned to medium and heavy regiments are similar, and the lay-out in action almost identical. The guns being larger, heavier, and therefore less mobile, are sited farther back and are more often used to engage enemy batteries (counter battery fire), fortified posts, etc. Survey regiments assist in linking up on a broad front by locating key points, and fix the positions of

enemy guns by means of their flash and report (flash spotting and sound ranging). A few super-heavy guns transported by road or rly. are sometimes employed for a special purpose, such as the attack of heavy concrete defences. Anti-tank regiments are now used in large numbers. The need to obtain an immediate hit with penetration limits engagements to a range of about 1,000 yds. No separate O.P. is required, for guns as a rule are individually sited and controlled according to local conditions.

Anti-Aircraft Guns

There are two distinct types of anti-aircraft artillery designed to meet the two normal forms of attack. A large vulnerable point (V.P.), such as a base port or industrial area, is most likely to be attacked by high-flying bombers which obtain accuracy by holding a steady course for an appreciable time before bomb release. Heavy A.A. guns are therefore organized in a defensive belt outside the V.P. to prevent accurate bombing and, if possible, to damage or destroy raiders. Each gun-site in the belt consists of a command post manned by a G.P.O. with the guns grouped round it. Static equipment has reached a stage where, in action, the human element has almost been eliminated. It is hardly necessary to do more than keep the guns supplied with ammunition and use a button to start and stop firing. The equipment of mobile heavy A.A. regiments necessarily sacrifices a proportion of these refinements.

A small V.P., such as a bridge or an individual factory, is generally attacked by low-flying aircraft of dive-bomber or fighter-bomber type. The general defensive lay-out is similar to that just described, but the nature of the

Artillery. Diagram showing the disposition of a troop of 25-pounder field guns over a frontage of about 100 yds.

target calls for totally different guns—light handy weapons to swing round and to have the highest possible rate of fire.

Coast artillery is the main defence of naval bases and ports against sea attack. As with A.A., the object is primarily deterrent; the ideal is to make the defences so strong that the enemy is unwilling to risk an action. Close cooperation with the Navy is essential because fixed naval defences, e.g. minefields, booms, and anti-torpedo nets, are generally installed. Each "fortress" is considered on its merits and an individual defence system is built up from standard components. The typical component is a battery of two or three guns, often mounted in a "fort" and having its own searchlights.

When the guns are fired as a unit, a single O.P. is used for control of lights, observation, and adjustment of fire. Unified control of lights and guns is essential, for attempts to enter a harbour are most probable at night, and guns fire at targets selected by the lights. Alternatively each gun may engage a different vessel with the aid of its own special form of sight. For long-range engagement of battleships and cruisers a heavy weapon is required to fire a large projectile capable of penetrating and doing damage. The fact that the target is moving involves a set of instruments comparable with those provided for A.A., but its limited speed enables adjustment of fire to be carried out so long as it is done quickly. All mountings are static, and this makes it easier to obtain accuracy and a high rate of fire for the size of gun.

Characteristics of Artillery

The typical characteristic of artillery, whatever its nature or purpose, is that it shoots at a given type of target from a greater range than other weapons. For example, the ordinary field gun may normally engage the enemy at a range of some 5 or 6 m., in contrast to the infantry, who must approach, or allow the enemy to approach, within a few hundred yards. Bombers flying at 30,000 ft. may be engaged by heavy A.A. guns or by fighter aircraft which rely on superior speed to get within short range. Coast artillery may fire on attacking warships up to some 20 m., but light naval craft must close before using their armament.

The actual weapon is the projectile, whether shot or shell. The

gun is simply a means of directing it and giving it the necessary speed. A large projectile is usually required, and this necessitates a comparatively heavy equipment. Thus although the gun itself is not as mobile as infantry, aircraft, or ship, the projectile may rapidly be fired to hit any point within a large area, so that artillery is extremely flexible. No time is lost in closing with the target; and, given the communications necessary for control, the fire of a number of guns may be concentrated on one spot or distributed

zone of a weapon depends mainly upon the range at which it is used, the fact that the gun is essentially a long-range weapon leads to unavoidable dispersion, which must often be taken into account.

A separate difficulty is that the centre of the zone may often be displaced from the target. This is due to errors which have a constant effect, such as an incorrect figure for the range to the target. Where observation is possible and other circumstances permit, fire is corrected by the characteristic

Artillery. The 240-mm. American howitzer, a modern super-heavy weapon

as required by changing conditions.

These advantages can be exploited only if it is possible to locate the target, allow for the various factors which may change from time to time, and then lay the gun so that the projectile arrives quickly enough and with sufficient accuracy for the purpose in hand. This process, known as fire control or fire direction, necessitates a great variety of instruments to perform the three operations involved for different targets in different circumstances.

The human element is necessary to select the target, decide and put into practice the measures to be taken, and in general observe and correct results. This procedure is gunnery. No weapon or instrument can ever be completely free from error, and the result is some degree of scatter of rounds over a zone of dispersion at the target. A large number of factors affect the zone, e.g. small irregularities in weight of projectile or charge, temperature of ammunition or atmosphere, barometer, wind, etc. Errors may be minimised by careful inspection after manufacture and by corrections in the field, but the complication and delay involved must be weighed against the degree to which accuracy is essential. The importance of the zone in artillery shooting arises from its size compared with the target. Since the

artillery process of ranging. The position of each round or group of rounds is observed, and the corrections deduced are ordered to the guns.

The only way of obtaining any degree of success without observation and correction is to employ "predicted fire" or a predicted concentration. This means using the most accurate methods available in order to minimise errors, and a large number of guns to cover a big proportion of the zone. The method is used by field artillery to obtain surprise and immediate results. At the beginning of an attack, predicted fire might be put down on certain enemy batteries and a number of guns would concentrate on each. In heavy A.A. the prediction is mainly concerned with the movement of the target, and time is so short that a special instrument must be employed to make the calculations. Each predictor controls a number of guns, so that the system is basically the same as that used by field artillery.

Although the basic features of artillery are common to all categories, the individual types of gun and instrument differ greatly in construction. The target to be engaged, in addition to governing the nomenclature and organization, has a fundamental effect on design. Many of the desirable features are mutually antagonistic,

and every design is therefore a compromise. A given problem can often be solved in several different ways, and a large number of special and experimental types of gun have been produced. The following examples have been selected to illustrate the main features of standard weapons. The first is American, the remainder are British.

The 240-mm. (9·5-in.) American howitzer is a modern super-heavy weapon. It travels on two separate transporters and is assembled by a mechanical crane which may also be used to prepare the ground. It fires a 360-lb. projectile some 25,000 yds. (about 14 m.) and the construction, which enables the legs of the "split trail" to be opened out on the ground, gives a relatively large traverse, or horizontal sweep, without danger of tipping. The gun may be elevated to an angle of 65° with the horizontal and all the mechanism is hand-operated. The heavy and medium series lie between this and the next example.

British 25-pounder Gun

The 25-pounder is the standard weapon of British field regiments. Its shell can be fired to about 13,000 yds., and it can elevate to 45°. It is strong in construction, which enables the trail to be quick to bring into action, but the top traverse is limited to a small angle. Greater changes in direction are obtained by moving the trail. The gun is fitted with a muzzle brake to reduce the effects of recoil. High explosive shell, smoke shell, and armour-piercing shot are provided. The propellant charge is contained in a separate brass case, and has several detachable portions. A round may be fired to hit a given point either with a high charge and flat trajectory for general purposes, or a small charge and curved trajectory for dropping a round into a trench or clearing an intervening obstacle.

The artillery board is used with all types of field weapons for recording target positions and obtaining the data for shooting. The board has a surface prepared for drawing, and is marked with a grid of squares. Any potential target or other

point can be plotted. The range scale, which pivots at the gun position, is swung over to intersect the required target, and the range from gun to target is read off. The angle between the direction of N. and the direction of the target is called the bearing to the target, and this is read on the scale provided. When the target is not visible from the gun, a suitable object is chosen as aiming point, and its bearing may be found by magnetic compass or survey methods, for which purpose a director is carried. The difference in direction between aiming point and target is the difference between these two bearings. The gun elevation corresponding to any range is given in the range table, and is applied by a system equivalent to depressing a bubble tube through the requisite angle. Levelling the bubble raises the gun to the correct elevation. Should the gun move on firing, it is only necessary to bring the telescope back on the aiming point and level the bubble.

An anti-tank gun must wait until the tank comes within very short range, otherwise the tank is liable to destroy the gun immediately it gives away its position by firing. Guns are generally sited to one side of the expected line of approach so as to hit the tank on the thinner side armour and to be less conspicuous when they fire. Concealment is important, and the 17-pounder is very low for this reason. The split trail gives a top traverse of about 45°, which makes it possible to follow a tank over a reasonable arc without the movement associated with lifting a trail. The long, thin high-velocity gun is fitted with a muzzle brake, but still has a powerful recoil, which necessitates long trail legs for steadiness. The breech has semi-automatic action, the empty case

being ejected during recoil and the breech remaining open until another round is loaded, when it is closed by a spring. This gives quick loading and the best chance of a second shot.

Two further types must be mentioned. In both the gun is intended to fulfil a normal purpose, but the general design sacrifices certain desirable qualities to attain exceptional mobility. The 3·7-in. howitzer is a "pack" weapon, i.e. it is extremely light and can be rapidly dismantled into several portable loads. It is an old design used by mountain batteries with mule transport, but it revived in importance when a demand arose for a weapon which could be loaded into gliders and aircraft. Its total weight is about one-third that of the 25-pounder. Its elevation is 40°, and it fires a 20-lb. projectile to 6,000 yds. Thus there is a very great saving in weight, but the whole performance is reduced—especially the range. Time into action is, of course, much greater, but a 25-pounder could not even approach many of the positions which may be used by this type of gun.

S.P. Gun for Land Warfare

Efforts to improve mobility for normal land warfare naturally led to self-propelled (S.P.) mountings. The S.P. gun has the cross-country performance of a corresponding tank and can usually outrange it, but if the tank approaches from the side the gun is often at a disadvantage. Thus the tactical handling is different, and the differences in design may be summarised by the statement that in an S.P. mounting the performance as a gun takes precedence over the performance as a tank. Tracks quickly wear out, especially on roads, so that although the S.P. mounting is very mobile in the battlefield, it must be loaded on to

Artillery. British 25-pounder, standard weapon of field regiments, which can be used as an anti-tank gun. It has great mobility, and can be turned inside its own length

a special transporter if it is required for a long journey.

The 3·7-in. A.A. gun is typical of the heavy A.A. class designed to engage raiders up to some 30,000 ft. or more. The difficulties of obtaining a direct hit are so great that a time fuse is used to burst the shell at the instant it is calculated to reach the target. The radius of burst is of the order of 60 ft., but the further difficulty of accurate fuse setting is introduced. Deterrent effect is increased because bursts can be seen by the enemy air crews even when they occur at a harmless distance. All-round traverse is provided and the elevation limit is about 80°. To keep the mounting reasonably low and simplify loading at high angles, the gun elevates about a point well to the rear at the breech.

The static type is balanced by a large counterweight and the mobile by springs which make a lighter arrangement. Some form of range-finder gives information of the target's present position, but if the gun were fired to hit this point the plane would have travelled forward some two miles by the time the shell burst. It is essential to lay the gun on the "future position," i.e. where the target will be when the shell arrives, so that as the plane travels forward the shell travels upwards and they both arrive at this point together.

Use of the Predictor

The predictor is a device which receives the present position, makes corrections to allow for the travel of the target, then passes the future position to the guns. The information is transmitted by means of electrically controlled pointers which show bearing and elevation for the gun and setting for the fuse, which must be applied at that instant in order to hit the target which is due to arrive in, say, half a minute.

On the mobile mounting a mechanical pointer is fixed immediately behind each electrical pointer and geared to the gun in such a way as to indicate its position. So long as the layers operate the traversing and elevating gears to keep each mechanical pointer coincident with its electrical pointer, the gun is laid. The whole process is continuous, but the pointers move fast and change in speed, so that laying is not easy.

Fuse setting must be extremely precise, for the object is to burst the shell at an exact point on its flight when it may still be travelling at, say, 2,000 ft./sec. and an error in setting equivalent to only

Artillery. Six-inch coast gun, a hand-loaded weapon enclosed in a box shield and protected by a concrete emplacement (not shown)

one-tenth of a second will cause a burst 200 ft. from the target.

Hand setting was superseded by fuse-setting machines. These, though quicker and more accurate, still set the fuse before loading began, so that any irregularities in the time taken to remove and load the round caused errors in the fuse. Later machines are completely automatic. Immediately the fuse is set, the round is swung over and rammed into the gun, the breech closes and the gun fires—all within a matter of seconds. The high rate of fire attained in this way helps to compensate for the impossibility of any normal ranging. The policy adopted is to develop the maximum volume of fire and rely on the instruments. To this end the predictor is designed or adapted to control a number of guns. The predictor assumes that the target will hold a steady course and speed, which assumption is justified for a normal heavy aircraft about to drop bombs.

Light A.A. weapons are typified by the 40-mm. Bofors, originally of Swedish design, adopted by Great Britain and other countries. The main structure is similar to that of the 3·7-in. A.A. and it is a mobile handy mounting. The loading mechanism is operated by the force of recoil, and, though complicated, gives little trouble. If the firing pedal is held down, the gun will fire approximately one round per sec. as long as ammunition is supplied. Alternatively, single shots may be fired. The very short time of action rules out any possibility of setting fuses, so that it is necessary to obtain a direct hit. The high-explosive projectile is fitted with "tracer" to make it visible in flight, but although this has some deterrent effect, considerable ex-

perience is required before it can be used for correction. Conditions change so rapidly that anticipation is necessary. The rates of traverse and elevation often amount to 30° or 40° per sec., so that it becomes impossible to follow when a plane in level flight passes almost over the gun. German dive-bombers proved easy targets when the guns had been sited to be roughly in the same direction of dive as the V.P.

The Six-inch Gun

The 6-in. gun has for many years been a standard weapon in coast artillery; on the modern mounting it is capable of elevating to 45°. The working parts are enclosed in a box shield and the whole installation is protected by concrete. The maximum range is about 26,000 yds., and the 100-lb. shell will sink a destroyer and damage larger warships. Only one propellant charge is fired, but several types of projectile are available in the magazine for use against different classes of vessel. Selection is based on recognition of the vessel and knowledge of the factors involved. The gun is hand-loaded, and, if it is to fire at high angles, it must first be brought to the loading position, for which purpose a special handwheel is used.

Hand laying is satisfactory against ships, and pointers similar to those described for the 3·7-in. A.A. are provided. Larger mountings have power-loading owing to the greater weights involved. Great accuracy is obtained from the steady mounting and from the refinements which are incorporated, e.g. mechanism to ensure automatically that all guns of a battery are concentrated, i.e. laid on the same point.

As in the field, a grid system is used, and every O.P. has a chart

similar to an artillery board for pointing out targets. But the static nature of the defences makes possible survey, mechanism, and transmission lines which enable any range-finder to serve any battery. The present position of the target is passed with reference to the grid and any battery concerned may apply this to an instrument on the lines of a mechanical artillery board so as to obtain the bearing and range for its own guns. The next step, as in A.A., is to allow for the movement of the target. This is done by the fire direction table, which may be used in the same way as a predictor to follow a range finder, or alternatively may be set to the course and speed of the ship, when it will continue to evolve the data required to hit such a ship whether there is any information coming in or not. As in A.A., the instrument assumes that the target will hold a steady course and speed. There is, however, the fundamental difference that when the ship makes some unexpected turn, observation of the vessel itself and of the fall of shot enables corrections to be applied. Results on the water take precedence over purely instrumental calculations.

Development of Searchlights

In short-range night actions the searchlights are directed from the O.P. by electrical remote control, and a lamp has been developed which gives six hours continuous light, automatically changing its own carbons as they are burnt. Shooting is possible up to about 3,000 yds. in average weather and automatic sights effective to about this range are fitted to the guns. These are characteristics of coast artillery, and depend upon the fact that the height of the gun above the ship is always known. The sighting telescope and the gun are mechanically connected, and the telescope is easily traversed to the direction of the ship.

For dealing with fast targets such as motor torpedo boats the 6-pounder twin is used. The conditions of action are generally similar to those just described, but it would be impossible to follow many fast, turning targets with searchlights; so an illuminated area, consisting of a number of fixed dispersed beams, is used. Ranges are likely to be under 2,000 yds. and the mounting with both semi-automatic guns firing will develop over 70 rounds per minute. Mountings operate individually on a pre-arranged

distribution of fire scheme and are provided with an automatic sight in case the normal control should fail. The unique feature is that corrections move the pair of guns relative to the mounting, so that the layers follow smoothly and the guns can be swung in the necessary direction without causing any disturbance to them.

At the beginning of the First Great War artillery was mainly used to fire shrapnel shell at targets in the open. This was a legacy from the veld conditions of the South African campaign. When trench warfare set in, more and more high explosive shell were used for demolishing earthworks. There was a clear distinction between gun and howitzer which has now almost disappeared. The gun was a weapon of limited elevation which fired shrapnel with a large charge, so that when the shell burst the bullets still had sufficient velocity. The howitzer could obtain considerable elevation and drop a high explosive shell into a trench. Modern field weapons, with their variable charges and high limiting elevation, can perform either task. The term gun or howitzer now simply indicates the predominant characteristic. The functions of shrapnel have been largely taken over by "air-burst H.E.," i.e. high explosive shell with a time-fuse burst at the proper height above ground.

The static conditions of trench warfare led to great developments in the technique of indirect fire. The forward O.P., better communications, improved survey methods, and meteorological information all helped towards accurate coordination of many guns. From this grew the "barage" (*q.v.*).

Mechanical Tractors

Between 1918 and 1939 tractors replaced horses for drawing the guns, and this removed the upper limit imposed on the weight of field guns by the capacity of the normal horse team. During the same period still more elaborate methods of survey, communication, and control were evolved, based mainly on static warfare.

The rapid German advances of 1940 presented the artillery with very different conditions. Tanks frequently appeared from flanks or rear close to the guns, and parachutists, dive-bombers, etc., caused added difficulties. Methods were rapidly overhauled, and there was a temporary swing in the direction of short-range direct fire by individual guns. The

modern system is to prepare positions in the first instance for all-round defence and direct fire, then to link up for centralised control and indirect fire as opportunity offers. Many more wireless sets are available, and communication procedure has been simplified and standardised so that a large number of guns can be effectively brought under central control. The ponderous barrage has been replaced by flexible massed artillery fire.

Use of Radar

In the technical field the advent of radar (*q.v.*) led to many revolutionary changes. The device is in essence a wireless method of obtaining the position of a target. Technical developments enabled radar sets to fix targets with sufficient accuracy for the guns. A.A. and coast artillery were already equipped with the necessary calculating instruments, and their capabilities had been limited mainly by reliance on optical range-finding and searchlights. Many effective actions in poor visibility or darkness were fired by A.A., and results were further improved by developments in technique, predictors, and guns. Application of radar to searchlights and night fighters contributed in making night raids almost as unprofitable as the earlier day raids had become. Predicted concentrations fired by coast artillery almost invariably turned back groups of light German mine-laying craft; and still better sets, which could locate the splash of a shell with reasonable accuracy, enabled a series of long-range night actions to be carried out with radar range-finding and observation. Numerous radar sets are now included in standard A.A. and coast equipment.

A notable revival is the rocket principle. Many weapons are in service which fire a shell attached to the nose of a rocket, and some may be regarded as being of artillery type. Rockets may be fired from very simple rails or guides, so that the projector is very light and easily made, but they are inaccurate and bulky. Thus a very heavy momentary burst of fire can be produced, provided no great accuracy is required, and a large preliminary effort can be made. The transport and labour involved in assembling the ammunition on the spot may present some difficulty. Rockets are visible from the air throughout their flight and one round can be avoided, but if enough are fired

together there is a prospect that in avoiding one the raider will fly into the track of another. Projectors have been fitted to craft supporting a landing and to assault-tanks. In the latter case the projector is usually discarded after firing and the tank proceeds unencumbered.

Many types of gun have been used for secondary tasks. The 3·7-in. A.A. mobile makes a useful field and anti-ship weapon. Its great elevation has on occasions enabled it to engage targets which were impossible for other guns. Units are trained in the special procedures, and the gun is fitted with extra sights. The 40-mm. has been used as a super-heavy machine-gun and against small vessels. In the desert a periodic round of tracer fire over the heads of advancing troops proved useful in maintaining direction by night. Coast guns are normally given selected land targets and provided with special ammunition in case there is no sea target during a land raid or invasion, but their primary task and concrete cover curtail the possibilities. They have also been used to fire concentrations against minelaying aircraft operating over harbours.

Artillery School. Institution for the technical training of the personnel of artillery units and the elucidation of gunnery problems. The first artillery school was established by the Venetians in the 16th century. This was followed by schools at Burgos and in Sicily founded by Charles V. A practical school was founded by the French in 1675, and a theoretical institute at Douai in 1679.

The chief British school for training artillery officer cadets used to be the Royal Military Academy, Woolwich, the oldest military educational establishment in the U.K., founded and endowed by a warrant of George II in 1741, though it was in existence before then. A school of gunnery was at Shoeburyness, this place being chosen because of the scope afforded for artillery practice by the immense area of the Maplin sands at low water. A start was made there in 1849, when restrictions prevented the necessary firing being done at Woolwich. The experimental establishment, which conducts the proof tests of ammunition and guns, and makes practical tests of new weapons, occupies this site. The school of artillery embraces the whole range of artillery science, including field, medium, heavy, and anti-tank

guns, anti-aircraft and coast artillery weapons. The introduction of radar into artillery fire control brought highly technical equipment into the hands of artillery officer and man alike. The school of artillery, at Larkhill on Salisbury Plain, is the centre of teaching of the operational and tactical handling of all artillery for the field force. In addition there are a school of anti-aircraft artillery and a coast artillery school. At each, general instruction and special courses are given to selected officers and n.c.o.s to fit them as instructors in gunnery.

Artiodactyla (Gr. *artios*, even; *daktylos*, finger). Term applied to that order of hoofed mammals, such as cattle, deer, and pigs, which possess an even number of toes, in contrast with horses, tapirs, and rhinoceroses, which have an odd number. They have cloven hoofs, the result of the third and the fourth toe being nearly equally developed and placed symmetrically on each side of a vertical line dividing the foot. There are never more than four toes altogether, and the animals stand on the toes alone, no other part of the foot touching the ground. Animals of this order often have horns set in pairs on the head, whereas in odd-toed animals the horn, where it exists, as in the rhinoceros, is nasal. Many of the Artiodactyla have a complex stomach adapted for rumination; this the odd-toed animals never possess.

Artists Rifles. British army unit. Founded as a volunteer corps in 1860 by Lord Leighton and other artists, it was originally recruited from artists and sculptors, and through constant contact with regulars quickly became proficient, excelling especially in bayonet fighting. The uniform was

Artists Rifles badge

grey with black and silver facings. A contingent fought in the S. African War. Mobilised on the first day of the First Great War, the Artists went to France, Oct., 1914, and were at once established by Sir John French as a training corps for officers in the field. In 1915 the regiment was reorganized as an officers' training corps, and the 2nd battalion was created by special order a school of instruction for officers. This school was the pioneer of officer cadet battalions, and its syllabus was adopted as a

model. It supplied over 10,000 officers. In 1917 the 1st battalion became part of the 63rd (Royal Naval) division. During the war eight V.C.s were won by the Artists, and about 2,000 members died on active service. In 1937 the Artists Rifles became officially an officer producing unit, in 1939 an O.C.T.U., and in 1947 a Special Air Service unit, the only one of its kind in either the regular or the territorial armies. See Special Air Service.

Art of Fugue, THE. Musical work by J. S. Bach (*q.v.*). Left unfinished at his death in 1750, it was the same year completed, edited, titled, and published by his son Karl, but not too skilfully. It consists of some 17 fugues (including two pairs of "mirror" fugues in which every part can be inverted), two 4-part canons, and 18 organ preludes; including Bach's final composition, dictated after he was blind. Long a puzzle to scholars, the work as orchestrated by a German student in 1924 was performed at Leipzig in 1927 and in London in 1932.

Art of Love (*De Arte Amatoria*). Poem by the Roman poet Ovid. It professes to give instruction in the art of winning and preserving woman's love. Though cynical and shameless to a degree, its brilliant wit and shrewd insight into human nature, combined with consummate versification, stamp it as a work of genius.

Artois. One of the provs. into which France was divided before the Revolution. It was the district around Arras, its capital, and was for a long time ruled by the counts of Flanders. In 1180 the kings of France obtained it, and for many years it had its own counts, who were vassals of the French king. In the 14th century it passed to Burgundy, then to Austria, and was recovered by France in 1659. When at the Revolution France was divided into departments Artois was included in that of Pas-de-Calais. At present the name is used in a vague sense for the district, as Wessex or East Anglia is used in England.

Artois, BATTLE OF. Operation of the First Great War, May-July, 1915. It was conducted mainly by the French, with British assistance. To prevent the dispatch of German troops to Russia, then hard pressed by the enemy, Foch was ordered to start an offensive N. of Arras. The main attack was designed to reach the coalfield of Lens. Here the defensive works comprised underground galleries,

concrete and steel machine-gun posts, and elaborate systems of mines and barbed wire. The most conspicuous point in the defences was the hill of Notre Dame de Lorette, 500 ft. To the S. of it lay the fortified villages of Ablain, Carency, and Souchez, the cellars of which had been connected. The Germans under Prince Rupert held the direct road from Arras to Béthune and threatened the roads to Aire and St. Pol.

The date fixed for the French attack was May 9. It was preceded by a demonstration of the British in force against Aubers Ridge. Then the French artillery of some 1,200 guns opened the most violent bombardment witnessed to that date. This inflicted severe loss, but did not destroy the fortified cellars or much affect the maze of underground works. At 10 a.m. the infantry assaulted, and before noon had advanced 2 m. La Targette was stormed and a house-to-house fight started in Neuville-St. Vaast and Carency; but then the fighting assumed the character of a fierce trench battle.

On May 10 the French reached the high ground near Notre Dame de Lorette, but were unable to establish themselves under the terrific fire. During the night, however, the important spur running from the height towards Ablain was captured. Next day the cellars of Carency were stormed and the large church of Notre Dame de Lorette was taken after some of the most desperate fighting of the war. By nightfall most of Ablain was in French hands. By May 13 the total of unwounded prisoners was 5,000, and by the 15th most of Neuville-St. Vaast had been carried. But with its fall the French found their advance held up by the huge system of works to the S.E. known as the Labyrinth; and for another week the Germans on the plateau of Notre Dame de Lorette still held out.

The battle for the Labyrinth took up the rest of May and all June; with only slow and painful gains, but step by step, the German position was captured. The closing stages of the battle in the second week of July were marked by monotonous trench fighting which made the severest demands on skill and determination. Success was only partial, for the break-through at which the French aimed was not achieved. The Germans at this date were too strong in numbers and morale to be easily shaken; their works too

formidable to be overcome without a heavier artillery and such instruments of assault as the Allies afterwards developed in the tanks.

Arts. Term applied to certain branches of study. In the Middle Ages, when universities were founded, instruction was classified in faculties, one of these being that of the arts or liberal arts a term inherited from the schools of the Roman Empire. Plato and Aristotle had already distinguished the liberal arts, calculated to promote literary and ethical progress, from the practical, concerned with what is useful. Philosophy stood by itself as *the* liberal art. The Romans also put forward several lists, but about the 5th century the arts were recognized as seven—grammar, dialectic, rhetoric, music, arithmetic, geometry, and astronomy, these representing the sum of human learning. Gradually as the nature and scope of education widened, the meaning of the term changed; it now includes, generally speaking, classics, philosophy, and modern languages and literature, while in some universities mathematics is still one of the arts. In most universities arts is the senior faculty, and possibly for that reason new branches of study, e.g. accountancy, are included therein, unless there is a faculty of commerce.

Arts, ROYAL SOCIETY OF. For details of this learned British society see Royal Society of Arts.

Art Sales. Disposal of works of art generally by auction or through the hands of art-dealers. The varying prices realized afford criteria as to the value or popularity of pictures and other works of art from the collector's point of view, and also serve to indicate changes in taste. Early in the 17th century London began to attract the choicer pictures, which had formerly gone to the marts of Amsterdam, Antwerp, and Paris. Christie's (*q.v.*) became and remains the most famous mart.

When a collection is to be sold, the auctioneer is called in to report, and, should terms be arranged, he carries through the whole transaction, including cataloguing, and receives a commission. The principal sales being attended by the leading dealers, many of whom act for wealthy amateurs, pictures of commanding merit fetch their commercial value, while, *per contra*, those which have not stood the test of time are appraised accordingly.

To cite a few of the more remarkable sales at Christie's,

Joseph Gillott's collection (1872) fetched £164,530; Sam Mendel's (1875), £101,134; Baron Grant's (1877), £106,262; George McCulloch's (1913), £136,859. In the Mendel sale, W. P. Frith's Dinner Party at Boswell's Lodgings fetched £4,567 10s., the highest price ever made at auction during the painter's lifetime, though it dropped to 3,050 gs. at the Grant sale. On the second day of the William Graham sale (1886) a Nocturne by Whistler, which had occasioned Ruskin's diatribe, was greeted with a hiss and went for 60 gs.

One of the most famous art sales ever held was when the Hamilton Palace treasures were sold in 1882. They yielded £397,562. In July, 1919, Sir Joshua Reynolds's portrait of Mrs. Siddons as The Tragic Muse was bid up to 52,000 gs. at Christie's.

Changing prices as a record of changing taste became evident during the years between the First and Second Great Wars. In 1923, Millais's *The Eve of St. Agnes* was bought by Sir Edmund Davis for £1,575 at Christie's, but in 1942 this picture fetched only £630. Important sales included Lord Harewood's Italian renaissance pendant, known as the Canning jewel, reputed to be the work of Cellini, which was sold for £10,000 at Sotheby's. In 1937, 43 pictures, mainly Dutch, were sold for £53,000, and in 1941-42 the remaining works of Wilson Steer fetched over £10,000. In 1943 the great assemblage of works forming the Brady collections was sold for about £100,000 in New York. At the Plaza art galleries in New York, receipts amounted to more than £200,000 during 1943.

Possibly the most romantic sale at Christie's occurred on July 27, 1945, when the long-lost Rowlandson drawing, *A Night at the Vauxhall Gardens in 1784*, was auctioned. Acquired in a dusty condition by an astute buyer for £1, it fetched 2,600 gs.

Art Schools. For information on these, see Schools of Art.

Arts Council of Great Britain.

Organization founded to assist the arts and to encourage knowledge, understanding, and practice of them. Earl de la Warr, president of the board of Education, in Dec., 1939, suggested the scheme to Lord Macmillan, then minister of Information, and the latter, as chairman of the Pilgrim Trust, was instrumental in obtaining from the trust an initial grant

of £25,000. This resulted in the formation of an emergency committee for the Encouragement of Music and the Arts (C.E.M.A.), which began activities on Jan. 1, 1940. It was confronted with a twofold problem: (1) decentralisation of the arts because of wartime conditions—the blackout, transport difficulties, the evacuation of London by thousands of people; (2) the maintenance of high standards, notwithstanding abnormal circumstances. As far as possible C.E.M.A. worked through existing organizations. Where none suitable was available and there was important work to be done, special facilities were created. In April, 1940, the treasury granted a further £50,000 for its continuance, with the condition that C.E.M.A., which became the Council for the Encouragement of Music and the Arts, raised an equivalent sum from non-statutory sources. The Pilgrim Trust maintained its support, and for the next two years C.E.M.A. financed its work from both public and private funds. In March, 1942, the government, convinced of the success of the experiment, accepted full financial responsibility. J. M. (later Lord) Keynes accepted the chairmanship, the treasury's annual grant-in-aid was made on the vote of the board of Education, and the president of the board appointed members of the council.

In order to take music to factory canteens, hostels, and the general public in small towns and villages, a special concert organization was created, and at the request of the Y.M.C.A. many concerts were given before the troops in Y.M.C.A. canteens and clubs. The council cooperated with the British Council in providing concerts for members of Allied forces. Special productions of plays were toured for the entertainment of war workers in hostels and in the small industrial towns. Art exhibitions were taken, either directly by the council or through the British Institute of Adult Education, to provincial galleries and small towns that lacked gallery accommodation, and held in varied premises—institutes, halls, commercial showrooms, and churches. The council also worked in association with approved orchestras and theatre companies.

During 1944 nearly 8,000 concerts were given either by the council or by orchestras and concert clubs working in association

with it. These were attended by about 3,000,000 people. During the same period 60 different exhibitions were circulated through the country; and 25 associated theatre companies were responsible for nearly 200 different productions of plays, operas, and ballets.

Permanent Status

These wartime services created not only a vigorous and an intensified interest in the arts among all classes of people, but also the desire that it should be maintained and developed; and the government, in June, 1945, granted C.E.M.A. permanent status as the Arts Council of Great Britain. Its members are appointed by the chancellor of the Exchequer, after consultation with the minister of Education for England and the secretary of state for Scotland. Their aims are to develop the two chief sides of the work, also to pay increasing attention to the acquisition or provision of suitable buildings for the arts, especially where accommodation is either non-existent or insufficient. With headquarters at 9, Belgrave Square, London, S.W.1, the council has offices for Scotland at 29, Queen Street, Edinburgh, and for Wales at 34, Park Place, Cardiff.

Artsibashev, MIKHAIL MIKHAILOVICH (1878–1927). Russian novelist, of Tartar descent. Born Nov. 18, 1878, he began as a caricaturist, but turned to the writing of realistic short stories. Of his novels, which are equally realistic, *Sanine*, 1907, translated into English by J. Povolozky, 1915, shows his hatred of the social order of the time. The same revolutionary strain is evident in his other works, e.g. *The Breaking Point*, 1915; *Tales of the Revolution*, 1917; and *War*, 1918. He was imprisoned for two months in 1912 as a revolutionary, and after the Russian revolution fled to Poland. He died March 3, 1927.

Arts Theatre. London stage society, founded in 1927 as a theatrical and social club. At its premises in Great Newport Street, W.C.2, were given first productions of *The Lady with a Lamp* (R. Berkeley), After October (R. Ackland), Oscar Wilde (L. and S. Stokes), and *The Infernal Machine* (J. Cocteau). In 1942 Alec Clunes, taking over theatre and club with 250 members, formed the Arts Theatre group of actors to provide high quality entertainment at reasonable prices; he gave plays by Bridie, Chesterton, Drinkwater,

Farquhar, Masefield, Maugham, Pinero, Shakespeare, Shaw, and Sheridan; and by Bernard, Goldoni, Molière, Odets, O'Neill, Synge, and Quintero. A festival of English comedy was held in 1943 and one of English drama in 1945. Clunes then bought the 28 years' lease of the theatre, whose membership had risen to 11,000.

Aru or **ARRU**. Group of more than eighty islands in Indonesia. At nearest some 70 m. S.W. of New Guinea, they cover an area of 3,250 sq. m., and are separated by narrow channels. Low lying, with steep and rugged coasts, they are well wooded, and on the E. are bordered by coral reefs. They produce for export pearls, trepang, rice, maize, sago, and tortoiseshell. Dabbo, the chief town, attracts many traders. Pop. 18,139.

Aruba or **ORUBA**. Island of the Dutch West Indies. It lies off the entrance to the Gulf of Maracaibo, belongs to the colony of Curaçao, and has an area of 69 sq. m. It produces phosphates, guano, and aloes, but the chief industry is oil refining. The plant here and at Curaçao (*q.v.*) is among the largest of its type. There is a good deep-water anchorage, and tankers bring the crude oil from Venezuela. Early in 1942 the Netherlands government came to an agreement with the government of Venezuela by which the latter shared in the defence of Aruba and Curaçao. In Feb., 1942, both islands were shelled by a German submarine, and tankers in the vicinity were torpedoed. Pop. 39,318.

Arum. In botany, name of the plant popularly called cuckoo pint, lords and ladies, or wake robin (*q.v.*), native to Britain. The so-called arum lily is not a lily but a calla.

Arun. River of Sussex, England. Rising in St. Leonard's Forest, it flows, through a notable gap in the S. Downs, W. and S. for 36 m. to the English Channel at Littlehampton. It is navigable for small vessels to Arundel.

Arundale, SYBIL (b. 1882). British actress. She was born June 20, 1882, and made her first appearance on the London stage in a Drury Lane pantomime, 1891, subsequently playing in musical comedy. A versatile actress, she appeared later in farce,

Sybil Arundale,
British actress

comedy, and drama. In 1925 she achieved a striking success as Gina Ekdal in Ibsen's *The Wild Duck*, and in 1928 was responsible with Herbert Jay for the building of the Embassy Theatre (*q.v.*). She was a frequent broadcaster in radio plays.

Arundel. Mun. bor. of Sussex, England. It stands on the declivity of a hill overlooking the river Arun, 11 m. E. of Chichester by railway. At the summit of this hill is the castle, the seat of the duke of Norfolk and earl of Arundel. Founded in the 10th century,

Arundel borough seal

it was besieged in 1102 by Henry I and in 1139 by Stephen, and was laid in ruins by the Parliamentary forces in 1644. Its restoration was begun in 1791, and it is now one of the most magnificent mansions in the kingdom. It includes a 12th century circular Norman keep, 100 ft. high, and is surrounded by a park of 1,200 acres stocked with deer.

The Perpendicular church of S. Nicholas, dating from the late 14th century, is a cruciform building with a central tower and a fine reredos. The Fitzalan chapel, or

chancel, containing monuments of the earls of Arundel, is the private property of the duke of Norfolk, and is screened off from the remainder of the church. This privilege was confirmed after legal proceedings in 1880. The Roman Catholic church of S. Philip Neri was built by the 15th duke.

The town trades in corn and is chiefly residential; the river is noted for boating and for mullet. Arundel was mentioned as a borough in the will of Alfred the Great. It is a borough by prescription and its privileges were confirmed by a charter from Queen Elizabeth. In 1950 Arundel and Shoreham became a co. parl. div. Pop. 2,489.

Arundel, EARL OF. English title, the oldest of its kind, now borne by the duke of Norfolk. In the 12th century the earl who watched over the king's interests in Sussex was sometimes called the earl of Arundel, the castle of which was his property. From one of these early earls Arundel Castle passed to the family of Fitzalan, and members of this family became known as earls of Arundel. They suffered the vicissitudes of fortune so common in the 14th and 15th centuries, and from time to time the earldom was without a holder. In 1433, however, it was decided that it was attached to the castle and lordship of Arundel, and as

owners thereof the Fitzalans retained it until 1580, when the family became extinct in the male line. The heir of the last Fitzalan earl was his grandson, Philip Howard, and in this way the dignity passed to the Howards, but their right to it was not secured until 1627, when an Act of Parliament settled it on Philip's son, Thomas. In 1660 Thomas received the dukedom of Norfolk, and since then earl of Arundel has been a subsidiary title of the duke.

Arundel, RICHARD, EARL OF (c. 1346-97). English nobleman. Like his brother Thomas, archbishop of Canterbury, he was a leading figure in the reign of Richard II, being one of the governors of the kingdom during the king's minority. He was one of the coterie of nobles, called the lords appellant, who, in 1389, overthrew the king's ministers and for some years controlled public affairs. In 1397, however, Richard took his revenge. Arundel was arrested, found guilty of treason, and beheaded Sept. 21, 1397.

Arundel, HENRY FITZALAN, EARL OF (c. 1518-80). English nobleman. He became 12th earl of Arundel on his father's death in 1544, when he had already served in public life as governor of Calais and in other ways. In Edward VI's reign he was imprisoned for an alleged share in a plot, and on the young king's death, although nominally a supporter of Northumberland he secretly opposed his plan of supplanting Mary by Lady Jane Grey. He was then the leader of the party which secured Mary's accession, and during her short reign was one of the chief persons in the realm. Elizabeth, too, favoured him, at least for a few years, but he was soon suspected with other Roman Catholics of attempts to secure the throne for Mary Queen of Scots. He was arrested more than once, but escaped capital punishment and died Feb. 24, 1580. Although twice married, Arundel had no sons, and his ultimate heir was Philip Howard, the son of his daughter Mary by marriage with the 4th duke of Norfolk, a union which united the Fitzalans and the Howards.

Arundel, PHILIP HOWARD, 1ST EARL OF (1557-95). English nobleman. The eldest son of Thomas Howard, 4th duke of Norfolk, his mother was Mary, daughter of Henry Fitzalan, 12th earl of Arundel. Born June 28, 1557, he married a Dacre in 1571, and in 1580 succeeded his grandfather as

Arundel. Air view of the town and castle. Left foreground is the R.C. church of S. Philip Neri; beyond is the 14th cent. church of S. Nicholas

earl of Arundel. His father had been put to death as a traitor in 1572, but he was allowed, after some debate, to succeed to the honour and castle of Arundel. In 1584 he joined the Roman Catholic Church; his conduct in promoting its interests laid him open to suspicion, and from 1585 until his death, Oct. 19, 1595, he was in prison. He was tried and found guilty of treason, but the death sentence was not carried out.

Arundel, THOMAS HOWARD, 2ND EARL OF (1586–1646). English nobleman and art collector. Born at Finchamfield, Essex, July 7, 1586, he was educated at Westminster School and Trinity College, Cambridge. His father's attainder cost his son, then about ten years old, the lands and titles; but James I restored the titles of Arundel and Surrey. Then marriage with a wealthy daughter of the earl of Shrewsbury enabled Thomas Howard, who joined the Church of England in 1615, to buy back Arundel House in London and other properties.

From 1615 onwards he collected all kinds of antiquities and works of art. His collection, ultimately arranged in Arundel House, comprised statues, busts, inscribed stones, pictures, etc. The earl, who had sided with the king in the Civil War, died at Padua, Oct. 4, 1646. His grandson, Henry, 6th duke of Norfolk, who had inherited the major part of his treasures, was induced by John Evelyn in 1667 to leave the bulk of the sculptures and inscribed stones to the university of Oxford.

Arundel, THOMAS (1353–1414). Archbishop of Canterbury. Third son of Richard Fitzalan, earl of Arundel, he was made bishop of Ely in 1374, archbishop of York in 1388, and archbishop of Canterbury in 1396, and was lord chancellor from 1386 to 1389 and again from 1391 to 1396. In 1397 he was banished by Richard II for his part in procuring the commission of regency eleven years before, but he returned to England with Henry IV, being lord chancellor again in 1399, 1407, and 1412. His later years were largely occupied with proceedings against the Lollards. He died Feb. 19, 1414, and

Thomas Howard, second Earl of Arundel and Surrey, English royalist
After the original by Rubens

was buried in Canterbury cathedral. Of princely tastes, he left fine buildings at Ely and Canterbury.

Arundell, DENNIS (b. 1898). British actor and producer. Born at Finchley, July 22, 1898, and educated at Tonbridge and St. John's College, Cambridge, he made his first stage appearance in 1926. He

Arundel Marbles. Collection made by the 2nd Earl of Arundel, now in the Ashmolean Museum, Oxford

scored a notable success as the sinister Victorian husband in *Gas Light*, 1939. He produced many plays and composed much stage music, appeared in a number of films, and was a frequent broadcaster.

Arundell of Wardour, BARON. English title borne by the family of Arundell, 1605–1944. Thomas Arundell of Wardour Castle, Wiltshire, served with distinction in the army of the emperor Rudolph II, and was made a count of the Holy Roman Empire in 1595. Because of this he was in disfavour when he returned to England; his father disinherited him and he was im-

prisoned. However, James I gave him his title, but his avowed sympathy for his fellow Roman Catholics brought him later into trouble. He died Nov., 1632, having inherited his father's estates.

Arundell's son, Thomas, the 2nd baron, was a supporter of Charles I during the Civil War. His castle, defended by his wife Lady Blanche, 1643, during his absence at Oxford, was lost and subsequently regained by his son. He died of wounds in 1643. His son, the 3rd baron, was impoverished by the war, but recovered his estates at the Restoration and was in the confidence of Charles II. A strong Roman Catholic, he was one of those who suffered when Titus Oates was active in 1678, but though impeached and imprisoned in the Tower until 1685, he was never brought to trial. He served James II, retired into private life, 1688, and died Dec. 28, 1694. In 1939 John Francis Arundell became the 16th baron. On his death Sept. 25, 1944, the title lapsed.

Arundel Marbles. Collection of antiquities and sculptures. It was bequeathed to Oxford university by the 6th duke of Norfolk in 1667 and housed in the Ashmolean Museum. The collection includes the Parian Chronicle, so named from the island of Paros, where it was found, a chronological outline of Greek history from 1582 to 264 B.C., the last 91 years of which are missing.

Arundel Prints. Collection of prints published by a society of that name founded in London in 1848 and closed in 1898. Usually chromolithographs, especially after the early Italian masters, they were of great value to students.

Aruns. Etruscan word, possibly meaning younger son. Used by the Romans as a proper name, especially in the Tarquin family.

Arunta. Aboriginal tribe and tribal group occupying the centre of Australia. Its social organization, probably of late development, differs radically from that of other tribes, and is related to its philosophic guesses at the mystery of human origin. The Arunta totem is not inherited, marriage within it is permissible, it may in some circumstances be eaten, and its supply—animal, plant, rain—increased by ceremonial invocation. See *Churinga*.

Arusha. Town of Tanganyika, formerly German East Africa. It is 56 m. W.S.W. of Moshi, and the continuation of the railway from that town has connected it with the port of Tanga. During the

First Great War it was occupied by General Smuts's mounted scouts on March 20, 1916.

Aruwimi. River of the Belgian Congo. It rises near the Albert Nyanza and flows generally W. to the Congo. It drains an immense tract of forest country, estimated at 70,000 sq. m., and is about 800 m. long. Its navigation is largely obstructed by rapids. Stanley explored it in 1883 and 1887. *Consult* In Darkest Africa, H. M. Stanley, 1890.

Arvad. Ancient city of Phoenicia. It was the Greek Arados and stood on the island of Ruad, near Tartus. Referred to in Gen. 10, it was an important town said to have been founded by refugees from Sidon, although probably of much earlier date. There are remains of the city walls, a temple, tombs, and an amphitheatre. The modern village is Ruad.

Arval. An old English funeral feast; also a funeral loaf or cake. The word apparently comes from Norse *arfr öl* (inheritance banquet). Arvel, arthel, and other forms occur. At the death of a person leaving property it was long customary, especially in the N. of England, to invite friends and neighbours to dinner on the day of the burial, when the corpse was exposed to avert any suspicion of foul play on the part of the heir and the beneficiaries. Arval bread or cake was given to the poor and sometimes sent to absent friends. The custom is of great antiquity and may have been introduced by the Romans.

In Roman antiquity, the Arval brethren formed a priestly college of twelve members, among them the emperor himself, who conducted various ceremonies to ensure fruitful harvests and celebrated the festival of Bona Dea, an old Roman goddess of fertility. Their ritual hymn furnishes the oldest existing specimen of the Latin language, and in late republican times was unintelligible even to the priests.

Arve. River of France. It rises in the Col de Balme in the Pennine Alps, and flows 60 m. through the valley of Chamonix to the Rhône below Geneva.

Arverni. Tribe of ancient Gaul, which inhabited the region of Aquitania now known as Auvergne. They bravely resisted Caesar in 52 B.C., but were defeated, their chief Vercingetorix being taken prisoner and later put to death.

Arveyron. A river of France. Rising at the N. end of the Mer de Glace, in the valley of Chamonix,

it issues as a torrent through an ice grotto and flows to the Arve.

Aryan (Skt. *arya*, noble). Name applied to the family of related languages alternatively called Indo-European or Indo-Germanic, synonyms which originated in 1814 with Thomas Young and in 1823 with H. J. Klaproth respectively. Aryan has also been employed to denote the inferential parent speech of the Indo-European family. By some philologists it is confined to the Asiatic branch, but no corresponding term for the European branch has met with acceptance. The word apparently indicates the claim to nobility made by the people by whom it was introduced.

This family of inflexional languages presents many affinities of word and syntax, pointing to an essential community of origin. Thus the word *father* appears in Gothic *faðar*, Armenian *hair*, Old Irish *athir*, Greek and Latin *pater*, Persian *pidar*, Sanskrit and Zend *pitar*. Further analysis established well-marked differences between the W. or European and the E. or Asiatic branches, as in the use of the guttural *k* by the one and the sibilant *s* by the other. The W. branch is again divisible into groups: (1) Teutonic, (2) Celtic, (3) Italic, (4) Hellenic; the E. branch into (1) Balto-Slavonic, (2) Albanian, (3) Armenian, (4) Indo-Iranian. The further development of this aspect of the subject belongs to philology.

It was Professor Max Müller who familiarised the public with the conception of a primitive Aryan population, dwelling in idyllic simplicity "somewhere in (west central) Asia." Yet, despite the vigorous protest of his maturer years, the notion that the Aryan-speaking peoples are members of a homogeneous Aryan race still survives in popular usage. Comparative philology has established their community of speech; ethnology has no less demonstrated their diversity of blood. While almost all these peoples are radically Caucasian, there is no place in the ethnic category for a generic Aryan stock. The tendency of modern research is to recognize in prehistoric Europe three physical types, which may be called Nordic, Alpine, and Mediterranean. The Nordic and Mediterranean long-heads are blonds and brunettes, Huxley's fair-whites and dark-whites; the Alpines are short-heads of intermediate tint and eastern affinities. Each type was developed under its own con-

ditions of geography and climate; each probably absorbed the racial elements which it encountered. Admitting that a complex effort of the human mind, such as the invention of an inflexional language, is unlikely to have been made more than once in the same way, a primary Aryan speech, as distinct from a parent Aryan race, may be accepted. The crux of the controversy concerning the site of the first Aryan homestead lies here. That Aryan speech began in Europe was first suggested by Latham in 1851; its eastern origin was maintained to the end by Max Müller. The rival theories are not irreconcilable, remembering that the steppe-land that extends from the Carpathians to the Pamirs is continuous and independent of modern continental demarcations.

That this inflexional speech displaced in turn the prehistoric tongues of the first Nordic, Alpine, and Mediterranean peoples, affecting their culture without coordinating their blood, accords with historic experience. That language exerted a profound influence upon social organization and religion is an equally permissible conclusion. The fuller solution of the Aryan problem awaits the systematic study of the archaeology and geography of the vast steppe-land which witnessed the birth of the speech that now dominates mankind.

All ethnologists are agreed that Aryan is primarily a philological term, and that even though Indians and Persians descended from an Indo-Iranian stock may permissibly be styled Aryans, there are no Aryans in Europe. Yet the word was seized on by Hitler and the Nazi theorists to describe the pure "Nordics," who were so strongly opposed to the "non-Aryan" Jews. The human suffering that has resulted in recent years from the adoption of the Aryan myth is impossible to over-estimate. See *Ethnology*; *Language*.

Arya Samaj (Hind., Aryan Society). A Hindu theistic association. It was founded by the Brahman Dayananda Sarasvati (c. 1825-83) about 1866. Its members, following their founder, hold that the Vedas constitute divine revelation, that they are the repository of the only true knowledge, and that in them the faithful can find all so-called modern scientific and ethical developments. The Arya Samaj is actively opposed to outside influences, and its programme includes extensive social and political reforms.

Arzeu. General view of the Algerian seaport looking towards the Quai des Pêcheurs

Arzeu OR ARZEW. A seaport of Algeria. The ancient *Arsenaria*, it is on the Mediterranean, 30 m. by rly. N.E. of Oran, and has rly. communication with Algiers and the interior. It is a French military station and exports salt and esparto. Near by are the Kléber marble quarries of Numidia.

Arzila OR AZILA. A harbour of Morocco, in the Spanish zone. On the Atlantic coast, 25 m. S.W. of Tangier, it ships grain. Pop. 10,766.

As. In Norse mythology, singular of *aesir* (*g.v.*), the chief deities.

As. General Latin term for a unit. It was used of measure and weight, being divided into 12 *uncia*, ounces or inches. *As* was also the name given to a Roman coin, originally weighing a pound (*libra*) of copper, but afterwards subject to great fluctuations. In France the term is used for the ace or the number one in games of chance.

Asa. Third king of Judah, 9th century B.C. An energetic and capable ruler, he is praised for his religious zeal. In alliance with Benhadad, king of Syria, whose services he repaid with the treasures of the Temple and the royal palace, he defeated Baasha, king of Israel (1 Kings 15).

Asafoetida. Gum-resin secreted by various species of *Ferula* from Eastern Persia and Western Afghanistan. It occurs as paste, "tears," and lumps, possesses an offensive odour, and is commonly called devil's dung. It is used to a small extent in medicine and in America for "heaves" in horses.

Asama-Yama. Largest active volcano of Japan. It is in Honshu, about 85 m. N.W. of Tokyo, and is 8,280 ft. high, with a crater 1,000 ft. in diameter. A destructive eruption occurred in 1783.

Asansol. A town in W. Bengal, India. It is situated on the river Damodar in the W. of the prov., and is a new town and rly. junction on the Raniganj coalfield. It is the most progressive town in the district of Burdwan. Pop. 26,499, two-thirds Hindus.

Asaph. Levite who was chief musician at David's festival sacrifice when the ark was brought up to Zion (1 Chron. 15 and 16). The superscription of the name of Asaph to Ps. 50, 73-83 suggests that these were sung by the Asaphite choir of the Temple.

Asar OR OSAR. Swedish term for steep-sided banks and ridges of stratified deposits of sand and gravel. They are believed to have been formed in tunnels made by streams under the great glaciers and ice sheets of the Ice Age. In the lower parts of Sweden they traverse the land like great embankments which attain an elevation of from 50 ft. to 100 ft., and follow a sinuous course comparable to that of a river, often for more than 100 m. In Scotland similar ridges are called *kames*, and in Ireland *eskers*.

Asarabacca (Latin *asarum*, hazelwort; *bacca*, berry). Perennial herb of the family *Aristolochiaceae*. It has a creeping fleshy rootstock and dark-green permanent leaves, two of which are produced each year, with a stalked, greenish-purple flower between them, and a bell-shaped perianth with three lobes, enclosing 12 stamens and six styles. Both leaves and root are acrid and aromatic, but only the rootstock was used in medicine, as a purgative and emetic.

Asbestos (Greek, inextinguishable). A silky fibrous mineral belonging to the group of amphiboles. Usually found in veins in association with serpentine and other rocks rich in magnesia, its value lies in its high melting point and low conductivity to heat. It resists alkalis and most acids, and when strengthened by compounding with Portland cement it forms a valuable building and constructional material. Fibrous asbestos is spun and woven into a fabric to form the lagging of pipes and vessels against heat loss. The fabric is used also for protective clothing of firemen, especially for personnel of aircraft carriers and

airfields who have to deal with petrol fires. Asbestos "boards" are employed to line walls and roofs of buildings as an insulation against heat loss; conversely, the boards are fixed to the inside of steel-roofed buildings to shield the interior from excessive heating by the sun's rays.

Asbestos-cement is made into sheeting—corrugated or plain—for clothing the sides or roofs of light buildings; "tiles" of asbestos-cement are largely used for roofing both permanent and temporary structures, and have the advantage of lightness as compared with clay tiles. The material is made into pipes and gutters for rainwater drainage; also flue pipes and baffles for gas-fired water heaters, geysers, etc. Ventilating cowls and baffles are other asbestos-cement products. Though the material is somewhat brittle it is in other respects very durable. Most of the world's asbestos comes from Canada, with Rhodesia, Russia, and South Africa next in order of magnitude. The serpentine rocks in which the small veins of asbestos occur are crushed to obtain the fibrous material.

Asbjornsen, PETER CHRISTEN (1812-85). Norwegian folklorist and zoologist. Born Jan. 15, 1812, at Christiania (Oslo), he was a student and later a lecturer at the university. He was employed from 1846 onwards in exploring the Norwegian coast, studying forestry, and investigating peat manufacture in Holland, Germany, and Denmark. He retired in 1876 and died at Christiania, Jan. 6, 1885. He collaborated with his friend Jørgen Engenbretsen Moe (1813-82) in making a collection of Norwegian Folk Tales, published in three series, 1842-71. He published an independent collection of fairy tales in 1845.

Asbury, FRANCIS (1745-1816). American Methodist bishop. Born near Birmingham, England, Asbury became a follower of John Wesley, and in 1771 went to America as a missionary, his headquarters being Philadelphia. In 1784 he was chosen one of the two superintendents of the new Methodist Episcopal Church. He was the first of his church to take the title of bishop. He died unmarried, March 31, 1816.

P. C. Asbjornsen, Norwegian writer

directed to the right training of the soul in the worship of God, and in the practice of charity between man and man. The teaching of Christ in Matt. 10, Luke 14, and other passages contains fuller expression of the significance of asceticism, the necessity for Christians, on occasion, of detachment from family ties, of the mortification of the senses, and of the refusal to accept the standards of the world. St. Paul in 1 Cor. 9 emphasises this doctrine. In the 3rd and 4th centuries came the beginning of Christian monasticism, and the vows of poverty, chastity, and obedience enjoined further practice in asceticism for the fuller conquest of the desires of the flesh and deeper contempt of the allurements of the world. At the same time, the Christian Church always steadily insisted that the disposition of the heart was the essential thing, that heaven could not be won by mortifications, and that family life was entirely compatible with that self-negation which is at the root of asceticism.

Against the official Christian and Catholic teaching of the Church on asceticism, the Encratites, a Syrian sect, revolted in the 2nd century, followed by the Montanists and the Manichaeans. The demand of all these sectaries was for the utmost mortification of the flesh, and it was based on the belief that matter being evil in itself the material body was a product of evil. The extravagances of asceticism were in these often followed by the wildest reactions.

The flagellants who wandered over Europe in the 14th and 15th centuries, scourging themselves in public processions, and the Cathari and Waldenses of N. Italy and S. France in the 12th and 13th, who professed a higher asceticism and, following the Manichaeans, declared the body evil, were all condemned by the Church. Protestantism in the Calvinists and Puritans of the 17th century and the Methodists of the 18th maintained that asceticism lay chiefly in abstaining from card-playing, dancing, and rural sports, and in refraining from social recreation on Sunday. See Christianity; Monasticism.

Asch. Town and district of Czecho-Slovakia. It stands at the base of the Hainberg, on the borders of Saxony and Bavaria, 16 m. by rly. N.W. of Eger. It is a manufacturing centre, with large woollen and silk factories, and bleaching and dyeing works. Pop. 22,493.

Asch, SHOLIM (b. 1880). Polish-American author. Born in Warsaw, he began by writing stories in Yiddish of Jewish life in Poland and Russia, of which *The Town*, 1907, was first. He became famous in 1930 with the translation of *Three Cities*, a long novel of life in Warsaw, Petrograd, and Moscow just before the Bolshevik revolution. Since then there have been translations of *The Paper Calf*, *Mottke the Vagabond*, *Salvation*, *The Nazarene*; a volume of short stories, *The Children of Abraham*; and *My Personal Faith*. Asch also wrote poetry and several plays, of which *The God of Vengeance*, 1907, was very successful. He left Poland for France, and eventually for the U.S.A.

Aschaffenburg. A town of Bavaria. It stands on the Main at its junction with the Aschaff, 26 m. by rly. S.E. of Frankfurt. It has a cathedral dating from the 12th and 13th centuries, containing interesting monuments; the castle of Johannisburg, built in the 17th century, and formerly a summer seat of the electors of Mainz, and now a museum and picture-gallery; and some fine old historic houses. It manufactures paper, clothing, and tobacco, and is a centre for the trade carried along the Main. In the Middle Ages it was an important place and the capital of a little principality, part of the electorate of Mainz, which was handed over to Bavaria in 1814. The German garrison put up fanatical resistance to the U.S. 7th army during the latter's spectacular advance into Bavaria in April, 1945. On April 4 the town was finally cleared by the Americans. Pop. (pre-war) 34,056.

Ascham, ROGER (1515-68). English classical scholar. Born at Kirby Wiske, Yorkshire, he was sent by Sir Antony Wingfield to St. John's College, Cambridge, where he obtained a fellowship in 1534. In 1538 he was appointed Greek reader at St. John's, and in 1545 published *Toxophilus*, a treatise on archery, written in the purest English and dedicated to Henry VIII, who gave him a pension of £10 a year. Tutor to Princess (afterwards Queen) Elizabeth at Cheshunt, 1548-50, Ascham spent three years on the Continent, mainly at Augsburg, as secretary to Sir Richard Morysin (Morison), ambassador to Charles V. A diary he had kept during this time was published in 1553, under the title of *A Report of the Affaires and State of Germany*. The remaining years of his life, passed

as Latin secretary and tutor first to Queen Mary and then to Queen Elizabeth, were clouded by poverty and anxiety for the future of his wife and family. He died Dec. 30, 1568, leaving his widow to bring out in 1570 *The Scholemaster*, his treatise on classical education, pleading for a more intelligent teaching of languages.

Asche, OSCAR (1872-1936). Anglo-Australian actor. Born at Geelong, Victoria, Jan. 26, 1872, of Norwegian descent, he studied acting at Christiania (Oslo), making his first appearance in London in 1893 at the Opéra Comique in *Man and Woman*. After eight

Oscar Asche, Anglo-Australian actor

years in Sir Frank Benson's repertory company, he joined Sir Herbert Tree in 1902. He became manager of the Adolphi Theatre with Otho Stuart in 1904, of His Majesty's Theatre in 1907, and later of the Globe Theatre. He married the actress Lily Brayton. He staged a number of spectacular plays, and played the title rôle (1916-21) in the record-breaking *Chu Chin Chow* (q.v.). He died March 23, 1936. His autobiography was published 1929.

Aschersleben. Town of Germany, in Saxony. It stands on the Elbe near its union with the Wipper, and is 36 m. by rly. N.W. of Halle. Founded in the 11th century, it possesses an old Latin school, a 15th century church, and a town hall. It manufactures sugar, beer, earthenware, and woollen goods. In the neighbourhood coal is found and beet grown. Aschersleben passed to Brandenburg by the peace of Westphalia in 1648, having previously been in the bishopric of Halberstadt. Pop. 28,627.

Ascidians (Gr. *askidion*, little skin bag). Group of tunicates or sea-squirts. Found attached to the rocks round the shore, and formerly regarded as molluscs, they form a kind of link between the vertebrates and the invertebrates. In appearance they resemble a leathern bottle with two necks, but in the larval stage, when they swim about freely, they possess a tail which contains a notochord, embryonic representative of the backbone in vertebrates. The sub-phylum Tunicata is also called Urochorda, meaning tail-string.

The common sea-squirt has a leathery cuticle, usually more or less coated with sand and largely composed of tunicin. The ascidians include a large number of genera and species, and vary greatly in size and shape. All take in their food with the water which they inhale through an orifice in the cuticle. The food particles adhere to the slime in the mouth-tube, and are thus passed into the stomach. The heart, after forcing the blood in one direction for a time, stops and then starts pumping in the opposite direction. All ascidians are hermaphrodites.

Ascites. Accumulation of fluid within the peritoneal or abdominal cavity. Most frequently it is the result of chronic Bright's disease, heart disease, cirrhosis of the liver, or a tumour pressing upon the veins and obstructing the circulation. In mild cases ascites can be relieved by the administration of drugs, which abstract water from the body through either the urinary or the intestinal system. In severer cases the abdomen must be tapped and the fluid drained off.

Asclepiadaceae. Large family of climbing shrubs and herbs, mostly with poisonous, acrid, milky juices, and chiefly natives of the tropics. There are many genera and more than 1,500 species. They agree in having the pollen-grains aggregated in waxy masses, sometimes enclosed in a bag formed from part of the stamens. These pollen-masses are accidentally picked up by insects visiting the flowers, and are then transported to the receptive disk of the pistil—thus effecting pollination. See *Carrion Flower*; *Swallow-wort*; *Wax-flower*.

Asclepiadaceae. Flowering part of *Asclepias Syriaca*

Asclepiades (c. 270 B.C.). A Greek lyric poet and epigrammatist of Samos. The invention of the Asclepiadean metre, in which the first Ode of Horace is written, is attributed to him.

Ascoli Piceno. Town and episcopal see of central Italy. The capital of the province of Ascoli Piceno, it stands on the Tronto, 20 m. by rly. W. of Porto d'Ascoli and 73 m. by rly. due S. of Ancona. The Asculum Picenum of the Romans, it retains portions of its ancient walls, gateways, and two Roman bridges. It has a cathedral said to have been founded by Constantine the Great, several churches, a communal palace containing a museum, a castle, a fortress, a convent, and a picture-gallery. Majolica, silk, glass, cloth, and leather are manufactured. Taken by Rome in 268 B.C., it suffered greatly in the Social War, 89, was occupied by Caesar, and taken by Totila in A.D. 545. Pop. 38,111.

Ascomycetes (Gr. *askos*, bag; *mykētes*, fungi). Large primary division of fungi. It contains many genera and thousands of species, most of them very small and little known. The character of the order is that eight spores are contained in a microscopic cell (*ascus*) embedded in the spore-bearing membrane (*hymenium*). Among the better known larger forms may be mentioned truffles, morels, and the saucer-shaped *Pezizas*.

Ascorbic Acid, HEXURONIC ACID, OR VITAMIN C. This substance is the anti-scorbutic vitamin present in most fresh fruits, salads, and lightly cooked vegetables and potatoes. It is a carbohydrate of simple structure ($C_6H_8O_6$), and is now manufactured on a commercial scale. Lack of ascorbic acid in the diet gives rise to symptoms of scurvy, the first disease proved to be due to a dietary deficiency. Ascorbic acid was first obtained in a pure state in 1923, when it was termed hexuronic acid. The international unit of vitamin C is 0.05 mgm. of pure L-ascorbic acid, equal to about 0.1 c.c. of lemon juice. See *Scurvy*; *Vitamins*.

Ascot. Village of Berks, England. It is 29 m. by rly. S.W. of London, 6½ m. S.W. of Windsor, and is a Green Line terminus. By order of Queen Anne a race-course was laid out on Ascot Heath in 1711, and the annual meeting in June, notable for the royal procession instituted in 1820, is one of the most popular and fashionable fixtures under the

auspices of the Jockey Club. It is a right-hand circular course of a little less than 1½ m., the last mile being straight and uphill.

Ascot Gold Cup.

Name of an English horse race. It is the principal event of the Ascot race meeting, and is run over a course of 2½ m. In 1907, the centenary of its first award, the cup was stolen from the grand stand, and The White Knight and a French horse Eider ran a dead heat, the latter being disqualified for bumping and boring. See *Horse Racing*.

Asdic. A highly efficient system of submarine detection, developed by the Royal Navy after the First Great War. The word itself is

Ascot Gold Cup

Ascomycetes. *Gyromitra esculenta*, of this division of fungi

compounded from the initials of Anti- (or Admiralty) Submarine Detection Investigation Committee, set up in 1918 to seek improved methods of tracking submarines under water. Hydrophones, which had been in use for this purpose in 1916-18, were found to have limitations. As the result of experiments undertaken between 1919 and 1939, the Asdic method was gradually perfected, proving an unpleasant surprise for the U-boats in their initial onslaught of the Second Great War. Later, the secrets of Asdic were shared with Allied navies, so are no longer completely confidential.

Before 1939 both the U.S. and German navies had conducted

experiments on similar principles, though without reaching equal results. All through the war the Germans continued to lag behind the Allies in the efficiency of their anti-submarine methods. The Italian navy continued to concentrate instead on highly sensitive types of hydrophones, with which some success was recorded.

Asdic transmits through the water a supersonic sound wave, which is echoed back to the transmitter by any solid object that may be encountered below the surface within a certain radius. Water is the essential conducting medium. Methods of operation may differ, but as a rule the returning wave is made audible to the operator's telephones by a heterodyne process, since the sounds would be inaudible to the human ear. By recording devices it is possible to ascertain accurately the range of any echo received, the speed of sound through water being a known factor. A suitable frequency is chosen for transmission, so that the sound beam sent out may be very narrow in width. By this means an accurate bearing of any object can be obtained. Range can be read from a scale, but it requires skill to operate the gear successfully. Without experience, mistakes may easily be made in the classification of returning echoes from rocks, sunken wrecks, etc.

When the Alarm is Given

When an echo has been received which the ship's Asdic operator classifies as coming from the hull of a submarine, the ship is at once headed towards the centre of the target, and closes it as rapidly as possible. Series of ranges and bearings are taken in quick succession, and the course and speed of the target are thus assessed. According to the type of weapon in use, the necessary attacking course is steered, so that no time may be lost in engaging the enemy. Depth charges or other missiles are released as soon as the target is within suitable range.

Differences in water temperatures, e.g. the intervention of a current of colder or warmer water, may affect the path of a sound beam through the sea. A skilful submarine captain seeks to take advantage of any such aid.

In times of peace Asdic is likely to be used extensively by the whaling industry. A whale beneath the surface can thus be located and attacked in much the same way as a submarine. See Hedgehog Projector.

Asellus (Lat., little ass). Small isopod crustacean common in English ponds and ditches, often called the fresh-water shrimp. Grey in colour, it is about $\frac{1}{2}$ in. in length.

Asepsis (Gr. *a*, not; *sepsis*, putrefaction). Term meaning the absence of septic matter or freedom from infection. Wounds are kept in an aseptic condition by solutions and dressings which have been made absolutely sterile, i.e. free from micro-organisms. See Antiseptics.

Asef. Variant name of the Moroccan seaport of Safi (*q.v.*).

Asgard (Old Norse *áss*, god; *gardhr*, home). In Norse mythology, city of the Aesir. Situated high in the heavens, it was reached from the lower worlds by the bridge Bifrost. Round its walls was a moat with inflammable vapour floating upon it (clouds and lightning). In the city the gods first built a great hall shining with gold, in which were twelve lofty seats; and then beautiful houses for themselves. See Aesir; Bifrost.

Ash (*Fraxinus excelsior*). Tree of the family Oleaceae, a native of Europe, N. Asia, and N. America. It attains a height of from 50 ft. to 80, or even 100 ft., with a trunk about 3 ft. in diameter, and a pale grey bark, which remains smooth for about 30 years and then becomes rough and furrowed.

The leaves, which are very large, are divided into from 9 to 15 lance-shaped leaflets, popularly regarded as complete leaves. The flowers are degenerate, having lost their petals and sepals to adapt them for wind-pollination. They are of several kinds: in some the pistil alone develops fully, the two stamens dropping off without shedding pollen; in others the

purple stamens mature, but there is no pistil developed; in a third form both pistil and stamens are perfect. The flowers are produced in clusters in April or May, before the leaf-buds expand. Female and bi-sexual flowers produce each a strap-shaped fruit, $1\frac{1}{2}$ in. long, one-third of which is taken up by the seed. Botanically known as samaras, these fruits are popularly called "ash-keys" or "spinners," the latter owing to a slight twist in the blade which causes them to spin as they fall when ripe. A secretion from the inner bark is known as manna, an old-fashioned laxative.

The ash becomes the dominant tree in woods on limestone at about 1,000 ft.-1,250 ft. elevation, and in non-calcareous soils if there is abundant moisture. The tough, elastic timber, which is harder and more durable when grown on limestone soil, is valuable for farm, carriage, and furniture work.

Ash. The residue of anything burnt. The mineral constituents of an organic substance are determined by incinerating the compound in a platinum crucible. The process destroys the organic or vegetable matter entirely, leaving the mineral matters behind. The ash, however, does not accurately represent the constituents of the plant, as the heat employed destroys carbonates and nitrates, while chlorine will be lost by volatilisation. Tobacco ash, for example, will show the presence of potash, but nitrogen, which was combined with it as nitrate of potash, will have been decomposed. Nitrate of potash is the component upon which the ready burning properties of tobacco depend.

Determinations of ash are useful in revealing the constituents of the soil which are absorbed by the roots of the plant and are necessary for normal growth. The information obtained enables the agriculturist to supply the soil with the elements required by the plant which may be absent or in insufficient quantity. In the analysis of vegetable drugs the proportion of ash is an indication of the amount of extraneous matter present, hence it is customary to limit the amount of ash present in crude drugs.

Volcanic ash is the finer solid particles ejected from active volcanoes of the Vesuvian type. Originating from the explosive disruption of lava at the time of its emission from the volcanic vent, it may be borne on the wind for great distances. Volcanic ash

Ash. Study of ash trees, by John Constable, R.A.

was largely answerable for the destruction of Pompeii, A.D. 79, and an important factor in the destruction wrought by the eruption of Mt. Pelée in Martinique in 1902. Beds of volcanic ash, composed of fragments of lava and broken crystals of felspar and other minerals, are met with among the stratified rocks of different ages in all parts of the world, pointing to volcanic episodes of which no other traces exist.

Ashango. Negroid tribe of forest-dwellers in French Equatorial Africa. Occupying a tableland midway between Cape Lopez and Stanley Pool on the Congo, they carry spears and poisoned arrows, and live in large untidy huts, exploiting the Obongo pygmies dwelling around them. They cultivate ground-nuts, keep bees, and raise goats and poultry, whose flesh is forbidden to women and children. *See* Negro.

Ashanti. British possession in West Africa. It is attached to the Gold Coast colony, and has an area of 24,379 sq. m. In 1931 its population was returned as 578,702. The French Ivory Coast colony is on the W., Togoland on the E., while the Gold Coast colony separates it from the Gulf of Guinea.

Much of the country is thickly covered with forests, with abundant tropical fauna. It is well watered by numerous broad streams, but the Volta, which divides Ashanti from Togoland, is the only navigable river. Kumasi, the capital, has some 42,000 inhabitants. It is connected by rly. with Takoradi and Accra, on the Gulf of Guinea, and by trunk motor-road to Pamu, Mampong, and Kpandu. The chief products are gold, rubber, cocoa, tobacco palm oil, bananas, and timber, especially mahogany and cedar. Tropical fruits and kola nuts are grown, cattle are raised, and some of the land is well cultivated with maize. Gold mining is the principal industry, especially in the Obuasi district, and the output has been valued at £300,000 a year. The rainy season lasts from May to October. The Ashantis make pottery, and are skilled in working in gold and in weaving. They worship spirits, and not long ago offered human sacrifices to their gods. Lake Busumchwi, about 26 m. S.E. of Kumasi, is regarded by them as sacred.

The Ashantis are a number of associated negro tribes akin to the Fantis. Each had its own king, but they recognized the king of Kumasi as their overlord, and he

occupied their golden stool or throne. The theory is that from the regions of the Senegal and the Niger they were driven into the forests to the S., where their warlike propensities developed. In the 18th century, especially under Osai Tutu, their activities attracted European attention, and they extended their dominion towards the coast. This brought them into conflict with the Fantis, and also with the British. Throughout the 19th century their recorded history is little more than conflicts with the British, arising out of their desire to push their authority still farther S. In 1896 Ashanti was made a British protectorate, and on Sept. 26, 1901, it was annexed. It is governed by a chief commissioner at Kumasi, who is on the executive council of the Gold Coast. It is divided into four provinces, central, southern, western, and northern, and for each there is a court of justice—at Obuasi, Kintampo, Kumasi, and Sunyani.

Bibliography. Ashanti and the Gold Coast, Sir J. C. D. Hay, 1874; Ashanti Law and Constitution, R. S. Rattray, 1924; The Tribes of the Ashanti Hinterland, R. S. Rattray, 1932.

Ashanti Wars. Great Britain has waged four wars against the Ashantis, the fourth being known as the Relief of Kumasi (*q.v.*).

The first war began in 1821, when, after some trouble about the right of protection over the Fantis and other tribes, a small British force, under Sir Charles McCarthy, entered Ashanti. This was routed, and Sir Charles killed at Essamako. The British crushed the Ashantis at Dodowah, Aug., 1826. In 1831 the Ashantis came to terms. Their king undertook to recognize the protectorate of Britain over all the tribes between the Prah and the sea.

In 1873 the second Ashanti war began. In Jan., the Ashantis invaded territory under British protection, and, the Fantis having been beaten in battle, Sir Garnet Wolseley was sent out. He advised a punitive expedition, and marched on Kumasi, fighting at Amoafu, Jan. 31, 1874, at Bekwai, and before Kumasi, which was entered Feb. 4. The town was set on fire, and Wolseley's little army, stricken with sickness, retired five weeks before an auxiliary force, under Sir John Glover, arrived, and found Kumasi deserted. The Ashanti king then asked for peace, and renounced all claims on the protected territory.

The third Ashanti war, in 1896, arose mainly out of King Prempeh's refusal to observe the terms of the treaty of 1874. A composite force, under Sir Francis Scott, advanced upon his capital in Dec., 1895. Kumasi was entered Jan. 17, 1896, and Prempeh taken a prisoner to the Gold Coast. The success of this bloodless campaign was largely due to the elaborate preparations made for its transport, and to the speed with which it acted. The Ashanti Star was awarded for this campaign. For the war of 1874, *consult* The Ashanti War, Sir H. Brackenbury, 1874; and The Story of a Soldier's Life, Viscount Wolsley, 1903; for that of 1896, The Downfall of Prempeh, R. S. S. Baden-Powell, 1896.

Ashbourne. Urban district and market town of Derbyshire, England. It stands on the Hemmore, near its junction with the Dove, 13 m. W.N.W. of Derby by the railway. It has a cruciform church, dating from 1241, with a central tower surmounted by a spire 212 ft. high, referred to locally as the Pride of the Peak, and a grammar school founded 1585. Ashbourne Hall was occupied by "Prince Charlie" during his advance in 1745. Ashbourne was often visited by Dr. Johnson, and Thomas Moore wrote part of Lalla Rookh here. Close by, in 1644, the troops of Charles I were defeated by the Parliamentarians. The industries include cotton and corset manufactures, and there is trade in agricultural produce. The Shrove Tuesday football match, in which all the village may take part, is a local tradition. Market day, Sat. Pop. 4,507.

Ashbourne, EDWARD GIBSON, 1st BARON (1837-1913). An Irish lawyer and politician. Born Dec. 4, 1837, he was educated at Trinity College, Dublin, and was called to the Irish bar in 1860. He sat in Parliament 1875-85 as member for Dublin university, and was attorney-general for Ireland from 1877 to 1880. In 1885 he was made lord chancellor of Ireland with a seat in the Cabinet, and was raised to the peerage. A strong advocate of land purchase, he was largely responsible for the Ashbourne Acts. He died May 22, 1913. His son, William Gibson, the 2nd baron, was born Dec. 16, 1868, and as president of the Gaelic League of London was a conspicuous protagonist of the Gaelic revival. The 3rd baron, Edward Russell Gibson (b. 1901), succeeded his uncle in 1942. *See* Land Purchase.

Ashburnham, EARL OF. British title borne by the family of Ashburnham 1730-1924. John Ashburnham was made a baron in 1689, and his son John an earl in 1730. John, the 2nd earl, was a courtier under George III, and from him the later earls are descended. Bertram Ashburnham, the 5th earl (1840-1913), succeeded to the peerage in 1878, having become a Roman Catholic in 1872. One of the earliest advocates of Irish self-government, he was chairman of the British Home Rule Association, 1886-1912. He was also the representative of Don Carlos in Great Britain and chairman of the Carlist Committee. Ashburnham Place in Sussex was the chief family residence. On the death of the 6th earl in 1924 the peerage became extinct.

Ashburnham, JOHN (c. 1603-71). English royalist. Son of Sir John Ashburnham, he became groom of the bedchamber in 1628. He sat in Parliament for Hastings, but in 1643 was discharged from the House for contempt. His conduct after Charles's escape from Hampton Court aroused the suspicion of the royalists, and for some years he was under a cloud. He suffered imprisonment under the Commonwealth. At the Restoration he was again made groom of the bedchamber, and from 1661 to 1667 was M.P. for Sussex.

Ashburton. River of Western Australia. Rising S.W. of the Great Sandy Desert, it flows 400 m. N.W. and enters the Indian Ocean at Onslow, traversing Ashburton goldfield. It is not navigable. It gives its name to a district.

Ashburton. Urban district and former market town of Devonshire, England. It lies in a beautiful valley, near the Dart, 24 m. N.E. of Plymouth by railway, and close to Dartmoor and Holne Chase. The 15th century church of S. Andrew has a tablet to the first Baron Ashburton, who was educated at the grammar school dating from 1314. Umberis worked for making paint. A borough by prescription, Ashburton was a stannary town, and returned a member to Parliament down to 1885. Pop. 2,395.

Ashburton. Town of South Island, New Zealand, in Canterbury county. It stands on Ashburton river, 53 m. by rly. S.W. of Christchurch. Pop. 7,130.

Ashburton, ALEXANDER BARING, BARON (1774-1848). British statesman and financier. He was the second son of Sir Francis

Baring, founder of the financial house of Baring Brothers & Co. He sat in Parliament 1806-35 for Taunton, Callington, Thetford, and North Essex, and opposed the Reform Bill. In 1834 he was president of the Board of Trade and master of the mint, and in 1835 was raised to the peerage. In 1842 he was sent to America to inquire into the north-west boundary and other questions, the treaty which ended the dispute being known as the Ashburton or Webster-Ashburton treaty (*v.i.*). He died at Longleat, May 13, 1848. The 6th baron (b. 1898) succeeded to the title in 1938.

Ashburton Challenge Shield. Trophy competed for annually at Bisley by teams of eight from the public schools junior training corps. The conditions are 10 shots each competitor at 200 and 500 yards. It was presented in 1861 by the third Lord Ashburton.

Ashburton Treaty. Treaty concluded at Washington in 1842 dealing with the boundaries of Canada and U.S.A., especially that between the prov. of New Brunswick and the N.E. state of Maine. Lord Ashburton acted for Great Britain and Daniel Webster for the U.S.A. The treaty provided for the cession of about seven-twelfths of the 12,000 sq. m. of disputed territory to the U.S.A., and the adoption of measures to suppress the slave trade.

Ashby-de-la-Zouch. Market town and parish of Leicestershire, England. It stands 21 m. N.W. of Leicester, and 118 m. N.N.W. of London by railway. The church of S. Helen has monuments to the Huntingdon family. Coal is worked and biscuits and soap are made. Market, alt. Sat. and Mon. There are remains of Ashby Castle, which figures prominently in Scott's *Ivanhoe*. It was held for the king during the Civil War and was demolished in 1648. It was for some time the prison of Mary Queen of Scots. Pop. 5,093.

Ashcroft, EDITH MARGARET EMILY (b. 1907). British actress, known as Peggy

Peggy Ashcroft,
British actress

Theatre in 1926 in *Dear Brutus*. In 1930 she appeared as Desdemona, with Paul Robeson as Othello, and in 1932 was engaged by the Old Vic-Sadler's Wells company and played a number of Shakespearian rôles. Her Miranda in *The Tempest* in 1940 was memorable. In 1939-40 she appeared in a revival of *The Importance of Being Earnest*; in 1943, in *The Dark River*. She was with the Gielgud repertory company at the Haymarket Theatre, 1944-45, playing the Duchess of Malfi. Later successful rôles were in *Edward, My Son* (London, 1947; New York, 1948); *The Heiress*, 1949.

Ashdown. Park and seat of the earl of Craven in Berkshire, England, 3 m. N. of Lambourn. As Aescandune or Assandune it may have been the scene in 871 of the defeat of the Danes by Ethelred and Alfred. In the neighbourhood there are several ancient camps and a cromlech, Wayland Smith's Cave.

Ashdown Forest. District in Sussex, England. It lies between Maresfield and E. Grinstead, and is the only remaining part of the immense forest known to the Saxons as the Andredsweald. Area, about 14,000 acres.

Asher. Eighth son of Jacob, by Zilpah, the handmaid of Leah (Gen. 30). The tribe of Asher was named after him. Possibly Asher was the name of a deity identical with Ashur, chief god of Assyria.

Asherah (pl. Asherim). Word usually understood to denote a pole or post placed by the Canaanites in the vicinity of an altar. The A.V. renders it grove or groves, altered to Asherah in the R.V. Asherah or Asherah is believed to have been a Canaanite goddess of fertility, who was succeeded by Astarte, and the pole or post her symbol. *Consult* Ex. 34; Deut. 7 and 16; Judg. 3; 1 Kings 14 and 18; 2 Kings 17, 18, 21, and 23; Jer. 17; Micah 5.

Ashes. Popular term for a set of five cricket matches played periodically between England and Australia, the side winning the greater number of matches being said to "win the Ashes." When Australia beat England at the Oval, Kennington, by seven runs on Aug. 29, 1882, the *Sporting Times* appeared with an epitaph in a black-edged border "in affectionate remembrance of English cricket," which concluded, "the body will be cremated and the ashes taken to Australia." In the following winter an English team was successful in Australia,

and some Melbourne ladies presented an urn with ashes to the visiting captain. This is now in the pavilion at Lord's. Up to 1938 English teams had been going to Australia in the winters following each leap year since 1924, and Australian teams coming to England in the other even-numbered years. After the break caused by the Second Great War the contests were resumed in Australia 1946-47 and in England 1948. The Ashes were in Australian hands continuously from 1934. *See Test Match*; also *illus.* p. 789.

Ashville. City of N. Carolina, U.S.A. The co. seat of Buncombe co., it is 210 m. W. of Raleigh, and stands at the junction of the Swannanoa and French Broad rivers, in the Blue Ridge, 2,350 ft. high. A popular health resort, it is served by rly., has tanneries, cotton mills, and timber works, and trades in livestock and dairy produce. It is an important educational centre. In the neighbourhood is Biltmore, the home of G. W. Vanderbilt. The Renaissance château, modelled on that at Blois, stands in grounds which originally covered 200 sq. m. Biltmore village is now a suburb of Asheville. Pop. 51,310.

Ashfield, ALBERT HENRY STANLEY, BARON (1874-1948). British business man and politician. Born

Lord Ashfield,
British magnate

at Derby, he spent his early years in the U.S.A. There he entered the railway world, becoming general manager of the United Railways of Detroit and of the Public Service railways of New Jersey. His success led to his return to England in 1907, to become general manager of the Metropolitan District and tube rlys., of the Underground group of companies including the London and in 1912 managing director General Omnibus co. Knighted 1914, he joined the Lloyd George govt., 1916, as president of the board of trade, and was coalition Unionist M.P. for Ashton-under-Lyne until 1920, when he received a barony. He was again managing director of the Underground group 1919-33, chairman of the L.P.T.B. 1933-47, then on the British transport commission. He died Nov. 4, 1948, leaving no heir to the title.

Ashford. Urban district and market town of Kent, England. It

Ashford, Kent,
arms

and an old grammar school. Ashford gives its name to a parl. co. div. returning one member. Market day, Tues. Pop. est. 22,300.

Ashford. Parish and village of Middlesex, England. The ancient Ekeford, it is 2 m. E. of Staines by railway, and is now largely suburbanised. Pop. 8,719.

Ashih-hê-Cheng. Town of Manchuria. Known formerly as Ai-so-ka, it is 26 m. by rly. S.E. of Harbin. It is a centre of trade for agricultural produce and has flour and beet sugar factories. Pottery, swords, and other relics of the Kin period have been found.

Ashikaga. Town of Japan, on Honshu island, 72 m. by rly. N.W. of Tokyo. It has important manufactures of silks and cottons. A famous school of learning is said to have been founded before the 9th century; restored in the 15th century, it contains a statue of Confucius. There is also a temple of the Shoguns. Ashikaga is the name of a period (15th cent.) in art. Pop. 43,896.

Ashington. A parish of Essex, England. The ancient Assandun, it is 2 m. N. of Rochford, and was the scene of Canute's defeat of Edmund Ironside, 1016.

Ashington. Urban district of Northumberland, England. It is 4 m. E. of Morpeth by railway, in a coal-mining district. Pop. 29,418.

Ashira. A negroid tribe in French Equatorial Africa. Occupying the hinterland S. of the Ogowe river, they speak the same language as the Ashango. They cultivate the plantain as their chief food. *See Negro.*

Ashkenaz. An ancient people of Armenia. According to Gen. 10

stands on the Stour, 14 m. S.W. of Canterbury, on the railway, and makes rly. materials, agricultural machinery, wheels, bricks and cider. It has a fine Perp. church

they were descendants of Japhet, the son of Noah. They spread along the shores of the Black Sea, and it has been suggested that the German Jews known as Ashkenazim are descended from them.

Ashland. City of Wisconsin, U.S.A. The co. seat of Ashland co., it stands on an inlet of Lake Superior, 55 m. by rly. E. of Superior. An important rly.

junction, it has large iron, steel, and boiler works, sawmills, and rly. repair shops. It is a summer resort, has various educational and state institutions, a good harbour with extensive docks, and ships iron ore and lumber. Pop. 11,101. There is also an Ashland in Kentucky; pop. 29,537.

Ashlar (Lat. *axilla*, small board). A term generally used to denote hewn and squared blocks of stone, as opposed to unfinished stone from the quarry. More particularly, ashlar is such stone used to face the surface of a wall composed of less durable materials. Plane ashlar is a hewn block so smoothed as to eliminate any marks of the tools with which it was cut: tooled ashlar, chiselled or pointed stones; and rusticated ashlar, more commonly called rusticated masonry, stones projecting from the joints.

Ashley, ANTHONY EVELYN MELBOURNE (1836-1907). British politician and biographer, usually known as Evelyn Ashley. Fourth son of the 7th earl of Shaftesbury, born July 24, 1836, and educated at Harrow and Trinity College, Cambridge, he was Palmerston's private secretary, 1853-65. In 1864 he helped to start *The Owl*, a pioneer society newspaper. Liberal M.P. for Poole, 1874-80, and Isle of Wight, 1880-85, he became under-secretary to the board of trade in 1880 and to the colonial office 1882-85. Of the standard biography of Palmerston, he finished in 1874 the third volume begun by Lord Dalling; two years later appeared vols. iv and v, of which Ashley was sole author. He died Nov. 16, 1907, at Broadlands, Romsey, which was formerly Palmerston's house, and is buried at Romsey.

Ashley, SIR WILLIAM JAMES (1860-1927). British economist, born Feb. 25, 1860. Educated at S. Olave's, South-

Ashford, Kent. High Street of the pleasant market town on the river Stour

wark, and Balliol College, Oxford, he became professor of political economy at Toronto, 1888-92, and of economic history at Harvard, 1892-1901. He then returned to England to organize a faculty of commerce, the first of its kind, in the new university of Birmingham. With great experience of contemporary commercial development in Europe and America he had also the belief that a university should provide vocational training, and his department, with its degree of bachelor of commerce, became a model. A supporter of tariff reform, Ashley served on government economic committees from 1915, and was knighted in 1917. His writings include *Introduction to English Economic History and Theory*, 1888-93, and *Economic Organization of England*, 1914. He resigned his professorship in 1925 and died July 23, 1927.

Ashmead-Bartlett, SIR ELLIS (1849-1902). An Anglo-American politician. Born in Brooklyn, New York, he came to England in boyhood and was educated at Christ Church, Oxford. He was an inspector of schools, 1874-77, and then a barrister. After visiting Bulgaria to investigate the "atrocities," he entered Parliament as Conservative M.P. for Eye, 1880, and from 1885 sat for Ecclesall. In 1885-86 he was civil lord of the Admiralty, and in 1892 was knighted. He was taken prisoner in the Greco-Turkish war of 1897, but was present at the front in the Boer War. He died in London, Jan. 18, 1902.

Sir Ellis's eldest son, Ellis Ashmead-Bartlett (1881-1931) was a well-known war correspondent during the Russo-Japanese conflict, 1904, and the First Great War, 1914-18. From 1924 to 1926 he was Conservative M.P. for N. Hamersmith. He died May 4, 1931.

Ashmole, ELIAS (1617-92). English antiquary. Born at Lichfield, May 23, 1617, he became a

solicitor, and as a royalist was captain of horse and comptroller of the ordnance during the Great Rebellion, and Windsor Herald after the Restoration. Although he declined the office of

Elias Ashmole,
English antiquary
Contemporary print

Garter king-at-arms, his chief work deals with *The Institutions, Laws and Ceremonies of the Order of the Garter*, 1672. In 1677 he presented

to his university, Oxford, the first public collection of antiquities in England, now in the Ashmolean Museum. One of the earliest English freemasons, initiated 1646 he was also largely interested in astrology and alchemy. He died May 18, 1692, and is buried in S. Mary's Church, Lambeth.

Ashmolean Museum. Building containing antiquities belonging to the university of Oxford.

The collection originated in the gift made by Elias Ashmole, and was long housed in a university building between High Street and Broad Street. In 1893-94 a new structure adjoining the Taylorian Institute at the top of Beaumont Street was erected to receive the main part of the collection, but the books and natural history exhibits were taken to the Bodleian and the University Museum respectively. The museum contains Egyptian, Greek, Roman, British, and other antiquities gradually added to Ashmole's gift.

Ashraf OR **ASHREEF**. Town of Persia, in Mazanderan province. It lies about 50 m. W. of Astrabad, and was once the residence of the kings and the favourite seat of Abbas the Great. It has a fair trade in silk and cattle.

Ashridge. Locality of Hertfordshire, England. In a park here, 3½ m. N. of Berkhamsted,

Ashridge Park, Herts, endowed as a College of Citizenship founded in memory of Bonar Law

stood a house which, founded in the 13th century as a monastery, was seized by the crown at the Reformation and became the home of Edward VI, Mary, and Elizabeth. Owned by Lord Ellesmere, between 1800 and 1815 and subsequently by Lord Brownlow, the old monastic buildings were pulled down, leaving only a tithe barn and crypt which still remain. The present house, over 1,000 ft. in

length, was built in 19th century Gothic by Wyatt, 1808-15. In 1928, Urban Broughton purchased the property as a memorial to his friend Andrew Bonar Law (*q.v.*) and endowed it as a College of Citizenship, offering adult citizens of both sexes and all classes education in democratic citizenship on Conservative and constitutional lines. During the Second Great War Ashridge was lent to the

Ashmolean Museum, built for the collection presented to Oxford by Elias Ashmole

ministry of Health free of charge as an emergency hospital. Some of the deer park is National Trust property. At the golf course T. H. Cotton (*q.v.*) was long professional.

Ashta. Town of Bombay, India, on the right bank of the Kistna or Krishna, 180 m. by rly. S.E. of Bombay. A thriving agricultural town, it has a weekly market.

Ashtabula. City of Ohio, U.S.A., in Ashtabula county. It is situated on the Ashtabula river,

3 m. from Lake Erie and 55 m. by rly. N.E. of Cleveland. It imports immense quantities of iron ore, exports coal, and is engaged in shipbuilding and manufacturing. One of the worst American rly. accidents occurred here in 1876. Pop. 21,405.

Ashtaroth. Ancient city of Palestine. It is named in the Bible (Deut. 1; Joshua 9, 12, 13) as the capital of Og, king of Bashan, 6 m. from Abila, and has been identified with Ashteroth-Karnaim (horned Ashtaroth), Carnion, or Carnain; but Eusebius mentions Ashtaroth and Karnaim Ashtaroth as names of two villages between Adara (Edrei) and Abila, Karnaim Ashtaroth being in Bahan.

Ashtaroth. The plural of Ash-toreth, Hebrew name for the Sidonian goddess Astarte, referred to in the O.T. (1 Kings 11; 2 Kings 23). The plural is used because the later mythology made separate deities of her several manifestations. See Astarte.

Ashtead OR **ASHSTEAD.** Village of Surrey, England. Part of the Leatherhead urban district, it is 2 m. S.W. of Epsom and 5 m. N. of Dorking, and is served by Rly. and Green Line. It is a residential district noted for its woods. A Roman villa was discovered in Ashtead woods in 1925 and quantities of tiles, pottery, and other objects were brought to light. The church is notable for a 16th century east window. A 19th century mansion is now used to house the City of London Freeman's School.

Ashton, FREDERICK WILLIAM MALLANDAYNE (b. 1903). British dancer and choreographer. Born

Frederick Ashton,
British dancer
and choreographer

at Guayaquil, Ecuador, Sept. 17, 1903, he was educated at Dover College and trained as a dancer by Massine and Marie Rambert. He made his first appearance at

the Lyric, Hammersmith, in 1926, in *Riverside Nights*, and toured European capitals with Ida Rubenstein, 1927-28. In 1930 he appeared in *Marriage à la Mode* at the Arts, London, and produced for Marie Rambert during the same year for the Camargo Society. In 1935 he was appointed choreographer at Sadler's Wells. Ashton's productions include *Façade*, *Les Rendezvous*, *Rio Grande*, *Capriol Suite*, *Les Patineurs*, *The Wise Virgins*, *The Quest*, *Cinderella*.

Ashton-in-Makerfield. Urban district and market town of Lancashire, England. It is 4 m. S. of Wigan by railway, has coal mines and cotton mills, and among its manufactures are nuts, locks, hinges, files, and nails. Market day, Sat. Pop. 20,541.

Ashton-under-Lyne. A mun. and parl. bor. and market town of Lancashire, England. It is on the Tame, 6 m. E. of Manchester, and is well served by rlys. Cotton and silk spinning, dyeing, bleaching, iron-founding, and hat-making are the chief industries, and there are large collieries in the neighbourhood.

It has a 13th century church almost entirely rebuilt, but with old stained glass, a town hall, a Classical structure built in 1840, technical and art schools, a library, and a public park. The old manor hall, with prison, and the Gallows Meadow recall

Ashton-under-Lyne
arms

the feudal powers of the Asshetons, lords of the manor. On Hartshead Hill there is an interesting tower, 80 ft. high, which was formerly used for a signalling station. "Under lyne" refers to the situation below the frontier between Northumbria and Mercia. Stamford Park belongs jointly to Ashton and Stalybridge. Ashton returns one member to Parliament. Market days, Mon. and Sat. Pop. 51,573.

Ashurada. Island of Russia off the Persian coast, at the S.E. end of the Caspian Sea. Sandy and flat, it was uninhabited until 1844.

Ashurbanipal. King of Assyria 668-626 B.C. The Biblical Assnapper—Osnapper in R.V.—(Ezra 4), son of Esarhaddon, his campaigns were marked by much barbarity. He plundered Thebes, 666; sacked Babylon, 648; and destroyed Susa, 644. Under him Assyrian art and literature reached their zenith. See Assyria.

Ashurbanipal, King of Assyria,
offering before an altar four lions
slain by himself
British Museum

Ashurnatsirpal OR **ASHURNATIRPAL.** Name of three Assyrian kings. The greatest, Ashurnatsirpal III, 883-858 B.C., greatly extended the empire northward and westward. With the captives and tribute brought from Lebanon, Phoenicia, and elsewhere he rebuilt Calah, and erected luxurious palaces. He was succeeded by his son Shalmaneser III.

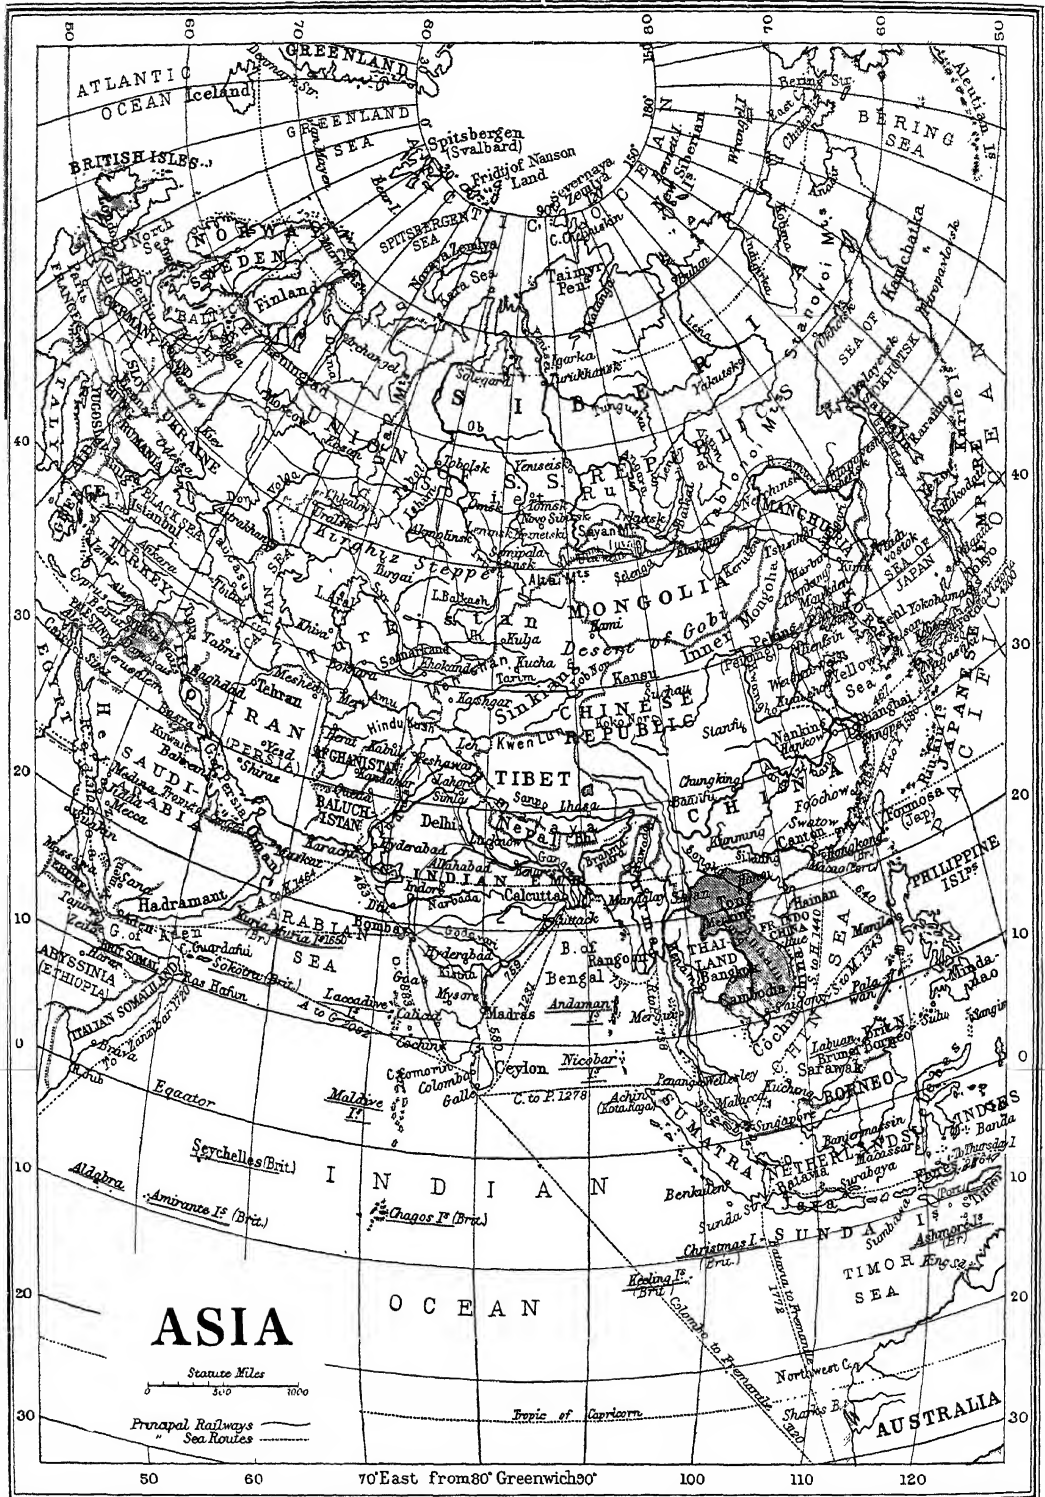

Ash Wednesday. Day observed in the Christian Church since the beginning of the 9th century partially, and since 1191 generally, as the first day of Lent. The name *dies cinerum* or day of ashes (Fr. *mercredi des cendres*) originated in the custom in the primitive Church of public penitents presenting themselves before the bishop and clergy of the diocese clothed in sackcloth and with naked feet. The seven penitential psalms were repeated, ashes were thrown upon the penitents, and they were expelled from the church, to be solemnly readmitted to Holy Communion on Maundy Thursday.

In the Roman Catholic Church the ceremony of taking the ashes on Ash Wednesday precedes Mass, and the ashes are of burnt palm-branches, blessed on the Palm Sunday of the previous year. These are placed on the altar, and the priest, after sprinkling the ashes with holy water, marks his forehead with them. Then the congregation approach the communion rails and kneel, and the priest marks the forehead of each with the sign of the cross with the ashes saying, *Memento, homo, quia pulvis es, et in pulverem reverteris* (Remember, man, that thou art dust, and to dust thou shalt return). In the Church of England the Communion Service replaced this ceremony in the 16th century.

Ashwell, LENA (b. 1872). British actress. The third daughter of Commander Pocock, R.N., she was educated in Canada and Switzerland, and studied at the Royal Academy of Music. Giving up music for the stage, on the advice of Ellen Terry, she made her début in 1891, became manager of the Savoy Theatre in 1906, and in 1907 obtained a lease of the Great Queen Street Theatre, Holborn, which she reopened as the Kingsway Theatre. One of her greatest parts was Mrs. Dane, in Mrs. Dane's Defence, first played in 1900. In 1908 she married Sir Henry Simson (d. 1932). During the First Great War she organized concert parties for troops overseas. She later founded the Lena Ashwell Players, and in 1924 took the Bijou Theatre, Baywater, renaming it the Century. Her publications include *Myself a Player*, 1936.

Lena Ashwell,
British actress

ASIA: SHOWING THE BOUNDARIES OF ITS COUNTRIES AS THEY WERE IN 1939

ASIA: GENERAL SURVEY OF THE CONTINENT

This general sketch is intended as an introduction to the articles on the countries of Asia: Arabia; China; India; Japan; Persia, and the rest. It also touches upon rivers, mountains, etc., about which fuller information is given under the several headings, e.g. Ganges; Hooghly; Himalayas; Pamirs; Caspian Sea, etc.

Asia, the largest of the five continents into which the world is divided, covers an area approximately of 17,300,000 sq. m., or over 1,000,000 sq. m. more than both the Americas combined. In old days large portions of Europe and Africa were included in Asia; the ancient geographers held that the Don, not the Ural, was its western limit, and it was usual to regard Egypt as an Asiatic appendage. The Asia of the Greeks was at first only part of the plains of Caesarea, but as their trade and colonies advanced they carried the use of the name with them.

On three sides the continent is bounded by great oceans, one of which is ice-bound. The Arctic to the N., the Pacific to the E., and the Indian, without a land barrier between it and the Antarctic, wash its shores, while on the W. a clearly marked frontier is provided in the Mediterranean, Black and Caspian Seas, the Caucasus, and the Ural mountains and river. Its greatest breadth from W. to E. (Suez to Bering Strait) is 6,700 m., and its greatest depth from N. to S. (Severo on the Arctic to Singapore) is 5,300 m. Within those limits it presents every variety of climate, soil, and scenery. It includes some of the coldest and some of the hottest lands of the habitable globe, some of the most productive regions and some of the most barren, some of the grandest scenery, as in the Himalayas, and some of the dreariest and least inviting, as in the sand desert of Gobi. It contains the loftiest peaks in the world, the most elevated plateaux where life is supportable, and depressed areas that have sunk lower than sea level.

Lofty Peaks of the Himalayas

Among the great mountain ranges may be named the Himalayas, with their extensions in the Hindu Kush and the Suleiman, the Kwen Lun, the Tien-Shan, the Altai, the Caucasus, and the Ural. Among these the loftiest peaks are to be found in the Himalayas, the famous snow mountains of the Hindus, the great natural defence of the plains of India against attack from the N. Godwin-Austen lies in the clump of peaks and glaciers N. of Kashmir, where the Mustagh furnishes the connecting link with the Hindu Kush. Here, within a comparatively recent period, ex-

plorers have discovered altitudes that were unsuspected not so many years ago. The permanent snow-line S. of the range is 15,000 ft., but to the N. it is as high as 18,000 ft.

The Kwen Lun range lies N. of the Himalayas and in a general sense parallel with them. It stretches from the Pamir plateau to the Hwang-ho, and forms the northern boundary of the great Tibetan tableland, which lies at an average height of 16,000 ft. above sea level.

The Tien-Shan, or Celestial Mountains of the Chinese, is a third range following very much a parallel line with the two just named. It serves as a boundary for Chinese Turkistan (or Sinkiang), and more particularly divides Kuldja from the Takla Makan desert. The fourth, the Altai, separates Siberia from China.

The Great Deserts

Among other mountain systems is the Caucasus, which was well known to the Greeks and figured largely in their mythology. It forms a natural barrier between Asia and Europe in the W., joining the Black and Caspian Seas as the northern boundary of that portion of Asia which projects to the Mediterranean. The Caucasus range is remarkable for the narrow and difficult defiles, few in number, which traverse it, and for the lofty and imposing peak of Elburz (18,570 ft.). The Ural mountains have always, at least in modern times, been regarded as the line of separation between European and Asiatic Russia. They now cut across Sverdlovsk prov. They contain no exceptionally high peak.

The deserts of Asia, too, are on the grand scale. That of Gobi or Shamo, the sea of sand, forms a great natural defence for China on the W. It rivals the Sahara in size, and if its offshoots in N. Tibet are included, far exceeds it. There are further the deserts of Arabia, the great salt desert of Persia, those of Seistan, Baluchistan, Rajputana, and Khiva, and that of Syria, which closes the land route from the Persian Gulf to the Levant. Many of these deserts are the sepulchres of departed civilization.

Asia is certainly not less remarkable for its great rivers than for its lofty mountains. India possesses in the Ganges, the Indus, and the Brahmaputra three of the most important streams of the continent,

and the Irawadi, which for its navigable course lies altogether in the Burma Union, is worthy of being classed with them. In Indo-China, to the E. of Burma, are the Mekong and the Salween, which have their sources on the Tibetan highlands. The great rivers of China, the Yang-tse-kiang and the Hwang-ho, outdistance those of India. The latter has been rendered useless for access to and from the sea by sandbanks; the former is the busiest water-route in the whole world, although the bulk of the traffic is still conveyed in native junks. The Si-kiang, or Chu-kiang, and the Amur are also rivers of the first magnitude.

All the above rivers flow into the Indian Ocean or the Pacific. Of those that seek the Arctic, the Ob, with its great affluent the Irtysh, the Yenisei, and the Lena are among the most notable waterways of the continent, and provide communication with the remoter provinces of Siberia as long as navigation remains open, about four months of the year.

Rivers Famous in History

Four rivers stand apart—more famous in history than for their present usefulness. They are the Amu Daria or Oxus, Syr Daria or Jaxartes, the Tigris, and the Euphrates. The Amu Daria, which affords Afghanistan a natural northern boundary, flows like the Syr Daria into Aral, and has been used by the Russians to a moderate extent as a channel of communication, but notwithstanding its being fed by the snows of the Hindu Kush, its volume is scanty, much of the adjacent land is desert, and there is only enough water left in its lower course to sustain the oasis of Khiva. The Syr Daria, coming from the Tien-Shan, waters the Turkistan and Ferghana regions, and is exclusively used for irrigation. As both these rivers are shrinking in volume, much of the water being lost by percolation, their utility shows no likelihood of expansion. It is otherwise with the Tigris and the Euphrates, especially the latter, which only need engineering skill and attention to become great arteries of commerce once more.

Though Asia is well endowed with rivers she is singularly poor in lakes and inland sheets of water. Moreover, many of these are

shrinking and will disappear in course of time. Baikal is the one lake of large size and great depth. Its waters are fresh, whereas almost all the others are salt or brackish. Balkash and Issyk Kul are the two other lakes within Russian territory, if Aral be not included. China has few lakes, Tungting being the only one of any importance. India is even worse off.

Fauna and Flora of the Continent

The lakes of the Tibetan plateau, Tengri Nor, Lob Nor, and Koko Nor, resemble salt marshes amid the sands, and in this respect Persia is on the same footing, with the Hamoon marsh, once called the Seistan lake. Asiatic Turkey has Lake Van and smaller lakes of the same character, all salt or brackish. Arabia has none at all. In Palestine are the Dead Sea and the Sea of Galilee. There are but few islands. The Japanese islands and Sakhalin, Ceylon, Formosa, and Hainan are the largest, excluding Indonesia.

The fauna and flora of the continent are both remarkable. Most of the world's animals are found here. There is hardly a tree, shrub, or plant that is not represented, and many, such as the tea, indigo, cinnamon, and spice trees, are not to be found anywhere else. Among forest trees the teak, the palm, and the cedar are identified with the East. India and Indo-China stand at the head of Asiatic countries in this respect. In addition to those named they have the oak, the walnut, the banyan, the cinchona, etc., and the Indian forestry department is charged with their development and preservation. Cinchona was introduced from Bolivia about the year 1860, tea from China about thirty years later, coffee, cotton, and the sugar-cane have long been cultivated, and the poppy is the monopoly of Bengal and Malwa. The camphor-tree flourishes in the island of Formosa. The rose-tree is to be met with in all the countries S. of Siberia, and the states of Central Asia have ever been famous for their orchards. India and Siberia are great wheat-producing areas, and China, Burma, Siam, and Japan, as well as parts of Bengal, are great producers of rice.

Among the fauna of the continent may be named the lion, the tiger, the leopard, the elephant, the camel, the dromedary, the wild horse, the wild ass, the yak, the argali, the buffalo, and the reindeer, in addition to domestic animals. The Pamir and Mustagh are the home of the great horned sheep,

Ovis poli. Siberia and the northern districts of Manchuria are noted for their fur-bearing animals, e.g. the sable, ermine, marten, and foxes of all colours, but the Russian hunters in the last three centuries have gone far to exterminate them.

Finally, Asia is celebrated for its mineral wealth. Gold, silver, and precious stones, the diamond, the ruby, the emerald, and the pearl, were, and still are, found within its limits; and if coal has only been exploited in later days it has not been because it was not there in abundance, but only because facilities for transport were lacking. Not for one reason but for many did the wealth and resources of Asia appeal to the imagination of the great minds of the Renaissance. When a poet sought splendour in his imagery he turned to Asia; thus Milton says:

High on a throne of royal state, which far
Outshone the wealth of Oimuz and of Ind,
O! where the gorgeous East with richest
hand
Showers on her kins barbaric pearl
and gold,
Satan exalted sat

Climatic and Racial Diversity

As Asia extends from the Arctic circle to the equator every variety of human existence may be found within it. At one extremity men cover themselves in skins and pass six months of the year underground for warmth; at the other, cotton provides the only garment, and many try to do without any at all. There is an equally wide range in the spheres of mental capacity and of social comfort. The primitive Aino and equally primitive Naga stand at the bottom of the scale, at the top of which pose the Indian Brahmin and the Chinese Buddhist, endowed with intellects as keen and subtle as any found in the western world. Socially there are men in the lowest stage who thrive on offal—cannibalism alone is unknown—and in the highest who are as epicurean as a French gourmet. Thickly populated as parts of Asia are and always have been, there is a sufficiency of food and nourishment for the inhabitants, and this is the more remarkable because the most is not made of the productive possibilities of the continent. Owing to drought in the one case and floods in the other, however, famine is periodic in India and China.

Asia is not only the largest, but the most densely populated of the five continents, and whatever deductions may be made it certainly contains more than half the population of the whole world. The estimates of 1939 placed the total at over 1,100,000,000. China had

at least 422 millions, India 389 millions, Japan nearly 100 millions. In Indo-China are some 24 millions and in Arabia perhaps 10 millions. India, China, and Japan represent the centres of dense and ever increasing masses of the human race. It is usual to divide these races into blocks, distinguished by their religions, thus: Buddhists, 150,000,000; Mahomedans, 160,000,000; Confucians and Taoists, 350,000,000; and Hindus, 230,000,000. The balance are Shintoists, animists, etc. The chief Asiatic races are most prolific.

The great states of the continent are India, Pakistan, China, Japan, Soviet Asia, Indonesia, and Turkey. Minor independent states are Iraq, Saudi Arabia, Persia, Afghanistan, and Siam. While much of Asia is self-governing or possesses native rule, a large part of the continent and perhaps a fifth of the population are under foreign sway. The foreign ruling systems are British, French, Russian, Dutch, and Portuguese. In extent of territory Russia stands first with over 6,000,000 sq. m., but the population is under 40,000,000. About 2,000,000 sq. miles with over 400,000,000 souls are associated with the British Commonwealth, and some 300,000 sq. m. with 22,000,000 persons with the French union. Portugal owns 9,000 sq. m. with about 1,000,000 inhabitants.

Early Civilizations and Conquests

This foreign domination is all the more remarkable, and perhaps all the more certain to prove transitory, because Asia, S. of the Altai, was the original source of all our civilizations and arts. The arts of painting and weaving in all its forms were known and practised there at remote epochs. The secret of chinaware only became known in Europe in the 18th century; the inlaid work of the Japanese is still unapproached. Nor is it only in art that Asia has stood pre-eminent. The practical task of government has been defined in its moral and political aspects. The code of Confucius and the laws of Manu cannot be surpassed.

The earliest records of what was known as Asia relate to only a small and contracted region. They reveal no suspicion of the vast continent behind. The Jews and the early Greeks had a limited horizon, not extending beyond the Caucasus and the Persian Gulf. When it was enlarged, the outer realms of Asia were comprehensively described as Scythia to the N. of the Caspian, India to the E. of Persia, and Serica, a remote

Asia. Map illustrating the distribution over the continent of natural resources, mineral and other, and of the agricultural and manufactured products

country corresponding more or less with China.

Ptolemy, writing in the 2nd century of the Christian era, was the first to refer definitely to the sub-divisions of Asia somewhat as they are now known; but the campaign of Alexander on the Indus and in the Punjab, in 327-325 B.C., had already made India well known, and left behind it a permanent memorial in the Bactrian kingdom of the Hindu Kush.

Egypt was, in the time of Ptolemy as it is now, a sort of half-way house to India, and it is even probable that some of the trade in silks, jewels, and gold-dust was carried on in galleys from India, if not to Suez, at least to Muscat and other places on the Persian Gulf. But the part taken by Egypt in making Asia known to the

western world was small compared to that of the Arabs, who, in the 7th and 8th centuries, carried the cult of the Koran at the sword's point far into the continent. The caliphs, of whom Haroun-al-Raschid was the most magnificent, also patronised trade, and their barques found their way to the Sunda Isles, where Arab influence is still in evidence; while before 900 their merchants even reached the coast of China. While on land they were putting an end to the Parsi dynasty in Persia, and planting their colonies and power on the frontier of India preliminary to its invasion by Mahmud of Ghazni, they were posing at sea as powerful traders.

The Mahomedan conquerors and traders first began that penetration by the west which was com-

pleted in the 19th century, when the barriers of China were broken.

The triumph of the Mahomedans would have been greater but for the appearance of the Mongols, who carried out a counter-move from E. to W., which overwhelmed all human obstacles that attempted to bar their way. It was early in the 13th century when this race, having occupied a large part of Northern China, began the aggressive movement which eventually carried them to the Adriatic and the Levant. In their brief career in Europe they conquered Russia, Hungary, and the principalities eventually formed into the Turkish empire. These triumphs were ephemeral, and no attempt was made to retain anything W. of Russia. But in Asia they not merely overthrew the caliphs;

1. An elderly Circassian from the Caucasus. 2. Beduin sheikh of the Syrian desert near Palmyra. 3. A typical merchant from Persia. 4. Armenian woman wearing the national headdress. 5. Old man of the Upper Yenisei basin, in Krasnoyarsk, Siberia. 6. A Punjabi

and his wife. 7. Miao woman, Siam, wearing the curious national headdress, which is formed mainly of bamboo and beads. 8. A Ceylon beauty. 9. Bengal dancing girl. 10. Village youth of Burma, showing the remarkable tattooing of the thighs

ASIA: TYPES OF RACES IN ITS NORTHERN AND FAR EASTERN COUNTRIES

they founded dynasties in Persia, Turkistan, and Afghanistan which eventually became merged in the empire of the Great Mogul in India, as well as in China, where the Yuen dynasty held sway during three centuries.

While the Mongol outpouring is interesting as a manifestation of Tartar power, in resentment perhaps for the encroachment of Islam, it was also noteworthy for bringing the existence of Asia home to the imagination of Europeans in a new sense. The campaigns of Charles Martel and Charlemagne had made them acquainted with the Saracens, and the Crusades had brought them face to face with the same foe in Syria and Palestine; but the Mongols were a different race, coming from a distinct and previously unknown part of Asia, and in such numbers as to make them seem as countless as the sand.

Papal Mission to the Mongols

At the worst moment, when Italy seemed to lie open to the invader, the pope declared a crusade against the Tartars and sent an urgent call to France and England, among other countries, to come to the aid of Christendom. But when the great Mongol leader, Batu, suddenly retreated on learning of the death of the Khakhan Ogotai, and Europe was able to breathe again, the pope changed his purpose, and decided to make an effort to convert this formidable race to Christianity. In 1243 he sent John Carpini, a Franciscan friar, on a mission to Karakorum, the Mongol capital, where he was present at the election of Ogotai's successor. He was treated with distinction and returned in safety. He made no converts, but he brought back the first authentic details of Tartary and China.

Fifteen years later Louis IX of France sent another priest, a Fleming named Rubruquis, on a similar mission, but he was instructed to attend to political as well as religious matters. He also brought back further particulars of the Tartar power and system, in this sense completing the work of Carpini; but there were no other results, and China would have remained comparatively unknown but for the remarkable visit of Marco Polo, who returned to Italy in 1295 after having resided in China for seventeen years. To him we owe not merely the first account of that country in any detail, but also the first mention of Japan, which had just successfully repelled and beaten off a Mongol invasion.

These travellers' tales whetted the desire of the trading nations, then confined to the Mediter-

anean, to tap the wealth of the Far East, but there was no way thither except overland, and navigation beyond circumscribed limits was impossible until the use of the mariner's compass enlarged the prospect for overseas voyages. The story may be true that Marco Polo brought the invention, or rather the application of it, from China, where it was said to have been known from an early period, and where it was certainly in use several centuries before the Christian era.

But the great discovery of all was that of the ocean route to the East. It was not until the voyage round the Cape by the famous Portuguese navigator, Vasco da Gama, in 1497, that Europeans learnt that the coasts of Persia, India, Indo-China, and China were accessible to their ships. It was in accordance with the spirit of the age that the discoverers should claim a monopoly. The Portuguese established themselves in the Persian Gulf at Ormuz, in India at Goa, and in China at Tamang and Macao, and they enjoyed forty years' start of all their rivals. Then followed the Spaniards, and from 1580 to 1640 the two nations were under the same sovereign. But in the meantime more formidable competitors had arisen in the Dutch and the English. The former established themselves in Java and the latter in India, both events occurring in the year 1612. After two hundred years of more or less keen rivalry the positions remained relatively unchanged. The British consolidated theirs in India, the Dutch theirs over the Sunda Isles, known to them as the Dutch Indies; while the Portuguese retained only the relics of their great discoveries in Goa and Macao, and the Spaniards forfeited all that was left to them when they ceded the Philippines to the U.S.A.

Birthplace of the Christian Religion

The influence that Asia has exercised on the life, culture, and religion of Europe has been so immense and in some respects so subtle as to defy estimation. In the earliest period of Europe's history it was the influence of but a small part of S.W. Asia, and there is nothing on record to show that at any time the older civilizations of India and China affected in the least, much less shaped, European evolution.

Perhaps it is not unreasonable to believe that those older systems had at some unknown period of human existence produced the civilizations in Assyria, Egypt, and Persia, and that they in their turn reacted on the systems of

Greece and Rome through which the light of Asia reached Europe. Of all the influences the one which Europe proceeded to assimilate and absorb with the most complete thoroughness was that of religion. It is a supremely important fact in human experience that Europe took its religion, not from a world-empire, not from any of the five great monarchies wrapped in luxury and idolatry, but from a small pastoral people who never attained any great material power, and whose name even might have passed into oblivion if Christianity had not accepted their national history as the Bible on which all religious teaching and instruction reposed. In this sense, then, the influence on Europe of Palestine or Judaea, the Holy Land not of the Jews but of the Christians, was greater, and has proved more enduring than that of the Great Powers and political entities which Asia has known, and which probably preceded in point of time the cosmogony Europe has been led to accept.

Asiago. Town of Italy, in the prov. of Vicenza. The chief town of the district known as the Seven Communes, it lies 25 m. by rly. N. of Vicenza, at an alt. of 3,280 ft. It has a museum of antiquities.

Asiago Plateau. Name given to a series of battles in the First Great War, fought between the Austrians and the Italians, Nov., 1917–Nov., 1918. The Austrians under Conrad von Hotzendorf were trying to force the line of the lower Piave by repeating the successful break-through which had won Caporetto (*q.v.*). Beginning their drive on Nov. 10, 1917, they took Asiago, attacked Monte Longara, and heavily pressed the Italians, who beat them off around Monte Castelgomberto. The line was hammered with little success for a fortnight. On Dec. 2 British and French troops joined the defenders but were not attacked. A renewal of the battle on Dec. 4 brought intense fighting and to the Austrians success at Badenece and Castelgomberto, where they took 15,000 prisoners. The fall of Sisemol to the Austrians led to another pause. Over Christmas, until snowstorms broke off the battle, there was further action in the Asiago sector, Melaga and the Col del Rosso several times changing hands. The Italians gained a local victory and took 2,600 prisoners on the Col. Jan. 28–29, 1918.

Austria Launches an Offensive

In mid-June the Austrians began a great offensive from the Val Lagarina to the sea, and also undertook operations on the W. side of the Trentino. On the 15th they attacked from S.W. of Asiago to the Brenta, from the Brenta to E. of Monte Grappa, and from the Montello to below San Dona di Piave, a front of about 45 m. The whole effort, for which a mass of artillery was concentrated, was directed by General Borovitch, with von Hotzendorf in command of the assault on both sides of the Brenta. On the W. of the Brenta stood the Italian 6th army, under General Montuori, consisting of Italian, British, and French troops. The British force, commanded by the earl of Cavan, was made up of the 23rd and 48th divisions. The French held the line between Italian troops in the Frenzela district, immediately W. of the Brenta, and the British, who were concentrated on the hills facing Asiago from the S.

The enemy made progress, taking the Col del Rosso and Costalunga, and delivered a powerful

assault at the Pizzo Ravea, 1½ m. W. of Valstagna, on the Brenta. The centre of the severest fighting was the Pizzo Ravea, which was taken and lost several times during the three days' struggle, but finally was lost by the enemy, who also was driven out of Sasso. The Austrian attack on the British 23rd division was entirely repulsed; the attack against the 48th division had some success at first, taking about 2 m. of its front.

Both British divisions assailed the Austrians on the 16th and took upwards of 1,000 prisoners and several guns from the enemy, whose losses in killed and wounded were put at 5,000. By the evening of June 17 the battle here was already over, with this part of the general Austrian offensive a complete failure.

The effect of Italy's victory was profound. In Austria it led to riots, and in Hungary to a serious attempt at a general strike. To the Allies on the western front it was of first importance, as it allowed Foch to use there his army of manoeuvre, which hitherto he had kept in reserve for eventualities between the N. Sea and the Adriatic. (*See* Monte Grappa.)

British Occupy Asiago

Beginning about Oct. 28, a final attack on the Austrians on the Asiago Plateau was made by the Italian 6th army, including the 48th British division, under Maj.-Gen. Sir H. B. Walker, the whole commanded by General Pennella. On Oct. 30 the British occupied Asiago; they stormed Monte Catz on Nov. 1; on that day the Italians advanced N. of the Monte di Val Bella, S.E. of Monte Sisemol, and progressed W. of the Brenta; by Nov. 2 the offensive was general along the plateau. The

Italians crossed the Assa and took Monte Longara and Monte Baldo on the N. edge of the Seven Communes. On Nov. 4 the leading British companies were on the outskirts of Trent, and in this area, up to the armistice granted by the Allies to Austria on that day, they had captured over 20,000 prisoners and 500 guns. Fighting ceased that day at 3 p.m.

Asia Minor. Name given to the peninsula forming the W. extremity of Asia. It was called by the Greeks Anatolia and later by the Turks Anadolı, meaning the rising of the sun. It is now practically continuous with Asiatic Turkey. Its shores are washed on the N. by the Black Sea, on the W. by the Aegean, and on the S. by the Mediterranean. On the N.W. the sea of Marmara with the Dardanelles or Hellespont and the Bosphorus form the historical division between Asia and Europe. The E. boundary has no fixed delimitation, but is usually regarded as extending from the Gulf of Alexandretta, along the Alma Dagh to Erzingan on the Euphrates, continuing thence to the Churuk Su, whose course is followed to the Black Sea. Its greatest length is 725 m., the extreme breadth 415 m., and its area nearly 200,000 sq. m.

Orographically, Asia Minor is an elevated peninsula comprising series of plateaux varying in height from 2,500 ft. to 4,500 ft., and falling away gradually from W. to E. It is buttressed on the S. by the Taurus range, which extends from near the Euphrates into the Aegean Sea, and is flanked on the N. by an unnamed and broken range which follows the S. shore of the Black Sea and varies considerably in altitude. Many smaller ranges

Asia Minor. Map of the great peninsula, bounded north by the Black Sea, west by the Aegean, and south by the Mediterranean

Asia Minor. Strange geological formation found in the volcanic plateau near Mt. Argæus. Caves cut in the soft lava are used as habitations
Photo Sir William Ramsay

between these larger ones transversely intersect the plateaux.

Among the best known summits are the volcanic Argæus Dagħ, 12,650 ft., the culminating height of Asia Minor, lying W. of the Anti-Taurus; Bulgar Dagħ, 11,400 ft., in the Taurus; Mount Ida, 5,749 ft., at the base of which stood Troy; and Olympus, 7,600 ft., not that of Greek legend. Many passes cross the Taurus and Anti-Taurus, including the historical Cilician Gates, through which marched the armies of Cyrus and Alexander the Great. Though several of the rivers are of considerable volume, they are generally of little importance, many having no sea outlet, and few only being navigable for short distances by small boats. The largest flowing to the Black Sea are the Yeshil Irmak, the Kizil Irmak, the Churuk Su, and the Sangarius. The Aegean Sea receives the waters of the Sanabat and the Menderes, and the Geuk Su; the Sihun and the Jihun discharge into the Mediterranean. The plateaux, largely composed of sandy deserts, salt steppes, and marshes, contain numerous salt and fresh-water lakes, the largest, the saline Tuz Gol, which is 55 m. long and part of the year almost dry.

The climate is very varied. In the N. the heat of summer is damp and the winters are cold. The plateaux have long cold winters and oppressive summers, but on the W. and S. coasts mild winters are experienced, and although the heat is intense in summer it is tempered by the sea-breezes. In some parts, especially on the Black Sea littoral, malaria is prevalent.

The mountains are heavily clothed with forests of fir, pine, beech, oak, cedar, and other trees, their growth being densest on the highlands of the N. The products of the coast lands, which vary according to climate, include the vine, apple, pear, olive, orange, and lemon; the plateaux yield wheat, and excellent crops of rice and other cereals are obtained in the valleys. In addition, cotton, gum, opium, liquorice, saffron, and tobacco are cultivated, but agriculture is undeveloped. Wild animals are numerous, and include the bear, wolf, boar, hyæna, lynx, and leopard; among domestic animals are the camel, buffalo, horse, ass, and the Angora goat, the last being extensively reared for the production of mohair.

There are industries in the larger towns, the chief manufactured articles being carpets, mohair, silks, cotton, wine, and tobacco; and these, with cereals, fruit, olive oil,

Asia Minor. Pastoral scene near the R. Menderes, the ancient Scamander

and opium, are the leading exports. Imports consist chiefly of cotton stuffs, woollens, coffee, hardware, coal, petroleum, and various manufactured articles of domestic use. The mineral wealth is considerable, but not yet fully exploited; products include coal, lignite, cement, chrome, sulphur, and copper.

The Anatolian Rly. (*q.v.*), together with its local branches, is the chief means of inland transport. The original main line extends from the Bosphorus to Konieh, whence the Berlin-Bagdad Rly. (*q.v.*) continues to the Caspian Sea.

The population, estimated at upwards of 16,300,000, is mixed. Ottoman Turks are the predominating race; Armenians, greatly reduced by massacres, Greeks, Jews, and Kurds form the larger portion of the remainder. The industrial element is represented by the Greeks and Armenians, who, with the Jews, are the principal land-owners. Turkish is the official language, but many other tongues are spoken, and Mahomedanism is the religion mostly professed. Muslims long paid small heed to education, but increasing opportunities are being provided and taken for study. Izmir is one of the chief ports of Asia Minor; others are Trabzon, Sinope, Uskudar, Adalia, and Mersina. The other largest towns are Ankara (Turkey's new capital, planned by Kemal Atatürk on Western lines), Adana, Bursa, Eskişehir, Gaziantep, Konieh, and Kaisariyeh.

Coming of the Turks

Its peculiar geographical situation explains the history of Asia Minor as the scene of continuous struggles between the East and West. In earliest historical times it was inhabited by non-Aryan-speaking peoples, about whom, apart from the Hittites, who established their capital at Boghaz Keui, little is known. The conquests of Alexander the Great and the Romans were preliminary to the introduction of western civilization, which was greatly assisted by the preaching of Christianity, but the coming of the Turks after the overthrow of the East Roman emperor, Romanus IV, in 1071, and further nomadic invasions in the following four centuries, reduced the country to a state of decay from which it is now making slow recovery.

Bibliography. Historical Geography of Asia Minor, W. M. Ramsay, 1890; Murray's Handbook for Asia Minor, 1905; Across Asia Minor on Foot, W. J. Childs, 1917; Anatolia, Sir H. Luke, 1924; Eastern Mediterranean Lands, P. H. H. Maass, 1928.

Asiatic Society, ROYAL. Association founded in 1823 for the investigation and encouragement of science, literature, and the arts in relation to Asia. It holds meetings, issues a quarterly journal, offers prizes for essays, etc., in schools, and collects a suitable library. Its offices are 74, Grosvenor Street, London, W. The Society of Biblical Archaeology was amalgamated with it in 1918.

Asiento (Span. *asentar*, to place, or make a contract). Agreement signed between Great Britain and Spain in 1713. The supply of slaves for the Spanish colonies in America, previous to 1713, had been in the hands of the Genoese and then of a French company. In 1713, when the War of the Spanish Succession came to an end, the privilege was made over to the British for thirty years. Each year 4,800 slaves were to be sent to America by British merchants. These merchants were also allowed to send each year to S. America one ship filled with their wares.

For a time the South Sea Company worked the contract, and it was not without its influence on the South Sea Bubble. By various tricks more goods were sent to America than the treaty allowed, and this caused much trouble between the two countries. At length war broke out, and when this came to an end in 1748, the Asiento was renewed for four years. Shortly afterwards Spain paid Britain £100,000 and it was cancelled.

Asinara. Island off the N.W. coast of Sardinia. It is about 10 m. long, and forms the W. shore of the Gulf of Asinara.

Asir. Territory of Arabia. It lies between the Hejaz and the Yemen, on the E. shore of the Red Sea, and is inhabited mainly by mountaineers. It has many fertile valleys which produce dates, figs, and other fruits, and cotton. Formerly ruled by an ameer of the Idriisi family, in semi-independence of Turkey, it was annexed to his dominion of Saudi Arabia by Ibn Saud in 1933. See Hejaz.

Asirgarh OR ASEERGHUR. Fortress of the Central Provinces, India. It is 87 m. S.S.E. of Indore, and stands 850 ft. high, on a detached hill of the Satpura range. Captured by Akbar in 1600, it was surrendered to the British in 1803 and 1819.

Askalon. Variant spelling of the name of one of the five chief cities of the Philistines. See Ascalon.

Askari (Swahili, soldier). Native soldier enlisted in the E. African territories. The term is

Askari. E. African native soldier

often erroneously applied to any native in Africa officered and trained by Europeans. Askaris were first enlisted in the native constabularies raised in Lagos in 1863. They were employed by both Great Britain and Germany in E. Africa during the campaigns of 1914-1918 and also by the Italians in the conquest of Abyssinia in 1936. In the Second Great War Askaris took part in the Middle East as well as the Burma campaign. See King's African Rifles; Royal West African Frontier Force.

Aske, ROBERT (d. 1537). Leader of the English Pilgrimage of Grace. A lawyer belonging to an old Yorkshire family, when the popular discontent at the suppression of the smaller monasteries developed into insurrection, he was chosen as leader. York was occupied Oct. 16, 1536, and shortly afterwards all the N.E. coast from Newcastle to Hull was organized for military defence. On Oct. 20 Pontefract Castle surrendered to Aske, who proposed to lead the Pilgrimage of Grace to London. Hostilities with the troops commanded by the duke of Norfolk were avoided by Aske advising his followers to return home on the promise of pardon from the king.

Aske was invited to London by Henry VIII under a safe-conduct pass, and returned to Yorkshire in Jan., 1537, with the promise from the king that a parliament should be held in York. After persuading the rebels led by Sir Francis Bigot in E. Yorkshire to disperse, Aske wrote to the king pointing out the disturbed state of the N. of England. He was thanked for his services, again invited to London, and in April arrested. He was then tried for high treason, and in July was hanged at York, in spite of having obtained promises of pardon from Henry VIII and Cromwell. See Pilgrimage of Grace.

Askew, ALICE AND CLAUDE (d. 1917). British novelists. Claude Arthur Carey Askew and his wife, Alice J. de C. Leake, were married in 1900 and in 1904 published the first of the long series of stories that they wrote in collaboration. During the First Great War they were engaged in work on behalf of the Serbians; and when returning to Corfu on Oct. 5, 1917, their steamer was sunk by an enemy submarine, both losing their lives. Their numerous novels, mostly of a dramatic and sensational nature, included *The Shulamite*, 1904, a dramatised version of which was produced at the Savoy Theatre, London, in 1906; *Anna of the Plains*, 1905; *Rod of Justice*, 1910; *Destiny*, 1911.

Askew, ANNE (c. 1521-46). An English Protestant martyr. The younger daughter of Sir William Askew, of an old Lincolnshire family, she was born at Stallingborough, near Grimsby. Having parted from her husband, to whom she had been married against her will, she went to London, where in 1545 she was examined for heresy and discharged through the influence of Bishop Bonner. In 1546 she was again examined, and after long arguments with the Council, in which she readily answered every interrogation but refused to change her views, was burnt at Smithfield, July 16, 1546.

Askey, ARTHUR BOWDEN (b. 1900). English comedian. Born at Liverpool, June 6, 1900, he was eight years in the civil service before becoming a professional comedian in 1924. Broadcasting, especially in the serial *Band Waggon* (1938-39), brought him wide celebrity, and he subsequently starred in films and musical plays.

Askhabad OR ASKABAD. Capital of the Turkmen Soviet Socialist Republic. It stands at the N. base of the Kopet Dag, 345 m. S.E. of Krasnovodsk on the Transcaspian Rly. There is communication by motor road with Meshed in Persia. It has a museum and technical school, and since the Russian conquest of 1881 has become an important commercial centre, with tanning, brickmaking, and other industries. Pre-war pop. 126,580. An alternative and historic name is Poltortsk.

Askja. The largest volcano of Iceland, near the centre of the island. Its crater is 34 sq. m. in area, more than 700 ft. deep, and 4,633 ft. high, and has a hot-water lake 5 m. in circumference. Intermittently and sporadically active, its old lava floods cover an

area of 1,500 sq. m. Ashes from the great eruption in 1875 floated as far as Sweden.

Askrigg. Parish and vil. in the N. Riding of Yorkshire, England. It stands on Ure river, 11 m. W. of Leyburn by railway. Once famous for clocks, it is noted now for its grouse moors. Pop. 481. One m. S.W. is Bainbridge village where a horn is still blown every winter's night to guide travellers.

Askwith, GEORGE RANKEN ASKWITH, 1ST BARON (1861-1942). British administrator. Born Feb. 17, 1861, the son of a general, he was educated at Marlborough and Brasenose College, Oxford, becoming a barrister in 1886. In 1907 he entered the Board of Trade as assistant secretary, and in 1911 was made chief industrial commissioner, in which capacity he reported on the labour laws of Canada, 1912, and presided over the Fair Wages Advisory Commission, 1909-19. Knighted in 1911, he was raised to the peerage on retirement in 1919, but did not leave public life and in 1931 was chairman of the royal commission on Malta. Among his public appointments were the treasurership of the Y.M.C.A., presidency of the Institute of Arbitrators, and presidency of the National Greyhound Racing Society. He published *Industrial Problems and Disputes*, 1920, and a book on British taverns, 1928. He died June 2, 1942.

Askwith married in 1908 Mrs. Ellen Graham, who became a member of several government committees. She was the author of *The Tower of Siloam* and *Disinherited of the Earth*.

Asmara. Capital of Eritrea, N.E. Africa. It is 74 m. by rly. S.W. of Massawa, and stands 7,765 ft. above sea level. Strongly fortified and garrisoned by Italian and native troops, it contains several fine public buildings and the governor's residence. Occupied in 1889 by the Italians, it is a hub of rly. and road systems and busv agricultural and trading centre, with gold mines in the neighbourhood. Asmara superseded Massawa as the seat of government in 1900. Of strategic importance during the E. African campaign of 1941, Asmara was heavily bombed by the R.A.F. and was taken by Gen. Platt on April 1, many Italians being captured. Pop. 85,000.

Asmodeus. Evil genius of Hebrew tradition. The name is supposed to be derived from the Aeshma daeva, or demon of evil, of ancient Persian religion. In

the Book of Tobit the seven husbands of Sarah, daughter of Raguel, are said to have been successively killed by Asmodeus, hence he is sometimes regarded as the spirit opposed to matrimonial happiness. He is the principal character in Le Sage's romance *The Devil on Two Sticks*.

Asnières. Town of France, in the department of Seine. It stands on the river Seine, 3 m. N.W. of Paris, of which it is in effect a suburb. It has boat-building and other industries, and is a pleasure resort of Parisians, and a yachting centre. Pop. 71,831.

Asodake OR ASOSAN. Volcano of Japan, in Kiushiu. It is situated 27 m. E. of Kumamoto and consists of one active, Nakadake, and four quiescent peaks, the highest, Takadake, being 5,525 ft. above sea level. The outer crater, 17 m. N. to S., 10 m. E. to W., contains the five peaks and is the largest crater in the world.

Asoka (d. c. 228 B.C.). Buddhist emperor of India. He was the grandson of Chandragupta, the founder of the Maurya dynasty, and began his reign in 264 B.C. Asoka's dominions included all India from the 13th degree of latitude up to the Himalayas, Nepal, Kashmir, the Swat valley, Afghanistan as far as the Hindu Kush, Sind, and Baluchistan. After conquering the kingdom of Kalinga, about 261 B.C., he was so distressed at the horrors of war that he turned Buddhist, devoting himself to spreading the principles of Buddhism. His edicts are chiefly concerned with his code of practical morality and his methods of disseminating it. More than

thirty have been found inscribed in the local vernaculars on rocks, pillars, or in caves in different parts of his empire. One of the ten surviving pillars stands in the grounds of the fort at Allahabad. His life has been written by V. A. Smith, rev. ed. 1920; J. M. Macphail, 1918, and R. Mookerji, 1928. Consult also *The Outline of History*, H. G. Wells, 1928.

Asolo. Fortified town of Italy, in Treviso province. The ancient Acelum, it stands on a ridge 685 ft. high, 10 m. E.N.E. of Bassano, and has ruins of Roman baths, and a theatre. The 13th century castle was once the home of Caterina Cornaro, the last queen of Cyprus, who retired here following her abdication, and did much to alleviate the sufferings of the poor. Asolo was a favourite resort of Robert Browning; the house in which he lived is marked by a tablet and the street bears his name. In the parish church is a fine altarpiece by Lorenzo Lotto.

Asopus. Name of several rivers in ancient Greece. The most important were (1) in Sicily, flowing into the Corinthian Gulf; (2) in S. Boeotia, rising near Plataea. In mythology, Asopus was a river-god with twenty daughters, most of them associated with geographical names, especially of cities.

Asp. Term for various poisonous snakes. It is applied to the *Vipera aspis* of S. Europe and especially to the Egyptian snake now used by Egyptian jugglers, possibly the sacred serpent of ancient Egypt. Cleopatra's asp is believed to have been the N. African horned viper, *Cerastes cornutus*. Asp and the variant

Asmara. Victorious Indian troops marching through the capital of Eritrea after it was captured on April 1, 1941

aspic are used in poetry to denote any venomous snake. See Snake.

Asparagine OR AMINO-SUCCINAMIC ACID. Crystalline nitrogenous body originally found in asparagus (1805). It also occurs in the juices, growing buds, and germinating seeds of many other plants. By means of ferments asparagine, $C_4H_8N_2O_3$, is converted into ammonium succinate, by nitrous acid into malic acid, and by boiling with acids and alkalis aspartic acid and ammonia result.

Asparagus. Genus of plants of the family Liliaceae. The best known species is the common asparagus (*A. officinalis*), a native of the sandy S. and W. districts of Britain and of the sea-shores of Europe generally, first cultivated in Britain in the 16th century. The establishing of a bed of asparagus is a long process, since at least three years must elapse from the sowing of the seed until the time the plants are mature for cutting. But, once established, the bed will continue to yield a crop annually for 25 years or more. Cutting begins after three years, during the period from the middle of April to the end of June. After this, the plants are left to make their characteristic annual growth of fern-like foliage during July and August.

Asparagus Fern is the name given to various greenhouse perennials with light and feathery foliage, bearing orange and black

Aspasia, wife of Pericles

was greatly exaggerated by contemporary writers, Aristophanes accusing her of instigating the Samian and Peloponnesian wars. When Pericles was indirectly attacked by an accusation of impiety brought against Aspasia, he successfully defended her.

Aspasia. The wife of Cyrus the Younger. A native of Phocaea, her name was altered from Milto to Aspasia by Cyrus. On the death of Cyrus she became the mistress of Artaxerxes, who later gave her up to his son Darius. Later Artaxerxes took her back and made her priestess of Artemis at Ecbatana.

Aspdin, JOSEPH (1779-1855). British inventor. Working as a stonemason at Leeds, he invented cement; presumably by accident, as he was ignorant of chemistry and applied science. He found that by mixing finely pulverised lime with clay, burning it at a high temperature so that the carbonic gas was expelled, and pounding the resulting product to

married her. Although it was illegal for any Greek to marry with a foreigner, Pericles' son by Aspasia was legitimised by a special decree. Her influence with Pericles

Portland Cement Association, was unveiled in the town hall of Leeds, Sept. 6, 1924, the centenary of the invention. See Cement.

Aspen (*Populus tremula*). Tree of the family Salicaceae. A native of Europe, N. Asia, and N. Africa, it attains a height of from 50 ft. to 80 ft. It has a grey bark

Aspen. Leaves of this tree, which are moved by the slightest of breezes

and spreading branches, and is a shallow-rooting tree with many suckers. The leaves are oval or roundish with irregularly toothed edges. The growth is rapid and the white wood inferior. The leaves are moved by the slightest breeze, and to this is due the popular image of the aspen leaf. See Poplar.

Asperges (Latin, Thou shalt sprinkle). Service preceding the principal Mass on Sundays in the Roman Catholic Church. The celebrant, having entered the sanctuary, sprinkles holy water from a portable vessel called the aspersorium, by means of a brush called aspergill or aspersol, on altar, clergy, and people. The service dates from the 10th century.

Aspern, BATTLE OF. Fought between the French under Napoleon and the Austrians under the archduke Charles, May 21-22, 1809. It is the French name for the encounter called by the Austrians the battle of Essling. The French had occupied Vienna, but the Austrian army was in being on the other side of the Danube. Napoleon sent his army across the river, using the island of Lobau as a centre for this operation, and soon 40,000 men were assembled on the Marchfeld, a plain between the villages of Aspern and Essling.

The French were unmolested while they crossed, but as soon as

Asparagus. On the left is a clump of the cultivated vegetable, showing how the edible shoots spring from the roots. On the right are two pieces of wild asparagus, showing the partly opened and fully developed upper growth

berries. *A. sprengeri* is a popular indoor plant, while *A. plumosus* is another variety. See Smilax.

Aspasia. The wife of Pericles. The daughter of Axiochus and a native of Miletus or Megara, she removed to Athens, where her wit and intelligence captivated Pericles, who divorced his wife and

powder, he evolved a material which was similar to Portland stone after water had been added and the mixture had set. Calling this substance Portland cement, Aspdin patented the process on Oct. 21, 1824, and set up a factory at Wakefield. A tablet to his memory, presented by the American

Asphalt. Damaged surface on the Victoria Embankment, London, being repaired by re-surfacing with hot powdered asphalt

they were over the last branch of the river, early on the 21st, the Austrians came on in five columns. Fighting ensued round the two villages, but neither side had secured any decided success when night came on. In the morning, fresh forces having arrived, the two villages were lost and regained, the Austrians in the end holding one and the French the other.

Napoleon then attacked and broke the Austrian centre, but the archduke prevented the advance from continuing, while the bridges behind the French were destroyed. In these circumstances Napoleon ordered the attack to cease and all the efforts of his troops were directed towards beating back the oncoming Austrians. The French at length got back to Lobau, and the battle ended in their defeat, the first ever suffered by Napoleon. The losses on both sides were heavy, amounting to about a third of the forces employed, which were 80,000 or 90,000 on either side.

Asphalt. Bituminous material associated with some inert mineral matter. Natural asphalt occurs in two main forms: (1) bitumen-impregnated limestone, known as rock asphalt; and (2) a fluid form composed of bitumen and silica (lake asphalt). Rock asphalt is found at Lovagny and Seyssel in France; at Neuchâtel in Switzerland; and at Ragusa (Dubrovnik) in Yugoslavia. Lake asphalt is found at the Pitch Lake (q.v.) in Trinidad, which yields annually upwards of 100,000 tons. At the middle of this lake the asphalt is liquid; nearer the shore it is semi-fluid in consis-

tency. Rock asphalt, after crushing and processing to free it from earthy materials, is used in one of two forms: powdered and heated, it is used directly as a paving material; it is also melted down and moulded into blocks of "mastic." For paving and road surfacing, the crushed and powdered asphalt is laid and rolled, after heating on the site, and then worked with heated irons to produce a smooth and impermeable surface. Mastic asphalt, after remelting in cauldrons at the place where it is to be laid or applied, is used to form damp-proof courses in brick or stone walls, for lining basements or areas against dampness; or to produce a waterproof top layer over a flat roof.

In the repairing of existing asphalt roadways the defective patch is "roasted" to melt the old layer, and new material is laid. Small portable roasters consist of a shallow bed of live coal supported over the patch and a few inches above it; larger (mechanical) appliances direct a body of flame over a large area of road, being fed by oil fuel. In another process the worn asphalt is dug out and new hot powdered material laid instead; the old material can be livened up with new and brought again into use. Lake asphalt is used with rock asphalt to produce mastic. A controlled amount of sharp grit is added, according to the solid content of the bituminous limestone, various grades being made for different purposes. Asphaltum is the name given to

a protective paint which is made from asphalt.

Under the influence of sunlight asphalt deteriorates; also, owing to its naturally dark colour, it absorbs solar radiation and becomes very warm, undergoing considerable expansion. This latter defect is overcome by using a top layer of crushed oyster shells or Derbyshire spar on a flat asphalt-covered roof or in a similar situation. Asphalt is attacked by oils and acids. During the Second Great War asphalt roofs proved very vulnerable to incendiary bombs, owing to the highly combustible nature of the bitumen content.

Artificial asphalts are made by mixing natural bitumen or some hydrocarbon of the same type with such materials as chalk, lime, sand, etc. Thus pitch or coal-tar can be used with crushed natural rock, the mixture being warmed until it is semi-fluid in form, and then laid and compacted. A hard-wearing top surface can be given to both the natural and the artificial product by incorporating suitable stone chippings, such as coloured marble. By incorporating certain pigments with the mastic a coloured asphalt surface is obtained, often used for tennis courts. See Bitumen; Road.

Asphalt. Lake in Trinidad. It yields large quantities of pitch or asphalt, and is better known as Pitch Lake (q.v.).

Asphodel (*Asphodelus*). Small genus of perennial herbs of the large family Liliaceae. Natives of the Mediterranean region, they

Asphodel. *Asphodelus ramosus*, one of the species of this Mediterranean genus

have fleshy roots in bunches and long slender leaves. The white or yellow flowers are clustered around the upper part of the tall stem, and are very showy. They are old-fashioned garden flowers, particularly the white asphodel (*A. albus*) of S. Europe and the yellow asphodel (*A. creticus*) of Crete. The ancient Greeks planted asphodel over graves, and Homer, in the *Odyssey*, speaks of an asphodel-meadow of vast extent in the under-world, the haunt of the dead. It was also used as an article of food by the poorer classes. The name daffodil is a corruption of asphodel. See Bog Asphodel.

Asphyxia (Gr. *a*, not; *sphysis*, pulsation). Condition produced by arrest of the respiratory functions ultimately terminating in death. Asphyxia may be due to natural causes, such as blocking of the pulmonary artery by a blood-clot, obstruction of the air passages by tumours, diphtheritic membrane, etc., or paralysis of the muscles of respiration by narcotic poisons such as opium.

Three stages are recognized in the condition. In the first the breathing is deeper, more laboured, and more rapid than normal, and muscles not usually concerned with respiration are called into play. In the second stage the efforts to obtain air become violent and convulsive, and are succeeded by general convulsions. In the third stage the sufferer becomes unconscious, all the muscles of the body are relaxed, and the pulse is scarcely perceptible. Feeble attempts at respiration occur at longer and longer intervals, and eventually death supervenes. The treatment of asphyxia is to remove the cause at once, if possible, and then start artificial respiration. See Drowning.

Aspic. Savoury jelly made from calves' feet, to enclose meat, fish, etc., flavoured with herbs, vinegar, and sherry. Aspic is also a poetical form of asp, and the jelly is perhaps so called from its being cold to the touch, like a snake.

Aspidistra. Foliage plant of the family Liliaceae, usually, but erroneously, called the parlour palm. A native of Japan and China, it was introduced into Britain in 1822. Ordinary garden soil with a mixture of leaf-mould suits it best, and it will flourish even in a smoky atmosphere.

Plunging the pot up to the brim in a pail of water of atmospheric temperature for about half an hour once a week, and sponging the leaves, is the best method of watering the plant in the absence of showers. When the aspidistra outgrows its pot, it should be separated by division of the roots in March. The presence of too much sand in the soil has a tendency to induce variegation in the colour of the leaves, and the practice of growing in very sandy soils is often indulged in for experimental and trade purposes.

Aspirate (Lat. *ad*, on; *spirare*, to breathe). Letter pronounced with a more or less emphatic emission of breath, or a sign used to indicate the same. Ancient Greek possessed two such signs, called rough and smooth, the former denoting an *h*-sound, but the distinction has now disappeared. French grammarians also speak of a mute and an aspirated *h*, but the latter is never pronounced. Its only effect is to prevent the elision of a vowel (*le Huguenot*) and to render the final consonant of a preceding word silent (compare the pronunciation of *les hommes* with that of *les Huguenots*). Although English recognizes no such difference, an idea of the existence and nature of the soft breathing may be obtained by contrasting the pronunciation of *an ice pudding*, where a sort of catch in the breath is heard, with that of *a nice pudding*. See Phonetics.

Aspirator. Appliance employed in filtering, and in several industrial and chemical processes. It is used to move fluids or gases by the production of a current of air. The simplest form of aspirator consists of a vessel with an outlet and an inlet tap. It is filled with water. When the tap is opened the water flows out, and air or other gaseous fluid is drawn through the upper tap from any other vessel with which it has been connected. The filter pump is another form of aspirator. It is

Aspirator. Surgical form, used for the removal of fluid matter from the body

a tube through which water is passed under pressure, and a small opening in the side of the tube leads from a vessel from which it is desired to withdraw the air. As the water passes through, it draws the air with it, thus rarefying the air in the connected vessel and creating a partial vacuum.

Aspirin. Short name for acetyl-salicylic acid, ($C_9H_8O_4$), also sold under other names. The drug is used in rheumatism as an antipyretic, and to relieve neuralgia, headache, sciatica, etc. The dose is from 5 to 15 grs. In excessive doses aspirin tends to depress the heart's action.

Aspromonte. Forest-clad mountain of S. Italy. It rises behind Reggio di Calabria in the prov. of that name, and overlooks the Strait of Messina. The W. extremity of the ancient Sila range, it was the scene of the defeat and capture of Garibaldi by the Italian forces in 1862. Montalto, 6,423 ft., is the highest point.

Asproptomato. Modern name of the Greek river Achelous (*g.v.*). The name means white river.

Asquith, ANTHONY (b. 1902). English film director. Born Nov. 9, 1902, he was the youngest son

Anthony Asquith, English film director

of the 1st earl of Oxford and Asquith (*g.v.*). Entering film production, he directed *Shooting Stars*, *Underground*, *Tell England*, *Moscow Nights*, *Pygmalion*, *French With-out Tears*, *We Dive at Dawn*. **Asquith, SIR CYRIL** (b. 1890). British judge. The 4th son of the 1st earl of Oxford and Asquith (*g.v.*), he was educated at Winchester and Balliol College, Oxford, and was called to the bar in 1920. Between 1925 and 1938 he was assistant reader in common law to the council of legal education, becoming a member of the council in 1938. Recorder of Salisbury, 1937-38, he became high court judge attached to the general claims tribunal, 1939; chairman of the commission on higher education in the colonies, 1943-44; chairman of the royal commission on equal pay for equal work, 1944; and, in Feb. 1946, lord justice of Appeal and Privy Councillor. His publications include *Trade Union Law for Laymen*, 1927; *Life of Herbert Henry Asquith* (with J. A. Spender), 1932.

Asquith, HERBERT (1881-1947). English poet and novelist. The second son of the 1st earl of Oxford and Asquith (*q.v.*), he was born March 11, 1881, and was educated at Winchester and Balliol College, Oxford. He was called to the bar in 1907. His poems include *The Volunteer*; *Poems*, 1914-18; *Youth in the Skies*, 1940; his novels comprise *Wind's End*; *Young Orland*; *Mary Dillon*; and he wrote a memoir, *Moments of Memory*. He died Aug. 5, 1947. In 1910 he married Lady Cynthia Charteris, daughter of the 11th earl of Wemyss and March, and a short story writer.

Asquith, HERBERT HENRY. This distinguished statesman took the title of 1st earl of Oxford and Asquith. See Oxford and Asquith.

Asquith, MARGOT. The second wife of the above H. H. Asquith appears under Oxford and Asquith, Countess of.

Asquith, RAYMOND (1878-1916). British lawyer. Eldest son of the 1st earl of Oxford and Asquith, he was born Nov. 6, 1878, and educated at Winchester and Balliol College, Oxford. After an exceptionally brilliant scholastic career, he was called to the bar in 1904. A distinguished lawyer, he was Liberal candidate for Derby when the First Great War broke out. At once he obtained a commission, and in 1916 joined the Grenadier Guards in France. On

the absence of the chestnuts or callosities below the hock; and from zebras and quaggas in the suppression of the striping, which is reduced usually to shoulder and back stripes, though striped legs are not uncommon.

In the wild state the ass inhabits Asia and Africa and includes several sub-species. The kiang of Tibet is the largest and most horse-like, and stands about 13 hands high at the withers. The dziggeta of Mongolia and the onager of Persia, Syria, and W. India are smaller and more lightly built, seldom rising more than 11 hands. The African wild ass, of which there are several varieties, inhabits

Nubia, the Sudan, and Somaliland, and is of rather stouter build, good specimens rising 12 hands. It is from this species that the domestic breeds have been derived. The domestic ass, or donkey, as usually seen, owes its stunted size and its unkempt appearance to neglect and promiscuous breeding. Owing to its hardy constitution, docile disposition, working capacity, and cheapness, it is largely employed by those who cannot afford a horse.

Proverbially regarded as stupid and stubborn, the ass is really remarkably intelligent, and, when kindly treated, the reverse of stubborn. Though early domesticated in Europe, it was not introduced into England until the days of Elizabeth. The largest of the domesticated asses is that of Poitou, which attains a height of from 14 to 16 hands, and is mainly used for mule breeding. A fine specimen is very valuable. The milk of the ass possesses qualities which render it suitable for invalids; its flesh is eaten in many parts, including France, and its skin is used in making drums.

Assab. Harbour of Eritrea. It stands on the W. coast of the Red Sea, at the entrance to Assab Bay, is a wireless station, and has a large export trade in hides, pearls,

and mother-of-pearl. Its industry is production of salines. Assab and the surrounding district were bought as a coaling station from the reigning sultan in 1870 by an Italian steamship company, and in 1882 became an Italian crown colony. The commissariat of Assab has an area of 5,500 sq. m. and a pop. of 3,926.

During the Second Great War Assab was announced as captured June 12, 1941, by troops from British ships and units of the Royal Indian Navy.

Assagai or **ASSEGAI**. Missile of the javelin kind employed by certain African tribes. The word is Berber, and came into English

Assagai. Specimens from weapons of various tribes: 1. Nubian desert; 2. S. Africa; 3. Madagascar; 4. S. Africa; 5. Lake Banguela (S. Central Africa); 6. Somaliland; 7. Zulu; 8. S. Africa; 9. Zulu

through Arabic and Portuguese, the form assagai being the more correct. The name was originally given to a Berber weapon adopted by the Moors, a kind of slender spear or lance of hard wood, usually pointed with iron.

Assai Palm (*Euterpe edulis*). Native tree of Brazil. It is slender, graceful, from 40 ft. to 100 ft. in height, the bare cylindrical stem being surmounted by a head of long pinnate leaves with narrow leaflets. The centre of this leafy tuft, including the growing point and leaf-buds, is plucked out to

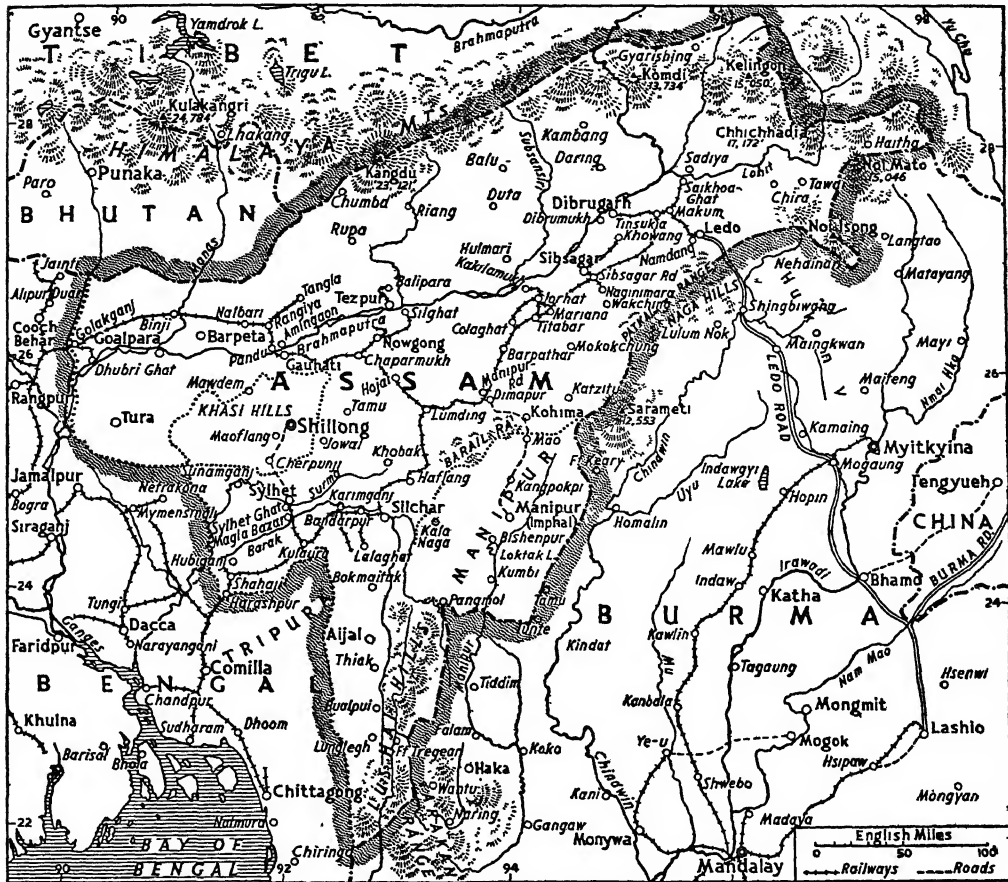

Assai Palm. *Euterpe edulis* of Brazil, both the growing point and the fruit of which are eaten

Ass. African wild ass and her foal. From this species the domestic breeds have been derived
Gambier Bolton, F.Z.S.

Sept. 15, 1916, he was killed near Ginchy while leading his men. His son Julian (b. 1916) became second earl of Oxford and Asquith.

Ass. Name applied generally to one of the four divisions of the genus *Equus*, the other three being the horse proper, the zebra, and the quagga. Asses differ from horses in the possession of an erect mane, a tufted tail, and long ears, and in

Assam, 1948. Map of the extreme N.E. province of India which lies beyond Bengal. It is a great centre of tea-growing. In 1947 almost all the Sylhet area was transferred to the E. Bengal province of Pakistan

be cooked as a vegetable or pickled, but this entails the sacrifice of the tree. It is more profitably allowed to flower and produce its sloe-like fruits, whose pulp, kneaded in water, forms a creamy fluid to which sugar and cassava farina are added. The resulting compound is a very nutritious food, which is the staple diet of large numbers of people, especially in and about the seaport of Para.

Assal. Salt lake of French Somaliland, E. Africa. It is in the volcanic basin of the Adel, 25 m. S.W. of Tajura, and is some 600 ft. below sea level—the lowest part of Africa. It is 10 m. long and 4 m. broad.

Assam. Prov. of the republic of India. In the extreme N.E. of the sub-continent, it is bounded N. by Bhutan and Tibet, W. and S.W. by Pakistan (E. Bengal), and E. and S.E. by Burma. It comprises many valleys, mainly of the Brahmaputra and its tributaries and the Surma, and the elevated

region which forms the watershed of these rivers. Its area, exclusive of Manipur and the Khasi states, is 55,043 sq. m. Mountainous in the N., where the eastern Himalayas form a natural boundary, the surface is generally hilly, especially S. of the Brahmaputra, the Khasi and Jaintia Hills districts covering an immense limestone area, the working of which has been carried on for a very long period. Coal and petroleum are extensively found, and gold and iron-ore are worked.

The soil is extremely fertile, although little more than one-third is under cultivation. Tea, its chief commercial product, was first cultivated in 1835, and the industry spread to such an extent that more than half the total area under tea in India now belongs to Assam. Rice is the staple product and mustard-seed is obtained; while in the forests several varieties of hard-wood trees flourish, besides lacquer and rubber-producing trees. The transport

facilities comprise an important system of railways in addition to the river service, by both of which communication is maintained with Calcutta. The rainy season lasts about half the year; Cherpunji, perhaps the wettest place on earth, averages over 400 ins. a year. Volcanic and seismic disturbances are not unknown, and the earthquakes of 1869, 1875, 1882, and 1897 caused much damage.

Tigers, leopards, bears, rhinoceroses, buffaloes, elephants, and other mammals infest the forests, and snakes also exist. Hinduism is the religion of nearly one-half of the natives; about one-fourth are Mahomedans, and one-sixth profess animism. Most of the towns consist of collections of small villages. The largest of them are Gauhati and Sibsagar; while the administrative headquarters are at Shillong. Pop. 10,204,733.

Assam is one of the least densely populated provinces of India. It was subject to incursions

by the hill tribes, and the Ahoms, who gave their name to the province, were engaged in ceaseless conflict with the Mahomedans of Bengal down to 1826, when, at the close of the first Burmese war, the southern territory was ceded to the British. Following gross misgovernment by the native ruler, the remaining portion of Assam was annexed and the whole province attached to Bengal. Constituted a separate province in 1874, Assam became part of the new province of Eastern Bengal and Assam in 1905, but in 1912 again became a separate province. On April 1, 1937, it was constituted an autonomous prov. In 1947 the dist. of Sylhet, formerly in Assam, was assigned to the Pakistan prov. of E. Bengal.

With the withdrawal of the British from Burma in May, 1942 the Japanese were at the frontier of Assam; but it was March 17, 1944, before they crossed it, in considerable strength, isolating both Imphal (Manipur) and Kohima. Kohima was relieved, and the Japanese cleared from it, by May 14; Imphal, fed, munitioned, and reinforced by air, held out until at the beginning of June troops broke out simultaneously from Kohima and Imphal, to meet and clear the road between them on June 22. By Aug. 25 the Japanese had been forced back over the frontier. See *Burma Campaign*; *Ledo Road*; *Sylhet*.

Bibliography. History of Upper Assam, L. W. Shakespear, 1914; History of Assam, E. Gait, 2nd ed., 1926; History of Assam, 1681-1826, S. K. Bhuyan, 1933.

Assam Highway. Road projected as an alternative supply route to China in the event of

Japan's capture of Rangoon and the consequent closing of the ocean terminus of the Burma Road. The route of the Assam Highway was surveyed in 1939, but the actual construction was not put in hand until 1940. The road runs from Chungking to Sadiya, the railhead of the Bengal-Assam railway, and gives the road-rail connexion with Calcutta (300 m.) and Chittagong (600 m.) on the Bay of Bengal. The total length of the Assam Highway is 2,200 miles, and its construction entailed even greater difficulties than those attending the building of the Burma Road. Between Chungking and Batang it crosses mountain ranges and broad, swift-flowing rivers. From Batang, over the Lower Himalayas, it passes through some of the most mountainous country in Asia. At one point it is 9,000 ft. above sea level, several thousand feet above the maximum height of the Burma Road.

Assassination. Term applied to the murder of a prominent personage. Most assassinations have been inspired by political motives, though occasionally, as in the cases of the duke of Buckingham and David Rizzio, private considerations have been a contributory cause.

Among instances in the Bible may be cited the slaying by Jael of the Canaanite leader Sisera, and of Eglon, king of Moab, by the judge Ehud; and in classical antiquity the murders of Hipparchus, tyrant of Athens, by the Athenian youths Harmodius and Aristogiton; of Philip of Macedon, of Julius Caesar, and of Elagabalus and other Roman emperors.

Among later victims were Albert I, German king, 1308; James I of Scotland, 1437; Cardinal Beaton, 1546; David Rizzio, favourite of Mary Queen of Scots, 1566; Lord Darnley, second husband of Mary Queen of Scots, 1567; the regent Murray, 1570; William the Silent, prince of Orange, 1584; Henry III of France, 1589; Henry IV of France, 1610; George Villiers, 1st duke of Buckingham, 1628; Wallenstein, the great imperialist general in the Thirty Years' War, 1634; Archbishop Sharp, 1679; Gustavus III of Sweden, 1792;

and the French Revolutionist J. P. Marat, 1793.

Notable victims in the 19th century were Paul I, emperor of Russia, 1801; the British prime minister Spencer Perceval, 1812; the German writer Kotzebue, 1819; Charles Ferdinand, duc de Berri, 1820; Abraham Lincoln, president of the U.S.A., 1865; Michael Obrenovitch III, prince of Serbia, 1868; the Spanish soldier and statesman Marshal Prim, 1870; the earl of Mayo, viceroy of India, 1872; Alexander II, emperor of Russia, 1881; James Garfield, president of the U.S.A., 1881; Lord Frederick Cavendish and Thomas Henry Burke, 1882; Marie François Sadi-Carnot, president of France, 1894; Elizabeth of Austria, 1898; Humbert, king of Italy, 1900.

William McKinley, president of the U.S.A., was assassinated in 1901; Alexander, king of Serbia, and his wife Draga, 1903; Carlos I, king of Portugal, and the crown prince, 1908; the Russian premier Stolypin, 1911; George I, king of the Hellenes, 1913; the archduke Francis Ferdinand and his wife, 1914; the French socialist Jean Léon Jaurès, 1914; Rasputin, favourite of the Russian empress, 1916; Nicholas II, emperor of Russia, and his family, 1918; Sir Henry Wilson, British general, 1922; Paul Doumer, president of France, 1932; the Japanese premier Inukai, 1932; Nadir Shah, ruler of Afghanistan, 1933; Engelbert Dollfuss, dictator of Austria, 1934; Alexander, king of Yugoslavia, 1934; Huey Long, dictator of Louisiana, 1935; Sir Michael O'Dwyer, British administrator, 1940; Trotsky, former Bolshevik leader, 1940; Heydrich, Nazi official in Czecho-Slovakia, 1942; the French admiral Darlan, 1942; Lord Moyne, British administrator, 1944; M. K. Gandhi, Indian leader, 1948; Count Bernadotte, U.N. mediator in Palestine, 1948.

Assassins. Name originally given by Europeans to the followers of the chief of a secret sect among the Mahomedans in Syria. It is a corruption of *Hashishin* (hashish eaters), since it was the custom to intoxicate the votaries of this sect with hashish before they discharged the tasks imposed upon them by their chief. Their law was unquestioning obedience to their head; their method mainly the organized murder of the victims selected by him. Their founder was Hassan Ibn Sabbah, who took the title of Sheikh-al-Jabal, the "old man of the

Assam. A chief's house in North Cachar. The large basket is used as a grain measure

mountains." He settled in Persia towards the end of the 11th century, but towards the middle of the 12th century the seat of authority was transferred to Syria. The sect or society whose initiated members had discarded the Mahomedan faith, while a rigid orthodoxy was generally imposed upon the uninitiated associates, played an obscure but active part in the politics of the East and in the intrigues of factions among Crusaders. They were finally suppressed in the 13th century by Hulaku, khan of the Western Mongols, who had made themselves masters of western Asia. So powerful was the society in its most flourishing days that it effected the murder of two caliphs.

Assault. In English law, a present threat of using force to the person of another, accompanied by a real or apparent intention and ability to carry the threat into effect. Words alone cannot be an assault. But the raising of a hand, with the apparent intention of striking a blow, is an assault, though the blow is never struck. If the blow is struck, however lightly, the offence is a battery which includes an assault. An assault is a crime punishable on summary conviction by a fine not exceeding £5 in amount, or by a sentence of not more than two months' imprisonment. On indictment, common assault may be punished up to one year's imprisonment. Aggravated assaults on females and young boys are more severely punishable. Assault with intent to rob is a felony and is severely dealt with.

Assaye. Village in Hyderabad, India. It is about 260 m. N.W. of the city of Hyderabad, and 43 m. N.E. of Aurangabad. It is notable for the battle between the British and the Mahrattas, Sept. 23, 1803.

In order to forestall the troublesome Mahratta chieftains, who were in league with France, two British armies were sent to Central India. General Wellesley, afterwards duke of Wellington, who commanded one army, found the enemy in a strong position near a river junction outside Assaye.

Although greatly outnumbered, he attacked at once. His men crossed the river and were led right up to the enemy's guns, which were in the charge of French officers and did much execution. The British got to close quarters, and using their bayonets put the foe to flight, but the fight was by no means over, for the Mahratta artillery got to work again, and their numerous cavalry was acting

vigorously when Wellesley saved the day by leading his horsemen against them. This charge was decisive, and the Mahrattas were routed. Their losses have been estimated at 12,000; those of the British were 1,650, a very high proportion of the men engaged.

Assaying (Fr. *essayer*, to try, test). Originally confined to the testing of ores and bullion, the term assaying now includes a large variety of industrial analyses. The accuracy required depends upon the particular industrial purposes for which the analysis is needed, the evaluation of precious metal ores and alloys requiring the highest degree of accuracy. Speed is usually of great importance, and advantage is taken of any new developments, both chemical and physical, which will shorten the manipulation without impairing the accuracy of the result.

The sample submitted to the analytical process must be truly representative of the consignment from which it is taken, and the importance of the sampling procedure cannot be over-emphasised. Considerable skill and experience are necessary and the method adopted will depend upon such considerations as the nature of the material, its monetary value, the processes to which it is to be subjected, and the labour and apparatus available. Consignments of ores and crushable materials may be sampled by taking one bag from, perhaps, every twenty, or by sampling one or more trucks from a train load. This would give the first "cut," the size of which would depend upon the total quantity to be sampled, the particle size, the value of the material, and the regularity of distribution of the mineral content. Fine material is more easily mixed, and is therefore easier to sample, but fine crushing is expensive and may be undesirable for economic or other reasons. Reduction of a consignment to a quantity suitable for analysis is effected by "hand sampling" or by "machine sampling." In the former case the pile of ore is "trenched" in two or more directions at right angles, the material removed forming the cut, or it may be built into a cone, flattened, divided into four quarters, and one, or more, of the quarters taken as the cut.

Another method is to shovel the ore from one point to another, one shovelful being taken at regular intervals to form the sample. The final assay sample is obtained

by repeating such treatments, crushing and grinding as necessary, until a suitably small sample is obtained. Sampling machines are of many designs, but work on one of two principles. The ore is caused to fall vertically and the sample is obtained either by deflecting a portion of the stream of ore continuously with a baffle or by removing a complete section of the stream at regular intervals with a rotating cutter. The process of crushing, mixing, and cutting is continued until a sample of suitable bulk is available for the assay office. The assayer obtains the actual sample for analysis by similar methods used on a smaller scale.

Metals are preferably sampled in the molten state, but this is not always possible. During solidification some segregation of the constituents usually takes place. This leads to sampling errors unless well-tried methods, peculiar to each metal or alloy, are employed. A suitable quantity of the metal is chipped, sawn, drilled, milled, or punched from specified points on the ingots that are to be sampled.

Dry or Fire Assay

The dry or fire assay simulates a smelting operation. The ground ore sample is mixed with such reagents and fluxes as are necessary and fused in a crucible. The reduced metal separates by gravity from the slag of fluxed gangue minerals which, after solidification, may be broken away with a hammer. In the assay of gold and silver ores, the weighed sample is mixed with lead oxide, charcoal, sodium carbonate, and borax, transferred to a crucible and heated to fusion in a furnace. The lead oxide is reduced by the charcoal to lead, which alloys with the gold and silver present in the ore and, when the melt is cast into a suitable mould, settles to the bottom where it solidifies to a "button," leaving a glassy, brittle slag on the surface. The lead alloy, cleaned from slag by hammering and brushing, is then cupelled, by fusing it at a yellow heat in an absorbent, shallow, cup-shaped vessel. This absorbs the lead, leaving the gold and silver in a globule or "pill," which is weighed and subsequently treated with "parting" acid, to dissolve away the silver. After annealing, the gold is weighed, the loss in weight indicating the amount of silver.

In the wet assay the metallic constituents of the sample are brought into solution, usually by

acid treatment. Chemical methods of separation are used to remove substances which would interfere with the reactions to be employed. Determination may be concluded by volumetric, colorimetric, gravimetric, or electrolytic methods.

In a volumetric assay the prepared solution is titrated with a standard solution of a chemical which reacts, preferentially, with the salts of the metal to be determined. Addition of this standard solution is continued to completion of the reaction, indicated by some convenient colour change which is due to a chemical "indicator." The percentage of iron in an ore, for example, may be determined as follows: the iron, brought into solution in sulphuric acid, is treated with a suitable reducing agent to form ferrous sulphate. Measured quantities of a standard solution of potassium permanganate are added to this solution which decolorises the permanganate so long as ferrous salts are present. In this instance the standard solution itself acts as the indicator: when all the iron has been oxidised, one further drop produces a pink coloration. The amount of iron in the ore is then calculated from the volume of the standard potassium permanganate solution added.

Testing by Colour

Colorimetric assays are based on the fact that some metals produce highly coloured solutions, the depth of colour being proportional to the quantity of the metal present. If ammonia, for example, is added to a solution of copper, an intense blue colour is developed. The assay sample having been dissolved, the copper is first separated from interfering elements with sulphuretted hydrogen. The precipitated sulphide is filtered, washed, and redissolved in acid. Ammonia is then added and the blue colour formed is matched with a series of standard solutions, similarly prepared, containing varying quantities of copper. The copper content is thus determined by comparison. The accuracy and speed of the method may be increased by physical means, e.g. photo-electric cells.

In the gravimetric assay the metal itself, or one of its compounds, is separated and weighed. Lead may be determined, after separation, by treating an acid solution with concentrated sulphuric acid and heating until all the lead is converted to sulphate. This is then filtered, washed, dried,

and weighed. The electrolytic assay depends upon the fact that the solutions of certain metallic compounds are electrolytes from which the metal may be deposited by the passage of an electric current. The electrode is weighed before and after the electrolysis, the gain in weight giving the quantity of metal deposited from the solution.

Asselyn or **ASSELIN**, JAN (1610–60). Dutch painter. Born at Diepen, near Amsterdam, he was trained under Esaias van der Velde and finished his studies in Italy. His pictures largely consist of views near Rome, in which cattle and figures are skilfully introduced. He died at Amsterdam.

Assembly (Lat. *ad*, to; *simul*, at one time). In general, a meeting of any kind. The term is used especially for an organized body of persons meeting together for some common purpose, and is thus different from an assemblage or promiscuous gathering. In a more particular sense the word is used to describe the second or upper house of certain legislative bodies; for instance, South Africa has a house of assembly. The word has a wide vogue in ecclesiastical matters, largely because it is used frequently in the Bible to translate two Hebrew words which denote the gathering together of the Israelites. Presbyterians especially adopted it about the time of Knox, as in the case of the Assembly of Divines or Westminster Assembly. Today the governing body of most of the Presbyterian churches is called the General Assembly. (See National Assembly.)

The phrase unlawful assembly has a legal significance. The best definition is by Sir J. Stephen: "An assembly of three or more persons (a) with intent to commit a crime by open force; or (b) with intent to carry out any common purpose, lawful or unlawful, in such a manner as to give firm and courageous persons in the neighbourhood of such assembly ground to apprehend a breach of the peace." In a case in 1882, where the Salvation Army persisted in holding meetings at a place where the rough element invariably broke them up with

violence, it was held that the Salvation Army meetings were not unlawful assemblies, because they had no unlawful or violent intent—the violent intent was on the side of their opponents. An unlawful assembly may be dispersed by force.

Assembly of Divines. Meeting convoked by the English Parliament in 1643, but forbidden by Charles I, to consider the liturgy, government, and doctrines of the Church. It is also called the Westminster Assembly (*q.v.*).

Assen. Town of Holland, capital of Drenthe province. It is 16 m. by rly. S. of Groningen, and is connected with the Zuider Zee by canal. An educational and civic centre, it has a museum containing some of the prehistoric remains found in the tumuli of the neighbourhood. Pop. 20,235.

Assent, ROYAL. Final stage in the passage of a bill through the British Parliament. The ceremony takes place in the House of Lords, and the assent is given at one time to a group of bills which have been duly passed by parliament. The king is represented by three commissioners, who sit in front of the throne, while the Speaker and members of the House of Commons stand at the bar. A clerk reads out the king's commission empowering the three peers to act for him, and the clerk of the crown reads out the title of each bill. The clerk of the parliament replies in Norman French, *Le roy le veult* (the king wishes it), and the bill is law. See Act of Parliament.

Asser (d. c. 909). An English historian and bishop. A monk of St. Davids, he was invited to court by King Alfred about 885, where he assisted the king in his studies. Some time before 900 he was appointed bishop of Sherborne. He was the author of a Life of Alfred, *De rebus gestis Aelfredi Magni*, an edition of which was issued by Archbishop Matthew Parker in 1572 and by Francis Wise, 1722. The best edition is that of W. H. Stevenson, 1904.

Assessment (Lat. *ad*, to; *sedere*, to sit). Term used in England, in connexion with the levying of rates and taxes, for the amount of money on which a person pays. He is assessed for income-tax for a certain amount, and his house and lands are assessed for local rates for a certain amount. In this way, the assessment being known, the amount to be paid is easily calculated at so much in the £, 8s. 6d. or 15s. 8d., or whatever it may be.

Great Britain is divided into assessment areas each with an assessment committee which approves the valuation list prepared by the rating authority. The term is also used for the damages fixed by a jury in a law court.

It is connected with assize. In early times an assize or sitting of men from the neighbourhood was held to settle questions of taxation—or, in modern parlance, to assess the taxpayers. See Rating.

Assessor. Name given to one called in by a court to assist in technical matters. The assessor is not a judge. Thus, in Admiralty cases the Elder Brethren of Trinity House may be, and often are, called in as assessors to advise the judges on matters of navigation and the like. In workmen's compensation cases the county court judge can call in a medical man to advise him on medical or surgical matters. Under the Clergy Discipline Act, 1892, lay assessors sit with the bishop's chancellor as a sort of jury to determine questions of fact.

Assets (Latin *ad*, to; *satis*, enough). Commercial term most frequently employed when an account of debits and credits is made. Such occasions are when the estate of a bankrupt is being investigated, or a company is in liquidation, or the property of a dead person is being distributed. In general, however, all the properties and possessions of a corporation, company, or individual are assets.

Asshur or **ASSUR**. Greatest of the ancient gods of Assyria. He was regarded as self-created and the father and king of the other gods. There was a great temple to him in Nineveh. See Assyria.

Asshur or **ASSUR**. The earliest Assyrian capital. It stood at Kalat Sherghat, on the right bank of the Tigris, 55 m. S.E. of Mosul, now in Iraq. Spelt more correctly Ashshur, it gave its name to Assyria. A prehistoric settlement, it was occupied by Semitic Babylonian migrants before Hammurabi, was deserted for Calah by Shalmaneser I, and was rebuilt by Tiglath-pileser I. Andrae's excavations, from 1904 onwards, revealed its Asshur temple, royal palaces, and tombs, and house foundations. See Patesi.

Assign (Lat. *ad*, to; *signum*, sign). English legal term for the passing of personal property by deed or other appropriate document. Thus, in a deed of gift of (say) furniture, the furniture is assigned by the donor. Leaseholds are assigned, but in conveyances

of freeholds the word assign is not used, because freeholds are real, not personal, property. The word is also applied legally to the person to whom property is transferred.

Assignat (Lat. *assignatus*, assigned). Name given to a species of paper money issued in France during the Revolution. The condition of the country's finances led to this expedient, and in 1790 the Constituent Assembly, on the motion of Mirabeau, issued notes to the value of 400,000,000 francs. The security behind them was the land forfeited to the state, which was assigned to the holders of the assignats, hence the name. The nation's creditors were paid by assignats and with them they could buy blocks of the public land. On the notes interest at the rate of five p.c. was promised.

So far the scheme was not altogether unsound, but in 1790 more public debts were discharged by a larger issue of assignats. They were made legal tender, and soon the country was flooded with them. Some were redeemed, but far more were issued and on them no interest whatever was paid. Consequently they began to fall rapidly in value, and the authorities in vain attempted to stop this by threatening those who refused to accept them with heavy penalties. By 1796 the assignats had become almost valueless, a state of affairs made worse by the circulation of forgeries. At one-thirtieth of their value they were exchanged for *mandats*, and later the unfortunate holders of these obtained about one-seventieth of their face value in coin.

Assignment. In Scots law, the transfer of rights or movable property to another, the equivalent of the English assignment. Such a transfer must be notified to the debtors concerned to make it valid.

Assignment. One of the most general words used to indicate the legal transfer of property from one person to another. Every species of property has its own legal mode of assignment or transfer. Thus personal chattels are assignable by delivery or by a writing called a bill of sale. Freeholds are assigned by deed of grant; leaseholds by deed of assignment; *choses in action*, except negotiable instruments, by writing under the hand of the assignor, and notice thereof to the debtor whose debt has been transferred. In equity many methods of assignment have been enforced which the common law would not have recognized. Thus, if A requested B, his debtor, to

pay the debt to C, it was an assignment of the debt to C, in equity.

Assimilation (Lat. *ad*, to; *similis*, like). Philological change, chiefly of consonants, to facilitate utterance. It is complete, when two consonants of different quality become the same (apposition, Lat. *appono*, originally *adpono*); incomplete, when they are only made more like in pronunciation (ankle, where *n* is sounded as if *g* followed, to facilitate change to *k*).

In physiology, the processes by which the living body of an organism builds up relatively simple materials into the complex substances of which it is itself constituted. In animals and non-green plants assimilation is usually preceded by the digestion of organic food into the simpler material required for the building-up process. In green plants such materials are synthesised (see Photosynthesis) from inorganic matter.

Assiniboins (Ojibwa, stone-roasters). Tribe of North American Indians of the Siouan linguistic family. Separated in late pre-Columbian times from their ancestral stock near the head-waters of the Mississippi, they migrated northward, giving their name to a stream that enters the Red river at Winnipeg and to Assiniboia, former dist. of N.W. Canada.

Assisi. Town and episc. see of Italy, in the prov. of Perugia. It is 15 m. by rly. E. by S. of the town of Perugia, and stands on a hill 1,345 ft. high. The ancient Assisium, it is dominated by a castle, and is famous as the birth-place of S. Francis (1182–1226), who established the order of Franciscans here in 1208. The monastery, founded 1228, has two churches, built one above the other and completed in 1253. They are adorned by many frescoes and pictures, the work of Cimabue, Giotto, and others, and have a crypt built in the 19th century, in which the bones of the saint were placed. Other ecclesiastical buildings are the cathedral, erected in 1140 and restored in 1572, and the churches of S. Maria, converted from a temple of Minerva, and S. Chiara, in which are buried the remains of S. Clara. S.W. of the town is the massive church of S. Maria degli Angeli, built over the oratory of S. Francis and containing the cell in which he died. At Assisi were born the poets Propertius (c. 50 B.C.) and Metastasio (1698–1782).

The town was captured from the German occupying force by the Allied 8th army on June 18, 1944. Assisi was undamaged as a result

Assisi. Historic town of central Italy. The prominent towered building is the Franciscan monastery which was founded in 1223

of the hurried retreat of the Germans, and the pictures, stained glass, etc., stored in the vaults below the Sacro Convento and the cathedral were safe. Pop. 20,000.

Assiut, *Asyūt*, or *SUT*. Prov. of Upper Egypt. It has an area of 812sq. m., and includes the districts of Abnub, Abu-Tig, Assiut, Bedari, Dakhla, Deirut, Kharga, Manfalut, and Mellawi. Pop. 1,205,321.

Assiut, *Asyūt*, or *SUT*. Town of Upper Egypt. It is situated near the Nile, 248 m. S. of Cairo. The Greek Lycopolis, Assiut has been, and still is, a centre for caravan trade with Darfur and the interior. Below El Hamra, port of Assiut, is the barrage across the Nile, completed in 1902 at a cost of £1,000,000, controlling the water supply of the Ibrahimiya Canal, which irrigates the surrounding land to within a few miles of Cairo. In 1934-38 the barrage was remodelled to increase by 3 ft. 4 ins. the head of water impounded. In the hills which rise behind the town are extensive rock tombs. Pop. 60,338. *See* Assuan.

Assize (Lat. *assidere*, to sit beside). In early England, a word with several meanings. It denoted an assembly, the decisions or laws of such an assembly, a method of judicial procedure, and a jury. The first sense passed into the second, hence the assize or laws of Clarendon and the assize or law of arms. Prices were fixed by an assize and so we have the assize of bread, ale, etc. Certain kinds of actions at law were known by the same word, e.g. the assize of *mort d'ancestor* and the assize of *darein presentment*. The assize meaning a legal action was not finally abolished in England until 1835, and in Scotland the criminal jury is still called the jury of assize.

Assize of Arms. Law of England, passed in 1181, towards the end of the reign of Henry II. By it every freeman was ordered to provide himself with armour suited to his rank and wealth. The feudal army composed of the barons and their retainers not having given satisfaction, the king fell back upon the older principle of universal service to provide a national force. By the assize a knight, or one who had an income of sixteen marks a year, had to provide a coat of mail, helmet, shield, and lance; a freeholder with ten marks a hauberk, iron cap, and lance; and all burgesses and other freemen a gambeson or leather coat, iron cap, and lance. The local justices had to see that the provisions of the law were enforced.

Assizes. Word, the plural of assize, used in England for the periodical visits of the judges to various provincial towns, where they try the more important civil and criminal cases. The whole of England and Wales, outside the metropolitan area, is divided into circuits which are visited by the judges twice, or sometimes three or four times, a year. The towns at which they sit are called assize towns. The official who records the doings of the judges is called the clerk of assize, one being appointed for each circuit. Circuits may be discontinued either temporarily or permanently by Order in Council. *See* Circuit.

Associate (Lat. *ad*, to; *socius*, companion). Name given to certain clerks of the Crown Office, and certain officials of circuits. They need not be barristers or solicitors, and their business is to help the court by drawing up a list of causes, drawing the jury

ballot, entering the verdict, making a note of the judgement, and the like. The associate always sits robed, under the judge, and facing the court. The word is also used for a member of a society whose status is not that of a full member, e.g. the Royal Academy has associate members (A.R.A.).

Associated Press. Non-profit-making, cooperative association serving the world news and photographic needs of more than 2,500 newspapers and radio stations. It operates 285,000 m. of news wires in the U.S.A., a 20,000-m. wire-photo network, and has extensive global facilities with offices and representatives in more than 150 world capitals on six continents. It employs thousands of full-time staff members and several thousand special correspondents. It produces a news report of 1,000,000 words every 24 hours. Head offices are at 50, Rockefeller Plaza, New York; the London office is at 85, Fleet Street, E.C.4.

The first Associated Press in the U.S.A. was started by J. Gordon Bennett and others in New York in 1848. There followed in 1865 the Chicago or Western Associated Press, and in 1867 the United Press. In 1889 the United Press became the Laffan News Syndicate, and the Chicago association dropped out in 1900. The existing United Press Association was founded by the Publishers' Press and two other news agencies. Other American agencies are the Hearst and International News Service, and the National Negro Press Association. *See* Newspaper; Press Association.

Association. Term for any society or combination existing for a common purpose. Thus there are business associations, of both masters and men, religious, philanthropic, political, cultural, and sporting associations.

In English history the word is used in a special sense for associations formed to protect the life of a sovereign in times of marked danger. In 1584, after the Roman Catholics had laid several plots against the life of Elizabeth, a voluntary association was formed, the members of which pledged themselves to "withstand and revenge" all attempts on her life. This association was at once legalized by Parliament. In 1696, after the failure of a plot to murder William III, a somewhat similar association was formed by Parliament. The word was also applied to a union formed by the eastern counties early in the Civil War, its

object being to keep the war outside their own borders. Cromwell was a leading spirit in this.

Association Cup. A trophy competed for annually by football clubs in England playing the Association game. It was arranged in 1871. Fifteen clubs, all amateur, entered, and the first final was played at Kennington Oval, March 16, 1872, between the Wanderers and the Royal Engineers, the former winning by one

Association Cup
English football
trophy

goal to nil. In 1884 Blackburn Rovers first won the cup, and soon afterwards amateur teams began to fall out of the competition. The cup has been won on six occasions each by the Wanderers, Blackburn Rovers, and Aston Villa. In 1889, and again in 1905-6, the method of competing was rearranged. As the competitors had become more in number than the original fifteen.

Nowadays preliminary and qualifying rounds are played all over the country between clubs in regional groups. On a Sat. in Nov., 27 survivors from this competition join 41 clubs from the third division of the football league in the first round proper of the Cup. Two rounds reduce these 68 to 17, and for the third round, in Jan., they are joined by the 44 clubs of the first two divisions and the three from the third division which have been exempted till then. After the sixth round come semi-finals.

With the exception of one game at Lillie Bridge, in 1873, and a replay at Derby in 1886, the final tie was decided at Kennington Oval from 1872 to 1892, but in the latter year it was found that the crowd had become too large for that enclosure and the final games in 1893 and 1894 were played at Manchester and Everton respectively. These grounds also proved too small, so in 1895 the game was transferred to the Crystal Palace ground, and here the final ties continued to be played down to 1914, when the competition was suspended as a result of the First Great War. From 1920 until 1922 the final tie was played on the Chelsea Football Club's ground at Stamford Bridge.

Since 1923 it has been played in the Wembley Stadium, usually in the presence of the King. *Consult* Official History of the F.A. Cup G. Green, 1949.

Association Football. For this game (popularly, Soccer), *see* Football.

Association of Ideas. In psychology, the theory that ideas are naturally so closely united that when the mind evokes one of them it recalls all others that have been associated with it. The process is involuntary, and governed by certain laws: (1) the law of succession and simultaneity: thus, places bring to mind events that have occurred there, and meeting one of two persons whose acquaintance has been made simultaneously recalls the other; (2) the law of similarity and contrast: thus, Gladstone and Beaconsfield, Homer and Virgil, Dickens and Thackeray, virtue and vice, heaven and hell, correlatives such as cause and effect, whole and part. -

According to the empirical school of the English philosophers of the 18th century, association is the combination and reproduction of ideas in a passive condition of consciousness. To this it is objected that reproduction in the strict sense of the word, that is, unchanged reproduction, does not take place, and that the ideas assumed to be unities are not unities at all, but the result of combinations. Modern psychologists define association as the passive combination of the elements of the content of consciousness. These, according to Wundt, are: fusions, the blending together of a number of sensation qualities, the result of which is the perception of the nature or character of some material object; assimilations, which, under the influence of the elements of other images, produce alterations of given mental images; complications, by which dissimilar psychical images are combined; successive associations, which in connexion with the simultaneous fusions, assimilations, and complications, produce combinations of successive mental images. *See* Metaphysics; Philosophy; Psychology.

Assolzie (Latin *absolvere*, to acquit). In Scots law, word used to describe the acquittal of a defendant or a prisoner.

Assonance (Lat. *ad*, to; *sonare*, to sound). Repetition of vowel sounds without regard to the consonants as a substitute for rhyme. Instances are dwell and tread, sleep and feel, gloaming and boating. Naturally, it is most common

in languages where the vowel sounds predominate over the consonants—Romance languages as distinct from Teutonic—but it is hardly satisfactory to the fastidious ear, and generally has been discarded in favour of rhyme as literature has developed. It is, however, a distinguishing characteristic of the lyrical and dramatic literature of Spain and Portugal. In France, assonance is found in the romances of the *trouvères*, but was rejected early in the history of French poetry, and some modern attempts to reintroduce it met with small encouragement. In Scottish poetry it is common, but it was long ruled out of English as not permissible, although Elizabeth Browning employed it, and modern writers have brought it back experimentally.

Assonance is found in its most elaborate form in Celtic poetry, where perfect rhyme is almost unknown. Here the original terminal assonance has been developed and a system invented by which the last word of one line corresponds with the middle word of the next, and words in the same line also chime, or are in assonance, with one another.

Assos. Ruined city of Asia Minor. It stands at the entrance to the Gulf of Adramyti, opposite Mitylene, and near it is the modern village of Bahram. It was built upon a high cone of trachyte, and supposedly founded by colonists from Methymna. Excavations undertaken in 1881-83 by the American Institute of Archaeology brought to light the fragments of bas-reliefs of the Doric temple of Athene, and enabled a plan of the temple to be outlined. A number of sculptured panels of the temple are deposited in the Louvre, Paris.

Assuan or **Aswân.** Province in Upper Egypt. It contains the districts of Assuan, Derr, and Edfu, and has an area of 363 sq. m. Pop. 305,096.

Assuan or **Aswân.** Town in Egypt, on the right bank of the Nile, near the first cataract. The ancient Syênê, it was of much importance under the Pharaohs, but its period of greatest prosperity was during the Roman domination. Near are the granite quarries whence materials for many of the Egyptian monuments and temples were obtained. The whole neighbourhood is rich in archaeological remains, especially some of the islands of the Nile, such as Elephantine and Philae.

Three m. S. is the dam across the Nile, opened Dec. 10, 1902. This

Assuan, Egypt. Air view of the great dam across the Nile, a mile and a quarter in length, planned and carried out by British engineers. It was opened in 1902, was made higher in 1912, and again in 1931-34

was designed for irrigation purposes and flood control, in conjunction with the barrage at Assiut (*q.v.*) and other similar works on the Nile. In 1912 the Assuan dam was made higher, and during 1931-34 its height was again increased, this last operation adding 30 ft. and doubling the storage capacity of the reservoir. Nearly 240 reinforced concrete buttresses were built to give the added strength to hold back the extra weight of water. Pop. 22,192.

Assumpsit (Lat., he has undertaken). In English law, an obsolete form of action at common law for damages for breach of any contract other than a contract under seal which a defendant "has undertaken" to carry out.

Assumption (Latin *ad, to; sumere, to take*). Term used for the taking up into bliss of the souls of departed saints, but more distinctively applied to the festival of the Assumption of the Virgin Mary, Aug. 15.

The festival was originally kept in January, in both the East and West, as early as the 5th century, and now in the former as the Falling Asleep, and in the latter as the Assumption of the Virgin Mary, is still the principal festival in her honour, and a day of obligation for Roman Catholics. It has no place in the prayer-book of the Church of England, and belief in the corporal assumption is not an article of faith in the Roman Catholic Church. The word must be distinguished from ascension. The latter implies a going up, while assumption is a taking up.

The Assumption is the theme of many famous pictures, *e.g.* by Perugino, in the Academy at Florence; Guido Reni, in the Munich Gallery; Fra Bartolommeo, in the Naples Museum and at Besançon ;

Antonio Allegri (Correggio), in the Duomo at Parma; Titian, in the Accademia delle Belle Arti, Venice, regarded as this artist's masterpiece; and Peter Paul Rubens, in the Brussels Museum.

Assumptionists. Name given to several Roman Catholic religious communities. That of the Little Sisters of the Assumption, or Nursing Sisters of the Poor, was founded at Paris in 1864. The Oblates of the Assumption are a community of women founded about 1866, with establishments in England, France, Belgium, Turkey, Bulgaria, and Asia who devote themselves to teaching children and visiting the poor. A branch of the Augustinian Order founded in 1845 is known as the Fathers of the Assumption.

Assurance

(Lat. *ad, to; securus, safe*). Act of making sure. The word is used for the insurance of life, the offices which do this being known as life assurance companies. Today the word insurance (*q.v.*) is more popular.

Assynt. Fresh-water loch or lake

of Sutherlandshire, Scotland. It is 6 m. E. of Lochinver, lies 215 ft. above sea level is $6\frac{1}{2}$ m. long by about $\frac{1}{2}$ m. wide, and contains sea and loch trout. On its shores the marquess of Montrose, escaping from defeat at Corbisdale, was captured by Neil Macleod, May 4, 1650.

Assumption of the Virgin. By Andrea del Sarto Pitti Gallery, Florence

ASSYRIA: THE MESOPOTAMIAN EMPIRE

Rev. T. Witton Davies, Professor of Semitic Languages

This article, like that on Babylonia, deals with one of the world's ancient empires. Related information will be found under the headings Mesopotamia; Tigris; Euphrates; and in articles on the various deities and cities of Assyria

Few ancient people have left behind them such copious material for reconstructing their history as the Assyrians and Babylonians. Their rulers felt the need as no others have done of recording their own achievements, engaging for this purpose a special class of men who engraved on stone in the cuneiform script the principal events of their reigns. They must also, in addition to these artists in stone, have had a literary guild whose business it was to prepare the substance and language of what the engravers had to commit to stone.

But Assyrians and Babylonians reflect their respective interests and character by the things which they loved to record. The Babylonian and Chaldaean inscriptions chronicle for the most part deeds of peace, the building of temples and palaces, the digging of canals, etc. They were, above all, a literary and religious people. Assyrian inscriptions, on the other hand, tell almost exclusively of wars, victories, triumphant processions, hunting expeditions and the like. The Assyrians were, above everything else, a military people.

THE LAND. The Assyrian homeland was an upland region, bounded on the N. by the Armenian highlands, on the E. by the Zagros ranges, on the W. by the middle Tigris. In these latitudes the Mesopotamian tableland, poised high above the alluvial plain of Babylonia to the S., is an arid, treeless, undulating country, adverse in all ages to settled life. With the exception of Asshur itself, which occupied a strategic spur guarding the right Tigris bank, no part of Assyria itself lay "between the rivers."

RACE AND LANGUAGE. The word Assyria comes from the Greek form of the original name *Ashshur*, usually transliterated as *Asshur*. This word stood first of all for the god, then for the city dedicated to that god; subsequently, as the city grew, the same name came to be used for the larger territory, standing in the course of time for the kingdom and finally for the empire.

The earliest accessible information shows that the Assyrians wrote and spoke in Semitic, their language differing only dialectically from the Babylonian. They had, however, Sumerian names for their gods and temples. All this points

to the high probability that the earliest Assyrians came from Babylonia. Some verses in Gen. 10, properly construed as in the R.V., support the evidence of language that the first settlers in Assyria were Babylonians.

Though of Babylonian origin, the Assyrians were more purely Semitic, because they were less exposed to invasions and lived in greater isolation. For their religion and culture they were dependent upon the Babylonians, as the Romans were upon the Greeks. Their climate was colder, being temperate, not, as in Babylonia, sub-tropical. They became, therefore, a hardier, more courageous people than the nation from which they sprang. They were pre-eminently a military and commercial people, ruthless in war, practical and selfish in business.

At its beginning Assyria embraced no more than the city Asshur, which was situated on the W. of the Tigris, near its confluence with the Lower Zab. It was not one-tenth the size of ancient Babylon. Its rulers were called Ishshakku, corresponding to the Babylonian Patesi. Such rulers combined the priesthood with the headship of the state.

HISTORY. The history of Assyria may be divided as follows: (1) Early Period down to about 1400 B.C., when the nation became independent of Babylon; (2) Middle Period, that of general though not uniform growth, from 1400-745 B.C.; (3) Final Period, climax and collapse, 745-607 B.C.

(1) *Early Period.* Assyria is mentioned as a dependence of Babylonia in an inscription left by Gudea, Patesi of Lagash (c. 2500 B.C.). The princes (*ishshakku*) of Asshur are mentioned in an inscription by Hammurabi, the great king of Babylon (c. 2100 B.C.). Among the earliest rulers of Assyria may be mentioned Shamshiadad I (c. 2100 B.C.), who fixed the prices of certain important articles of commerce, just as his Babylonian contemporary, Hammurabi, determined the rate of wages as well as the price of certain commodities. Ilushuma (c. 2000 B.C.) was the first Assyrian ruler to challenge in the field the military power of Babylonia, though without success. These early Assyrians erected private houses, mansions, palaces, and temples. They dwelt in walled cities. Their religion was polytheistic. They had learnt to write, the script being cuneiform, the language Semitic—closely akin to the Hebrew. They had acquired a knowledge of the arts of war and government, and of the principle of taxation as applied to the homeland and conquered peoples. We know from the Tel-el-Amarna tablets that about 1450 B.C. the Babylonians still claimed supremacy over Assyria.

(2) *Middle Period.* About 1400 B.C. Assyria became relatively so strong that Burnaburiash I, king of Babylon, was glad to make a treaty on equal terms with Buzur-Ashir I, king of Assyria. The decline of Babylonian power during the reign of the Kassite kings gave Assyria its opportunity of asserting its independence (c. 1400 B.C.), and even its superiority over Babylon. Ashurbanit II (1418-1370 B.C.) was the first Assyrian king to become ruler also of Babylonia, though he was soon expelled, Babylonia becoming independent once

Assyria. Map showing the position of the ancient empire, with its capital, Nineveh, midway between the Mediterranean and Caspian seas

more. The success of Assyria in Babylon whetted her appetite for further conquests. She had her mind upon the land about the Upper Euphrates, and also upon the land westward towards the Mediterranean, her object being to a large extent to command the trade route from Egypt and Syria to the N., but she had powerful enemies to contend with—the Hittites, the Arameans, the Mitanni, and the Armenians.

Conquests of Tiglath-pileser I

The history of Assyria from about 1300 B.C. to its fall in 607 B.C. may be not inaptly described as one continuous battle, sometimes for existence, very often for extension of territory and increase of wealth, but most of all for the suppression of rebellions in cities, provinces, or countries which she had once conquered, for the kings of Assyria never mastered the art of attaching subject peoples to themselves or to their government.

From 1240 to 1120 B.C. the Assyrian records are almost silent, for there were no great achievements to boast. With the advent to the throne of Tiglath-pileser I (c. 1120 B.C.) a new and greater era began. Before the end of his reign he had won back for his country the whole of Babylonia and made Assyria the greatest empire of the time. He was a great hunter, and boasts of having killed 120 lions on foot and 800 in his hunting chariot. He made Asshur once more the Assyrian capital, greatly enlarging and improving it, planting in its vicinity a botanical garden and also zoological gardens.

Under Ashurnatsirpal III (884-860 B.C.) a still more prosperous time for Assyria set in. He was a military genius, though ruthlessly cruel, as were most of the Assyrian kings. In one of his inscriptions, which has come down to us, he thus describes the punishment of a rebellious city—"with battle and slaughter I assaulted and took the city, 3,000 warriors I slew in battle. Their possessions I carried away. Many captives I burnt with fire, many of their soldiers I took alive; of some I cut off hands and limbs, of others the noses, ears, and arms; of many soldiers I put out the eyes, I reared a column of the living and a column of heads. I hung up their heads on trees; their boys and girls I burnt; I destroyed the city, burnt it." It should be added that this same king was a great builder and did much to promote artistic work, both sculptural and architectural of a very high standard. The next king, Shalmaneser III, reigned for thirty-five years (860-825 B.C.),

and that period may be described as one continuous military expedition, for every one of those years, certainly down to the thirty-first, was crowded with wars, conquests or defeats; there was a rebellion in the last years of his reign. From 783 B.C. onwards to 745 B.C. Assyria was under an eclipse, and the kings of these times, having nothing great to write about, left no inscriptions.

(3) *Final Period, 745-607 B.C.* Assyria was saved from what might have proved a radical revolution by the strong hand of a leading general whose name and descent are unknown, but who by a happy inspiration assumed the title Tiglath-pileser, usually called the fourth of that name, and who lived up to the reputation of Tiglath-pileser I. He brought under his sway Armenia, Syria, Palestine, N. Arabia, and other countries; he reorganized the Assyrian army and made it the most effective military machine in the world. He was the first to adopt the principle of deporting a conquered people to parts of his dominions where the inhabitants were loyal, thus destroying the old feeling of local patriotism. A new administrative system was introduced, Nineveh being made the centre of government, and the king presiding over a kind of cabinet.

The Destruction of Samaria

The reign of Shalmaneser V (727-722 B.C.) was brief and inglorious, and is only interesting because in it Samaria was besieged for three years, falling a few months after the king's death. He was followed by four rulers, each the son of his predecessor, under whom Assyria reached the very acme of its greatness. Sargon II (722-705 B.C.) was, like Tiglath-pileser IV, a usurper and also a distinguished general. Each, however, was just the man required at a crisis in his country's history. Shortly after he had become king, Samaria surrendered and was destroyed, the best of its population being exchanged for loyal Assyrians. These Israelites mingled with the people among whom they were placed and are lost to history from that time onwards. This king carried on many wars and was almost uniformly victorious. The efforts of the ambitious and restless Chaldaean prince, Merodach-baladan, to secure the throne of Babylonia were frustrated.

Sargon's campaigns in Armenia, Asia Minor, Syria, Phoenicia, and Philistia were a series of triumphal processions. It was during a military campaign, probably, that he was assassinated, and was suc-

ceeded by his son Sennacherib (705-681 B.C.). Though less distinguished as warrior and administrator than his father, he was able to keep intact the empire which he had inherited, notwithstanding many revolts, especially in Babylonia, where the irrepressible Merodach-baladan was seeking to stir up strife, that being probably his business at the court of King Hezekiah. (See 2 Kings 20 and Isaiah 39.)

Annexation and Loss of Egypt

Esarhaddon, Sennacherib's son (681-668 B.C.), added Egypt to the Assyrian empire and organized it for purposes of government into 22 nomes or provinces. Assyria was now greater in extent, power, and prestige than it had ever been. For the first time in her history Assyria proper, Babylonia, Mesopotamia, Egypt, and the stretch of territory between were under one government—that of the Assyrian king, still called, however, by the old name Sharru. Yet at the very moment clouds were arising in the sky that were the harbingers of her total eclipse. From the N. and E. powerful peoples with unexhausted energies and courage amounting to ferocity were threatening her borders, sometimes even crossing them. These were the Medes, the Scythians, called on the monuments Ashguzeans, i.e. the Ashkenaz of the Old Testament, and also the Kimmerians, identified by many with the Cymry or Welsh. All these peoples were Aryans.

Esarhaddon had bequeathed his vast empire to his two sons—Assyria and the suzerainty of the rest to Ashurbanipal, who succeeded him, and Babylonia to another son. When Ashurbanipal, the Sardapalos of the Greeks and the Asnapper of Ezra 4, ascended the throne, Egypt threw off its allegiance, but was soon subdued, Thebes, the No Amon of Nahum 3, being captured. But in a few more years Egypt was lost, never to be regained. Other parts of the Assyrian empire were now tottering to their fall. Assyria had been won, and had to be held, by the sword, and this king was no warrior, though he was a great bookman and brought together at Nineveh thousands of clay books treating of science, philology, history, and religion. His brother of Babylon declared his independence of Assyria, but was soon conquered and committed suicide. His two successors were weak in every way, for the very year after he died, Nabopolassar, a Chaldaean prince, became king of Babylon and the surrounding country, adding continually to his gains.

In 607 B.C. the Medes under their king Cyaxares and the Babylonians under Nabopolassar made a united and successful attack upon Assyria. Nineveh was taken and destroyed, and its very name disappeared from human knowledge until its remains were discovered by explorers early in the 19th century. Thus passed away, in 607 B.C., the greatest military power that the world has ever known. Its language ceased to be spoken and written, and no attempt was ever made to revive the national life.

It may be said in general that the intellectual and religious culture of the Assyrians is of Babylonian origin, having been brought by the Assyrians from their ancient home in Babylonia. They however, modified what they took over and, in a measure, improved it.

LANGUAGE AND LITERATURE. The Assyrian language is essentially the same as that of Babylonia, differing only dialectically. Both are Semitic, closely allied to Hebrew, and in a less degree to Arabic. The cuneiform script employed in Sumerian, Persian, Cappadocian, as well as in Assyrian and Babylonian, was peculiarly suitable for Babylonia, where the writing material was clay and the writing-tool a kind of stylus. It was also suitable for Assyria, which copied, though without the same necessity, the Babylonian custom of writing on clay, which was afterwards dried either in the sun or in kilns. The literature of the Assyrians was comprehensive, though the art of writing in prose or poetry in the lofty style of Greek, British, and other writers was hardly attempted. What Assyrian and Babylonian writers aimed at was the communication of facts and ideas, not the production of aesthetic or even ethical impressions upon the mind.

Babylonian and Assyrian Libraries

Assyrian literature consists in the main of dried bricks or tablets, and of inscriptions on the walls of palaces, temples, and rocks. The early Babylonians had libraries, chiefly of brick books, at most of their important centres, and the Assyrians copied them in this as in so many other things, for there were such libraries at Calah, established about 1300 B.C., and at Asshur; but the best preserved of all ancient oriental libraries is that founded at Nineveh (Kuyunjik) by Ashurbanipal (668-626 B.C.). For this library the king sent his scribes to Babylon and other great literary centres to purchase or copy important books. Much of the contents of that library is now housed in the British Museum. The literary products of Assyria and Babylonia may be thus

arranged: (1) Linguistic: lexicons, grammars, etc., of Sumerian, Babylonian, and Assyrian. (2) Geographical: lists of countries, cities, etc. (3) Scientific: books on astronomy, astrology, mathematics, medicine, etc. (4) Historical. (5) Magic.

GOVERNMENT. The Babylonians and Assyrians were upholders of the monarchical form of government, and believed in the divine right of the king to rule. Indeed, in the early years of the Babylonian monarchy the king was first of all a priest, and to the end, in both countries, he was the head of both church and state.

COMMERCE AND INDUSTRY. Among the Babylonians and Assyrians there were craftsmen, workers in ivory, silver, and gold, weavers, potters, glassblowers, and especially builders and artists. Babylonia is the original home of wheat, which grows there wild and in abundance. Enamelled bricks were first made in that country, and none more beautiful have ever been known than some discovered in the ruins of the two countries between the rivers. We know of at least one great commercial bank established in Assyria about 900 B.C., which carried on extensive operations for centuries. Since Babylonia and Assyria lay along the trade routes between India and China on the one hand, and Egypt, Syria, and the extreme north on the other, they had great opportunities for establishing commercial relations with other countries, and they made fairly good use of them.

SCIENCE AND INVENTION. The Babylonians and the Assyrians were great astronomers, predicted eclipses, to them always ominous of disaster, and distinguished between the planets and the fixed stars. By the 7th century B.C. they were able to trace the course of the sun through the twelve stations of the zodiac. They were also great mathematicians; their skill in astronomy proves this, and it is further proved by mathematical tablets which have come down to us. These peoples made a special study of medicine. They classified diseases, noting their causes and prescribing remedies; but their science of medicine, as that of astronomy, was a good deal mixed up with superstition. Disease was thought to be largely the work of evil spirits, and the remedy consisted in either driving them out or in making them harmless by charms, incantations, or even by drugs. All education was confined to the upper classes. The only schools were those connected with the temples, the priests being the teachers, the subjects reading and religion. Writing was a difficult and elabor-

ate process, as there were nearly a thousand signs to be mastered, and only those intended to be scribes by profession learnt it.

ART. The character of Babylonian and Assyrian art was determined almost entirely by the materials on which the artists worked. There were no rocks in Babylonia, and it was almost impossible to obtain stone from distant countries owing to expense and difficulty of transport. So the Babylonian artists had to work in clay, and though in Assyria there was an abundance of stone, hard and soft, Assyrian artists were so much dominated by Babylonia that they built palaces, etc., with bricks, and their walls were made of decorated bricks. There were, however, exceptions in Assyria, especially in the later years of the kingdom, and it should be added that this people used stone, alabaster, limestone, etc., for statues, altars, and for the slabs with which they decorated their great edifices. No specimens of dressed stone from among Babylonian and very few from Assyrian remains have come down to us. Columns of solid stone appear in Assyrian edifices only, and in them exclusively as decorations in front of palaces and temples.

The Palace of Sargon II

Their architecture included that of palaces, temples and tombs, but it may be said that only the ground floor of either palace or temple has survived to modern times. We are left to speculate as to the character and number of the upper rooms. The most characteristic feature is the palace, of which we have many descriptions and some drawings, though nearly all the palaces portrayed by Assyrian artists were foreign. Of the private buildings of these Mesopotamian peoples we know nothing, as the inscriptions are silent about them and no remains have been found. The most completely preserved Assyrian palace is that built by Sargon II in his new capital, Dursharrukin (Sargon's fortress), i.e. the modern Khorsabad, 10 m. N. of Nineveh. It consisted of a series of rectangular halls of one storey with long corridors enclosing inner courts. The entrances were flanked by colossal human-headed bulls. The inner walls were lined with enamelled bricks and also with alabaster slabs on which were bas-reliefs of the most beautiful description. It covered over 23 acres of ground, had 200 apartments, and more than 300 open courts. The unfortunate feature of all Assyrian palaces is that, being built of sunburnt brick, they

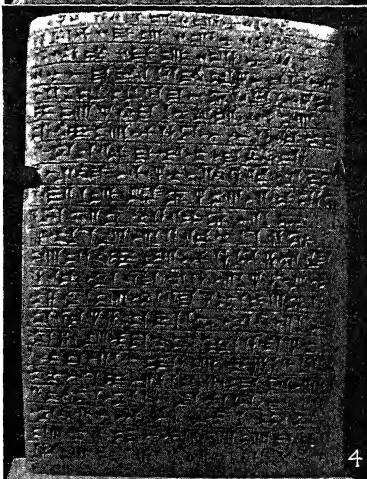

1. Winged figures kneeling beside a sacred tree 2. Group of terra cotta vases, cups, and other vessels 3. Stone model of a basket held in the hands of deities from a statue. 4. Figures of a man and of a human-headed

winged bull from the palace of Sargon, King of Assyria, 722-705 B.C. 5 and 6. Necklaces made of various stone, glass, and porcelain beads 7. Assyrian chief deity holding a basket 8. Deity holding a flower

have not survived with anything like the completeness of Egyptian temples, but enough remains in the various mounds to show how vast and magnificent they were.

Next in importance to the palaces were the temples, which were built always upon high ground, the characteristic form being that of staged towers. First there was the quadrangular base, surmounted by another storey of similar form but smaller, and so on to the third, fourth, or even seventh storey.

Temples "as High as Heaven"

This pyramid-like building was called by the Mesopotamian people *ziquurat*, or *ziggurat*, i.e. a conspicuous house. The tower of Babel must have been one of these, and indeed in an inscription Tiglath-pileser I boasts that he had made the summits of his temples "as high as heaven." Their loftiness may have been due to religious considerations: compare the idea of the Indians and Greeks that the gods lived on mountains, and the high places of the Old Testament. But perhaps we are to account for this feature of the Assyrian temple on utilitarian grounds; the higher the buildings, the safer were they from the floods and miasmata below.

The oldest *ziquurat* which has yet been found is that of Nippur, this dating from 2700 B.C. at latest. Excavations show that attached to these pyramid-like temples were courts, altars, and entrance pillars, closely resembling those of the Jerusalem temple. No tombs with any claim to artistic beauty have been discovered in Mesopotamia. In Egypt the tombs are far more important and the remains much more substantial and abundant than those of the palaces.

Assyrian sculpture had no infancy. Received from the Babylonians, it began almost as fully developed as it remained. The examples of Assyrian sculpture are to be seen chiefly on the slabs of alabaster, etc., that covered the walls of palaces and temples, but they were also engraved on rocks in their natural position. Both Babylonian and Assyrian sculptors worked in bas-relief, hardly ever in the round, though among the Assyrians there are many specimens of statues in solid stone. The palace decorations were of two kinds: (a) historic, battle-fields, the chase; (b) royal attitudes, the king being represented in his various occupations and amusements, performing religious rites, etc. Almost all Mesopotamian sculptures were prompted by royalty and lauded the royal person and his doings.

Both Babylonian and Assyrian

sculpture had serious defects. Human figures were hardly ever differentiated, even though the individuals belonged to different races. The king, however, was always made taller than anybody else, whatever may have been his actual size. All pictures were in profile, but the artist gave each individual a full eye. The artists had no sense of perspective. When drawing a four-legged animal they would give it five legs, in order that four might be seen from every point of view. The nude was always avoided and therefore the delicate portraiture of the human body and its drapery, so characteristic of Greek art, is lacking. Assyrian sculpture began in the reign of Tiglath-pileser I and reached its apogee in the reign of Ashurbanipal. It is remarkable that when the Assyrian Empire came to its end, the art of the country was at its highest and promised most. Its last great king, Ashurbanipal, did more for it than any other, but his absorption in intellectual and religious pursuits led to the downfall of his country and with that downfall there came to an end the language and culture of Assyria.

Colour and Ornament

The fine art of painting in the modern sense did not exist among the peoples of Mesopotamia. The walls of palaces and of temples were coloured chiefly in blue and yellow, and many portraits and historical and other scenes were drawn on bricks, enamelled or otherwise, and on slabs of stones. But all colouring among these artists was ornamental. It was not used, as in modern art, for the conveyance of artistic impressions. The beauty of temples and especially of palaces was greatly augmented by precious stones and coverings of gold and silver. Some very fine specimens have come down to us of decorated pebbles and shells, and also of seals, of cylinders enclosing deeds, gems, and of ornaments in stone and in the precious metals, as well as in bronze and wood.

RELIGION. The religion of the Assyrians was virtually that of the Babylonians, the main difference being that in Assyria the principal god was Asshur, the principal god of the Babylonians after about 2000 B.C. being Marduk (Merodach), the tutelary deity of Babylonia, whose character was far more ethical and gracious than that of Asshur.

Next in importance was Ishtar (Istar), like Aphrodite a goddess of love and war, the latter aspect being more especially emphasised among the war-like Assyrians.

Other Assyrio-Babylonian deities were Dagon or Dagan, whose name and functions are obscure; Hadad or Adad, also known as Rimmon, the god of storms; Shamash, the sun-god, and Sin, the moon-god; and Nergal, the god of destruction, chiefly of war and the chase.

The spiritual beings recognized, feared, and to some extent worshipped by these two Mesopotamian peoples may be described as (1) evil spirits—a survival of the primitive animism of the Sumerians; (2) astral gods—sun, moon, etc.; (3) gods representing natural elements or forces, such as fire, water, etc., and others which cannot be categorised. This ancient religion was polytheistic in that each city had its own deity, but with the progress of thought Asshur and Marduk became each the supreme deity of his own country, inferior gods being regarded as merely their representatives, so that there came an approach to monotheism. Yet anything like the ethical and absolute monotheism of the Hebrews is entirely absent from the religions of Mesopotamia. One result of the belief in evil spirits, supposed to be the causes of all diseases and of every kind of disaster, was that an enormous number of magical contrivances were employed to counteract the supposed nefarious working of these demons.

Sacrificial Worship

Worship in Mesopotamia consisted of sacrifices—animal, cereal, liquid (wine), and incense—agreeing closely with the sacrifices of the ancient Hebrews. These were offered to the superior gods, but the offerer had his share of the repasts to which he invited his deity. Prayers for protection against evil spirits accompanied the sacrifices. But in order to neutralise the power of evil spirits these peoples resorted to incantations; certain formulae were recited, even words were regarded as countercharms if recited with perfect accuracy; but the smallest error in any part of the enchantment meant the impotence of the whole. They had no ethical doctrine of sin; what offended the gods was the omission of the proper ceremonial, or the defective performance of the whole. They had no doctrine of a future life of happiness or misery, depending upon the life lived in this world. All human beings go, at death, to the land of no return called Arallu, which corresponds to the Greek Hades and the Hebrew Sheol. It was a gloomy world where its people lived a ghostly life, semi-conscious and never happy. The blessed isle of Babylonian

and Assyrian mythology was shut to all except a few of the more favoured gods.

Born Fred Austerlitz, May 10, 1900, at Omaha, he began his career in a dancing team with his sister Adele, thus founding a partnership which achieved brilliant success in New York and London. They appeared in London in *Stop Flirting*, 1923; *Lady Be Good*, 1926; *Funny Face*, 1928. In 1931 Adele Astaire (b. Sept. 10, 1898) married Lord Charles Cavendish and announced her retirement from the stage. Fred Astaire subsequently starred

in such outstanding films as *Roberta*, 1935; *Top Hat*, 1936; *Story of Vernon and Irene Castle*, 1939; *Holiday Inn*, 1942 *Blue Skies*, 1946; *Easter Parade*, 1949; *The Barkleys of Broadway*, 1949, in which Ginger Rogers was, as often before, his dancing partner.

Astartê. Principal female deity of the Phoenicians, her male counterpart being Baal. She is identified with the Ashtoreth of the O.T. (1 Kings 11 and 2 Kings 23), with Ishtar, the Assyrian goddess, and Hathor, the Egyptian goddess. Her worship, attended by licentious rites, spread from Phoenicia among the Greeks, and in course of time Astarte became identified with the Greek goddess of love, Aphrodite.

Astartê. Marine bivalve mollusc belonging to the family Cyprinidae. Several species are found off the British coast, and form a favourite food of the cod.

Aster (Gr., star). Large genus of mainly perennial herbs of the family Compositae. Natives of most temperate and cold regions of the earth, especially America, they have undivided leaves and daisy-like flower-heads, the disk-florets of which are always yellow, and the ray-florets lilac, blue, purple, or white. From their general habit of flowering in autumn they are popularly known as Michaelmas daisies, and extensively grown in gardens. The garden plants known as China asters are annuals belonging to another genus (*Callistephus*).

Asteria. Name given to certain rubies and sapphires. These, known as star rubies and star sapphires, appear to be divided by six rays, spreading from the centre to the

Aster. China aster, a familiar garden flower. Left are blossoms of a single, and right those of a double variety

the birthplace of Apollo and Leto (Latona).

Asterisk (Gr. *asteriskos*, little star). Mark (*) in printing or writing to indicate a marginal reference or footnote, the omission of a letter, word, or words, or, placed at the foot of a page, to indicate, for binders' guidance, an inset. In guide-books places of special interest are indicated by an *; and the mark is used with an obelus or dagger (†) in lists of names to denote respectively the birth or death of a person. Some-

Astaire. Film sequence of Fred Astaire dancing in "Roberta." This American tap dancer, who has starred in several successful films, possesses great agility and remarkable technique

edges. This is probably due to the presence of small channels in the stones or to an arrangement of twin lamellae. Though very beautiful when the stones are properly cut (*en cabochon*), the peculiarity does not add to the market value of really high-class stones.

Astarte, from an ancient bronze statuette

Asteria. In Greek mythology, daughter of one of the Titans. When pursued by Zeus, she was changed into a quail, flung herself into the Aegean Sea, and became a floating island, called Asteria, star island, or Ortygia, quail island. Later, this was known as Delos,

times the * in such a list indicates death (cf. "Ye, against whose familiar names not yet The fatal asterisk of death is set," Longfellow's *Moriturus Salutamus*, stanza 12). In reference books and printed programmes the sign may indicate some attribute which is common to several entries, thus saving repetition.

Roger North (1653-1734) makes use of the word asterisk as both noun and verb: "The lantern is in the centre of an asterisk of glades" (*Life of Lord Guilford*); "I need not asterisk the quaint words" (*Examen*). The Alexandrian grammarians employed the asterisk, with the addition of the obelus, to indicate that the text was spurious.

Asteroids (Gr. *astēr*, star; *eidos*, form). Name given to the thousands of minor planets, which revolve round the sun between the orbits of Mars and Jupiter.

With one exception (Vesta) their light, which is reflected sunlight, is too faint to be visible to the unaided eye. Their mean position is that predicted by Bode's law (*q.v.*) for a planet, but the first to be discovered, Ceres, was not found till 1801, nearly 30 years after the law was first stated. Dozens are at present discovered each year by photography, and over 2,000 are now known, ranging in diameter from 480 m. (Ceres) to a few miles. In total mass they are probably less than one-thousandth that of the earth. They may be fragments of a former planet destroyed by some cataclysm, or perhaps primeval bodies which have failed to coalesce into a planet.

On account of their highly elliptical orbits, some of the asteroids may approach the earth closely at certain points. Eros came within 17 million miles in 1931, when photographs were taken at observatories all over the world to obtain its distance, and thence, by calculation, the scale of the solar system. Since 1932, asteroids have been discovered which may make still closer approaches: Amor can come within 10 million miles, Apollo within 7, Adonis within 1, and Hermes may even come closer to us than the moon does. A collision between the earth and a flying mass of rock a few miles across would be catastrophic, but the probability of such an event is extremely low. See Astronomy; Planet; Star; Sun.

Asthma. A disease characterised by sudden paroxysms of difficult breathing, occurring often at night when the patient is asleep. He awakens fighting for breath, often blue, sweating, and frightened. Sometimes he goes to the open window, gripping the sill to assist respiration. Attack may be preceded by a sensation of tightness in the chest and by mental depression. The difficulty is in expiration, which is prolonged and wheezing. Although the chest is greatly expanded, respiration is shallow. These symptoms are caused by severe narrowing of the smaller air passages, due to spasm of the bronchial muscles, swelling of the mucous membrane, or excessive secretions, or any combination of these. The attack is rarely fatal of itself, and, untreated, lasts 1 to 2 hours, ceasing suddenly, the patient coughing up much sputum.

There are many causes of asthma, in all of which a hereditary predisposition is of great import-

ance. Asthma may be due to irritation of the respiratory tract from such causes as nasal polypi or malignant disease, or more commonly to allergy to foods or inhaled substances. Some cases are psychological. In treating the disease, relaxation of the bronchial musculature is the immediate object, and is achieved by the use of anti-spasmodic drugs such as adrenalin and ephedrin. To achieve fundamental cure, the primary cause, such as irritation or the allergic factor, must be removed. In 1928 an asthma research council was instituted.

Asti. City and episc. see of Italy, in Asti prov., Piedmont. It stands on the Tanaro, 34 m. by rly. E.S.E. of Turin. The ancient Asta Pompeia, it has a cathedral dating from the 13th and 14th centuries, in the left aisle of which are two fine altar-pieces by a master of the Vercelli school; the church of San Giovanni, built over a 6th century Christian basilica; and an 11th century baptistery. The birthplace of the poet Alfieri (1749-1803, *q.v.*), it has an Alfieri museum, in the house in which he was born, and a statue. Manufactures include silk, leather, hats, and matches, and it is celebrated for its horticulture and sparkling wine (see Asti Spumante). Anciently famous for its pottery and for its 100 gates, many of which remain, it was a powerful republic in the Middle Ages, but was razed by Frederick I in 1155. It was successively held by the family of Visconti and by the king of France, from whom it passed to the duke of Savoy in the 16th century. Pop. 48,898.

Astigmatism (Gr. *a*, not; *stigma*, a mark). Defect in the refracting surfaces of the eye. It most frequently occurs in the cornea, but sometimes in the lenses, which are unequally curved in different directions. The result is that rays of light are not all focused at one point, and vision is blurred. The condition can be corrected by the use of cylindrical glasses. See Eye.

Asti Spumante. A wine of Piedmont, Italy, so named from Asti, the city of export. It is made from a species of muscatel grape, and, though too sweet for English taste, is highly esteemed in Italy. The wines of Asti are red and white, still and sparkling (Ital. *spumante*, frothing).

Astle, Thomas (1735-1803). British antiquary. Born in Staffordshire, Dec. 22, 1735, he was

engaged on editing the rolls of parliament, 1770-77. He was keeper of the records, 1783-1803, and died Dec. 1, 1803. Besides his official reports on the documents in the Tower of London, Astle was the author of *The Origin and Progress of Writing*, 1784, a valuable contribution to the study of medieval handwriting.

Astley, Jacob Astley, Baron (1579-1652). An English royalist soldier. Of a Norfolk family, he was in early life a soldier of

1st Lord Astley,
Royalist soldier
Contemporary print

fortune in the Netherlands, Denmark, and Germany. Having returned to England, he was made governor of Plymouth, after which he was actively engaged at Newcastle in preparing to oppose the Scots. Being a member of the council of war, he remained there almost until the outbreak of the Civil War, 1642.

In that struggle Lord Astley took a prominent part. He fought for Charles at Edgehill and at the second battle of Newbury; helped to besiege Gloucester and to take Reading and Arundel; and was with the king when he escaped from Oxford. He commanded the royal foot at Naseby, and made the last royalist stand at Stow-on-the-Wold, March, 1646. He was imprisoned for a short time, but had been set at liberty when he died at Maidstone in Feb., 1652. Charles I had created him a baron, but the title became extinct on the death of his grandson in 1668.

Astley, Philip (1742-1814). English equestrian and circus manager. Born at Newcastle-under-Lyme, Jan. 8, 1742, and brought up as a cabinet-maker, in 1759 he joined General Elliott's light horse in Holland during the Seven Years' War as a breaker-in and rough-rider. After serving with distinction, he went round England giving exhibitions of horsemanship, in which his son later joined him. At different periods he had various amphitheatres in London, Dublin, and Paris, including Astley's Royal Amphitheatre near Westminster Bridge. He died in Paris and was buried in Père-Lachaise. Consult Greatest Show on Earth, M. Willson Disher, 1938.

Aston, WALTER ASTON, BARON (1584-1639). English ambassador. The eldest son of a wealthy Staffordshire knight, he was one of the first baronets created by James I, and in 1627 was raised to the Scottish peerage by Charles I. He was twice ambassador to Spain, 1620-25

Walter Aston,
1st Baron Aston

and 1635-38, and is remembered as the patron of Drayton the poet. He died Aug. 13, 1639.

Aston, FRANCIS WILLIAM (1877-1945). British scientist. Born at Harborne, Birmingham, Sept. 1, 1877, he was educated at Malvern College and Birmingham and Cambridge universities. He was assistant lecturer in physics at Birmingham in 1909 and entered Trinity College and Cavendish laboratory, Cambridge, in 1910. He was a technical assistant at the government experimental station at Farnborough, 1914-19. In 1920 he was awarded the Mackenzie Davidson medal of the Röntgen Society; in 1922 the Nobel prize for chemistry for his work in connexion with isotopes; in 1938 the Royal medal of the Royal Society, to which he was elected in 1921. The production of the atomic bomb was greatly assisted by his work on isotopes. His published works include *Isotopes*, 1922; *Mass-spectra and Isotopes*, 1933. He died at Cambridge, Nov. 20, 1945.

Aston Manor. Former municipal and parl. borough of Warwickshire, England. In 1911 it was incorporated with Birmingham and forms one of its parliamentary divisions. Its manufactures include arms, cycles, and motors. Aston Hall is now a museum and art gallery, and the adjoining grounds, opened to the public 1858, contain the Aston Villa football ground. Market day, Thurs. Pop. 35,612. See Birmingham.

Aston Villa. English Association football club founded in 1874, by members of Aston Villa Wesleyan Sunday school, Lozells, Birmingham. After consistent successes in local competitions over several years, the club adopted professionalism in 1886-87, when it won the F.A. Cup for the first time. One of the founders of the Football League, it won in 1910 the League championship for the sixth time, and in 1920 the F.A. Cup also for the sixth time. It shared with Preston North End the distinction

of winning both competitions in one season (1896-97). The club originally played at Perry Barr, but in 1897 moved to the present ground, Villa Park, Aston.

Astor, WILLIAM WALDORF ASTOR, 1ST VISCOUNT (1848-1919). Anglo-American financier. A great-grandson of John Jacob Astor, he was trained as a lawyer, and when quite young became manager of the Astor estates in New York. In 1878 he was elected to the legislature of New York State, but did not succeed in entering Congress. He was U.S. ambassador to Italy, 1882-85, and in 1899 was naturalised in England, which had been his home since 1890. In England he was chiefly known for his large donations to war charities, as the owner of *The Pall Mall Gazette* and *The Observer*, and as the purchaser of Cliveden, a beautiful estate on the Thames, and Hever Castle, in Kent. In 1916 he was made a baron and in 1917 a viscount. He died at Brighton, Oct. 18, 1919.

His eldest son, William Waldorf Astor, 2nd viscount (b. 1879), was educated at Eton and New College, Oxford, and elected M.P. for Plymouth in 1911, retaining his seat until he succeeded to the peerage in 1919. He served in France during the First Great War. In Aug., 1919, he became parliamentary secretary to the ministry of Health, having taken a leading part in the fight against tuberculosis. From 1939 to 1943 he was lord mayor of Plymouth, and actively exerted himself in the cause of reconstruction and post-war planning. Like his father he became owner of *The Observer*.

Astor, NANCY WITCHEL ASTOR, VISCOUNTESS (b. 1879). Anglo-American politician. She was

the daughter of C. D. Langhorne, of Mirador, Greenwood, Virginia, U.S.A., and sister of Irene, wife of Charles Dana Gibson (q.v.). In 1906 she married W. Waldorf Astor, afterwards 2nd Viscount Astor. Primarily interested in social work, temperance reform, and child welfare, she helped her husband in his political career, and when he succeeded his father in the house of lords, Lady Astor was chosen as Coalition candidate for his constituency, the Sutton division of Plymouth. On Nov. 28, 1919, she was elected M.P. and took her seat on Dec. 1, the first woman to sit in the British House of Commons. She represented her constituency until in 1945 she retired from parliament. In 1937 Lady Astor was made a Companion of Honour.

Lady Astor,
Anglo-American
politician

Astor, JOHN JACOB (1763-1848). American merchant and founder of the wealthy family of that name. Born near Heidelberg, of humble parentage, Astor went to New York in 1783 and acquired a fortune by trading with the Indians for furs. His business grew rapidly; he founded Astoria in Oregon as a trading centre, and sent his wares all over the world. Much of his wealth was in land in New York City, which increased enormously in value during the 19th century. His chief heir was his son William Backhouse Astor (1792-1875). A great-grandson, another John Jacob Astor (1864-1912), a man of versatile gifts, was drowned when the Titanic was lost in 1912.

Aston Villa. The team that won the Football Association Cup in 1886-87. Back row (left to right): F. Coulton, F. Dawson, G. Kynoch, M.P. (president), J. Warner, R. Davies, J. Burton. Middle row: D. Hodgetts, H. Vaughton, A. Hunter, J. Simmonds. Front row (on ground): H. Yates, A. Brown

Astor, JOHN JACOB (b. 1886). English newspaper proprietor. The youngest son of the first Viscount

J. J. Astor,
English newspaper
proprietor

He represented Dover as Conservative M.P. from 1922 until his retirement in 1945. In 1922, after the death of Viscount Northcliffe, he acquired a controlling interest in *The Times*. He became president of the Press Club, chairman of Middlesex Hospital, and a director of the G.W.R. He was a distinguished sportsman, notably in rackets. In 1916 he married Lady Violet, daughter of the 4th earl of Minto and widow of Lord Charles Mercer Nairne. His residence, Hever Castle, Kent, was the scene of an annual garden party for his employees.

Astoria. A city and port of Oregon, U.S.A., in Clatsop co. It is on the S. side of Columbia river, about 9 m. from the open sea. Grain and lumber are exported; the canning of salmon is a big industry, and there are manufacturing establishments. Astoria owes its origin and its name to John Jacob Astor (1763-1848), who here founded the first station for the collection of furs. For some years it was in possession of the English. It became a city in 1876. Pop., 10,389.

Astrabad or **ASTERABAD.** Prov. of Persia. It is bordered on the N. by the Caspian Sea and on the S. by the Elburz Mts. Mountainous and well wooded, it contains many fertile valleys which produce wheat, rice, and other cereals.

Astrabad or **ASTERABAD.** Town of Persia. The capital of Astrabad prov., it lies at the foot of the N. slope of the Elburz Mts., about 20 m. E. of Astrabad Bay in the Caspian Sea. Enclosed by a mud wall about 3 m. in extent, largely in ruins, it was once the residence of the shahs, and has remains of a fine palace. Its exports include rice, cotton, and carpets. From its unhealthiness it has been called the City of the Plague. Pop. 22,000.

Astraea (star-maiden). In Greek mythology, daughter of Zeus and Themis. The last of the deities to

leave the earth at the beginning of the Iron or Bronze Age, after her return to Olympus she was placed among the stars as the constellation Parthenos or Virgo. Dryden's poem *Astraea Redux* (Astraea brought back) celebrates the Restoration as the revival of a Golden Age.

Astragal (Gr. *astragalos*, ball of the ankle joint). Architectural term for a small rounded moulding at the top or base of a column, usually with a bead or leaf design.

Astragalus. Second largest bone of the foot, at the summit of the arch. It articulates with the bones of the leg to form the ankle joint and receives the weight of the body, when the latter is in a standing position.

Astrakhan. Skin of certain lambs. When this is cured and the short curly wool dyed, the so-called fur is very suitable for clothing. The natural skin is imitated in astrakhan woven and knitted goods, in which curls of mohair are supported upon a foundation of threads. In artificial astrakhans of one type the pile yarns are curled before weaving by being twisted into rope form and boiled. In another type the mohair curls are burst from the groundwork by milling, or hammering, the cloth.

Astrakhan. City of R.S.F.S.R., in Stalingrad region. It is situated on an island of the Volga river, about 50 m. from the Caspian Sea. The seat of Greek and Armenian archbishops, it is divided into three parts, the Kreml, or citadel, the White City, and the suburbs. In the Kreml are the massive cathedral, dating from the time of Peter the Great, and the archiepiscopal palace; the White City contains the bazaars and most of the administrative buildings. There are Greek, Roman Catholic, Armenian, and Protestant churches, museums, educational institutions, and a large public library.

Astrakhan is the chief port on the Caspian and an important commercial town, attended yearly by many thousands of merchants. It imports raw cotton, fruits, rice, silk, and leather, and exports fish, caviare, petrol, cotton, and sugar. Its manufactured products include soap, candles, leather, and spirits, and it gives its name to Astrakhan (*v.s.*) fur.

Founded in 1395, it suffered at the hands of the Tartars, and was besieged by the Turks in 1569. Fires, epidemics, inundations, and earthquakes have caused much damage. Pop. 254,000.

Astral (Lat. *astralis*, belonging to a star). Term applied in ancient

times in the East to spirits which were believed to animate the stars and exercise a good or evil influence on human affairs. The belief was of Babylonian origin, and was current in the later Middle Ages among astrologers and alchemists.

In theosophy the term is used in an entirely different sense. There is supposed to be an intermediate condition of existence, or "astral plane," nearer the realm of spirit than of matter, which is believed to interpenetrate the material universe. It is akin to the *Anima Mundi* of the medieval philosophers. In this plane there are believed to be intelligent entities called astrals. See Theosophy.

Astralite. Explosive of German origin. In it trinitrotoluene is the active ingredient, with the addition of nitroglycerine to increase sensitivity to detonation. It is used for filling mortars, grenades, and similar weapons. The composition of astralite is ammonium nitrate, 84.5 p.c.; trinitrotoluene, 7 p.c.; nitroglycerine, 4 p.c.; wood meal, 1 p.c.; charcoal, 1 p.c.; paraffin oil, 1 p.c.; and other miscellaneous ingredients 1.5 p.c. Wetter astralite differs from this only in having 10 p.c. of the ammonium nitrate replaced by an equal weight of sodium chloride, whereby the flame temperature is decreased.

Astrid SOPHIE LOUISE THYRA (1905-1935). First wife and consort of Leopold III, King of the

Astrid, Queen of
the Belgians

Belgians. The third daughter of prince Charles of Sweden, and niece of king Christian X of Denmark, she was born in Stockholm on Nov. 17, 1905. She married Leopold III, then duke of Brabant, elder son of Albert, king of the Belgians, in Stockholm on Nov. 4, and in Brussels on Nov. 10, 1926. She had three children, princess Josephine, b. Oct. 11, 1927; prince Baudouin, b. Sept. 7, 1930; and Albert, prince of Liège, b. June 6, 1934. Queen Astrid met her death near Lucerne, Switzerland, as the result of a motor accident on Aug. 29, 1935, in which her husband, King Leopold, who was driving, was injured. In 1936 a memorial chapel was built at Küsnacht, close to the spot where she was killed. *Consult* Life, J. Cappe, 1937.

Astringents (Latin *astringere*, to bind fast). Drugs which cause contraction of vessels and thus lessen the amount of exudation from them. They are most often used to stop bleeding, but are also employed to check diarrhoea and reduce discharges from mucous membranes. Alum, salts of iron, and tannic acid are examples.

Astrographic Catalogue. A catalogue of several hundred volumes, giving the positions and brightnesses of all the stars in the sky, as far as those about 250 times fainter than the faintest visible to the naked eye. It was planned in 1887 by international cooperation amongst 18 observatories all over the world, and is only now nearing completion. It will contain information about nearly 4,000,000 stars derived from 44,000 photographic plates. In some zones of the sky the work has already been repeated to discover by how much the stars change their positions with the lapse of time.

Astrolabe (Greek *astron*, star; *labein*, to take). Instrument used by the Greeks and Arabs and in

theodolite. For astronomical observations the astrolabes used were more complicated and embodied various circles (armillary circles) the rims of which lay on the surface of a sphere; e.g. one circle would represent the horizon, another the equator, a third the ecliptic. The place of the astronomical astrolabe has been taken by the equatorial instrument.

Astrolabe Bay. Inlet on the N.E. coast of New Guinea. On its shore stands the port of Madang, called Friedrich Wilhelmshafen when the territory was German.

Astrology (Greek *astron*, star; *logos*, discourse). Pseudo-science concerned with a hypothetical connexion between the changing aspects of the stars and the changing course of human life, and thence with predicting events and advising on the conduct most likely to achieve desired ends.

The birth of astrology is lost in antiquity, but the prospect of practical guidance was probably the motive for the patient study of the stars which led eventually to the establishment of the science of astronomy. Thus astrology, like alchemy, gave birth to the science which supplanted it. The main assumption of astrology is evidently bound up with the primitive doctrine that the earth is the centre of the stellar universe. In the 17th century the heliocentric theory obtained general acceptance, and by completely altering the point of view from which the stars were regarded, deprived astrology of the credit it had formerly enjoyed among the learned.

There seems never to have been exact agreement among astrologers as to the rules of their art. The cardinal assumption was that a man's life was governed primarily by the aspect of the stars at the hour and place of his birth; this aspect was represented by a figure called a horoscope. For the purpose of the horoscope, the celestial sphere was considered in relation to the horizon visible from the birthplace, and divided in a way on which agreement was not general, into twelve parts called houses, six being above the horizon and six below. The most important part of the sky for the horoscope of the native was the ascendant, i.e. the first house below the horizon, and it was necessary to determine which planet, or sign of the zodiac ruled by a planet, occupied that house at the moment of his birth. The planet whose sign was rising and

therefore occupying the upper portion of the ascendant was called the "lord of the ascendant," and its peculiar influence was supposed to govern the native's destiny. The ruling planet had an intimate relation to the native's temperament; he might be, e.g. of a saturnine, a jovial, or a mercurial disposition—words which have permanently left the mark of astrological ideas on the English language. Consult *The Mystery and Romance of Astrology*, C. J. S. Thompson, 1929.

In modern times there has been a popular revival of the cult of astrology amongst the credulous. The modern astrologer's knowledge of astronomy is, however, usually defective. Cosmic happenings can and do influence certain terrestrial phenomena (see Sun), and the relevant connexions have been established by astronomical investigations carried out scientifically; but no such statistical investigation has ever been made to verify the basic hypothesis of astrology, which is regarded by all men of science as a baseless delusion.

Astrometry. The astronomy of position, which deals with the precise location of the heavenly bodies, both on the celestial sphere and in space, and with their real and apparent motions. Most astrometric work is now done by photography.

Astronomer Royal. Head of the Royal Greenwich Observatory. This institution was founded in 1675 by Charles II, to whom John Flamsteed became the first "Astronomical Observer." Subsequent holders of the office of Astronomer Royal have been Halley (appointed 1720), Bradley (1742), Bliss (1762), Maskelyne (1765), Pond (1811), Airy (1835), Christie (1881), Dyson (1910). The tenth holder, Sir Harold Spencer Jones, was appointed 1933. The Astronomer Royal for Scotland is head of the Royal Observatory, Edinburgh, which stands on Blackford Hill.

Astronomical Unit. The fundamental unit of astronomical distance, defined as the mean distance between the earth and the sun. The latest value (1941), determined by the Astronomer Royal from international observations of the minor planet Eros (see Asteroids), is 93,003,000 m. The unit is used for specifying distances in the solar system, but is much too small for convenience in expressing stellar distances. See Light Year; Parsec.

Astrolabe. The astrolabe of Regiomontanus, an instrument to measure the angular distance between two heavenly bodies

From the original made in 1468, in the Museum at Nuremberg

medieval Europe to take altitudes and to mark the positions and movements of sun, moon, and stars. In its simplest form it consisted of a circle with two radial pointers, one fixed and the other movable, and both fitted with sights; it thus measured the angle between two stars or between a star and the horizon. This simple form of astrolabe was called the "mariner's astrolabe," and was used by sailors until superseded in the 18th century by the quadrant, which finally gave place to the sextant; it was likewise used for land-surveying, where its place has been taken by the

ASTRONOMY AND ASTROPHYSICS

A. HUNTER, Ph.D., F.R.A.S., Royal Greenwich Observatory

A general survey of the history and present state of man's study of the universe. For more detailed information see the articles on Moon; Stars; Sun, etc., and on the different planets, stars, and constellations. See also biographies of astronomers: Copernicus; Eddington; Galileo; Herschel; Newton, etc.

Astronomy (Gr. *astron*, star; *nomos*, law) is the science which deals with the heavenly bodies. It treats of their positions and distances; their motions, real and apparent; their interactions with one another; their forms, dimensions, masses, and surface features; and their probable past and future history. The study of their physical condition, their radiation and constitution is spoken of as astrophysics (Gr. *physis*, nature). The two sciences have a single purpose, viz. to advance our knowledge of the universe, but their methods of attaining that purpose are different, and a fairly definite dividing line can be drawn between them.

Four Branches of Astronomy

Four main branches of astronomy may be distinguished: (1) astrometry, which deals with the determination of the positions and motions of the heavenly bodies; (2) theoretical astronomy, which includes the theory of eclipses, celestial mechanics, gravitational theory, the calculation of orbits and perturbations, stellar statistics, and mathematical studies generally; (3) descriptive astronomy, or the investigation of the heavenly bodies themselves, as distinct from their positions and motions; and (4) practical astronomy, dealing with the optics and mechanics of telescopes and auxiliary instruments, and with observational methods and errors. Astronomy is also closely concerned in the study of the earth (especially of its atmosphere and the tides), in geodesy and surveying, in navigation, and in chronology. It differs from most other sciences in being not experimental but observational. Astronomers are powerless to alter the conditions in the objects of their study; on the other hand they can observe heavenly bodies of almost every conceivable variety in almost every conceivable state.

The utilitarian value of astronomy is almost negligible: it is practically confined to accurate time-keeping for scientific work, to the preparation of almanacs for navigation, and to the prediction of certain phenomena in radio communication. But its cultural value can scarcely be assessed. Every civilization has

developed its study of astronomy to a pitch which is a good measure of the general level of culture attained. The impact of modern astronomy on mathematics has resulted in the development of methods (e.g. the calculus) of basic importance in such practical matters as engineering; it has been the testing-ground of many philosophies and physical hypotheses (e.g. relativity theory); and in the distant objects observed by the astronomer the physicist can verify his theories under extreme conditions unattainable in terrestrial laboratories. The modern observatory is the platform from which an earth-bound pygmy with an insatiable thirst for knowledge seeks to probe the uttermost recesses of the universe; and he regards any possible material advantage to be got from his work as incidental, if not irrelevant.

HISTORY. The beginning of astronomy is lost in antiquity. The practical desire to observe the heavenly bodies no doubt arose acutely when primitive peoples turned from nomadism to agriculture and felt the need for calendars to regulate their work. The first astronomers were probably priests, for celestial knowledge was their preserve; and early astronomy was bound up closely with religion and divination. Thus arose astrology (*q.v.*), the forerunner of astronomy, in such lands as Egypt, Persia, India, and China. Though Egyptian and Chaldean astronomers recognized the main observational facts of astronomy—the seasonal march of the constellations, the irregular motions of the planets, the sweep of sun and moon around the zodiac—their astronomy was confined to the preparation of numerical tables giving the positions of the sun, moon, and planets, and roughly predicting eclipses. There was no attempt to represent the motions by any geometrical model: no explanation of the observed facts.

The Greeks were the first to study astronomy systematically and to speculate how the universe might be constructed so as to give rise to the observed phenomena. From the observations of Hipparchus (c. 120 B.C.) they knew of

such matters as the precession of the equinoxes and the eccentricity of the sun's apparent orbit, and had a good idea of the moon's distance. Their theories culminated in the model universe described in the *Almagest* of Claudius Ptolemy (c. A.D. 150), who combined the rotating concentric spheres of Eudoxus (350 B.C.) with the epicycles (*q.v.*) of Apollonius (220 B.C.) into his geocentric theory, which was to persist for 14 centuries. This hypothesis postulated a fixed earth around which the heavenly bodies revolved daily. In addition to this diurnal motion, the sun and moon moved slowly round fixed circles somewhat eccentric to the earth; and the planets moved in small circles themselves carried round the earth on eccentric circles. The *Almagest* also included an expanded version of the star catalogue of Hipparchus with the stars arranged in order of brightness according to a system which, given some additional precision, is in use today.

Theory of Copernicus

Under the severely practical Romans astronomy stood still, and during the Dark Ages in Europe the science was kept alive by the Arabs, who were content to add minor improvements to the Ptolemaic theory as more precise observations showed them to be needed. With the Renaissance, Greek philosophy came under intense scrutiny in an awakened Europe. The Polish astronomer Copernicus in 1543 revived in an improved form the primitive (and hitherto rejected) heliocentric theory of Aristarchus (c. 280 B.C.) and postulated a fixed sun, central in the stellar universe, around which the planets, now including the earth, moved in eccentric circular orbits. The diurnal motion of the heavens now became merely the reflection of the earth's daily rotation on its axis. In spite of the simplicity of this view, a century of barren controversy among astronomers, philosophers, and theologians was needed before it gained any great measure of acceptance. Meanwhile, the Dane Tycho Brahe (1546–1601) spent his lifetime making observations which were later used by his pupil Kepler to

prove that the planets moved not in eccentric circles but in ellipses with the sun at one focus. The simplification thus introduced established the heliocentric theory as it is today, but as yet no reason for the motion was known. Astronomy was still concerned with the geometry and not with the mechanics of the solar system.

Up to the time of Tycho, astronomical instruments were mere sighting devices for the accurate measurement of angles. With the invention of the telescope (c. 1609), however, the heavenly bodies could be magnified and the effective light-gathering power of the eye increased many hundredfold. With one of the earliest telescopes Galileo, a contemporary of Kepler, discovered in rapid succession the lunar mountains, the satellites of Jupiter, sunspots, and the phases of Venus. As a result especially of this last discovery, by the time of his death few still accepted the geocentric theory. Continued improvements in the telescope enabled Huygens and Cassini, in the latter part of the 17th century, to explore more thoroughly the planetary satellites. Their observations enabled the theorists to establish the universal truth of Kepler's laws, and to arrive at the scale of the solar system with fair accuracy.

Newton's Law of Gravitation

For nearly half a century after Kepler announced his laws of planetary motion they remained unexplained. Isaac Newton (1642-1727) showed that they were a necessary consequence of a universal law of gravitation, applying equally to falling bodies on the earth, to the moon in her orbit, and to the remotest satellites of the farthest planets. Newton found that every body attracts every other with a force proportional to the product of their masses and varying inversely as the square of their separation. Other factors than mass and distance play no part in the forces which hold the solar system together. Subsequently this theory was taken up by the 18th century group of French mathematicians, including Euler, Lagrange, and Laplace, in whose hands it explained most of the outstanding anomalies and perturbations of the planetary motions.

The late 17th and early 18th centuries produced in England a band of brilliant instrument-makers who perfected the optics and mechanics of the telescope to such an extent that English

astronomy swung away from the mathematical studies of Newton to the observational work of Halley and Bradley. This was carried out largely at Greenwich, where in 1675 the Royal Observatory was founded for perfecting knowledge of star positions and preparing lunar tables so as to aid navigation. Bradley's accurate observations of star-places led to the discovery of aberration and nutation; and they are still of use. The Greenwich tradition in astrometry, continued into the time of Maskelyne with the foundation of the Nautical Almanac, survives healthily still.

Herschel's Improved Telescopes

So far, the stars had merely provided a background against which the planetary motions were observed; and descriptive astronomy was concerned only with the solar system. The improvements made in the reflecting telescope by William Herschel, who between 1782 and 1789 increased its aperture from 12 ins. to 4 ft., made possible the exploration of the universe of stars. He discovered the motion of the sun amongst the stars (*see* Apex) and from his observations of the Milky Way put forward a disk model for the stellar system which is very close to present ideas. His discovery of binary stars extended the sway of gravitation beyond the solar system and made possible the first measurements of stellar masses; and his observations of the nebulae gave the first inkling of "island universes" more distant even than the Milky Way itself.

The solar system was not neglected in the 19th century. Indeed, a new planet, Neptune, was predicted by its gravitational effect, and found close to the predicted spot; the asteroids (*q.v.*) were discovered; and many new satellites were found. But the main activity remained with the sidereal universe. To astrometry the greatest contributor was perhaps Bessel, who first measured the distance of a star, using the trigonometric method employed on a smaller scale in surveying. Later in the century Argelander's great star catalogue, completed in 1862, was only the forerunner of a host of more comprehensive and more accurate catalogues of position, to the making of which there is no end. The application of photography to astrometry (*see* Astrographic Catalogue) soon revolutionised this branch of the subject, as it did many others. In descriptive astronomy the work

of Herschel and his son was carried on by Lord Rosse, whose great 6-ft. reflecting telescope in 1845 first showed the nature of the spiral nebulae; by Schiaparelli, a painstaking observer of planets and comets; and later by Barnard, who investigated the Milky Way by photography.

MODERN ASTRONOMY. The main front of advance in our knowledge of the universe since the middle of the 19th century has been in the field of astrophysics, which differs radically in methods and approach from the old astronomy. Though the older branches of the science still flourish, advance is rather towards increasing precision in existing studies than in fundamentally new directions. Only a few standard star-places are now found by visual means, to form a basic network for the photographic maps now made possible by wide-angle lenses. Stellar distances are measured photographically, the trigonometric method used still being necessary to scale the other more versatile methods of astrophysics. Theoretical astronomy still has hard nuts to crack with such varied subjects as lunar perturbations and stellar statistics; and the discovery in 1930 of a new major planet, Pluto, though it followed a theoretical investigation, was not made entirely as a result of it. Apart from observations of the surfaces of the planets, of binary stars and variable stars, and of meteors, little visual astronomy is now worth while; and is impotent in the study of the more distant parts of the universe.

Results of Astrophysical Research

The modern picture of the universe as consisting of an insignificant heliocentric solar system embedded eccentrically in a discoidal galaxy, itself one of innumerable stellar systems scattered haphazard throughout an unplumbed space, is one the basis of which was indeed suspected as a result of the older studies; but our knowledge of its scale and detailed construction has come almost entirely from astrophysical research. Nevertheless, the position of the newer science will not be secure without continued attention to its purely astronomical foundations, and the work which goes on in the older observatories, though along lines already laid down, is as vital to progress as the more spectacular advances made in astrophysics.

Astrophysics is largely the logical development of descriptive

astronomy. The stars affect our senses in only one way, *i.e.* through the light they send us; and the astrophysicist makes a physical study of starlight—its brightness, its colour, its polarisation, etc. All astronomical phenomena which indicate or depend on the physical conditions existing in the atmospheres or interiors of celestial objects, or in interstellar space, are properly the domain of astrophysics. Some of the objects studied for centuries by astronomers, *e.g.* sunspots, comets, and variable stars, remained largely a mystery whilst direct examination, either by the naked eye or telescopically, by visual means or photographically, was all that could be done; but they are yielding their secrets to an increasing extent when investigated by the methods and apparatus of the physical laboratory.

The physical study of the stars falls naturally into two parts: (1) observational astrophysics, in which the radiation sent to us by the heavenly bodies is measured and analysed; and (2) theoretical astrophysics, in which the results obtained by observation are collated, subjected to mathematical treatment, and extended, aided by physical theory, to unobserved regions such as stellar interiors.

Use of the Spectroscope

Observational astrophysics may be said to have its origin in the middle of the 19th century with the application of the spectroscope (*q.v.*) to celestial studies. The dark lines in the sun's spectrum, missed by Newton but discovered by Fraunhofer, were shown by Kirchhoff in 1861 to correspond exactly to the bright lines in the terrestrial spectra of such substances as iron, hydrogen, and sodium. Modern observations only strengthen the conclusion that cosmic matter is the same as terrestrial matter, and even suggest that the elements occur everywhere in much the same proportions, with certain explicable exceptions. The versatility of the new method of investigation was clearly shown when Huggins found in 1864 that some at least of the nebulae could not be myriads of stars, since they showed the characteristic bright-line spectrum of a glowing gas. In 1868 the element helium was discovered spectroscopically in the sun 25 years before it was detected on the earth. Empirical investigations continued apace until, with the quantum theory of the atom, it became possible to see more

clearly what was involved in the production of absorption and emission spectra. It is now possible to find the origin of celestial spectra unknown in the laboratory: the nebular lines of Huggins were ascribed by Bowen to oxygen in 1927, and the spectrum of the solar corona was attributed by Edlén in 1941 to iron, calcium, and nickel. Few celestial spectra remain unidentified, and the rôle of the spectroscope in celestial chemistry is almost over.

Detection of Binary Stars

But in other directions the instrument is of increasing importance. The Doppler effect (*q.v.*), by which motion of a source of light in the line of sight can be measured, was first verified with the sun's rotation (known independently from direct observation of sunspots) and then applied to the stars. Thus were first measured stellar radial velocities, which together with the proper motions of classical astronomy have proved invaluable in the exploration of the galaxy and later of the "expanding universe." Binary stars, the components of which are too close for visual separation, were detected in 1889 by their orbital Doppler effect, and the study of these spectroscopic binaries is now an important branch of astrophysics. From the continuous spectrum of a star can be found the temperature of the surface layers: the hotter the star, the more intense are the blue rays relative to the red. Accurate colour temperatures of this kind are now known for hundreds of stars, and less accurate means of measuring colour give approximate temperatures for thousands of others. But perhaps the most far-reaching application of the spectroscope has been the development, from 1914 onwards, of methods of estimating the intrinsic brightness of a star from certain delicate features of its spectrum. Comparison of this intrinsic brightness with its apparent brightness gives a direct indication of the distance of the star. These "spectroscopic parallaxes" have in recent years greatly increased the range of accurate measurement of stellar distances.

Parallel to these spectroscopic advances has been the development of photometers for astrophysical use. The visual photometer developed by Pickering in 1887 was the first instrument to make possible accurate measurements, as distinct from mere estimates, of the brightness of the

stars. By the use of this and similar instruments a catalogue of 46,000 star magnitudes was available by 1908. Meanwhile, as a result of Schwarzschild's researches, photographic photometry was developing. By measuring the diameter or the optical density of star images on photographic plates their apparent brightnesses can be obtained, and many catalogues of photographic magnitudes have been published from 1900 onwards. Nor has the work yet more than begun: more and more magnitudes of greater and greater precision are needed to solve one of the most fundamental problems of astronomy, *viz.* the structure of the galaxy.

Study of the eclipsing variable stars with photometers (particularly of the photo electric type) has greatly extended our knowledge of stellar diameters and masses. Another class of variable star, the Cepheid variables, are found to vary periodically in brightness at rates which depend upon their intrinsic brightness. Thus a Cepheid variable anywhere in the universe betrays its luminosity and thus its distance by the period of its variation. In this way photometry has given astrophysics its most powerful tool for exploring extragalactic space.

THEORETICAL ASTROPHYSICS.

This is of more recent development than observational astrophysics. It is founded on observational data, and is concerned with most of the fundamental problems of the universe: how the stars and nebulae are distributed in space; how the atmospheres and even the interiors of stars are constituted; and how the universe and its separate units have evolved. Photometry and spectroscopy are the astrophysicist's main weapons in attacking these problems.

Kapteyn's "Model Universe"

The photometric studies of the late 19th century were extended in 1906 by Kapteyn, who proposed and started the exhaustive study of over 250 "selected areas" of the sky as a sample of the whole expanse. From counts of stars of various brightnesses he was led in 1922 to propound a model universe in which the sun was nearly central in a flattened system of stars extending 55,000 light years in the direction of the Milky Way but only 11,000 light years thick at its centre. Analyses of stellar spectra by Oort and Plaskett have proved that the stars in the sun's neighbourhood take part in a general galactic rotation about a

1. Eclipse of the sun, May 29, 1919, as seen at Sobral, Brazil. 2. The moon at the third quarter, showing one of the so-called seas. 3. Jupiter, with its system of belts and zones. 4. Absorbing nebula of the galactic

system in Orion. 5. Comet Finsler, 1937; motion during 5-hour exposure shown by sharp images drawn out into elongated trails. 6. Globular cluster of stars in Centaurus. 7. Spiral nebula, foreshortened view

ASTRONOMY AND ASTROPHYSICS: PHENOMENA SEEN THROUGH THE TELESCOPE

Photos, courtesy of Royal Astronomical Society

distant centre 30,000 light years away. It is now known that Kapteyn was misled by galactic obscuration into assigning the sun a central position when it is in fact quite eccentric in a larger galaxy, 100,000 light years across, probably resembling (from outside) a spiral nebula. Similar nebulae are scattered, apparently at random, in all directions in space, their spectral lines showing shifts which, if they are interpreted as due to line-of-sight motion, mean that the nebulae are receding from us at speeds proportional to their distances. The theoretical explanation of this "expanding universe" is a matter of dispute.

The modern theory of stellar constitution dates back to 1916 and is based on the work of Eddington, who showed that energy is transported from the centre of a star mainly by radiation, which percolates through to the surface, helping gas pressure in supporting the outer layers against gravitational contraction and keeping the interior in a state to which the ordinary gas laws of the physics laboratory are applicable. From these laws probable internal pressures and temperatures can be calculated, and the brightness to be expected from a star of any given mass can be deduced. The mass-brightness relation so found agrees so well with observation that Eddington's basic assumptions are now accepted as correct. By 1938 physics was so far advanced that the probable source of stellar energy had been identified, viz. the transmutation of elements at the temperatures of millions of degrees likely to prevail in stellar interiors. These nuclear reactions (like those occurring in the atomic bomb) give rise to enormous energy outputs by the destruction of mass.

The spectra of stars are determined by surface conditions: the continuous spectrum by the temperature, which is itself controlled by the nature of the absorbing material which obstructs the outflow of radiation and renders the star opaque, though gaseous; the lines mainly by the temperature and secondarily by the pressure at the surface. The observed sequence of stellar spectra is certainly determined by physical conditions, and is almost as certainly an evolutionary sequence. The problem of stellar evolution is, however, by no means solved, and bound up as it is with the origin of stellar energy, itself

a subject which is still very far from being fully understood, presents one of the outstanding challenges to the theoretical astrophysicist. This and the countless other unsolved problems of astronomy and astrophysics will yield only to patient observation, skilful and persistent experiment, and bold analysis by astronomer, physicist, and mathematician.

Jeans, new ed., 1944.

Astrophel. Poetic name adopted by Sir Philip Sidney in his sonnet sequence, *Astrophel and Stella* (star-lover and star), addressed to Lady Penelope Devereux. Spenser used it for the title of his elegy on Sidney. See Sidney, Sir Philip.

Astruc, JEAN (1684-1766). French physician and biblical critic. Born at Sauves, Languedoc, March 19, 1684, he was professor of medicine at Montpellier, 1717, and at Paris, 1731. He wrote several medical works of note, including *De Morbis Venereis*, 1736. In 1753 he issued anonymously a book on Genesis which originated modern textual criticism of the Pentateuch. To support the theory that Moses compiled it from earlier writings, he attempted to divide Genesis into two parts, Jehovistic and Elohist. He died in Paris, May 5, 1766.

Astura. Ancient town of Italy. On the coast of Latium, it stands on the Bay of Anzio, 7 m. S.E. of the ancient Antium and modern Anzio (*q.v.*). Its site was once an island but is now a peninsula. It is unhealthy, and both Augustus and Tiberius are said to have contracted here their fatal illnesses. Cicero had a villa here, and remains of other villas can be traced along the coast.

Asturias. District in northern Spain bordering on the Bay of Biscay. At one time a small independent kingdom, and later a province, it is now represented by the province of Oviedo, although the older name is retained in a general sense. Asturias pre-

serves the name of its early inhabitants, the Astures, a tribe subdued but never wholly subjugated by the Romans.

When, early in the 8th century, the Moors completed their conquest of Spain, the few remaining Christians retreated into Asturias, and in that wild and mountainous region maintained their independence. Having chosen a certain Pelayo as their ruler, they defeated the Moors in 718 at the battle of Covadonga. One of his successors, Alfonso I, may fairly be described as king of Asturias. He extended his rule over Galicia and Navarre, and seized some of the Moorish fortresses, and at his death in 759 left a large kingdom. Another Alfonso took up the work of conquest, and in numerous encounters defeated the Moors. His son Garcia transferred his capital in 910 from Oviedo to Leon, and soon the kingdom of Asturias became the kingdom of Leon. Asturias is thus the nucleus of the kingdoms of Christian Spain. The heir to the Spanish throne was given the title of prince of Asturias. In Oct., 1934, there was a serious uprising by extreme Left elements in Asturias, and during the Spanish civil war (1936-39) Asturian miners put up fierce resistance against Gen. Franco's forces at Gijón and Oviedo. See Spain: History.

Asunción. Capital of Paraguay, S. America. It stands on the Paraguay, at the head of navigation for sea-going vessels, and is 645 m. directly N. of Buenos Aires. It has through rly. connexion with Buenos Aires, and communicates with Encarnación, on the Paraná, by the Central Paraguayan Rly. The seat of a bishopric, it has a cathedral, congress buildings, government palace, university, national college, library, school of agriculture, a hospital, and the handsome building of the Bank of Paraguay. It has a wireless station, shipyards, distilleries, foundries, and mills, and trades in maté (*q.v.*), tobacco, sugar, hides, cedar, and fruits. Founded on Assumption (Span. *Asunción*) Day, Aug. 15, 1537, it was bombarded and plundered by the Brazilians in 1869, and subjected to blockade in 1905. Pop. 130,067.

Asunción, LA. Town of Venezuela, capital of the state of Nueva Esparta. It is situated on the E. shore of the island of Margarita, and manufactures straw hats, linen, embroidery, hammocks, and bricks. The harbour and a great part of the town are in ruins.

Asylum (Gr. *a*, not: *sylē*, right of seizing). Place of refuge. Among the ancient Hebrews asylum was afforded in the cities of refuge—three on each side of the Jordan—to those who had committed homicide unawares. In ancient Greece slaves, debtors, criminals, and others sought asylum at temples, altars, sacred groves, and statues of the gods, from which it was sacrilege to drag them. In imperial Rome statues and other representations of the emperors, and also the Roman eagles, were deemed inviolable refuges. In modern times the name has been specially applied to institutions for the care of the unfortunate and afflicted, especially lunatics; but under the Mental Deficiency Act, 1930, these institutions are officially styled mental hospitals (*qv*). See Sanctuary.

Asylum, RIGHT OF. In international law, the right of a sovereign state to harbour refugees from other countries. Mutual extradition treaties exist between states providing for the surrender of criminals fugitive from justice, but the right of granting asylum to political refugees is absolute, bound only by the international obligation on the state receiving the fugitive not to allow him to use his refuge as a place whence to injure the country from which he has fled. See Extradition.

Asymptote (Greek, not falling together). Line continually approached by a curve but never meeting it. A cone can be cut by a plane in such a way that the curve formed by the section of the plane will be an open one: i.e. its branches will never cut the side of the cone again, but will stretch away to infinity. The curve thus described may be either a parabola or a hyperbola. If a hyperbola, the curve may be figured as being formed by the cutting plane, in a double cone or complete cone, so that it forms a double curve with four branches, instead of two, stretching to infinity. Through the origin of this curve two lines

can be drawn which the branches of the curve will continually approach, but can never meet. These are called the asymptotes of the hyperbola. Mathematically the line touches the curve at infinity and is called a tangent at infinity. See Conic Sections.

Asyndeton (Greek, not bound together). The omission of the connecting word before the second of two, or the last of a series, of similar words. "The duke of York was a man, big, burly, jolly, cursing, courageous," and Julius Caesar's *Veni, vidi, vici* (I came, I saw, I conquered), are examples. Occasionally effective in giving point by its variation from normal practice, the device may easily become an unpleasing mannerism.

As You Like It. Romantic pastoral comedy by Shakespeare. Rosalind, dismissed from court by her uncle Frederick, the usurping duke, and Orlando, fearing assassination at the hand of his elder brother Oliver, take refuge in the Forest of Arden—Ardenne, geographically, but the Warwickshire woodland as depicted. Here the exiled duke holds his court. Rosalind, dressed as a boy and calling herself Ganymede, teaches Orlando how to woo, without his recognizing her. The usurping duke is converted "from his enterprise and from the world" and retires into a monastery; Orlando and Oliver are reconciled; Rosalind is married to Orlando, Oliver to Celia, Rosalind's cousin and companion; and the exiled duke returns to his dukedom.

Contrast to the love passages is supplied by the melancholic humorist Jaques the courtier, the dry humorist Touchstone the clown, and the phlegmatic humorist Audrey, Touchstone's sweetheart.

Written about 1599–1600, and first printed in the 1623 folio, this five-act play betrays evidence of hasty composition. It is based on Thomas Lodge's *Rosalynde*, a romance of the Ardennes, 1590; but Shakespeare, who is said to have acted the part of the old servitor Adam, introduced the characters of Touchstone, Jaques, and Audrey, and altered the name of Lodge's hero Rosader to Orlando. In it the poet makes a notable quotation (Act. III, sc. 5) from Marlowe's *Hero and Leander*, just published. The play contains 2,904 lines, of which 925 are blank verse and 71 pentametric rhymes. In the part of Rosalind, possibly the most vivacious of Shakespeare's heroines and a favourite part with most actresses, Ada Rehan was outstanding in 1890, and Edith Evans scored a great success in 1937. As Jaques, Oscar Asche excelled.

Atacama. Desert of N. Chile. It comprises the greater part of the provs. of Atacama and Antofagasta, and covers an area of about 70,000 sq. m. It rises from the coast in rocky plateaux, broken by mt. ridges, and attains an elevation of from 7,000 ft. to 13,000 ft. in the Cordillera. Rain seldom falls, except in the E. It is almost devoid of vegetation, and is partly covered with saline,

As You Like It. Shakespeare's comedy finds an appropriate setting in the Open-Air Theatre in Regent's Park, London. The scene shown is the wrestling match in the first act

Photo, J. W. Debenham

nitrate, and borax deposits, dried lake-beds, and shallow ponds. It corresponds in lat. with the Kalahari desert of South Africa and the great Central Desert of Australia.

Atacama. Province of Chile. Bounded N. by Antofagasta and S. by Coquimbo, and extending from the Pacific to the Andes, it has an area of 30,834 sq. m. Hilly and barren, it produces borax, nitrates, salt, copper, iron ore, and silver. Copiapó is the capital. Pop. of prov., 84,312.

Atahualpa (c.1495-1533). Last Inca ruler of Peru. Born probably at Cuzco, he was the son of the Inca sovereign Huayna Capac. Atahualpa, though the elder son and his father's favourite, was illegitimate by Inca law, his mother not being of the Inca royal line. On his father's death in 1525 he received Quito, and his half-brother, Huascar, the rest of the realm. In the spring of 1532, refusing to recognize Huascar as overlord, Atahualpa defeated and captured him and became sole ruler.

In Nov., 1532, the Spaniard Pizarro invited Atahualpa to a friendly interview, and took him prisoner. After paying a large ransom, Atahualpa, still in captivity, plotted the murder of Huascar; but his plans were discovered and he was condemned to be burned alive. On his professing Christianity this sentence was commuted to strangulation, and he was garrotted Aug. 29, 1533.

Atakpamé. Town of Togoland. On the rly. to Blitta, it is 103 m. N. of Lomé, in the centre of a rich agricultural and rubber and cotton-producing district.

Atala. Story by François René Chateaubriand, written during his wandering life and published on his return to France, 1801. It is a tragic romance of a half-Spanish, half-Indian, Christian girl, Atala, and Chactas, an Indian whom she saves from death at the hands of his captors, only to die herself rather than marry against the dictates of her religion. The story established its author's reputation, and is regarded as the starting point of the romantic movement in French literature.

Atalanta. In Greek mythology, the name of an Arcadian maiden. Wishing to avoid marriage, she made it a condition that her suitors should run a race with her. The one who beat her in the race was to have her hand; those whom she overtook she slew with a spear-thrust in the back. At last she was beaten by Milanion, who as he ran dropped three golden apples given

him by Aphrodite. Atalanta, stopping to pick them up, lost the race, and became the wife of Milanion. A similar story, in which the name of the successful suitor is Hippomenes, was current concerning a Boeotian Atalanta. She is said to have accompanied Jason on the Argonautic expedition and to have taken part in the Calydonian boar hunt, an incident which forms the subject of Swinburne's *Atalanta in Calydon*. There is little doubt that Atalanta, like Callisto (*q.v.*), was really a personification of the Arcadian goddess Artemis. See Calydon; Meleager.

Atargatis. A Syrian goddess. This Greek name, often transliterated Derceto, embodies the Aramaic form of Ishtar with the Syrian Ate or the Lydian Attis. Goddess of life-giving water, her chief temples were at Hierapolis, Edessa, and Ashteroth-Karnaim. Mostly represented in human form, as the Philistine Ashkelon she became fish-tailed. Traders carried her worship to Delos and other Mediterranean lands.

Atatürk, MUSTAFA KEMAL (1881-1938). First president of the Turkish Republic. The maker

Kemal Atatürk, 1st President of Turkey

of modern Turkey, he was born at Salonica and entered the army in 1904, identifying himself with the Young Turk movement. In the First Great War he was promoted general and commanded a division defending the Dardanelles. He was given commands in the Caucasus and Palestine and had many disputes with the Germans, resenting their interference with Turkish internal affairs. He was sent to Anatolia in May, 1919, to suppress the nationalist movement, of which instead he became the leader. Outlawed by the Istanbul government, he became a popular hero after the signing of the Treaty of Sèvres (*q.v.*). He was appointed generalissimo in 1921, and drove the Greeks out of Asia Minor, being honoured with the title Ghazi by the national assembly. He concluded the Treaty of Lausanne, and on Nov. 1, 1922, the national assembly abolished the sultanate.

Turkey was declared a republic on Oct. 29, 1923, with Atatürk its first president and chief of state. He embarked at once on a policy

for the modernisation and secularisation of Turkey. On March 31, 1924, the caliphate was abolished and all members of the House of Osman banished from the republic. Atatürk ruled as a dictator and was completely ruthless. In 1925, following the suppression of a rebellion inspired by Muslim clergy, he ordered all religious houses to be closed. The wearing of European hats and clothes was made obligatory; polygamy was abolished, and the wearing of veils by women was banned. A civil code based upon the Swiss model was substituted for the Muslim sacred law, and on April 10, 1928, Mahomedanism ceased to be the state religion. Later in the year the Latin alphabet was substituted for the Arabic script. In 1934 the franchise was granted to women, and the adoption of surnames was made compulsory, the ruler taking that of Atatürk. The reconstruction of Angora as a capital on Western lines was one of his great interests, the city being renamed Ankara (*q.v.*). He married Latîfe Hanım in 1923, but divorced her in 1927 for endeavouring to influence his political missions. He died on Nov. 10, 1938, and was succeeded by İsmet İnönü.

Ataulf (d. 415). King of the Visigoths. He was the brother-in-law of Alaric, whom he succeeded in 410. After assisting Alaric in his invasion of Italy, Ataulf crossed into Gaul. In Jan., 414, he married at Narbonne his captive Placidia, sister of Honorius, emperor of the West, and later went to Spain to quell a revolt of the Vandals and Suevi. He was assassinated by a groom at Barcelona in 415. The name, variously spelt, appears in the latinised form Adolphus. See Visigoths.

Atavism (Lat. *atavus*, father of a great-great-grandfather). Term used in biology. It expresses the occurrence in an organism of some feature or structure not usually present in the existing generation of that species, but suggesting reversion to a type present in some former generations. In the dentition of the horse an extra premolar tooth of this nature occurs. See Biology; Heredity; Life.

Ataxia or **ATAXY** (Gr. *a*, not; *taxis*, order). Medical term for defective coordination of the muscles of movement and balance, or loss of the power of coordinating them. It is a late symptom of the disease locomotor ataxia (*q.v.*).

Atbara. Tributary of the Nile. Rising near Lake Tsana in Abyssinia, it joins the Nile above

Berber, and is the last tributary to enter the Nile before that river reaches the Mediterranean. It contributes fertile silt to Egypt. The summer rains in the highlands of Abyssinia, carried away by the Atbara, Blue Nile, and Sobat, cause the annual Nile flood. For nine months the bed of the river is little but a dry watercourse.

Athara. Town in the Anglo-Egyptian Sudan. It is a junction on the rly. from Wadi Halfa to Khartoum with the Nile-Red Sealy. to Port Sudan, and is 388 m. S.E. of Wadi Halfa.

Atbara, BATTLE OF THE. Fought April 8, 1898, between the British under Sir Herbert (afterwards Earl) Kitchener and the followers of the Mahdi under Mahmud. Kitchener's army had advanced from Berber along the right bank of the Nile and then along that of the Atbara, meeting only minor attacks by the dervish horsemen; but on the 5th it was evident that the enemy was preparing to fight. The Anglo-Egyptian army moved from Abatar to Umdabia, and on the evening of the 7th was in order of battle. The dervishes were encamped in a zareba built amid the scrub on the banks of the Atbara, about seven miles away.

The force, consisting of four brigades of infantry, one British under General Gatacre, and three Egyptian, with cavalry and artillery, arrived in front of the zareba just before dawn on the 8th. Three brigades formed up for the attack. They were in the form of a great bow, the British on the left and the Egyptians in the centre and on the right. At 7.40 the infantry advanced, coming under fire when within 300 yards of their objective. According to plan the leading battalion, the Cameron Highlanders, tore gaps in the zareba, and the whole force then pressed through the trenches and stockade within it. There was a sharp fight therein, for the dervishes fought bravely, but in a short time many of them were killed and the remnant driven to the river. By 8.30 the fight was over and Mahmud a prisoner. The cavalry crossed the river, but the pursuit was not pressed. The losses of the Anglo-Egyptians were 34 officers and 525 men, out of about 12,000 engaged. *Consult* With Kitchener to Khartoum, G. W. Steevens, 1898; The River War, Winston S. Churchill, 1899.

Atchafalaya. River of Louisiana, U.S.A. Rising near the junction of the Red river with the Mississippi, it flows S. through

Grand Lake into the Gulf of Mexico at Atchafalaya Bay. Most of its 224 m. are navigable. It is probable that the river was once the outlet of the Red river.

Atchison. City of Kansas, U.S.A. It stands on the Missouri, 50 m. N.W. of Kansas City by rly. A rly. and commercial centre, it ships grain, lumber, and livestock, manufactures furniture and wagons, and has flour-mills and iron-foundries. It has a county court house, a government building, and a public library. It was named after D. R. Atchison, who settled here in 1854. Pop. 12,648.

Atē (Gr., infatuation). In Greek mythology, daughter of Zeus, or of Eris (strife). The goddess of mischief, Atē figures in Greek tragedy as the power who lures the guilty to further deeds of evil until they compass their own doom.

Atebrin. Synthetic acridine derivative used as an alternative to quinine in the treatment of malaria. It relieves the condition by killing the malarial parasite in the asexual stage of its life-cycle. It is relatively non-toxic to man, but intolerance may arise and be manifest as gastric pain, loss of appetite, and headache: mental disturbances may occur; and the patient may show pigmentation not due to jaundice. The substance was of extreme importance in the Second Great War, when quinine was almost unobtainable. It was known to the British forces as mepacrine.

Atef. Symbolic crown or head-gear worn by ancient Egyptian gods. It consists of a tall white cap with a plume at each side, and bearing the solar disk and uraeus, or serpent emblem.

Ateliers Nationaux. French national works or workshops, especially those set up in Paris in 1848. In Feb. of that year the provisional government guaranteed work and subsistence to all, starting experimental works in Paris and in the neighbourhood. As the employment available proved quite insufficient for the numerous applicants, it was decided to pay those for whom no work could be found 1.50 fr. a day, those who worked receiving 2 fr., irrespective of their qualifications or the amount of work done. Many found it possible to draw the allowance for unemployment and carry on their usual occupation.

The scheme was reorganized by Émile Thomas, who reduced the pay of the unemployed to 1 fr. a day, and arranged the employed in companies of about 900 each,

subdivided into smaller groups, the intention being to put them to useful work in squads. The number of unemployed continued to increase, until there were more than 115,000 names on the roll, while many of those employed did as little as possible. In May the new National Assembly dismissed all single men under 25 years old who refused to join the army, all who refused offers of private employment and all who had been in Paris for less than six months. These and other changes led to the insurrection of June, 1848, and the system collapsed.

These ateliers must be distinguished from the *ateliers de charité*, societies formed to assist destitute workmen; and from the *ateliers sociaux*, productive societies established by Louis Blanc, who was also largely responsible for the idea of the *ateliers nationaux*.

Atella. Town in ancient Campania, Italy, between Capua and Neapolis. It was the birthplace of the popular farces called *Atellanæ fabulae* (Atellan plays), which subsequently enjoyed great vogue at Rome down to imperial times. They dealt with scenes from the country life of the lower classes. Their standing characters were *macrus*, the buffoon, *bucco*, the garrulous toady, *pappus*, the avaricious old man or pantaloon, and *dossennus*, the humpbacked sharper and cutpurse.

Ateshga or **ATECH-GAH.** Locality of Russia, in Azerbaijan S.S.R. It is in the centre of the peninsula of Apsheron on the Caspian Sea, 15 m. N.E. of Baku. The fire-worshippers have their principal temple here. A naphtha spring feeds the sacred flame.

Atessa. Town of Italy, in Chieti prov. It stands on the E. slopes of the Apennines, 25 m. S.S.E. of Chieti, and is noted for its sausages, known as salami.

Ath or **AATH.** Town of Belgium, in Hainaut prov. Formerly fortified, it stands on the canalised Dender, 32 m. by rly. S.W. of Brussels. The Tour du Burbant dates from the 12th century. During the First Great War it was the scene of the last fighting in the west, Nov. 11, 1918. Pop. 10,186.

Athabaska. Lake of Canada, in Alberta and Saskatchewan. Situated in lat. 59° N., long. 106° W., it is 195 m. long, from 5 m. to 35 m. wide, and has an area of 2,842 sq. m. Its outlet to the N. is by the Slave river, and it is navigable by light-draught steamers. There are trading stations on its shores, which are rocky

and infertile. It was discovered in 1771 by Samuel Hearne, who called it the Lake of the Hills.

Athabaska or **ELK**. River of Canada. Rising near Mt. Brown in the Rocky Mts., it issues from a small lake and follows a N.E. direction before curving sharply E. above Athabaska Landing, after receiving the waters of the Little Slave Lake. Thence it turns N. and enters the S.W. end of Lake Athabaska after a course estimated at 776 m. Navigation begins just above Athabaska Landing for stern-wheel steamers, but is interrupted by the Grand Rapids, between which and McMurray the river makes a descent of 355 ft. in 85 m. From McMurray steamer navigation is continuous downstream.

Athabaska. Former district of the North-West Territories of Canada. It was bounded N. by the former district of Mackenzie, S. by Alberta and Saskatchewan, E. by the former district of Keewatin, and W. by British Columbia. Under the Dominion Act of 1905 the W. part was merged into the new prov. of Alberta, and the E. part, with the exception of a strip on the extreme E., was united with the district of Saskatchewan to form part of the new prov. of that name. The remainder was absorbed into the newly constituted North-West Territories, and was acquired in 1912 by Manitoba. The district is a portion of the great American Plain, rising towards the S.W., and is watered by Athabaska, Peace, Reindeer, and other rivers and the Athabaska, Reindeer, and other lakes. It had an area of 251,300 sq. m. See Manitoba.

Athabaska Pass. Depression in the Canadian Rocky Mts. It is between Mts. Brown and Hooker, and crosses from Alberta into British Columbia. It is 10,505 ft. high. See Rocky Mountains.

Athaliah. Daughter of Ahab and wife of Jehoram, king of Judah (2 Kings 8). A worshipper of the Phœnician Baal, after the assassination of her son and Jehoram's successor, Ahaziah, she seized the throne and had all the royal children killed except Joash, who was rescued by his nurse. After she had reigned six years, the high priest Jehoiada arranged with the officers of the army to have Joash suddenly proclaimed king and crowned. When Athaliah appeared on the scene she was seized and slain (2 Kings 11; 2 Chron. 22-23). Racine wrote a tragedy, *Athaliah*, 1690; and there are operas, both entitled *Athaliah*, by Handel, 1733, and Mendelssohn, 1844.

Athamas. In Greek mythology, king of Orchomenus, in Boeotia. Husband of Nephelê, the cloud-goddess, he deserted her for Ino, daughter of Cadmus, by whom he had two children, Learchus and Melicertes. Nephelê complained to the gods, and Athamas, driven mad by Hera, killed his son Learchus. Ino and Melicertes, who threw themselves into the sea to escape from his mad fury, were changed into marine deities.

Atharic (d. 381). Ruler of the Visigoths. After three campaigns against the East Roman emperor Valens, he was compelled in 369 to sue for peace, the negotiations between the emperor and the Goth taking place on a barge on the Danube. In 376 Atharic was defeated by the Huns and took refuge at the court of the emperor Theodosius I. He died at Constantinople in 381.

Athanasian Creed. Statement of the Christian faith, containing a short exposition of the doctrines of the Trinity and the Incarnation. It is one of the three creeds of Western Christendom, and in the Church of England is ordered to be recited at Morning Prayer in place of the Apostles' Creed on Trinity Sunday and on twelve festivals during the year. In the Roman Catholic Church it is said at Prime every Sunday, and in the old Sarum rite it was said daily at Prime.

Its authorship remains problematical. The influence of S. Athanasius is seen in its wording, and while no allusion to either the authorship or existence of the creed is found before the 6th century, critical opinion inclines to the 4th century as the date of its composition. Known sometimes by its opening words, *Quicumque vult*—Whoso wills or wishes—its so-called "damnable" clauses have provoked considerable criticism in the Church of England. These clauses declare that whoso wills to believe the truths held by the Christian Church to be necessary to salvation must hold these truths as defined by the Church, and that the wilful and culpable rejection of these truths entails eternal punishment. See Christianity; Church; Creeds; consult also The Athanasian Creed, A. E. Burn, 1896. History of the Creeds F. J. Badcock 2nd ed., 1938.

Athanasius (c. 297-373). Saint and doctor of the Church. Born at Alexandria, he was present as a deacon at the Council of Nicaea, 325, and was made bishop of Alexandria the same year. For his refusal to recall Arius from exile in 330 he was banished by the Emperor Constantine in 336, but on the deaths of Arius and Con-

stantine he was allowed to return. The Arian party drove him out of Alexandria again in 340, and after appealing to Rome and to the bishops of Gaul he was again restored in 346. For 10 years he laboured in his diocese, and then by the decree of the Arian majority in the Council of Milan, 355, he was once more banished. From 356-362 he withdrew to the desert, to be restored in 363, exiled and finally restored in 364. His last nine years were spent in Alexandria, where he died May 2, 373—the date of his festival. It is due more to Athanasius than any other man that the faith as defined at Nicaea prevailed in the Church. The saying, *Athanasius contra mundum*, Athanasius against the world, passed into a proverb, so considerable was the Arian majority against whom he contended. See Arianism; Arius; consult also Select Writings and Letters of S. Athanasius, A. Robertson, 1892.

Athapascans (Cree, reeds-here-and-there). Tribe of N. American Indians in N.W. Canada. Living around Lake Athabaska, and related to the Chipewyans, they give their name to a linguistic family formerly extending from the Arctic coast to Mexico. Broader-headed than the Algonquins, they may have followed that people from Asia, driving them out of the western tundras. The N. division are hunters and fishers and number about 3,000 in Alaska and 12,000 in Canada. The agricultural S. division inhabit Arizona, New Mexico, and Oklahoma. See American Indians.

Atheism (Gr. *a*, not; *theos*, God). System of thought opposed to theism or belief in God. The term has been applied in an accusatory sense to the denial of current beliefs on divinity—e.g. to Socrates by his accusers, and to the early Christians by the supporters of Roman mythology. Atheism is not the declining to assert an affirmative belief in theism, but is the assertion of the negative to theism. It may take the form of asserting the exclusion of a First Cause, or of asserting the non-existence of a Personal God. Moral atheism is expressed in the assertion that no spiritual First Cause exists, that if God exists man never has learnt and never can learn His will, and that, as no divine sanction can be found for morals, right or wrong in conduct are determined solely by circumstances.

While atheism must not be confounded with materialism, pantheism, or agnosticism, all philosophy that omits the existence of God from its consideration may

be defined as a negative atheism. No philosophic system of positive atheism can be said to exist, but Giordano Bruno (1548-1600), Holbach in the 18th, and Buchner and Haeckel in the 19th centuries, are near such a system. Atheism was inaccurately ascribed to the deism of Voltaire and Rousseau, and to the theism of Thomas Paine. Huxley, Darwin, and Spencer, again, never asserted the non-existence of God, but declared the Absolute to be unknowable. Charles Bradlaugh in England and Ingersoll in the U.S.A. were more concerned with asserting the non-existence of divine revelation than of a First Cause. See Christianity. Deism; Freethought.

Bibliography. G. J. Holyoake and Modern Atheism, S. D. Collet. 1855; A Candid Examination of Theism, G. J. Romanes (pseud. "Physicus"), 1878; Atheism and the Value of Life, W. H. Mallock, 1884; Atheism in the English Renaissance, G. T. Buckley, 1933.

Atheling (A.S., of noble birth). The root of the word appears in the names of some early kings, e.g. Ethelbert and Ethelred. Before the 8th century atheling was used of anyone of noble birth, later only for members of the royal family.

Athelney OR **ATHELNEY ISLE**. Tract of land in Somerset, England. It is situated within the angle formed by the confluence of the Tone and Parret rivers. After his defeat by the Danes in 878-9 King Alfred took refuge here, and fortified the place against attack. In gratitude for the asylum, he later founded a Benedictine monastery on the site. In 1693 excavation brought to light the famous Alfred Jewel (q.v.).

Athelstan (c. 895-940). Anglo-Saxon king, the first to be called King of the English. The son of Edward the Elder and grandson of Alfred the Great, he was crowned at Kingston, Surrey, in 925. In 937 he overthrew all his rivals at Brunanburh, probably in Northumbria. He died at Gloucester, Oct. 27, 940, and was buried in Malmesbury Abbey.

Athena. Major deity of ancient Greece. Also called Athene, Pallas Athene, or Pallas, she was identified by the Romans with Minerva. A daughter of Zeus, she is represented as having sprung fully armed from the head of her father. Pre-eminently the goddess of wisdom, she was also the goddess of war, regarded as a matter of strategy and tactics, not, like Ares (Mars), the deity of blood and slaughter. Athena was also patron of the useful arts, and was asso-

Athena. "The Mourning Athena," a 5th century B.C. Greek memorial to fallen soldiers

ciated with Athens as its special protectress.

A magnificent temple, the Parthenon, was erected in her honour on the Acropolis, and according to Aeschylus the court of Areopagus, on the Hill of Ares, was instituted by her. In the Trojan war, Athena espoused the cause of the Greeks, and Achilles, Odysseus, and Diomedes were under her special protection. She was always regarded as Parthenos, or the maiden-goddess, and in art she is represented as of a somewhat masculine appearance, wearing a helmet and shield. There were three famous statues of Athena by Pheidias, the best known being the colossal Athena Promachos on the Acropolis. See Minerva; Mythology.

Athenaeum (Gr., temple of Athena). Name given in classical times to schools of science and art. Such institutions existed at Athens, Alexandria, Rome, and elsewhere, one of the most famous being that founded by the emperor Hadrian at Rome (A.D. 135). At first much used for the recitation of their productions by poets and rhetoricians, they developed into something like the modern teaching university, with a system of lectures and salaried professors. Athenaeum is the name of various learned societies, and of schools in France, Belgium, and Holland ranking next to universities.

Athenaeum. London club. It was founded in 1824, and its house at the corner of Pall Mall

and Waterloo Place was built soon afterwards, the frieze of the building being a copy of that of the Parthenon at Athens. Persons eminent in public life, science, literature, and art are eligible for membership, and the committee may elect nine persons of eminent attainments every year. There are about 1,700 members, who pay an entrance fee of 40 guineas and an annual subscription of 18. The club contains a fine library.

Athenaeus (c. A.D. 195). Greek grammarian and rhetorician. Born at Naucratis in Egypt, he spent most of his life at Alexandria and Rome. His *Deipnosophists* (Doctors at Dinner) is a miscellany in fifteen books, of which much has been lost. It is a mine of information on ancient life and thought.

Athenia. British steamship, of the Donaldson line (13,581 tons). The first U-boat victim of the Second Great War, she was attacked at 7.45 p.m. on Sept. 3, 1939, when about 250 m. N.W. of the Irish coast on her outward voyage to the U.S. The passengers were at dinner when a torpedo struck the ship. The U-boat then came to the surface and fired a shell which was aimed apparently at the wireless aerial and exploded on the middle deck. On board the Athenia were 1,418 passengers and crew (including about 300 Americans). Of this number 128 remained unaccounted for by the rescue ships.

The U-boat captain, Lemp, claimed to have mistaken the Athenia for an armed merchant cruiser. The German Admiralty falsified the U-boat's log; and German propaganda, denying that any U-boat had been concerned, sought to put the responsibility on Churchill, then British first lord of the Admiralty.

Athenaeum. Façade of the London club, showing its classical design

ATHENS: IN ANCIENT AND MODERN TIMES

E. A. Gardner, Litt.D., and Henry Baerlein

The important part taken by Athens in history is here outlined and some account given of its wonderful buildings. Reference should be made to the article Greece and to those on Pericles, Socrates, and other great Athenians. See also colour plate, facing p. 1, and illus. p. 74

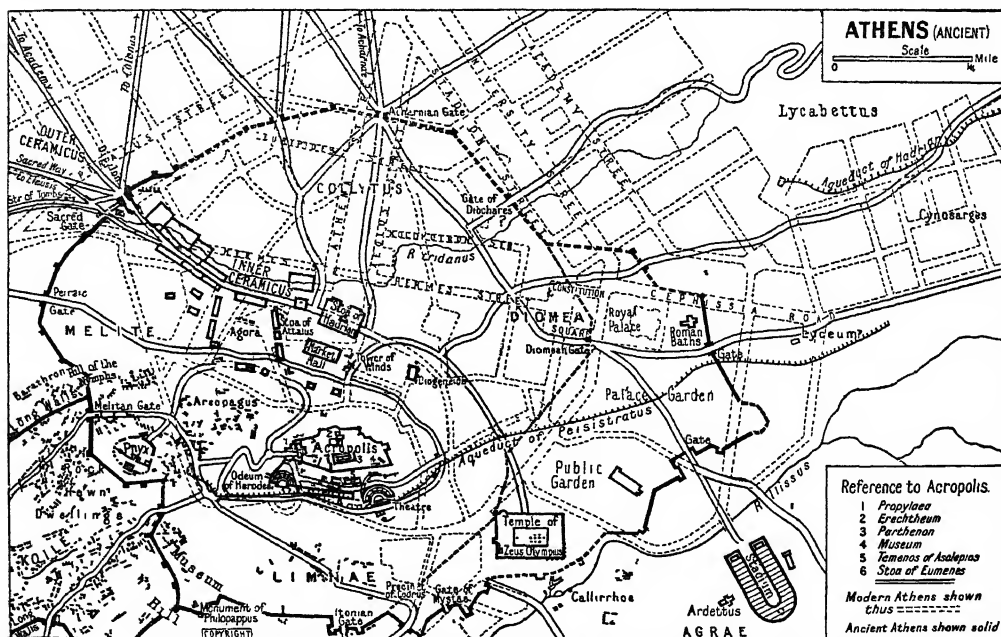

Athens, in ancient times the most famous of Hellenic cities, and now the capital of the Greek kingdom, is situated in Attica on and around a group of hills, about three miles from the coast and four from its harbour town, the Peiraeus. Such a position was a common one for ancient Greek towns, since it conferred the advantage of easy communications by sea, while it was not liable to sudden attack by pirates or other enemies. The hills of Athens are at the south-western end of a range which divides the Attic plain, the two rivers, the Cephissus and Ilissus, running on each side of the range and meeting below the town. The plain, which forms the immediate territory of Athens, is bounded on the N.E. by Mt. Pentelicus, on the S.E. by Mt. Hymettus, and on the N.W. by Mt. Aegaleus, with Mt. Parnes farther away to the N.

The other main divisions of Attica are the Thriasian plain, stretching away westward to Eleusis beyond Aegaleus, the plain of Mesogaea, beyond Hymettus to the E., and the district of Marathon beyond Pentelicus.

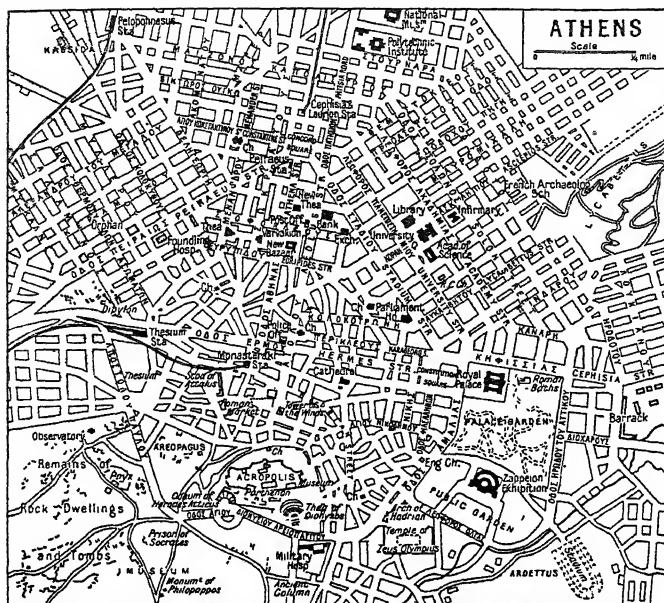

The synoecism or concentration of the scattered population of Attica in the town of Athens was attributed by tradition to Theseus. The earliest town consisted, according to Thucydides, of the Acropolis and its immediate surroundings. The Acropolis itself was a fortress, similar to those of Mycenae and Tiryns, containing the palace of the king, and its massive walls of Cyclopean masonry are still preserved in many places. It was also the chief religious centre, and contained the most sacred objects, the olive tree of Athena and the salt spring of Poseidon, which were said to have been produced by these two deities as tokens in their contest for the guardianship of the land. The old temple of Athena as goddess of her chosen city stood on the site of the palace of the early kings; the date of its building is unknown, but may well be associated with the abolition of the kingship, traditionally c. 1060 B.C. The tyrant Peisistratus (560-528 B.C.) did much to improve and beautify the city. He added a peristyle to the old temple of Athena, and began the huge temple of Zeus Olympius, not completed until

Roman times; he also made an aqueduct to supply the town with water, and decorated the famous fountain of Callirrhoe with an architectural façade, after which it was called Enneacrounos (the Nine Spouts). After the expulsion of the tyrants the Acropolis was no longer maintained as a fortress, but a new and much larger temple of Athena was begun on the site later to be occupied by the Parthenon, and the massive substructure was built which still carries the later temple.

At the time of the Persian invasion in 480 B.C. the town was indefensible, and the entrance of the Acropolis had to be blocked by a wooden palisade. The Persians sacked both town and Acropolis, burnt the half-finished temples, and broke or threw down the statues and other offerings. The Athenians, on their return, built the remains of these older structures and offerings into their new walls, or used them to fill in the terrace of the Acropolis, thereby preserving a valuable record of their early art. The wall of the town, thus hurriedly constructed, was extended on all sides. That of the Acropolis on the N. side was similarly rebuilt; the great walls of the Acropolis on the E. and S. were more regularly constructed at a later date, when Cimon brought home the spoils of his victory over the Persians at the Eurymedon (c. 466 B.C.), and the hill then assumed the regular shape which

Athens. Plan of the ancient city superimposed upon a slightly defined plan of the modern one

Athens. Ground plan showing the modern town with the academy, library, university, national museum and archaeological schools side by side with ancient temples and ruins

has ever since distinguished it. To the time of Cimon must probably be assigned many famous buildings round the Agora (market place) in the lower town, including the Stoa Basileios (royal portico) and the Stoa Poikilē (painted portico), which contained the famous paintings of the battle of Marathon and other mythical and historical combats, by Polygnotus and his pupils. Cimon also brought the bones of Theseus to Athens from Scyros and built the Theseum—not, however, in all probability, the temple now known by that name—for their reception.

It was not until shortly before the Persian invasion that the Athenians became the chief sea power of Greece, and consequently turned their attention to their port, its defences, and its communications with the city. Before that time they had been content with the open roadstead of Phalerum. It was one of the great achievements of Themistocles that he made them realize the value of the Peiraeus, with its defensible hills and its three natural harbours. After the Persian defeat he persuaded them to adopt the policy, carried on by Cimon and Pericles, of building and fortifying the harbour town, and connecting it with Athens by the "Long Walls," which made the city well-nigh unassailable by land, so long as Athens kept control of the sea. Themistocles even went so far as to advocate the transference of the

city itself to the Piraeus, in case of enemy pressure

The age of Pericles was the time of the highest artistic activity in Athens, when the Acropolis was decorated with the most typical examples of Greek architecture and sculpture. The earliest of these (about 450 B.C.) was the little temple of Athena Nikē (sometimes called Wingless Victory), which stood on the bastion S. of the entrance; then came the Parthenon, built between 447 and 433 B.C.; and after this the great columned gate-house or Propylaea, begun in 437 B.C. The general

control of all the work under Pericles was assigned to the sculptor Pheidias, who executed the colossal gold and ivory statue of Athena Parthenos within the Parthenon. At an earlier date he had made the great bronze statue of the goddess set up in the open on the Acropolis and forming a conspicuous landmark from the sea.

During the Peloponnesian War the population of Attica was crowded within the city and the Long Walls, and artistic activity was curtailed. But the Erechtheum, the graceful Ionic temple which enshrined the most sacred objects on the Acropolis, must have been begun in an interval of the war—probably after the Peace of Nicias in 421 B.C. It was still unfinished, as is proved by inscriptions, in 409 B.C.; with its completion, then undertaken, the buildings on the Acropolis, except for insignificant additions, took the form which they preserved to the end of the classical era.

By the terms of the peace concluded with the Spartans at the close (404) of the Peloponnesian War, Athens undertook to give up all her colonial possessions, to hand over all her ships except twelve, to support the Spartans in war and peace, and to pull down the Long Walls. These, however, were restored by Conon after his victory at Cnidus in 394 B.C. had restored Athens to something like her former position. There were many fine public buildings erected in Athens during the 4th century B.C., especially under the administration of Lycurgus. He completed the Dionysiac Theatre, in something like its present form, the Stadium, and the gymnasium known as the Lyceum.

Athens. Constitution Square, centre of the social life of the city, lying directly in front of the royal palace

1. Ruins of the second Erechtheum, an Ionic temple, containing altars to Poseidon, Erechtheus, and Hephaestus
2. Monument set up in 334 B.C. to commemorate the victory of Lysicrates when choragus (leader of the chorus)

in a musical contest. 3 Temple of Wingless Victory on the Acropolis 4. Corinthian columns of the Temple of Olympian Zeus, rebuilt by Antiochus IV. 5. Part of Hall of Carya on S. side of Erechtheum, supported by Caryatides

ATHENS: NOTABLE REMAINS OF SOME OF THE TEMPLES FOR WHICH THE CITY WAS FAMOUS

At this time, probably, many fine public gardens were laid out, notably the Academy. There were also many beautiful private monuments, of which the circular choragic monument of Lysicrates, dedicated in 334 B.C., survives

To the 4th century also belongs the beautiful series of Attic tomb-reliefs, which are still to be seen in the Ceramicus and elsewhere. In the Hellenistic age Athens, though her political importance was diminished, had come to be regarded as the literary and artistic metropolis of the world; and consequently the Greek kings who ruled as the successors of Alexander's empire vied with one another in adorning Athens with splendid buildings. Conspicuous among these were the Stoa (porticoes) of Attalus and Eumenes of Pergamum, still visible in the more solid parts of their structure, and the Gymnasium of Ptolemy. But above all Antiochus IV Epiphanes of Syria undertook the rebuilding of the great temple of Zeus Olympius, begun by Peisistratus, and completed in the

time of the Emperor Hadrian. The enormous Corinthian columns still to be seen in the precinct S.E. of the Acropolis probably date from the period of Antiochus.

The Roman age has also left its monuments in Athens. Among these are the octagonal Tower of the Winds in the Roman market place, built by Andronicus of Cirrhus in Syria, and described by Vitruvius; and a market hall, with a Doric portico of entrance, dedicated to Athena Archegetis in the time of Augustus. A small round temple to Rome and Augustus was built on the Acropolis in front of the Parthenon. The Odeum of Pericles, which had been burnt when the town was captured by Sulla, was rebuilt by King Ariobarzanes of Cappadocia. A still conspicuous monument is that set up A.D. 114-6, on the top of the Museum Hill, by Philopappus, to commemorate his ancestors of the dynasty of Comagenē. But the chief age of imperial activity in Athens was the reign of Hadrian (A.D. 117-

138); he completed the great temple of Zeus Olympius, and built round it a new quarter of the city, separated from the old by an arch with a grandiloquent inscription, stating that one side is the city of Theseus, the other that of Hadrian. He also built a great library. To his time also belongs the rhetorician Herodes Atticus, who rivalled the emperor in the magnificence of the public buildings erected or decorated by him—notably the Stadium, which he supplied with marble seats (since carried off, but renewed by a modern benefactor for the Olympic games of 1908), and the small theatre known as the Odeum of Herodes, still almost completely preserved. The visit of S. Paul to Athens is especially associated with the Areopagus (Hill of Arēs, or Mars' Hill), a natural mass of rock facing the Acropolis, famous in ancient times for its court.

The buildings of Athens remained practically unchanged until the 5th or 6th century A.D., when the old religion was officially

abolished, and the statues of the gods removed. The chief temples, including the Parthenon, the Theseum, and the Erechtheum, were converted into churches, and so survived with some alterations in their structure and some damage to their sculpture. In the time of the Frankish dukes of Athens (1204-1456) the Propylaea were used as their palace, and the tower was built which may be seen in views of Athens previous to 1874, when it was removed. The walls of the old city had long been dismantled, and a new and much smaller circuit was constructed to defend the Acropolis and the district immediately to the N.

After the capture of Athens by the Turks in 1456, the Parthenon became a mosque, and a minaret was built at its western end. In 1687 the Venetians bombarded the Acropolis, and exploded the powder magazine which had been placed in the Parthenon by the Turks, destroying all the central part of the temple. From this time onwards the monuments of Athens were in constant danger of damage or destruction, and many portions of their sculpture were carried off piecemeal. In 1801 Lord Elgin obtained a *firman* permitting him to remove sculpture from ancient buildings in Athens and to take it to England; the Elgin Marbles were deposited in the British Museum in 1816. His action met with adverse criticism from Lord Byron and others; but it not only made the Athenian sculptures known to a wider circle, but also preserved them from the dangers to which they were exposed in Athens, especially during the Greek War of Independence, when the Acropolis was twice bombarded.

Capital of the New Kingdom

Up to this time Athens was but a small provincial town; Shelley's prediction, "Another Athens shall arise," was hardly to be taken in its literal sense. But in 1834 Athens was made the capital of the new kingdom of Greece, and soon began to take a form worthy of her restored dignity. Fortunately the new quarters were built mostly to the N. and E. of the Acropolis, leaving the most characteristic monuments of ancient Athens open towards the sea. The Acropolis and its immediate surroundings have been cleared of medieval or Turkish remains; and systematic excavations, especially dating from the end of the 19th century, have revealed all that could be recovered from

primitive or classical times. Several of the ancient buildings have been restored as far as was possible from extant remains.

E. A. Gardner

Bibliography Journal of Hellenic Studies, 1881 *et seq.*, Plans and Drawings of Athenian Buildings, J. H. Middleton, 1900; Life in Ancient Athens, T. G. Tucker, 1930 The Greek Commonwealth: Politics and Economics in the 5th-century Athens, A. E. Zimmern, 1931; The Glory that was Greece, J. C. Stobart, 1933; The Social and Economic History of the Hellenistic World, 3 vols., M. I. Rostovtzeff, 1941

The modern town has been laid out on a systematic plan, the Hermes street running from the Old Palace to the N. of the Theseum, and the Athena and Aeolus streets intersecting it at right angles, running N. from the Acropolis; fine broad streets run to join these diagonally—especially the Stadium and University streets, which contain the finest modern buildings. Chief among these are the academy, the public library, the university, the polytechnic, and the national museum, all built of white marble in the classical style. Athens has also become a centre of international archaeological study, by the foundation of the French, German, American, British, and Italian schools. It is the see of the archbishop of Athens, who is head of the Autocephalous Church of Greece, and the financial centre of the country. Since 1922 a considerable industry has sprung up in the environs of Athens and at the Piraeus, which has grown to be one of the chief ports in the Mediterranean. Railways extend W. to the Piraeus and the Peloponnese, S.E. to Laurium, and N. to Salonica and central Europe. Pop. 487,045.

Between 1923 and 1930 there was built round the city a belt of refugee working-class settlements, the refugees being in the main from Turkey. The greatest improvement during this period was the construction of the Marathon Dam by the American Uhlen Company, which provides Athens with an excellent water supply.

From April 28, 1941, the city was administered by the Italian invaders, while its port Piraeus was in the hands of the Germans. (See Greece in the Second Great War.) When Italy capitulated in Sept., 1943, the Germans disarmed their late allies and took over the administration completely. During the entire period of occupation the arresting of hostages and executions

of patriots of every class of society proceeded uninterruptedly; just outside Athens the large concentration camp at Haidari was always full of political prisoners. Both Germans and Italians were extremely severe, but while the Italians did not enforce special measures against the Jews, the Nuremberg laws were at once applied by the Germans when they took over, the Jews, except for those concealed by their fellow-citizens, being usually dispatched to Poland. Every form of sabotage found expression in Athens, telephone wires being cut, industrial plants damaged; and British officers and men who had been left behind when their comrades were evacuated had shelter provided for them, while military information was regularly sent to the Middle East Command in Egypt. No fewer than 60 clandestine newspapers and news-bulletins were published and distributed in Athens. They told the citizens, for instance, of what archbishop Damaskinos was doing in his resistance to the demands of the enemy and of the relief measures organized by him. There was wholesale requisitioning of stocks of food and materials, which resulted in famine.

Aftermath of War

In Oct., 1944, the Germans withdrew, blowing up bridges behind them, and on Oct. 13 a British commando force entered the city, which became a port for Allied troops and for reception of UNRRA supplies.

The exiled Greek govt. returned to the capital Oct. 18. Its task of restoring order was hampered by the hostility between left- and right-wing groups of the resistance movement, between whom sharp fighting broke out in and around Athens during Dec. A visit to the city of the British premier Winston Churchill, who called a conference there of representatives of all parties, failed to effect reconciliation, and British troops had to intervene; they cleared Athens of the fighting groups during the first week of 1945. Civil war did not return to the city.

Unharmed by the Germans, Athens had suffered badly during the fighting of Greek with Greek; owing to the poverty of Greece, and the drain upon her resources of the continuing civil war elsewhere, it was 1948 before the damage to the city began to be repaired. Athens airport at Elleniko was reconstructed at the same time.

Athens. City of Georgia, U.S.A., the co. seat of Clarke co. It stands on the Oconee river, 69 m. N.E. of Atlanta, on the Georgia and other rlys. An important rly. and educational centre, it is the seat of the university of Georgia and of the state college of agriculture, and contains the Lucy Cobb girls' institute, a state normal school, and a public library. It has cotton and woollen, fertiliser, and cottonseed oil manufactures. It was founded in 1785 as the seat of the university (opened 1801), and was chartered as a city in 1872. Pop. 20,650.

Athens. City of Ohio, U.S.A., the co. seat of Athens co. On the Hocking river, 74 m. S.E. of Columbus, it is served by the Toledo and Ohio Central and other rlys. The seat of Ohio university, founded 1804, it has a state mental hospital and a public library. Athens lies in an important coal region and has brick, furniture, shirt, and lumber industries. In the vicinity are several Indian mounds. Settled in 1797, it was incorporated in 1811, and reincorporated 17 years later. Pop. 7,696.

Atherine (Gr. *atherinē*). Genus of small fishes known as sand smelts. They are caught in great numbers off the Devonshire coast, and may be distinguished from true smelts by the spines on the dorsal fin. See Smelt.

Atheroma. Medical name of a degenerative change in the arteries. See Arterio-sclerosis.

Atherstone. Parish and market town of Warwickshire, England. It is on Watling Street, 102 m. N.W. from London, on the railway. In the town is a milestone purporting to be equidistant from London, Liverpool, and Lincoln. The church of S. Mary, of monastic origin, dates from the 12th century. It was rebuilt in 1849, except the tower and chancel. Hat making is the chief industry. Market, Tues. and Sat. Pop. 6,500. The remains of Merevale Abbey are in the vicinity. At Fenny Drayton, 3 m. E., was born George Fox, founder of the Quakers.

Atherton OR CHOWBENT. Urban district and market town of Lancashire, England. It is 5 m. S.W. of Bolton by rly., and has cotton factories, ironworks, and collieries. Market day, Sat. Pop. 19,985.

Atherton, GERTRUDE FRANKLIN (1857-1948). American novelist. Her maiden name was Horn, and Benjamin Franklin was her great-grand-uncle. She was born at San Francisco, Oct. 30, 1857, and made her name with many novels of

Californian life, several of a political or sociological tendency. Alexander Hamilton, some of whose letters she edited (1903), is the hero of *The Conqueror*, 1902; and her other works include *Patience Sparhawk and Her Times*, 1897; *American Wives and English Husbands*, 1898; *Senator North*, 1900; *The Tower of Ivory*, 1910; *The Avalanche*, 1919; *Black Oxen*, 1923; an autobiography, *Adventures of a Novelist*, 1932; *The Horn of Life*, 1942; *Golden Gate Country*, 1945. She died at San Francisco, June 14, 1948.

Athgarh. A former state of Orissa, India, now merged in the prov. Its area was 168 sq. m. on the forested Nagpur plateau, inhabited mostly by primitive tribes.

Athletics (Gr. *athlētēs*, contestant). Art or practice of physical games or exercises. The Olympic Games of the Greeks are traceable to the forms of exercise usual among the Egyptians. Running, leaping, throwing the discus, boxing, and wrestling were popular among the early Greeks and Romans. Among the earliest sports to be organized in the British Isles were the Taitin Games in Ireland, said to be two or three thousand years old; the Highland Games of Braemar, Aboyne, and other places in Scotland; and the various gatherings at Bath, on the Cotswold Hills, and Halgawar Moor, near Bodmin, Cornwall. The Westmorland and Cumberland sports are closely allied to the Highland Games.

Young Londoners in Henry II's time indulged in leaping, wrestling, and casting the stone; and Henry VIII was famed for throwing the hammer, or, as it was then called, casting the bar. During the reign of Elizabeth sports of this kind were more popular among the humbler classes than with the nobility. There was apparently a great vogue for foot-racing in the time of the Stuarts, probably due to the fashion of noblemen keeping running footmen and to the desire to match the speed of their respective servants one against another. Pepys describes a match between one of these footmen and a professional runner in Hyde Park on Aug. 10, 1660.

One of the first athletic meetings properly so called was that convened by Major Mason in 1807, in connexion with an athletic society called the Necton Guild, at Necton, Norfolk. The various events included wrestling, jumping in sacks, foot-races, etc.

Exeter College, Oxford, was the pioneer in instituting annual athletic meetings at that university; the first, held in 1850, comprised two miles cross-country, a quarter-mile flat, 300 yards, 100 yards, 140 yards, and one mile over ten flights of hurdles. Now nearly every public school, university, and institution has its annual athletic meeting. The first athletic meeting at Cambridge university took place March 16-18, 1857; and the annual Inter-University Meeting was inaugurated at Oxford, March 5 1864.

In the United Kingdom one of the principal athletic functions of the year is the Inter-University Meeting at the White City, held before Easter, at which there are 12 events: the 100 yards, quarter-mile, half-mile, one mile, and three miles (running); 120 and 220 yards hurdle races; the high and long jumps; weight, discus, and javelin. Another important fixture is the Amateur Championship Meeting, held on the second or third Saturday in July at the White City, just after the Scottish and Irish Championship Meetings. Eleven of the same events make up the programme with 440 yards hurdles replacing the 120, and with the following added: 220 yards (flat), marathon (q.v.), pole vault, hammer, tug-of-war, and (normally held earlier in the season) ten miles race and seven miles walk.

The principal athletic meetings sponsored by the Amateur Athletic Association (q.v.) are the County Championships, the Amateur Championship meeting, the Mid and Counties and Southern Championships, and the Junior Championships.

British record holders in 1949 included the following:

100 yds.	E. Conwell	9'6s.
	E. McD. Bailey	
220 yds.	W. R. Applegarth	21'2s.
440 yds.	A. S. Wint	47'4s.
880 yds.	S. C. Wooderson 1m.	49'2s.
1 mile	S. C. Wooderson 4m.	6'4s.
3 miles	S. C. Wooderson 13m.	53'2s.
120 yds. hurdles	F. G. Towns (U.S.A.)	14'4s.
40 yds. hurdles	J. Patterson (U.S.A.)	5'3s.
High Jump	A. Patterson	6ft. 7½ins.
Long Jump	W. Steele (U.S.A.)	25 ft 8 ins
Pole Vault	C. Warnerdam (U.S.A.)	14 ft. 3 ins.

In 1896 a great international athletic meeting was held at Athens in the form of the old Olympic Games (q.v.). Similar meetings took place at Paris, 1900. St. Louis, U.S.A., 1904; in England, 1908. in Sweden, 1912; at Antwerp. 1920: at

Athletics. Tense moments in an Inter-University and Allied forces athletic meeting. 1. First jump in the 120 yds high hurdles. 2. Over the bar in the high jump. 3. Throwing the discus. 4. The long jump. 5. Breaking the tape in the 880 yds. race

Paris, 1924; at Amsterdam, 1928; at Los Angeles, 1932; at Berlin, 1936; and in England, 1948. At these gatherings, in addition to the usual athletic events, were included almost every sport and game practised by the competing countries.

Some winners at the Olympic Games, London, 1948:

100 metres	Dillard (U.S.A.) 10'3s.
400 metres	Wint (Jamaica) 46'2s.
800 metres	Whitfield (U.S.A.) 1m. 49'2s.
1,500 metres	Eriksson (Sweden) 3m. 49'8s.
10,000 metres	Zapotek (Czecho-Slovakia) 29 m. 59'6s.
110 metres hurdles	Porter (U.S.A.) 13'9s.
400 metres hurdles	Cochran (U.S.A.) 51'6s.
Marathon	Cabrera (Argentina) 2h. 34m. 51'6s.
4 x 400 metres relay	U.S.A. 41'3s.
Decathlon	Mathias (U.S.A.)
Walking Race (50 km.)	Ljunnggren (Sweden) 4h. 41m. 52s.
High Jump	Winter (Australia) 6ft. 6ins.
Long Jump	Steel (U.S.A.) 25ft. 8ins.
Pole Vault	Smith (U.S.A.) 14ft. 1ins.

Mrs. F. E. Blankers-Koen (Holland) won the women's 100 metres (11'9s.), 200 metres (24'4s.), and 80 metres hurdles (11'2s.).

A perennial athletic effort is the attempt at a 4-minute mile. On

July 18, 1945, G. Haegg (Sweden) set up a world record of 4 m. 1'2s. See Hurdling; Jumping; Running.

Athlit or **ATLIT**. Town of Palestine. It lies about 10 m. S. of Haifa on the Mediterranean. It figured in the Crusades, and contains the remains of a castle built by the Knights Templars in the 13th century.

Athlone. Urban district and market town of co. Westmeath, Eire. It is 78 m. by rly. W. of Dublin, and is divided by the

Athlone. Bridge over the River Shannon in this Eire market town

Shannon, which river and the Grand and Royal canals enable it to engage in trade with Limerick and Dublin. A fine bridge, opened in 1844, spans the Shannon. Athlone has linen and woollen manufactures, and fishing is engaged in. It has a broadcasting station. The old castle withstood a lengthy siege in 1641 and an attack by William III in 1688, but fell to General Ginkel three years later. Market days, Tues. and Sat. Pop. 7,546.

Athlone, **EARL OF**. British title borne from 1692 to 1844 by the family of Van Reede, and revived in the Royal Family. Godard van Reede, a Dutch general in the service of William III, distinguished himself at the siege of Athlone in 1691, and was created earl of Athlone in 1692. The title was held by his descendants until 1844. From 1890 to 1892 Albert Victor, eldest son of King Edward VII, then prince of Wales, was earl of Athlone; and in 1917 the title was given to Prince Alexander of Teck (b. 1874), brother of Queen Mary. He was governor-general of the Union of S. Africa from 1923 to 1931, and governor-general of Canada, April 3, 1940, until 1946. *Consuli* Life, M. E. Sara, 1941

Athmallik. A former feudatory state of Orissa, India, now merged in Orissa prov. It covered an area of 730 sq. m. on the Chota Nagpur plateau.

Athodyd. Abbreviated form of aero-thermo-dynamic duct, a type of jet propulsion for aircraft. It is also known as a propulsion duct or ram-jet, and differs from most "jet" units in having no turbine, compressor, or other moving parts. The air is compressed solely by forward motion, or ram effect, and even the combustion chamber involves no elaborate engineering. The propulsion unit of the V1 or flying bomb (*q.v.*) was not a true athodyd, being of the intermittent impulse type. The disadvantages of an athodyd are its excessive fuel consumption and inability to provide take-off power unassisted. *See also Jet Propulsion.*

Atholl or **ATHOLE.** District in Perthshire, Scotland. It surrounds Ben Dearg in the Grampians, and has an area of about 450 sq. m. Famed for its deer forests and salmon-fishing, it gives the title of duke to the chief of the Murrays.

Atholl, Duke of. Scottish title borne since 1703 by the family of Stewart-Murray. The first earl of Atholl was Sir John Stewart (15th century). The 4th earl was a prominent supporter of Mary Queen of Scots, until he joined her enemies. His son John, the 5th earl, died in 1595, when the earldom became extinct. John's daughter married William Murray, earl of Tullibardine, but by arrangement their son became earl of Atholl in 1629. He and the 7th earl were royalists during the Civil War. The latter, made a marquess in 1676, took the lead in suppressing Argyll's rebellion in 1685.

His son, the 2nd marquess, adhered to William of Orange in 1688, and in 1703 was made a duke. Afterwards he turned against the Government and was associated with the Jacobites. In 1714, on the accession of George I, he was deprived of his offices, but did not join the rebellion in 1715. Three of his sons did so, and in consequence the dukedom, on his own death in 1724, passed to his second son James, and through his descendants to James Thomas Stewart-Murray (b. 1879), who became the 9th duke in 1942.

The 8th duke (1871-1942), as Lord Tullibardine, was Unionist M.P. for West Perthshire from 1910 until he succeeded to the title in 1917. He served in the Sudan campaign of 1898, and in

the S. African War. During the First Great War he raised mounted troops among his clansmen and served in Gallipoli. He was lord high commissioner to the church of Scotland, 1918-20. He died March 15, 1942.

The 2nd duke inherited, in 1736, the sovereignty of the Isle of Man. In 1765 this sovereignty and certain rights were sold to the British Government for £70,000, and John, the 4th duke, sold the remaining rights for a further £417,000 in 1828. The duke's chief seat is Blair Castle, near Blair Atholl, Perthshire. The eldest son is called the marquess of Tullibardine, and the duke sits in the House of Lords as Earl Strange.

Atholl, KATHARINE MARJORY MURRAY, DUCHESS OF (b. 1874). British politician. The daughter

Duchess of Atholl,
British politician

of Sir James Ramsay of Banff, the historian, she was born Nov. 6, 1874, and in 1899 married the marquess of Tullibardine, afterwards 8th duke of Atholl. From 1924 to 1929 she was parliamentary secretary to the Board of Education, and a British delegate to the Assembly of the League of Nations, 1925. Conservative M.P. for Kinross and W. Perth from 1923, she resigned her seat in 1938 as a protest against the British government's foreign policy in regard to Spain and Italy. An outspoken champion of the Spanish government during the Spanish civil war, she then contested her seat as Independent in Dec., 1938, but was defeated by a small majority. The duchess was trained as a musician at the Royal College of Music, London, and published settings of poems by R. L. Stevenson. Her literary works include *Women and Politics*, 1931; *Conscription of a People*, 1931; *Searchlight on Spain*, 1938.

Athor. Ancient Egyptian goddess, usually called Hathor (*q.v.*).

Athos. Mt. of Greece, famous for its monasteries. It is situated on the Hagion Oros, the E. tongue of the Chalcidice Peninsula, is 6,332 ft. high, and about 80 m. S.E. of Salonica. The majority of the monks are Greek; they engage in farming, fishing, and weaving, in addition to their religious offices. Each of the 20 monasteries is a republic, its head being an abbot

elected for life, or an overseer elected for a term of years. The mt., with most of the peninsula, is administered by a council of four members and an assembly. This virtual autonomy was recognized by the Greek government on Sept. 10, 1926. The isthmus bears visible traces of the canal cut by Xerxes before his invasion of Greece in 480 B.C.

Athos. One of the Three Musketeers in Dumas's romance of that name, and also in Twenty Years After and the Vicomte de Bragelonne. He is a somewhat romantic grand seigneur, whose real name is the Comte de la Fère, and he is the father of Raoul, the Vicomte de Bragelonne. Thackeray wrote of him as his favourite among "heroic heroes." *See Aramis; Porthos.*

Athribis. Grecised name of two ancient Egyptian towns. One, at Kom el-Atrib near Benha in the Delta, yielded XIIIth dynasty sculptures and a lion of Rameses II, now in the British Museum. The other, on the left bank of the Nile below Akhmim, excavated by Petrie in 1908, revealed Old Kingdom tombs and Ptolemaic temples.

Atitlán. Lake in the S. of Guatemala. About 24 m. long by 10 m. broad, it is 64 m. in circumference. It occupies a deep crater and lies 4,700 ft. above sea level. On the S. side is the Indian town of Santiago de Atitlán.

Atitlán. Volcano of Guatemala. It lies at the S. end of Lake Atitlán, is 11,720 ft. high, and was occasionally active during the 19th century.

Atiu or **VATU.** One of the Cook islands in the Pacific Ocean. A dependency of New Zealand, it is 20 m. in circumference, being a mere bank of coral 10 ft. to 12 ft. in height. Pop. 1,086.

Atkin, JAMES RICHARD ATKIN, BARON (1867-1944). British judge. Born in Queensland, he was educated at Christ College, Brecon, and Magdalen College, Oxford. He was called to the bar by Gray's Inn in 1891, becoming a recognized authority on law relating to the Stock Exchange. In 1913 he was raised to the bench and in 1919 was appointed a lord justice of appeal. Ten years later he became a lord of appeal in ordinary; and, until his death on June 25, 1944, he was doyen of the judiciary, having then been a judge for 31 years.

Atkins, ROBERT (b. 1886). British actor and stage producer. Born at Dulwich, Aug. 10, 1886, and educated privately, he studied

at Tree's Academy, now the Royal Academy of Dramatic Art, in 1905, making a first stage appearance in Nero at His Majesty's Theatre in 1906. From 1920 to 1925 he was director of plays at the Old Vic. During this period he played Caliban, Richard III, Wolsey, Sir Toby Belch, and Sir Giles Overreach. A strong advocate of the retention of the apron stage and of the production of Shakespeare so as to preserve the spirit and tradition of the Elizabethan stage, he organized the Bankside Players. They gave performances of Shakespeare's plays in the Boxing Ring, Blackfriars, converted into an Elizabethan theatre in 1936. Atkins was director of plays at the Open Air Theatre, Regent's Park, London, 1932-39, and manager 1940-45; director at Stratford Memorial Theatre 1944-45. He was awarded the C.B.E. in 1949.

Atlanta. Capital and largest city of Georgia, U.S.A. It lies in the N.W. part of the state, 137 m. S.S.E. of Chattanooga, Tenn., by the state-constructed rly., and at the centre of several other rlys. It is laid out in the form of a circle. Here are Emory university, founded 1836, with over 2,000 students; and for negroes, Atlanta university, 1867, and Morris Brown college, 1885. The largest state-owned farmers' market in the world is at Atlanta, which exports cotton, tobacco, and mules. The city figured prominently in the civil war of 1861-65 and is portrayed in Margaret Mitchell's *Gone With the Wind*. Pop. 302,288.

Atlanta, BATTLE OF. Fought July 22, 1864, during the American Civil War, when the Northerners under Sherman besieged Atlanta. To relieve the pressure the Confederates under General J. B. Hood made a desperate but unavailing attack on the besiegers. A second attack, made on the 28th, the battle of Ezra Church, was equally unsuccessful, and on Sept. 1 the Confederates had to abandon Atlanta. See American Civil War.

Atlantes (plural of Atlas). Sculptured figures of men used as supports in place of ordinary columns. They are rarely found earlier than the neo-classic architecture of the 17th century, but in

Robert Atkins,
British actor

the great temple of Zeus at Agrigento, Sicily, there are pilasters projecting from the walls on which stand Atlantes supporting the roofs. Atlantes correspond to Caryatides, female figures used for the same purpose.

Atlantic Bases. By an agreement made between Great Britain and the U.S.A. on Sept. 2, 1940,

the U.S.A. transferred 50 over-age destroyers to Great Britain in return for 99-year leases of bases in British territory, to be developed as naval and air stations in Newfoundland (S. coast and Avalon peninsula), Bermuda (Great Bay), British Guiana, the Bahamas, Jamaica, St. Lucia, Trinidad, and Antigua.

ATLANTIC BATTLE OF 1939 TO 1945

Francis E. McMurtrie

Here are the facts of that grim struggle of the Second Great War in which Great Britain fought unceasingly to conquer the menace of German submarines in order to preserve the Atlantic communications which were vital to her existence. See also under Coastal Command: Submarine and Submarine Warfare

The German submarines from 1939 to 1945 tried to sever sea communications between the British Isles and America, and the Allied forces ceaselessly waged war against them, with ultimate success. This conflict has been justly described by Admiral of the Fleet Lord Cunningham of Hyndhope as the Trafalgar of the Second Great War.

Hostilities began with the destruction without warning of the Donaldson liner *Athenia* (q.v.), Sept. 3, 1939. Fortunately, the British merchant navy was somewhat better prepared for the onslaught than it had been in the previous war. During 1938-39 an appreciable number of masters and officers of British merchant vessels had attended courses of instruction in convoy duties and in methods of countering or evading submarine attack and many of their ships had been strengthened to allow for the mounting of defensive armament. Another factor which told against the U-boat attack was that in the years between the two wars the Royal Navy had developed effective devices for the location and destruction of submerged submarines. (See Asdic.)

Thus the enemy was driven to employ fresh tactics. A number of U-boats in a formation known as a "wolf pack" would attack on the surface at night, a method not easy to defeat. This was the German reply to the convoy system, put into force in the first month of the war. Up to the end of 1939 the results of the submarine campaign must have been disappointing to its planners, the total of British shipping sunk being only 115 vessels of 421,919 tons gross. On the other hand, the German flag had everywhere been driven from the seas.

Until the end of May, 1940, the Germans were able to do little in

the way of increasing this rate of destruction; but in June they were materially aided by two circumstances. Italy entered the war, adding greatly to the commitments of the British fleet, and throwing another 100 submarines into the struggle on the side of the enemy. Almost simultaneously France dropped out of the war, signing an armistice which gave Germany the use of her Channel ports. Norway, Denmark, the Netherlands, and Belgium having also been overrun by the enemy, U-boats were able to operate from various ports along the entire stretch of coastline from the North Cape to Bayonne. Naval forces available for anti-submarine service were severely reduced by the defection of the bulk of the French navy and the necessity for coping with the Italian fleet in the Mediterranean. From time to time such operations as the Dunkirk evacuation, the Malta convoys, landings in N. Africa, and the Japanese attacks on British possessions in the Far East, all tended to reduce the anti-submarine forces available in the Atlantic.

Including Allies and neutrals, a total of over 2,500,000 tons of shipping was sunk in the seven months from June to Dec. So serious did the situation become during this period that an agreement was made with the U.S.A. by which that nation ceded to Britain 50 over-age destroyers, built in 1917-1919, in exchange for the lease for 99 years of certain bases (v.s.). This timely reinforcement helped to fill the gap until new escort vessels ordered earlier in the war were forthcoming in adequate numbers. By the end of 1940 there seemed more hope of checking the submarine menace.

Italian participation in the battle of the Atlantic had been

definitely recorded during 1940, and some of the submarines sunk proved to be of that nationality. Another fresh development was a decided increase in the number of U-boats attacked and sunk by aircraft, the value of which for anti-submarine patrols was thus convincingly demonstrated.

In the course of 1941 the situation in the Atlantic, though for a time little change could be observed, underwent a gradual improvement. This may be attributed to a steady increase in the number of escorts available for convoys, as well as to growing proficiency of naval personnel in the technique of hunting submarines. A contributory factor was the U.S. navy's assumption of responsibility for the patrolling of the waters between the N. American continent and Iceland.

It had for some time become evident that, as in 1914-1918, the bulk of the destruction accomplished by U-boats was to be credited to a minority of exceptionally daring and skilful submarine captains. Several of these having been eliminated—notably Prien, Schepke, and Kretschmer—the intensity of the enemy attack tended to slacken as 1941 drew to a close. Up to Nov. the number of prisoners from enemy submarines was stated to be 1,310, of whom 467 were Italians, affording concrete evidence that the number of U-boats that had been destroyed was considerable.

Japan then made her surprise attack on the U.S. fleet at Pearl

Harbour, introducing a fresh complication for which little or no provision could be made.

With the U.S.A. as one of the Allies, the enemy was presented with a fresh and hitherto unexploited area of attack off the N. American coast. Here, in the early months of 1942, were to be found plenty of victims lacking weapons and escorts, and a fresh and serious rise in shipping losses was the inevitable sequel. Not only were the U-boats furnished with easy targets, but comparatively inexperienced personnel in newly commissioned submarines soon gained confidence from the practice so provided. Apart from American coastal shipping, the most serious losses were those of oil tankers from the Gulf ports, Venezuela and Curaçao.

This, the most dangerous crisis of the Battle of the Atlantic, was at length overcome by the institution of the convoy system in the Western Atlantic area, aided by the detachment of a number of British escort vessels and trained personnel to reinforce the U.S. navy and coast guard. Not for a considerable while were the Americans able to concentrate on the submarine menace in the Atlantic, all their energies being devoted to the restoration of the situation in the Pacific.

In the second half of 1942 the position improved perceptibly, a fact which the enemy tried to conceal by exaggerating his claims. One of these, made by an Italian officer named Enzo Grossi, en-

titles him to rank with Munchausen. In May, 1942, he reported having sunk a U.S. battleship of the Maryland class off the coast of Brazil, a story which Rome tried to support by announcing that 52 survivors had been landed at a S. American port. In fact, these 52 seamen were from a British cargo vessel.

Encouraged by the Iron Cross received from Hitler as a reward for his supposed achievement, Grossi declared four months later that he had torpedoed an American battleship of the Mississippi type off the West African coast. He maintained that he actually saw this ship sunk after being hit in the bow by four torpedoes. All that really happened was that Grossi's submarine, the *Barbarigo*, fired four torpedoes at H.M. corvette *Petunia* without hitting her. For his second effort of imagination Grossi was given the Knight's Cross by Germany and a gold medal for bravery by Italy, besides being promoted.

During 1942 there were many who advocated the construction of more fast merchant vessels, on the plea that this would be of material assistance in defeating the enemy campaign against commerce. It was pointed out in reply that faster ships would take longer to build and engine than the slower vessels of standard type, and would require to devote more of their space to bunkers. Sailing independently, there was no likelihood of their losses averaging less than those of slower ships in convoy; while if escorted, the provision of more fast escort vessels would be entailed.

At this date U-boat tactics had been more or less standardised. By making use of their speed, nearly double that of the average convoy, and operating in packs, they could spread themselves over a wide area of ocean and thus greatly increase their chances of sighting their prey. On sighting a convoy a submarine would report it and endeavour to keep it in view until nightfall, when the other units of the pack would close and attack on the surface. Obviously this method of attack needed less skill than did the individual approach usual in the previous war. It enabled the enemy to curtail considerably the training period for newly constructed U-boats, which, it is estimated, were then commissioned at the rate of 14 a month.

The anti-submarine activities of Coastal Command aircraft, which

Atlantic Battle. Convoy under British escort crossing the Atlantic, the ships in line formation. A convoy consisted usually of forty to fifty ships

Photo, Royal Canadian Navy

since Dec., 1940, had been under the operational control of the Admiralty, began now to bear more fruit. During 1942, 71 German and 2 Italian submarines were destroyed in the Atlantic, compared with a total of 66 German and 10 Italian from Sept., 1939, to the end of 1941; this was an encouraging sign in an otherwise black period. In 1942 also the escort a-raft carrier, later to become a potent factor in the hunting down of U-boats, made its first appearance; and all in service at this time were extemporised vessels, developed from mercantile hulls, mostly American.

During the ensuing twelve months the tide at last turned, and the enemy attack received a defeat from which it never recovered. Yet 1943 opened with the threat of an intensified onslaught on Allied sea communications. Dissatisfied with the conduct of naval operations by Grossadmiral Raeder, hitherto C-in-C. all German naval forces, Hitler took the drastic step of superseding him by his subordinate Grossadmiral Karl Doenitz, who had previously been in command of the submarine service.

Every effort was made by the enemy to impress neutrals with the belief that this change would

decide the battle of the Atlantic in favour of the Axis. Instead, the first lord of the Admiralty was able to announce that the results of anti-submarine operations in a period of four months had been "the most encouraging of the war," those of Feb. being the best experienced in any single month. Still there remained the question, would the appointment of Doenitz reverse this?

In March attacks certainly became more frequent, and losses were correspondingly severe. But simultaneously the influx of many more new escort vessels, including carriers, had its effect, and shipping losses in April were much lower than in March. Accounts published of attacks made on convoys by large packs of U-boats made it plain that escorts were being provided in much greater strength than formerly.

Closing The Gap

May proved to be one of the best months of the war for the number of submarines destroyed—41 in the Atlantic, five in other seas—more than could have been built during the same period. U-boat building was being overtaken by sinkings. In July it became known that the escort carriers were being used to close the mid-ocean gap between the extreme ranges of

shore-based aircraft on either side of the Atlantic. For some time the enemy had been making most of his attacks in this area in the belief that air patrols were unlikely to be encountered there. Extended endurance of the new escort vessels passing into service, and the provision of shore-based aircraft with very long range, which cooperated closely with our surface forces, also helped to bridge the gap.

An ample supply of escort vessels being now available, special hunting groups were formed with the object of intercepting enemy submarines on their way to and from bases on the French Atlantic coast. The name of Capt. F. J. Walker, R.N., became famous as leader of the most successful of these groups, composed of sloops or frigates, and often operating in conjunction with Coastal Command formations. The latter did great work in their 'Bay offensive,' as well as in the seaward defence of the Normandy landings in the following year.

On Aug. 14, a red-letter day in the records of the Atlantic battle, a joint statement signed by Winston Churchill and President Roosevelt revealed that in the three months of May, June, and July Allied forces had sunk 90 submarines, or at the rate of one a day. In Oct., 1943, the Portuguese government agreed to grant facilities for an Allied anti-submarine base in the Azores. Further good news came in Nov., when it was made known that in the six preceding months U-boat losses were not fewer than 150 units. Nothing approaching this rate of mortality had been known in the First Great War, when the largest number of German submarines lost in any six months was 46, and the total destroyed in the whole period from 1914 to 1918 was only 178.

Though less spectacular in the character of its announcements, 1944 continued to yield evidence of satisfactory progress, as in the announcement that, from the outbreak of hostilities to the end of July, more than 500 German submarines had been destroyed. Other comforting news was that Oct., 1944, was the month in which so far the fewest merchant vessels had been sunk. Loss of the use of French ports had further crippled the operations of U-boats, which were thenceforward based chiefly on Bergen and Trondhjem. Though still able to threaten convoys proceed-

ing to N. Russia, their claws had been blunted.

Systematic cooperation between sea and air forces had much to do with the defeat of the U-boats. Our own submarines also contributed their share.

In an endeavour to cope with the ascending scale of air attack, U-boats were re-armed with 37-mm. and 20-mm. anti-aircraft guns; and in the closing months of the war the majority of those operating had been equipped with a breathing tube, the *Schnörkel* (q.v.).

After the surrender in May, 1945, a hundred U-boats were found more or less damaged at Kiel, and 170 surrendered intact, 67 at sea. In all, 866 German and Italian submarines were sunk by Allied forces. *Consult* Battle of the Atlantic, H.M.S.O., 1946; German, Italian, and Japanese U-boat Casualties, H.M.S.O., 1946.

Atlantic Cable. The first Atlantic cable was laid between Ireland and Newfoundland in 1858, and the first telegraphic messages between the Old World and the New were exchanged Aug. 13 of that year. The cable failed through faulty insulation and the use of currents of too high potential. A second cable was partly laid in 1865 by the ship *Great Eastern*, but had to be abandoned temporarily on account of imperfections in the cable and difficulties in laying. In 1866 the same ship successfully laid a new cable, which was the first Atlantic cable of commercial value, and she recovered and completed the 1865 cable. In 1873 a fourth British cable was laid, and in 1879 a French cable was put into operation, followed by a German one in 1885.

Improvements in the making and laying of cables continued and others were soon in service. In 1871 the duplex system permitted simultaneous transmission of messages in both directions; speed of transmission is now 2,500 words a min. In 1946 twenty-one cables spanned the Atlantic. One of the first cables laid from shore to shore without break or fault was the Western Union line from New York to Cornwall via Newfoundland, completed in 1926.

The first high speed co-axial cable, which can carry several messages simultaneously, was laid in 1931 between England and Newfoundland via the Azores. The cable had to be laid as close as possible to the distance of 1,341 nautical m. specified by the engineers for the Azores-Newfoundland span if it was to function

efficiently. To that purpose, the exact route of the cable was measured by a continuous tape line of fine steel piano-wire.

All but six of the existing Atlantic cables are laid along a high submarine ridge known as Telegraph Plateau. The plateau, which was discovered during the laying of the first cable, is comparatively level, with a greatest depth of 2 m., and is covered with a soft ooze in which the cables are bedded, but from which they may easily be grappled and raised for repairs. The plateau makes it possible to use shorter and lighter cables than would be necessary to stretch over the alp-like surface of other parts of the Atlantic bed. On Oct. 18, 1929, a submarine earthquake severed twelve of the principal Atlantic cables, interrupting service for six weeks.

Atlantic Charter. Name given to an eight-point declaration issued by the U.S. president, F. D. Roosevelt, and the British prime minister, Winston Churchill, after a four-day conference on board H.M.S. *Prince of Wales* in the W. Atlantic, and first made public by radio in both countries simultaneously Aug. 14, 1941. There was no document signed. The U.S.A. was not then at war, which made her bold declaration of aims the more welcome to the Allies.

Terms of the "charter", basis of the Washington Declaration, (q.v.) were: (1) Great Britain and the U.S.A. to seek no aggrandisement. (2) No territorial changes that did not accord with the freely expressed will of the peoples. (3) Right of all peoples to choose their own form of government. (4) Means of trading and access to raw materials for all states needing them for economic prosperity. (5) Fullest collaboration between all nations in the economic field. (6) After the destruction of Nazi tyranny, a peace to ensure to all nations the means of dwelling in safety. (7) All men to traverse the high seas and oceans without hindrance. (8) Pending the establishment of a wider and permanent system of social security, disarmament of warlike nations to be essential.

Although the terms of the declaration had already been embodied, or were implicit, in recent speeches by Churchill, Roosevelt, and other British and American leaders, their formal affirmation was of great practical value in emphasising the unity of their aims and of their definition of the requirements of peace.

Atlantic City. City and popular seaside resort of New Jersey, U.S.A. It is 56 m. S.E. of Philadelphia, on the Atlantic City rly., and stands on a long, narrow, sandy island. It has a splendid beach, six long ocean piers, and a promenade 8 m. long. It claimed to have the world's first airport. Here was worked out in 1943 the project which became the United Nations Relief and Rehabilitation Administration, and here was held the first session of U.N.R.R.A., Nov., 1944, at which 44 nations were represented. Pop. 64,094.

Atlantic Ferry. Service operated by R.A.F. Transport Command for ferrying to Great Britain aircraft built in Canada and the U.S.A. The shipping of crated aircraft across the Atlantic entailed a lapse of some three months between the test flight in America and delivery to an operational destination in Britain. In addition, many aircraft were lost in ships sunk by enemy action. The first delivery of American landplanes flown across the Atlantic was completed Nov. 11, 1940, when seven Hudson bombers landed at Prestwick after a non-stop flight of 2,467 m. from Newfoundland. The aircraft were operating with Coastal Command a fortnight after their test flights in America. By the end of 1941 the Atlantic Ferry was operating a 24-hour service in all weathers. Under the direction of Air Chief Marshal Bowhill, who was appointed C-in-C. Ferry Command (merged into Transport Command in 1943), bases were established in Greenland and Labrador, and a network of radar and radio services was set up.

In Sept., 1941, the Return Ferry Service was started by B.O.A.C. to ensure the speedy return to Canada and the U.S.A. of those who flew aircraft to Britain. By the end of the war, the Atlantic Ferry had flown to Britain and to operational destinations in the Middle East, India, and the Pacific 10,000 aircraft valued at £500,000,000. The loss rate was slightly in excess of 1 per 1,000. In peace time, the Ferry continued a daily service and delivered large quantities of essential commodities and medical supplies to the liberated countries of Europe. Canadian troops were carried on the return flights. Flying in all weather conditions, the Atlantic Ferry accumulated invaluable data for speedy, comfortable, and safe trans-Atlantic passenger services of the future. See Bowhill, Sir Frederick.

ATLANTIC FLIGHTS: NORTH & SOUTH

Captain Norman Macmillan, M.C., A.F.C.

A record of the stages, since the unique pioneering achievement of Alcock and Brown in 1919, whereby the sky over the Atlantic Ocean has been opened up as one of the great highways of the world in war and peace alike

The Atlantic was first flown by a U.S. Navy N.C.4 Curtiss flying boat piloted by Lt.-Cmdr. A. C. Read. Leaving Newfoundland May 16, 1919, it refuelled at the Azores and Lisbon and reached Plymouth May 27. Five British and three other aircraft meanwhile mustered in Newfoundland to fly the Atlantic non-stop to win a Daily Mail prize of £10,000. Harry Hawker with Cmdr. Mackenzie Grieve started first in a Sopwith biplane, dropping the land undercarriage after taking off. Water cooling trouble forced them down hundreds of miles from Ireland, alongside a small vessel without wireless, and they were assumed lost until the vessel put in at the Faroe Is. Both airmen received the A.F.C.

Capt. John Alcock and Lt. Arthur Whitten Brown left St. John's in a Vickers Vimy bomber at 4.23 p.m. G.M.T., June 14, 1919, and landed at Clifden, Galway, 15 hrs. 57 mins. later, after flying 1,890 m., a world's record for distance flown non-stop. Both were created K.B.E.

First Airship Crossing

The first airship crossing and the first out and home flight were made by the British R.34, carrying Air Commodore E. M. Maitland, with Major G. H. Scott as captain of a crew of 30. The airship left East Fortune, July 2, and reached New York July 6, 1919. Leaving Mineola, Long Is., July 9, it arrived at Pulham, Norfolk, July 13. Its outward flight of 3,600 m. averaged 33.3 m.p.h.; the return of 3,800 m., 50.7 m.p.h.

The next N. Atlantic flight was made some time between Aug. 2 and 31, 1924, when two Douglas floatplanes, manned by American naval airmen, flew from England to Canada via Iceland and Greenland during one stage of the first complete flight round the world. Between Oct. 12 and 15, 1924, the German airship Z.R.3 (Los Angeles) flew 5,000 m. from Friedrichshafen to Lakehurst, N.J., on delivery to the U.S.A. as part of the First Great War reparations.

A £5,000 prize was offered for the first non-stop aeroplane flight between New York and Paris. On May 20-21, 1927, Capt. Chas. Lindbergh, flying solo in a Ryan monoplane of 225 h.p., completed

the journey to Paris in 33½ hrs. The first flight in the reverse direction was made by Major Dieudonné Costes and Lieut. Bellonte, who left Le Bourget Sept. 1, 1930, in a Breguet XIX and landed at Curtiss Field 37 hrs. 17 mins. later.

N. Atlantic air crossings were frequent from 1927 onwards. There were five in 1927, three in 1928, two in 1929, five in 1930, six in 1931, five in 1932, nine in 1933, and five in 1934. Airmen of many nationalities, essayed the flight—American, Australian, British, Danish, French, German, Hungarian, Irish, Italian, Polish, Spanish. Their aircraft ranged from light planes, like the Fuss Moth flown by J. A. Mollison in the first E.-W. solo flight from Dublin to Pennfield, New Brunswick, Aug. 18-19, 1932, to the large Dornier DO-X flying boat, manned by a crew of 14 under Christiansen, which flew from Newfoundland to Vigo via the Azores, May 19-22, 1932. In 1933 the Regia Aeronautica formations of 24 Savoia S.55X flying boats under Gen. Italo Balbo flew from Orbetello to Chicago via Iceland, July 1-15; and 23 returned via Newfoundland, the Azores, and Lisbon, Aug. 8-9.

Amelia Earhart's Solo Flight

The first E.-W. aeroplane flight was accomplished April 12-13, 1928, in a Junkers 33 by Capt. Hermann Köhl, Baron von Hünfeld, and Cmdt. J. Fitzmaurice of the Irish Air Force. They flew from Baldonnel, Dublin, to Greenly Is., Belle Isle Strait, Labrador. The first woman pilot to fly the Atlantic was Amelia Earhart, from New York via Newfoundland to Londonderry in a Lockheed Vega, May 21-22, 1932. This flight took 13½ hours.

The airships Graf Zeppelin, R.100, and Hindenburg made crossings; the German airships maintaining a regular trans-Atlantic air service until the Hindenburg was destroyed by fire at Lakehurst, May 6, 1937.

In 1937 experimental Anglo-American transport flights began with flying boats. Ground organization was in the hands of the governments, with air transport companies responsible for supplying aircraft and professional crews. Special sea and land airports were

established and radio stations erected. The aircraft used full aids to navigation. On July 5 the first Imperial Airways Short flying boat left Foynes, Eire, while the first Pan-American Airways flying boat left Botwood, Newfoundland. The route was extended at one end to Southampton, and at the other to Montreal and New York. Eight crossings were made that year.

The first wartime crossing was made by the Guba, a Consolidated commercial flying boat bought by the Air Ministry, in 16 hrs. 21 mins., Oct. 22-23, 1940, with a cargo of aluminium tubing. On Nov. 10, seven Hudson reconnaissance aircraft were flown by civilian crews from Newfoundland and landed in Great Britain next day. Thereafter thousands of aircraft were flown across by civilian and service crews, and a return air ferry service was maintained. (See Atlantic Ferry.) Hampden bombers were flown from Great Britain to Canada for training duties in the Dominion.

Trans-Atlantic Speed Records

On Sept. 6, 1945, a photographic reconnaissance-type Mosquito broke all Atlantic transit records, when with Wing Cmdr. J. R. H. Merifield as pilot and Flt. Lt. J. H. Spiers as navigator, it crossed from Newquay, Cornwall, to Newfoundland in 6 hrs. 58 mins. (2,300 m. at 330 m.p.h.). The return was made on Oct. 23 in 5 hrs. 10 mins. at an average speed of 445 m.p.h.

While B.O.A.C. maintained the Atlantic service with Boeing flying boats, landplane services were restarted by American companies with Douglas DC4s (Skymasters.) Flying from New York, via Gander, Newfoundland, and Rineanna, Eire, the first machine, owned by American Export Airlines, left New York Oct. 23, 1945, landing at Hurn, near Bournemouth, next day. P.A.A. flew their first landplane from New York on Oct. 28, and landed at Hurn next day, thus inaugurating a twice-weekly service between New York and London. The first American Overseas Airlines Chicago-London Service DC4 landed there Nov. 20. (See N.V.)

SOUTH ATLANTIC. Flights S. of the Azores and Bermuda, the N. Atlantic southern loop used by B.O.A.C. flying boats in the winter of 1945-46, may be defined as South Atlantic air crossings. The first of such crossings was made in 1922 by two Portuguese naval officers, Commander Cabral (pilot) and Admiral Cou-

tinho (navigator), in a Fairey IIC floatplane, flying via the Azores and S. Paul's Rock from Portugal to Brazil. Four years later a Spanish air crew—Commandante Franco, Capt. Ruiz de Alda, Ensign Beran, and Mechanic Rada—crossed in a Dornier Wal flying boat from Spain via the Canary Is., Cape Verde, and Pernambuco to Rio de Janeiro.

Italian airmen—the Marchese de Pinedo, Major del Prete, and Zachetti—next flew by stages from Sardinia to Pernambuco in a Savoia S.55 flying boat (Feb. 18-24, 1927). On March 2-18, 1927, Portuguese airmen—Commander de Beires, Duvalle Portugal, and Castilho Gouveia—flew a Wal from Lisbon via Casablanca, Villa Cisneros, and Bolama to Natal (Brazil). Dieudonné Costes and Lt. de Vaisseau Lebriz made the fifth, and first non-stop, crossing, flying a Breguet XIX from St. Louis, Senegal, to Natal (Oct. 14, 1927). Two Spanish and one French flight followed and then, on Jan. 6, 1931, Gen. Italo Balbo led ten Savoia S.55 flying boats from Portuguese Guinea to Natal during a formation flight from Rome to Rio de Janeiro.

Sqn. Ldr. H. J. L. Hinkler made the first flight from W. to E. and the first solo crossing when, during a 10,500 m. flight in a de Havilland Puss Moth from New York to London, he crossed from Natal to Bathurst on Nov. 26, 1931. J. A. Mollison made the first flight from Britain to S. America and the first E. to W. solo crossing in a Puss Moth via Barcelona, Villa Cisneros, and Thiés to Natal in Feb., 1933.

During the Second Great War Accra airfield became the main arrival base for aircraft flown across the S. Atlantic to reinforce the Middle East and Far East. Ferry pilots flew Baltimores, Bostons, Mitchells, Liberators, Marauders, and Dakotas from Nassau (Bahamas) to Accra in groups of from two to six via Puerto Rico, Trinidad, Belem, Natal, and Ascension Is. The ocean crossing was 2,810 m., with Ascension lying almost midway and having a single runway blasted out of lava rock, first landed upon in 1942. See N.V.

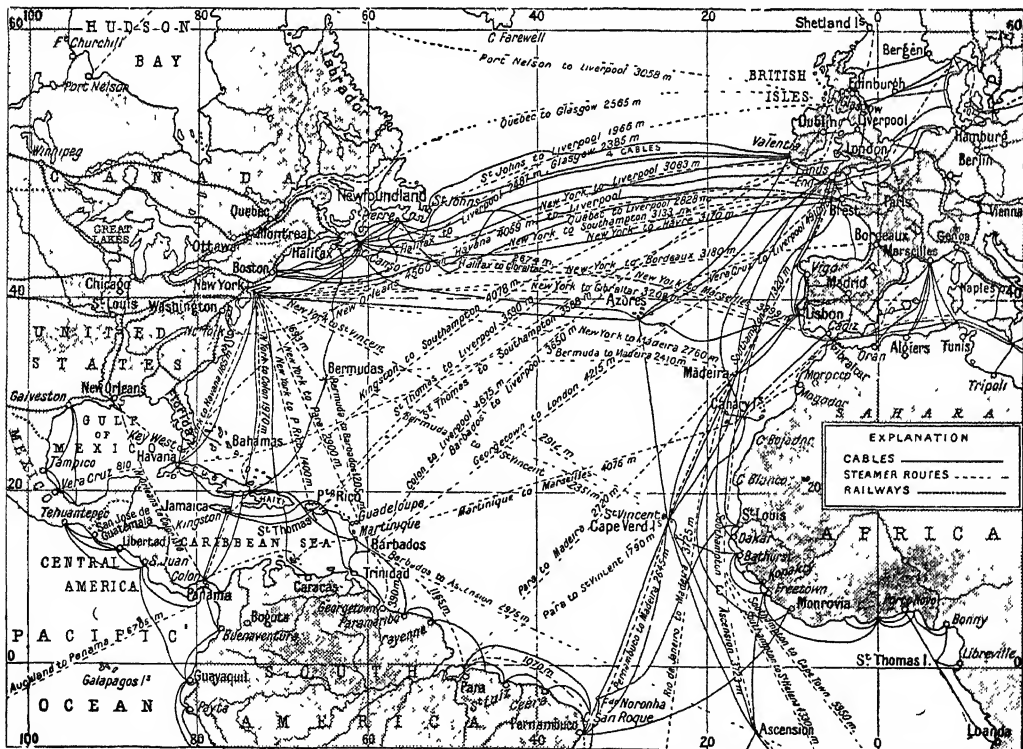

Atlantico. Department of Colombia. It lies between Magdalena and Bolivar, and borders on the Caribbean Sea. It has an area

of 1,340 sq. m. Cocoa, tobacco, sugar-cane are produced. Barranquilla is the capital. Pop. 268,409.

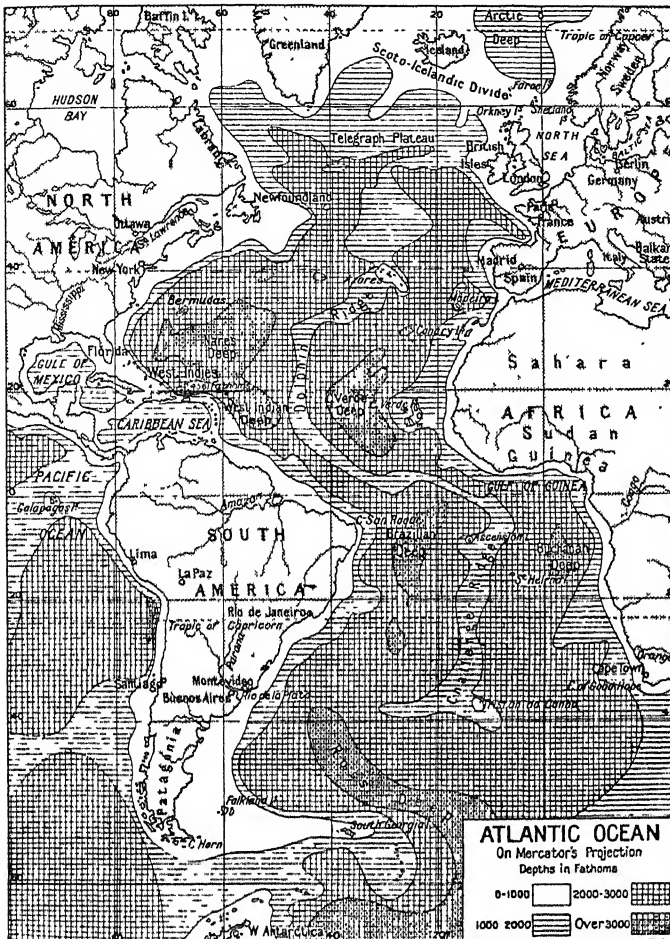

Atlantic Ocean. Second largest of the four great oceans. From N. to S. it is about 8,500 m. and from E. to W. between 2,500 m. and 4,500 m.; its area is about 31,500,000 sq. m. Constricted to about 1,500 m. N.E. of Cape San Roque, its main feature is its comparative narrowness. Wide open to the Antarctic in the S., it is cut off by a continuous submarine ridge from the Arctic basin.

From this Scoto-Icelandic divide, which joins the European Continental Shelf to Greenland and N. Canada, rise Iceland and the Faroes; between the latter and the Shetlands the E. portion, known as the Wyville-Thomson ridge, interferes with the S. movement of the Arctic waters, making the Atlantic waters warmer.

Roughly midway between the E. and W. margins, a long ridge rises from the floor of the Atlantic to within about 1,700 fathoms, nearly 2 m., of the surface. The N. end of this ridge forms the Telegraph Plateau between Ireland and Newfoundland; farther S. the Azores rise above it, whence

Atlantic Ocean. Map showing the relation of the European, African, and American continents to this ocean, with the principal cable lines and steamer routes and their distances

Atlantic Ocean. Map showing the ridges and deeps of the second largest ocean of the world, which in places has a depth of over five miles

to the Equator it is called the Dolphin Ridge. Near the Equator the ridge is less definite, but as the Challenger Ridge stretches beyond lat. 50° S.; from it rise the volcanic islands Ascension, St. Helena, and Tristan da Cunha.

Between the ridge and the margins the hollows contain a series of deeps more than 3,000 fathoms, 3½ m., below the surface; in two places the floor slopes steeply beyond 4,000 fathoms; the Blake deep reaches 4,561 fathoms, over 5 m. The border seas of the north—Hudson Bay, the Baltic and North Seas—are shallow; the Gulf of Mexico and Caribbean Seas are deep. The British Isles and Newfoundland rise from extensive continental shelves which are the most important fishing grounds of the world, with a depth of less than 100 fathoms or 600 ft.

The surface waters have a temperature of 80° F. in the narrowest portion, and are colder in higher latitudes until the limits of pack-ice are reached, where the temperature is about 32° F. The deeper waters are colder, and the bottom temperatures range between 34° and 40° F. The salinity of the surface waters varies between 3 and 4 p.c., and is lowest on the N. and S. fringes of the ocean and highest about the latitude of the tropics. The greater part of the floor of the ocean is covered with the greyish deposit, Globigerina ooze, while red clay lies in some of the deeps. See Continental Shelf; Gulf Stream; Sargasso Sea.

Atlantic Star. British Empire medal issued for service in the battle of the Atlantic. It was awarded for six months' service afloat in the Royal or Merchant

Navy in Atlantic or home waters between Sept. 3, 1939, and May 8, 1945. The ribbon is blue, white, and sea-green, watered and shaded. For a description of the star see under Campaign Stars.

Atlantis. Mythical island in the Atlantic. Larger than Asia Minor and Libya together, it was according to Plato populous and flourishing. But its immorality brought upon it the wrath of the gods, and it was swallowed up in a day and a night. Though there is no reliable evidence for the existence at any time of such an island in what is now the Atlantic Ocean, geologists and ecologists regard it as likely that land once above the level of the sea has sunk, and they seek to explain some facts of animal and plant distribution by the breakage in this way of previous land bridges. (See Gondwana Beds.) New Atlantis is the title of a philosophical work by Francis Bacon, depicting, somewhat in the style of More's Utopia, an ideal commonwealth.

Atlas. In Greek mythology, a giant. Having, with other Titans, rebelled against Zeus, he was condemned to hold up the heavens on his shoulders in the extreme far west, near the garden of the Hesperides (*q.v.*).

Atlas. Term first applied by Mercator to a collection of maps. It was derived from the figure of the giant Atlas bearing the universe on his shoulders, which was used to decorate the title page of the early volumes in which the maps were collected. Primarily an atlas is a book of maps which have an essential unity of conception or treatment. But a volume which contains specimens of all the known examples of a certain type of map, *e.g.* a reproduction of all the existing Portolano, or port-finding, maps of the medieval navigators, is not an atlas.

The most common and permanent type of atlas is an attempt to convey by means of maps a summary of the world as known to man. Since such a volume with its accompanying gazetteer or index would make a bulky atlas of the world, atlases are now frequently limited to maps dealing with only certain portions of the globe.

In the development of cartography various types of map have been evolved, and it is possible to publish an atlas containing maps of only one type, such as an orographical atlas, wherein all the maps specially depict, by means of contours, or hachures, or colour layers, the surface features or

relief of the earth both above and below sea level.

Similarly, maps are used to indicate the summarised knowledge of the climatic conditions which prevail throughout the world and together constitute an atlas of meteorology. The facts regarding plant or animal life, or rock structure, or the varied forms of life and physical conditions in the oceans, are mapped in atlases of zoology, geology, and oceanography. A useful commercial atlas presents a summarised picture of man's economic activities in all parts of the world. Comprehensive atlases contain an eclectic set of maps of many types. An original copy of Mercator's Atlas came to light at Ostend in 1920, dated 1613, and containing 197 maps. See Map and Map-making.

Atlas. In anatomy, the first cervical vertebra, supporting the globe of the head. It articulates above with the condyles of the occipital bone, two processes at the base of the skull; below, with the axis or second cervical vertebra and in front with the odontoid process of the axis.

Atlas Mountains (Berber *adrar*, a mountain). Mountain system in the N. of Africa. It consists of two

The Algerian or Eastern Atlas falls into two well-defined chains, the Tell Atlas in the N. and the Saharan Atlas in the S., between which is the lofty plateau of the Shotts. The Tell Atlas extends through the Rif territory of Morocco eastward along the line of the Mediterranean coast and drops away to the sea in steep escarpments. The interior chain fringes the Saharan desert and contains several summits exceeding 6,000 ft., although its crests frequently descend to the level of the desert, into which many spurs project.

The mineral wealth of the Atlas Mts. includes copper, iron, antimony, salt, and marble, but their working is not extensively undertaken. Vegetation is mostly of the Mediterranean and African varieties, but Alpine flora occasionally occurs. The well-watered valleys are fertile and actively cultivated.

The Atlas forms the W. end of the great system of folded mts., including the Alps and Caucasus, which terminates on the shores of the Pacific beyond the Himalayas.

Atlas Powder. Modified form of dynamite. In it the nitroglycerine is absorbed in potassium nitrate and wood pulp instead of Kieselguhr. The proportion of

18th century by Priestley, Scheele, Rutherford, and others proved that the atmosphere is a mixture, the principal constituents of which are nitrogen, oxygen, and carbon dioxide. The atmosphere is denser in the layers near the surface of the earth and less dense above mountains and at still higher levels. The composition of the air is on the whole very uniform except in the amount of water vapour contained in it, which is greater in damp weather and in the vicinity of the sea and large lakes; the proportion of carbon dioxide is rather larger in the neighbourhood of large towns and volcanoes. The gases in the normal atmosphere consist of molecules of the various gases, and these molecules are in a state of constant movement. At a great distance above the surface of the earth the molecules break up into atoms which are electrically charged and are known by the name of ions.

Some of the gases in the atmosphere are heavier or denser than others; and in stating the composition of the air it is for this reason necessary to indicate whether this is taken by volume or by weight. The normal composition of dry air is, by volume:

Atlas Mountains. Panoramic view of part of the great system extending N.E. for 1,500 m. from Cape Nun in Morocco to Cape Bon in Tunis. The slopes are covered with vast forests and the valleys are inhabited by Berber peoples

main ranges, with many minor ramifications, and extends for about 1,500 m. from the Atlantic coast to the E. coast of Tunis on the Mediterranean.

The Moroccan Atlas comprises three main chains, running more or less parallel to each other. The principal and central of these is the Great Atlas, which attains a mean height of 11,000 ft., is densely forested, and has summits covered with snow for a great part of the year. It contains Tagharat, over 15,000 ft. high, the culminating peak of the entire system. On the S. of this chain is the Anti or Lesser Atlas, with a considerably lower elevation, and on the N. the Little or Middle Atlas.

wood pulp is 10-15 p.c., and two types of the explosive known as B and C contain respectively 60 p.c. and 45 p.c. of nitro-glycerine. Large quantities were used in the construction of the Panama Canal. See Explosives.

Atmolysis (Gr. *atmos*, vapour; *lysis*, loosing). Process of separating a mixture of two gases by making use of their different rates of diffusion through a porous partition. The process is analogous to that of osmosis (*q.v.*), applied to the separation of two liquids of different densities.

Atmosphere (Greek *atmos*, vapour; *sphaira*, sphere). The gaseous envelope which surrounds the earth. Researches in the

nitrogen 78.03 p.c., oxygen 20.99 p.c., argon 0.932 p.c., carbon dioxide 0.03 p.c., hydrogen 0.01 p.c., neon 0.0018 p.c., krypton 0.001 p.c., helium 0.0005 p.c., ozone (a modification of oxygen) 0.00006 p.c., and xenon 0.000009 p.c. As oxygen, argon, carbon dioxide, and some of the other gases are heavier than nitrogen and hydrogen, the proportion of the former gases by weight is greater than is stated above; thus oxygen contributes 23.2 p.c. of the weight of the air.

In general, animals take in from the atmosphere oxygen that is used to combine with the food-stuffs, especially those consisting largely of carbon; the carbon

dioxide produced in this way returns to the atmosphere through the lungs of the animals. On the other hand, plants absorb carbon dioxide from the atmosphere and give off oxygen through minute holes in their leaves. The atmosphere gradually becomes lighter the greater distance it is from the earth, and the molecules of the different gases become more widely separated from one another so that at a distance of several miles from the surface of the earth the atmosphere has almost ceased to possess the characteristics with which we are familiar; it would not support life and would not sustain combustion and its pressure on a barometer would be quite trifling. At a distance of about 60 miles above the surface of the earth the upper region is called the stratosphere, and the region in the neighbourhood of the junction of the stratosphere and the ordinary atmosphere has been called the tropopause. The temperature of the atmosphere becomes lower and lower the farther distant it is from the warm surface of the earth. At about 1½–2 miles away from the earth the temperature is on an average lower than the freezing point of water; at about 6–7 miles from the earth's surface it is supposed that the temperature is about -55°C .

Layer of Electrified Atoms

The boundaries of the various layers of the atmosphere are very indefinite and variable, and our information about them has been derived from observations on meteorites, on small balloons fitted with scientific instruments, from a study of the aurora borealis, and from careful research during recent years on radio-activity. The information collected from these sources appears to demonstrate with a considerable measure of certainty that at a distance of about 60–70 miles from the earth's surface there is a layer of electrified atoms of some of the atmospheric gases. This layer is known as the Kennelly-Heaviside layer; it was discovered independently by A. E. Kennelly and Oliver Heaviside in 1902. From this layer electric waves such as are used in radio work are reflected back to the earth's surface. If such waves are emitted from the earth's surface at an angle of about 40° or 50° they will be reflected back to the earth not to the place from which they were sent, but to another

place many miles away. The nature and degree of the reflection depend on whether the waves are emitted by day or by night and on the wave-length of the waves. For wave-lengths of about 1,000–2,000 metres in the daytime the reflecting surface seems to be about 40–50 miles away; by night it is about 60–70 miles away. When the wave-lengths are as short as about 100 metres or less the reflecting layer seems to be about 150 miles away. This reflecting layer is called the Appleton layer after its discoverer, Sir Edward Appleton. The whole of the atmosphere capable of reflecting radio waves is known as the ionosphere. It was concluded by Harrison and Dobson in 1925 that there is a considerable quantity of ozone in the upper atmosphere up to, very roughly, 100 miles from the surface of the earth. The green auroral line seems to be due to oxygen, but according to Rayleigh may be partly due to nitrogen.

The Atmosphere in Industry

The production of nitric acid, ammonia, and nitrates from the nitrogen of the atmosphere has become an important industry, and the supply, from this source, of fertilisers to the soil has been of enormous value to the growing population of the earth. The possibility of such an industry was made clear by the researches of Ramsay and Young in 1884, and of Le Chatelier in 1901, but the development on a manufacturing scale was worked out by Haber, Le Rossignol, and others at a later period, and the process began to be worked on a large scale in Germany before the First Great War. By cooling the air to a very low temperature and under great pressure, it can be liquefied, and by regulation of the pressure and temperature the liquid air can be distilled so that the nitrogen, the oxygen, the helium, the neon, and the argon can all be separately collected. For the manufacture of fertilisers nitrogen, obtained by the distillation of liquid air, is mixed with hydrogen, obtained by the electrolysis of water or from water gas, in the presence of an iron catalyst and under a pressure of 200–300 atmospheres. The nitrogen and hydrogen combine to make ammonia, which is oxidised to make nitric acid. From this nitric acid calcium nitrate and other nitrates are made in very large quantities. Further details of the processes are given in

chemical text-books, and especially in *The British Chemical Industry*, by Morgan and Pratt. From the atmosphere by means of cooling, high-pressure liquefaction, and distillation are obtained supplies of helium, neon, argon, and the other inert gases. Neon is used for neon signs; argon is used for filling incandescent lamp bulbs, and helium has been used for filling balloons.

Observations on the aurora are more successfully made in arctic or antarctic regions than in temperate regions. In northern Norway and Sweden the auroral displays are remarkable. The light of the aurora is electrical and is formed usually about 60–100 miles above the surface of the earth, though sometimes as far away as 500–600 miles. Auroral displays are connected with the electrical disturbances associated with sun spots.

Bibliography. *The Weather Map*, Sir Napier Shaw, 1916; *The Sea Surface and the Air: Scientific Results of the Norwegian Antarctic Expedition, 1934*; *The Humidity of the Air*, C. Burdick, 1938; *Investigation of Atmospheric Pollution*, Dept. of Scientific Research, 1939.

At Mrs. Beam's. Three-act comedy by C. K. Munro, produced by the Stage Society at the Kingsway Theatre, Feb. 17, 1921. Discursive and garrulous, it is set in a London boarding-house. The plot is without distinctive merit, but there are witty lines and interesting types, with Miss Shoe a memorable character. Selected by professional repertory companies as a representative comedy, it quickly became a favourite also with amateurs.

Atoll. Ring-shaped coral reef which constitutes an island enclosing a lagoon in the middle. Atolls vary considerably in size, from tiny rings to others whose diameters reach several miles, but they are all very low, as the coral polyp cannot live above the water level. Usually the reef is closely grown with coconut palms which take root in the sand formed by the decayed coral. The shallow lagoon often contains numerous pearl oysters. Frequently the coral ring is broken, and the atoll is horse-shoe or fret-saw shaped. Atolls occur in groups and lines. Their greatest development is in the south-western Pacific, particularly in a narrow band of ocean, more than 4,000 m. in length, between the Low Archipelago and the Marshall Archipelago. *See* Coral.

ATOM: ITS NATURE AND STRUCTURE

E. N. da C. Andrade, Director, Davy Faraday Laboratory, R.I.

This article explains succinctly the revolutionary discoveries arising from atomic research—the separation of the electron, or negative charge, from the nucleus, or positive charge, and the effect of nuclear change—which point the way to a new era in scientific achievement.

See also the article on Atomic Bomb, immediately following

The word atom is derived from the Greek, and means literally "that which cannot be cut, or divided." When the word was originally used it was believed that if we went on, in imagination, dividing matter up into smaller and smaller parts we should eventually come to small grains, or particles, which could not be further divided; these were the atoms. The fundamental feature of all modern science is the conviction that all substance is made up of characteristic particles, that it is granular in structure.

The science of chemistry is built up on the assumption that there are some ninety-two different kinds of matter which cannot be broken down by chemical means into anything simpler. These are the so-called elements. Each element is made up of atoms, all of which behave chemically in the same way. The lightest atoms are those of hydrogen, the heaviest those of uranium. The different kinds of atom are of different size, but they do not differ in magnitude so much as do the eggs of different British birds. It is therefore possible to speak in a general way of the size of atoms without speaking of any particular atom. Atoms are extremely minute: it is possible to form fairly precise estimates of their size from, among other things, a study of certain properties of gases and from consideration of the structure of crystals, in which they are built up more or less touching one another. They are about one-hundredth of a millionth of an inch across; the finest wire that can be prepared, which is itself about one-fiftieth of the diameter of a human hair, has about three thousand atoms packed side by side in a diameter.

Discovery of the Electron

Until some fifty years ago it was generally believed that the atoms of elements were ultimate particles, that they could not be broken up into anything simpler. The discovery of the electron, the atom of negative electricity, which could be produced from atoms of any kind and which was very much smaller than the smallest atom, suggested that the atom itself might be built up of electrons. As the electrons are negative charges,

and as the atom is normally electrically neutral, there must also be a carrier, or carriers, of positive charge.

The modern view, due to Lord Rutherford, is that the atom consists of a minute particle, called the nucleus, which carries the positive charge, surrounded by widely spaced electrons. The nucleus is very small indeed, even compared to the atom; if it be represented by a pea, which means multiplying its diameter by about a million million times, the outside boundary of the atom is something like a hundred yards away. The nucleus not only holds the whole positive charge of the atom, but nearly the whole mass, for the electrons are comparatively light.

How Atoms are Classified

The number of units of positive charge on the nucleus fixes the number of electrons, since by a unit of charge is meant the quantity of electricity in the electron, and since the atom as a whole must be neutral. The number of electrons determines their arrangement, and it is the number of outside electrons that decides the chemical behaviour of the atom. Hence the size of the nuclear charge gives the chemical species of the atom.

The number of units of positive charge on the nucleus is called the atomic number. To give examples, the atom of hydrogen, atomic number one, has a nucleus carrying one unit of positive charge; this hydrogen nucleus plays a great part in atomic structure and is called the proton, meaning, from the Greek, "the first thing." The atom of sodium, which is the eleventh when the elements are arranged in order of atomic weight, has eleven positive charges and atomic number eleven. In general, the atomic number is the number of the element in question when the elements are all arranged in order of atomic weight.

It used to be thought that all atoms which had a given chemical behaviour were identical in all respects. As the result of the work of F. W. Aston, following on certain pioneering experiments of J. J. Thomson, it is now known that atoms of a given chemical species may have different masses

—for example, there are chlorine atoms of mass 35 and chlorine atoms of mass 37, taking the mass of the hydrogen atom as unity.

Ordinary chlorine is a mixture of atoms of these two kinds, the lighter being the commoner, so that the atomic weight of chlorine is 35.46. Atoms of different mass having the same chemical properties are called isotopes of the element in question; thus it is said that there are two isotopes of chlorine. The word isotope is derived from the Greek and means "having the same place," since the isotopes of an element have the same place in the so-called periodic table, in which the elements are distributed according to chemical properties. The nuclei of isotopes of a given element have, then, the same charge but different masses.

The existence of isotopes is explained in terms of the structure of the nucleus. There are certain particles called neutrons which have about the same mass as the hydrogen nucleus but carry no electric charge. They can be considered as protons without charge. The nucleus is built up of these neutrons and protons. The number of protons gives the number of units of positive charge and hence the chemical properties of the atom. Each proton also contributes one unit of mass. The neutrons contribute mass only, and do not affect the chemical properties. Hence different isotopes of one element contain different numbers of neutrons, but the same number of protons.

Nuclear Changes in the Atom

If we can tamper with the nuclear charge we can change the nature of the atom, that is, transmute one element into another, to do which was the alchemist's dream. The chemical processes used by the alchemists, and all other chemical processes, only affect the outer regions of the atom and leave the nucleus untouched. The first indications that nuclear changes were possible were given by the radio-active bodies: certain of these elements send out spontaneously from the nucleus a so-called alpha particle, carrying two units of positive charge and four units of mass, i.e. an atom of helium, and so become other elements. Others undergo a nuclear change which finally results in the loss of an electron, a unit of negative charge; this also leads to a change in the chemical nature of the element. These radio-active transformations,

Atom. This photograph, by Dr. P. M. S. Blackett, shows the paths of alpha rays in helium gas after the successful bombardment of an atom

however, take place of themselves, at a rate which cannot be hurried or retarded by ordinary laboratory processes. The nuclei of such radio-active elements are, then, unstable, and at odd times fall to pieces of themselves.

By bombarding light elements with alpha particles Rutherford succeeded in breaking the nuclei of certain light elements and so transforming their nature. In much of the work he had the co-operation of Chadwick. Later Cockcroft and Walton used for the same purpose electrified particles which were given high speed by an electric field in an exhausted tube. These particles were a kind of artificial alpha particle, of a different chemical nature, not so energetic but far more numerous. Their impact also effected nuclear changes. All such positively charged particles are repelled by the nucleus and so have to be very swift to get near it. Neutrons have the advantage that they are uncharged and so can penetrate easily into the charged nucleus, and with their aid Fermi and others have produced many atomic transmutations.

In all these cases very few atoms are transformed. It is only because of the great sensitiveness of the methods used that the effects can be detected at all. It was soon realized that in many of the nuclear changes a relatively great amount of energy was liberated per atom, but it required so much effort to provoke the change in a very few atoms that no use could be made of the process, although it was of the highest scientific interest.

In 1939 a new effect was produced by bombarding uranium with neutrons: the nucleus was split into two parts, which rushed apart with great energy. At the same time neutrons were given out

and it turned out that only one, uranium 235, was suitable for the bomb. The separation of this isotope is a most tedious and costly process and accounts for much of the trouble in producing the bomb. Releasing of nuclear energy in a sudden rush on a large scale has thus been shown to be possible. To be able to release it in a controlled way is necessary before industrial use can be made of it.

The outer parts of the atom are inhabited by electrons which, although very sparsely distributed, can prevent the outer parts of other atoms intruding. In the hydrogen atom a single electron effectively patrols a comparatively immense space, and even in the heaviest atoms the outer parts are very thinly occupied. The electrons are arranged more or less in shells, of which the outer shell is usually incomplete. It is these outer electrons that give the main chemical properties of the atomic species: it is energy changes among them that lead to the emission of light by atoms. Chemistry, spectroscopy, and the emission and absorption of X-rays are all inseparably bound up with the electronic structure of the atom, outside the nucleus. Thus the old chemistry is the study of the behaviour of the outer electron of the atom. The study of the behaviour of the nucleus is the chemistry of a new era in science.

Atomic Bomb. Bomb in which the explosive force is derived from atomic fission. As explained under Atom, when atoms of certain elements are bombarded with neutrons (*q.v.*) the atomic nuclei can be split, with the liberation of a relatively enormous amount of energy. The effect depends upon the equivalence of mass and energy, propounded as part of his relativity theory by Einstein in 1905. A very small mass of matter

represents an enormous amount of energy. A mass of one ounce, if it could be entirely converted into heat energy, would be sufficient to transform about 1,000,000 tons of water into steam. One pound of uranium 235 in an atomic bomb would in theory be equal in effect to 8,000 tons of the explosive T.N.T.

Atomic bombardment has been carried out for a number of years as a laboratory operation by the use of the cyclotron (*q.v.*) or similar apparatus. It involves the input of a comparatively large amount of energy in the form of electricity at high voltages, but the amount of matter that could be handled was so tiny that the resultant output of energy was small. By 1939 scientists in many countries were studying the possibility of atomic fission on a scale large enough to yield a source of energy available for industrial power, and were investigating the use of atomic energy in lethal weapons. Uranium, the element commonly chosen for the operations, consists of the isotope (*q.v.*) of mass 238 to the extent of 99.3 p.c., the isotope of mass 235 to 0.7 p.c., and the isotope of mass 234 to the extent of 0.008 p.c. Only the first two are suitable for the purpose, and the first is fit only for what are called slow neutron operations, and is less suitable for use in an atomic bomb.

The problem was therefore to separate from uranium a sufficiently large amount of isotope 235; this was done by the gas-diffusion process, the work being carried out largely in the U.S.A. Uranium itself is derived mainly from pitchblende, of which there are large deposits in Canada and the Belgian Congo. The work of preparing the atomic bomb was shared by the governments of Great Britain, Canada, and the U.S.A. In 1940 an investigating committee of scientists was set up in Great Britain with Sir George Thomson as chairman; at first it was under the Air ministry, and later the ministry of Aircraft Production. In the middle of July, 1941, this committee reported that the feasibility of a military weapon based on atomic energy was established. Endorsed by the war cabinet, the project was then entrusted to a division of the department of Scientific and Industrial Research, of which Sir E. Appleton (*q.v.*) was secretary. In October, 1941, President Roosevelt suggested to Winston Churchill that the work should be carried on jointly by

Great Britain and the U.S.A. A U.S. mission came to Britain in Nov., 1941, and British scientists visited the U.S.A. in the following Feb. Great plants in the U.S.A. were placed under the responsibility of the U.S. secretary of War. One at Oak Ridge, Tennessee, employed over 65,000 persons. Another great group of buildings was erected at Richland, Washington. In the late summer of 1943 many British scientists working on the atomic bomb were transferred to the U.S.A. in order to join the appropriate groups there.

For the final stages of the project, an atomic laboratory staffed by physicists and chemists from Britain and the U.S.A., under the direction of J. R. Oppenheimer, was established in 1943 at Los Alamos, New Mexico.

Concurrently the governments of Germany and Japan were striving to produce an atomic weapon. But the Anglo-American experiments came first to fruition. At 5.30 a.m. on July 16, 1945, the first atomic bomb in the history of mankind was detonated at Alamogordo, a U.S. army airfield in the New Mexico desert, 120 m. S.E. of Albuquerque.

The bomb was exploded from the top of a tall steel tower, while scientists and military experts occupied observation posts at a distance of 17,000 yards. The explosion caused a great boiling, surging cloud of many colours to rise to some 40,000 ft. in height. The heat of the explosion, estimated at several millions of degrees, completely vaporised the tower; where it had stood was a huge crater, the floor of which consisted of glass formed by the fusion of the sand.

Destruction of Hiroshima

At 8 a.m. on Aug. 6, 1945, the first atomic bomb to be used in warfare was dropped by a Superfortress of the U.S.A.A.F. flying at 30,000 ft. over the Japanese mercantile city of Hiroshima (*q.v.*). The bomb was dropped by parachute and exploded 1,000 ft. above the centre of the city. The flash of the explosion was observed by a reconnaissance aircraft 170 m. away. The entire business section in the centre of the city was destroyed over an area of 2 m. in diameter. Of Hiroshima's population of 343,000, 78,150 were killed, and 58,839 injured; though many of the latter later succumbed to the gamma rays generated by the bomb's release of atomic energy. Some 95 p.c. of people within a quarter mile of the explosion were

killed outright, and 50 p.c. exposed to radiation at a distance of one mile eventually died.

Three days later, at 11 a.m. on Aug. 9, a Superfortress released a second atomic bomb over the industrial city of Nagasaki (*q.v.*). This dropped between the two large Mitsubishi ordnance plants in the N. part of the city. As in Hiroshima, virtually every building within a radius of one mile was razed to the ground. Casualties were 73,884 dead, 76,796 injured. The effects of the flash burns and gamma rays were similar to those in Hiroshima.

What Happens on Detonation

When an atomic bomb of this type detonates, a ball of fire one-third of a mile in diameter, with a central temperature of about 4,000,000° F., is formed at the centre of the explosion. The effect of this sudden generation of great heat is an immediate expansion which violently repels the air once occupying the centre of the explosion. This pressure, or blast wave, destroys or damages all structures in its path.

At the instant of explosion great numbers of radium-like rays are emitted. These rays affect the blood-forming tissues in the bone marrow, and the whole function of the blood is impaired. The blood does not coagulate, but oozes in many spots through the unbroken skin, and internally seeps into the cavities of the body. The white corpuscles which counter infection disappear, and persons subjected to the rays usually die within two or three weeks of the exposure.

Each of the atomic bombs detonated over Japan had an explosive effect equivalent to that of 20,000 tons of T.N.T. Because of severe censorship, the immediate moral effect caused in Japan by the use of the two bombs was limited; but they gave the Japanese govt. a decisive reason for surrender, Aug. 14, thus making invasion of Japan unnecessary and, in the view of U.S. military experts, shortening the war by a year and thus saving possibly millions of Allied and Japanese lives.

With a view to testing the effect of the atomic bomb on warships, a combined experiment by the United States Navy and Army Air Forces was carried out at Bikini Atoll (*q.v.*), and attended by representatives of the United Nations. Some 73 U.S., German, and Japanese warships were assembled for the test. Known as Operation Crossroads, the experi-

ment cost £125,000,000 and employed some 42,000 men and several hundred ships of all descriptions to man, supply, and administer the tests. The target ships were, of course, unmanned, but large numbers of animals were placed on board to test the reaction of living things to the rays emitted by the atomic explosion. Cameras and recording instruments were set up in steel towers on the shores of the lagoon to provide a record of the explosion.

The first part of the test took place, July 1, 1946, when a Superfortress dropped the world's fourth atomic bomb on the target fleet. Its fuse was set to burst the bomb in the air above the ships; this sank or damaged 20 vessels, those totally lost being all small vessels. Little damage was done to the hulls of the battleships and cruisers, but blast wrecked their superstructures and all light deck-gear. Had the ships been manned, casualties amongst the crews would have been heavy. It was not until the following day that the rays had dissipated sufficiently to make it safe to board the ships still afloat.

Second Bikini Experiment

The second Bikini bomb was exploded July 24, this time beneath the water. The explosion threw up a column of water 2,200 ft. across and 5,500 ft. high and estimated to contain 10,000,000 tons of water. Lateral blast pressure initiated waves 100 ft. high from the centre of the explosion. The explosion sank two battleships and an aircraft carrier, and severely damaged a number of other vessels.

The Bikini tests proved less destructive to the structure of ships than had been anticipated, but the rays emitted by the explosion raised entirely new problems in naval architecture and warfare. Radio-activity, estimated to have been equivalent to many hundreds of tons of radium, poisoned the sea and temporarily made the ships death traps. A few minutes' exposure would have incapacitated the crews and caused their deaths within a few days. The second bomb caused a deluge of water saturated with radioactive elements over some 90 p.c. of the target area.

Exclusive possession by the U.S.A., and part possession by Great Britain and Canada, of the secrets of atomic bomb manufacture gave rise to political implications and speculations from the end of the Second Great War.

Photographs 1-4 are of the Japanese town of Hiroshima after the explosion over it on August 6, 1945, of the first atomic bomb used in warfare. 1. Centre (indicated by the arrow) directly above which the bomb burst. 2. Detail of gasholder 1½ m. from the centre of damage: the bituminous coating of its sides was damaged by heat radiation except where it was shielded by the

valve-wheel and spindle, the area thus protected showing up afterwards like a shadow. 3. Similar "shadow" left by a human body on steps 200 yds. from the centre of damage. 4. Walls of the gutted theatre left standing among debris. 5. Mushroom-shaped cloud produced by the underwater explosion of an atomic bomb in the lagoon at Bikini Atoll on July 24, 1946

ATOMIC BOMB: EFFECT OF EXPLOSION OVER HIROSHIMA, AND UNDERWATER AT BIKINI

Photos 1, 2 and 3, from "The Effects of the Atomic Bombs at Hiroshima and Nagasaki," H.M. Stationery Office; 4, Associated Press, 5, Keystone

An Atomic Energy Commission (*q.v.*) was set up by the United Nations; and both the U.S.A. and the U.K. continued to study possible uses of atomic energy for peaceful as well as warlike ends. U.S. monopoly of the secret of producing atomic explosions appeared to end during 1949, President Truman announcing on Sept. 22 that such an explosion in the U.S.S.R. had been detected.

Wimperis, 1946; General Account of the Development of Atomic Energy for Military Purposes; International Control of Atomic Energy; Effects of Atomic Bombs at Hiroshima and Nagasaki (H. M. Stationery Office pub., 1946).

Atomic Energy Advisory Committee. Body, of which Sir John Anderson was chairman, set up by the British govt. in Aug. 1945, to give technical advice on development of atomic power for use in industry and in war. It advised the development of Harwell (*q.v.*) experimental station. It was dissolved Jan. 7, 1948.

Atomic Energy Commission. Body set up by the U.N. Feb. 23, 1946, to discuss ways of international control of the use of atomic energy. On it were represented all members of the security council plus Canada. From its first meeting in New York, June 14, deadlock attended its deliberations, Russia refusing support for proposals by Bernard Baruch (*q.v.*) on behalf of the U.S.A., and having her own proposals outvoted. The commission suspended its activities from May, 1948, to Feb., 1949, when it resumed discussions, which continued to be fruitless.

Atomic Number. Term used in chemistry to denote the number of an element when arranged with others in order of increasing atomic weight. It is equal to the total number of orbital electrons in an atom of the element. Atomic numbers were first assigned by Moseley (*q.v.*) from observations on the characteristic X-ray spectra of the elements. See Chemistry.

Atomic Weights. In chemistry it is of great importance to know the relative weights of the atoms of the various elements, and tables of these relative weights have for a century or more been published. Originally hydrogen was taken as the standard and given the atomic weight of 1; afterwards oxygen was taken as the standard and given the atomic weight of 16. It

was discovered in 1913, independently by Soddy and by Richards, that there were two varieties of lead with identical properties, except that one had heavier atoms than the other. Soddy called such different varieties of the same element isotopes, and over more than thirty years it has been proved that most elements are mixtures of isotopes (*see Atom*). The proportion of the different isotopes in most chemical elements occurring in nature remains nearly constant; both hydrogen and oxygen are mixtures of isotopes, and whichever element is taken as a standard the resulting relative weights of the various atoms are seldom exactly whole numbers. The atomic weights, which are now the relative weights of an average atom of an element compared with an average atom of oxygen, have been determined with great accuracy and are revised from time to time by an international committee of chemists. The atomic weight of aluminium is 26.97, of boron 10.82, of carbon 12.01, of gold 197.2, of helium 4.003, of hydrogen 1.0080, of oxygen 16, of tin 118.7, and of uranium 238.07. Uranium is itself a mixture of three isotopes with atomic weights of 234, 235, and 238 respectively. A full list of atomic weights will be found under Chemistry.

Atonement. Word used in a religious sense to imply reconciliation with God through sacrifice. In all religions men dread the judgement, and desire the forgiveness of God, or of the gods, and seek to avert the one and secure the other not only by prayer, but also by sacrifice. It depends on the stage of moral development in any religion whether moral transgression or ceremonial offence is the more seriously regarded.

The sacrifice offered in the lower stages of moral religious development is conceived as a gift so well pleasing to the god to whom it is offered that it changes his anger into favour. If the deity is conceived as malevolent, the death of the victim may be regarded as satisfying this feeling because of the pain and loss involved. When conscience is awakened, and the connexion between transgression and penalty is recognized, the death of the victim is regarded as substitutionary for that of the transgressor. Even when the conception is less definite, some sort of equivalence between the sacrifice and the suffering which the sin deserves is assumed. —

The conception of atonement, as it meets us in the history of religions, is not merely, as modern liberal theologians often represent it, at-one-ment, or reconciliation, a restoration of the interrupted relation, moral and religious, of God and man; reconciliation is the result, but atonement is the means by which the end is brought about. The complementary conceptions of expiation and propitiation must not be excluded. In offering the sacrifice the sinner offers a compensation for the wrong he has done; by thus recognizing his own ill-desert, and the claim the deity has for some such compensation, he turns displeasure into favour: in expiating his sin, he propitiates the god worshipped, and so his sacrifice atones in restoring him to that relation to his god which his sin had interrupted.

Sacrifice and Forgiveness

This is the conception of atonement involved in the universal institution of sacrifice. In the O.T. the contrast between the popular and the prophetic religion is at once noticeable. For the one the number and the costliness of the offerings were regarded as determining the efficacy of sacrifice to turn God's judgement into forgiveness; for the other goodness and godliness were insisted on as the sole conditions of God's good will towards men (Micah 6, 6-8). While the prophets denounced the false view of sacrifice as atoning, it is in a psalm (51, 17) that "a broken and a contrite heart" is represented as the acceptable sacrifice unto God, to which God responds in forgiveness. In the description of the suffering servant of Jehovah in Isaiah 53, the greatest advance is made in the O.T. towards the Christian conception; the righteous is made a sin-offering for the sinful people, and by his sacrifice secures their salvation.

In the N.T. Jesus describes His death as a ransom for many (Matt. 20, 28), and as the sacrifice of the new covenant unto forgiveness (Matt. 26, 28; 1 Cor. 11, 25). As there is evidence, however, that He accepted as predictive of His own vocation the description of the suffering servant just referred to, it may be assumed that He regarded His sacrifice as securing salvation because atoning for sin. The Epistle to the Hebrews exposes the failure of the whole Levitical ritual to meet man's need of a conscience cleansed from sin (9, 14; 10, 2, 22), and lays stress on two elements in the sacrifice of Christ as giving it value, His

perfect sympathy with man (2, 17, 18; 4, 15), and His perfect obedience unto God (10, 8, 9; 5, 7-9). He accepted in obedience to God and sympathy with man all the consequences of human sin.

Paul regards Christ's death as propitiatory (Romans 3, 25), "as showing both the divine wrath and the appeasement of that wrath." Christ's death as a sacrifice, the endurance of sin's penalty on behalf of men, if it does not render God propitious in the sense of changing hate to love, or anger to mercy (a heathen notion), at least exhibits Him as propitious, as both forgiving and judging sin. As His "passing over of the sins done aforetime in His forbearance" (v. 25, R.V.) might give the impression of His indifference, in the death of Christ His righteousness was exhibited. By His propitiation men are redeemed (set free) from sin, guilt, law, and death, and God and man are reconciled.

In the history of the Christian Church the view of the Atonement has been always affected by the dominant religious interest and current theological conceptions. In paganism the power of demons was dreaded. Accordingly, in one of the earlier theories of the Atonement, Christ's death was regarded as a ransom paid to the devil in order to set men free from his dominion, to which at the Fall they had subjected themselves. In the feudal atmosphere Anselm thought of sin as an insult to the honour of God for which an adequate compensation must be offered; the voluntary death of Christ, who as sinless was not under the doom of death, afforded an infinite satisfaction because of the infinity of His person as God. With the development of judicial punishment by established government the Atonement came to be regarded (as by the Reformers) as the endurance by Christ in His death of the equivalent penalty of man's sin.

A later political development with a corresponding theory led Grotius to represent the death of Christ as an expedient of God as moral governor of mankind to impress on men what sin deserves. The ransom, the satisfaction, the substitution, and the governmental theories are the main historical forms of the doctrine of the Atonement. None is accepted by contemporary theology. See Christianity; Incarnation.

Bibliography. Atonement and Personality, R. C. Moberley, 1907;

The Doctrine of the Atonement, J. K. Mozley, 1915; The Problem of the Cross, V. F. Storr, 1919; The Idea of Atonement in Christian Theology, H. Rashdall, 1919; Short History of the Doctrine of Atonement, L. W. Grensted, 1920; The Atonement (Dale lectures for 1933), R. S. Franks, 1934; The Atonement, A. C. Headlam, 1935.

Atonement, DAY OF. Great fast day of the Jews. Defined in the Talmud as The Day, and observed on the 10th day of the seventh month of the sacred year, or Tishri (Sept.-Oct.), it is the one day of humiliation or expiation commanded in the Mosaic law. It is said to have been instituted either on account of the sin and punishment of Nadab and Abihu, or as commemorating the day on which Moses came down from Sinai with the tables of the law and proclaimed forgiveness for the worship of the golden calf. Familiar as Yom Kippur, directions as to its observance are given in Ex. 30; Lev. 16, 23; and Num. 29. Referred to by Philo and Josephus, its relation to the Christian Atonement is dealt with in Heb. 9 and 10.

Atrato. River of Colombia. Rising in the western Cordillera, it flows about 400 m. N. to the Gulf of Darien, which it enters through 16 mouths. Its mouths admit vessels only of about 4 ft. draught, though the upper river is navigable by steamers for more than 250 m.

Atrauli or **ATROWLI**. Municipality of the United Provinces, India, in Aligarh district. It lies 70 m. by rly. N. of Agra, is an old, but well-built town, and was a local headquarters of the mutineers in 1857. More than half the inhabitants are Hindus, most of the remainder are Mahomedans.

Atrebrates. Tribe inhabiting Berkshire and the neighbourhood at the time of the Roman invasion of Britain. There were also Atrebrates in northern Gaul, the modern Belgium. *Prox.* At-re-bay-teez.

Atrek. River of Persia. It rises in Khorassan and flows into the Caspian after a course of 350 m. For part of this it forms the boundary between Russia and Persia. At its mouth it is normally only 30 ft. wide, but when flooded in spring spreads to a width of 2 m.; at other times it is almost exhausted by evaporation and the withdrawal of water for irrigation.

Atreus. In Greek mythology, son of Pelops and grandson of Tantalus. He and his brother Thyestes, having murdered their half-brother Chrysippus, fled from Pisa in Elis to Mycenae, where Atreus became king. Owing to an

intrigue with Aërope, wife of Atreus, Thyestes was driven from Mycenae. To avenge himself he sent Pleisthenes, son of Atreus, whom he had brought up as his own son, to kill his brother, but Pleisthenes was slain by Atreus in ignorance of his identity. Discovering what he had done, Atreus, under pretence of reconciliation, invited Thyestes to Mycenae, and served to him at a banquet the children of Thyestes by Aërope. This crime called down upon the house of Atreus the curse of the gods. The tragic fortunes of the Atridae, notably Agamemnon (*q.v.*) and Orestes (*q.v.*), were favourite subjects of Greek drama.

Atri. City of Italy, in Teramo prov. The ancient Hatria, it lies 8 m. from the Adriatic and 7 m. W. of its station, Atri-Mutignano, on the Brindisi line. It has a fine 13th cent. Gothic cathedral and palace of the Acquaviva family.

Atrium. Originally the entrance hall of a Roman dwelling-house. In a building of the early and simple type it was the principal room, and contained the hearth whereon the cooking was done. The more elaborate atria of Pompeian houses were courts partly covered by a roof. In the early days of Roman Christianity, many upper class houses were places of reunion for converts, and in the atrium penitents had to await their turn. Hence, when the basilica was adopted as the model of the Christian place of worship, the atrium became essential to the ritual. It was usually surrounded by covered ambulatories or cloisters.

This form of atrium may be studied in the basilica of S. Ambrogio at Milan (9th century), but in most instances the space occupied by the atrium has been given to other buildings. See House.

Atropatēnē. Old name of a district of N. Persia, now approximately the province of Azerbaijan. It owes its name to Atropates, a general of Alexander the Great, who, after the death of his master, established an independent kingdom here. For about five centuries after 100 B.C. Atropatene was under the suzerainty of Armenia. See Persia; History.

Atrophy (Gr. *a*, not; *trophē*, nourishment). In biology, a change in the living process of a plant or an animal, as the result of which the individual diminishes in size or function, either as a whole or in part. General atrophy is usually the result of lack of nutrition, or disease. Local atrophy may affect either a single organ or tissue in

whole or part, or a group of allied tissues. Examples of local atrophy are to be found in certain organs, which disappear or become smaller at definite periods of life. Thus, the thymus gland diminishes during childhood. The uterus diminishes in size after parturition. Certain bones, such as the lower jaw, undergo the same process in old age, constituting senile atrophy. These are normal processes.

Local atrophy may also occur as the result of disease, especially if nourishment cannot reach the part affected. Excessive use over a long period of time may cause atrophy of muscles and glands. Injury to the nervous system affects tissues similarly. Continuous pressure, as in the former Chinese custom of bandaging the feet, produces a like effect. The evidence of atrophy is seen in the gradual wasting away of the tissue or individual concerned, to an extent which may even reach emaciation. The changes which take place in the tissue itself are that the cells constituting the tissue diminish in size and lose some of their characters, and tend to lose their power of reproduction, so that not only are they smaller in size, but ultimately less in number. See Biology; Embryology.

Atropine. Alkaloid prepared from the deadly nightshade or *Atropa bella 'onna*. See Belladonna.

Atropos (Gr. *a*, not; *trepein*, to turn). In Greek mythology, the eldest of the three Fates, the others being Clotho and Lachesis. Clotho spun the thread of life, Lachesis distributed men's lots, and Atropos, the inflexible, cut the thread. See Fates.

At Sight. Commercial term meaning payable on demand. It applies chiefly to bills of exchange and promissory notes. If on these the words "at sight" are written they are not entitled, like ordinary bills of exchange, to the customary days of grace. See Bill of Exchange.

Atsugi. Important Japanese aerodrome 22 miles from Tokyo. This airfield was frequently bombed by the U.S.A.A.F. in 1944 and forward elements of the American 11th Airborne division landed here on Aug. 28, 1945, forming the advanced guard of the main army of occupation. General MacArthur (*q.v.*) landed at the aerodrome on Aug. 30.

Atsuta. Town of Japan, in Honshu. It stands on the S. coast, near Owari Bay, 70 m. E. of Kyoto and almost adjoining Nagoya, on the rly. It is noted for its 7th century Shinto temples.

in one of which the Sacred Sword, one of the three imperial regalia, is stored.

Attaché (Fr., attached). Subordinate official attached to an embassy to gain diplomatic experience, and enjoying some of the privileges appertaining to the official diplomatic service. Intending diplomatists usually gain their early experience as attachés. Military, naval and air officers are detailed for duty as attachés on the staff of ambassadors, to observe and report on matters of professional interest. In time of war the neutral powers usually send officers to be attached to the staff in the field of each belligerent, to observe and make independent reports on the operations to the governments appointing them. See Diplomacy.

Attachment. In English law, the writ by which a person against whom a judgement has been given or order made by the court is arrested, or attached, to compel

Attalus. Finely sculptured head of Attalus I, king of Pergamum. Berlin Museum; from Delbrück, *Antike Porträte*.

his obedience. It can only be issued by leave of the court. When the writ is applied for, the court always gives the person against whom it is applied for an ample chance to obey the order, and so escape arrest; but if he is contumacious the writ will go in the end. See Writ.

Attainder (Old Fr. *atvindre*, Lat. *attingere*, to attack). Obsolete legal term. In feudal times any person found guilty of treason or felony of a capital kind was declared attainted, i.e. his lands were forfeited, and no one could inherit land from or through him. Attainders began in England about the time of Edward II, and were common during the Wars of the Roses, when each party condemned its opponents in this way, thus securing their lands. In 1459

the Yorkist lords were attainted at Coventry, and in 1461 Henry VI.

It was towards the end of this period that bills of attainder were introduced into Parliament, this being a legislative, not a judicial, method of removing obnoxious persons and acquiring their land. Under Henry VIII attainders were frequent. Thomas Cromwell suffered by such an act, and later, Strafford and Laud. The death penalty was inflicted under a writ of attainder for the last time upon Sir John Fenwick in 1697, although it was used for minor punishments until attainder was abolished in 1870. The last bill of attainder passed in England was against Lord Edward Fitzgerald in 1798. See Treason.

Attalus. Name of three kings of Pergamum. Attalus Soter, by his alliance with the Romans against Philip V of Macedonia, established and increased his kingdom. Under his able rule the art flourished and that splendour originated for which Pergamum, as a centre of Hellenistic culture, was famous. He died 197 B.C. His second son, Attalus Philadelphus, reigned 159-138 B.C., following in all things his father's policy. His nephew, Attalus Philometor, reigned tyrannically 138-133 B.C., bequeathing his kingdom to Rome at his death.

Attar of Roses. Alternative name for Otto of Roses (*q.v.*).

Attempt (Lat. *ad*, to; *temptare*, to try). In law, an endeavour to commit a crime. It used to be thought that a prisoner could not be found guilty of an attempt when if he had consummated his act he could not have committed the crime: for example, that it was impossible to be legally guilty of an attempt to pick a pocket when the pocket was empty. This doctrine is now exploded. A prisoner indicted for a crime in England may be found by the jury not guilty of the crime, but guilty of attempting to commit it, although he has not been specifically indicted for the attempt.

Attention (Lat. *attendere*, to direct towards). In psychology, direction of the mind towards an object. An essential factor is the amount of interest taken in the object, which attracts involuntarily (passive attention), or incites the will to energetic activity (active attention). There are some things it is impossible not to notice; others require an effort of will. A third stage has been called secondary passive. The mind, from being actively engaged in work, becomes so taken up with it that the work

becomes automatic; active becomes passive attention.

Atterbom, PER DANIEL AMADEUS (1790–1855). Swedish poet. Born at Osbo, in East Gothland, Jan. 19, 1790, he was educated at the university of Uppsala, in which he became professor of philosophy (1828) and of aesthetics (1835). Leader of the Swedish romantic school, Atterbom helped to start the Aurora League in 1807 for the propagation of its views, and he edited two critical organs in which poems and essays by its representatives appeared: *Phosphoros* (1810–13), and the *Poetic Calendar* (1812–22). He was admitted to the academy in 1839, and died July 21, 1855. His best known works are *The Flowers*, a cycle of lyrics, and *The Isle of Happiness*, 1823, a romantic drama.

Atterbury, FRANCIS (1662–1732). English divine and politician. Born at Milton, Buckinghamshire, March 6, 1662, and educated at Westminster and Christ Church, Oxford, he was ordained in 1687 and became one of the royal chaplains. His championship of the Church of England, and his successful efforts for the revival of convocation, brought him in 1701 the archdeaconry of Totnes, and in 1704 the deanery of Carlisle. A pronounced Tory and high churchman, he was the principal composer of Sacheverell's defence before the House of Lords in 1710, and in 1712 was appointed dean of Christ Church, Oxford, and in 1713 bishop of Rochester and dean of Westminster.

Soon after the accession of George I Atterbury began to communicate with the exiled Stuarts in France, and in 1722 was imprisoned in the Tower for plotting their restoration. He defended himself before the House of Lords, but was condemned, on certain compromising letters, and banished for life. He died in France, Feb. 22, 1732, and was buried privately in Westminster Abbey. He inspired Charles Boyle's attack (1698) on Richard Bentley regarding Bentley's exposure of the spuriousness of the so-called Letters of Phalaris, and was the author of numerous controversial works and sermons. As a preacher and a political orator, he was held amongst the greatest of his time. *Consult* Life, H. C. Beeching, 1909.

Attestation (Lat *ad*, to; *testis*, a witness). The signing by a person of a statement to the effect that he was present as a witness when another person signed a document. Witnessing was not

necessary to any deed or document at common law. By the Wills Act, 1837, all wills, except wills by persons on actual military service or marines at sea, are required to be attested by two witnesses, who are to be present at the same time and subscribe their names in the testator's presence. A declaration to this effect in writing is usually added at the foot of the will, and is desirable to save trouble, though not strictly necessary. Deeds are usually attested by one witness for each person who executes the deed, though this is not necessary except in a few cases, e.g. bills of sale.

Attic. Term usually applied to a room on the top storey of a building. Properly speaking, it is a room with vertical walls, as opposed to a garret, the walls of which slope inwards from the cornice of the structure. An attic storey is often employed as an architectural device to diminish the apparent height of a building's front. The use of the term is confined to neo-classic buildings, the construction being supposed to belong to the Attic style of architecture. In Roman architecture the term is applied to a purely ornamental construction above the entablature.

Attica. A district of ancient Greece, bounded by Boeotia on the N., Megara on the N.W., and the Aegean Sea on the E. and S.W. The surface is partly plain and partly mountainous, among the well-known mts. being Hymettus, Pentelicon, and Cithaeron. Owing to the unproductiveness of the soil, a large proportion of the population took to the sea for a living. The intellectual keenness of the people of Attica was attributed by ancient writers to the dry and braising climate. Attica and Boeotia together form a nome or dept. of Greece with a pop. of 1,144,330. *See* Greece: History.

Atticism. Use of correct and elegant diction. The language of the people of Athens and Attica was considered to represent the highest standard of literary Greek. A refined, incisive form of wit was characterised as Attic salt.

Atticus, TITUS POMONIUS (109–32 B.C.). Roman literary man and publisher. Educated with Cicero and the younger Marius, on the outbreak of the war between Marius and Sulla he withdrew to Athens in 85, and did not return to Rome until 65. For the rest of his life he steadily kept aloof from politics, taking no part in the war between Julius Caesar and Pompey, and liv-

ing on friendly terms with the leaders of all parties. His most intimate friend was Cicero, whose letters to Atticus are a model of familiar correspondence. An Epicurean in philosophy, familiar with Greek and Roman literature, and a man of great wealth, he possessed a large library and carried on an extensive publishing and bookselling trade. He was the author of a chronicle of Roman history, and of an account of Cicero's consulship written in Greek. He starved himself to death at Rome on discovering that he was suffering from an incurable disease. His biography was written by Cornelius Nepos.

Attila (c. 400–453). King of the Huns. He succeeded to the chieftainship in 434, when his people were masters of E. Europe N. of the Danube and the terror of the west up to the Rhine, and of W. Asia. Attila broke over the Danube (447) into the Balkan peninsula, compelling the emperor at Byzantium to cede him territory and pay a huge tribute. In 451 he stormed westwards; the German tribes through whose territories he passed were forced to swell the ranks of his army. But the Roman general Aëtius and Theodoric of Toulouse, the king of the West Goths (not to be confused with the more famous Theodoric the Ostrogoth), united to resist the invading hordes. Attila then laid siege to Orleans, where he was held in check until Aëtius and Theodoric appeared with relieving armies. Then he fell back to the valley of the Marne, where he relied on making full use of his mounted hosts. In the Catalaunian plains near Châlons, in June, 451, a terrific battle took place, with the result that the eastern hordes were decisively defeated.

But Aëtius did not strike home; Attila was allowed to retreat to Pannonia. Next year (452), with reorganized hosts, he burst into Italy, ravaged the north, and even reached the defenceless gates of Rome, when he turned back. Overawed, according to tradition, by the majesty of Pope Leo I, who came forth in state to bid him hold his hand, he retired to the headquarters of his dominion in the modern Hungary. Attila demanded and was promised the hand of Honoria, the Roman emperor's sister, but in 453, before the nuptials could be celebrated, he died suddenly—slain, it was said, by the hand of another jealous wife. *See* Huns; Rome: History. *Consult* Attila: The Scourge of God, M. Brion, 1929.

Attleboro. Town of Bristol co., Massachusetts, U.S.A. It is 32 m. S.W. of Boston on the New York, New Haven, and Hartford rly. It contains a state armoury and the Attleboro Home Sanitarium, manufactures jewelry, cotton goods, machinery, and leather, and has bleaching and dyeing works. It was incorporated in 1694. Pop. 22,071.

Attleborough. A market town and parish of Norfolk, England. It is 16 m. S.W. of Norwich by the railway. The ancient capital of Norfolk, it had a Holy Cross college, founded 1387. Market day, Thurs. Pop. 2,608.

Attlee, CLEMENT RICHARD (b. 1883). British statesman. He was born at Putney on Jan. 3, 1883, one of a large family, of well-to-do middle-class parents, and was educated at Haileybury College. Thence he went to University College, Oxford, where he gained second class honours in modern history. At the university his politics were Conservative, and his first speech in debate there supported a policy of protection.

Soon after leaving Oxford, however, he was considerably influenced by reading the works of William Morris and Ruskin. Under this influence he went to work in a social settlement at Limehouse; here he acquired firsthand knowledge of the misery and drabness of the lives of London's poor. The political consequence was that he attached himself to the Labour movement. In 1907 he joined the Fabian society and the Independent Labour Party, and began active political work.

Called to the Bar at the Inner Temple in 1905, he practised for some years. Later, he undertook secretarial and lecturing work in the campaign for the reform of the Poor Law. In 1912 he became lecturer in sociology at the London School of Economics. This post he held until the outbreak of the First Great War in 1914. Volunteering for service, he was given a commission in the South Lancashire Regt., and saw service in Gallipoli and Mesopotamia, where he was severely wounded. After convalescence in England, he served in France for the last few months of the war.

Released from the army in 1919, he resumed his political activities, and stood as Labour candidate for the L.C.C. at Limehouse, but was defeated by a narrow margin. In the autumn of 1919, Labour gained control of the Stepney borough council, and

Attlee accepted the mayoralty of the borough.

Attlee entered parliament in 1922 as member for Limehouse. In the general election Labour

Clement Richard Attlee, who became British prime minister, 1945

became the official parliamentary opposition for the first time, and Attlee became parliamentary private secretary to the Labour leader, Ramsay MacDonald. Within a year another general election took place, with the result that the first Labour government was formed in Jan., 1924. In this administration Attlee was under-secretary of state for War. In the autumn of 1924 the Labour government fell. Re-elected for Limehouse in the subsequent election, Attlee was again on the opposition benches. In 1927 he was appointed a member of the Indian Statutory Commission, on which he afterwards spent the greater part of two years in India and Burma.

Second Labour Government

In the general election of May, 1929, Labour won office for the second time, and Attlee was appointed to the sinecure post of chancellor of the duchy of Lancaster, in order that he might devote his attention to such matters as imperial preference, agriculture, and the Economic Advisory Council. In the spring of 1931 he was appointed postmaster-general and given his first opportunity as head of a department, but this lasted for five months only, for in Sept. the government came to an end and MacDonald headed a National government. With the great majority of the Labour party Attlee refused to have anything to do with the new coalition.

The election that followed in Oct. resulted in a heavy defeat for Labour, fewer than sixty Labour

members being returned to parliament. Of these Attlee was one, though with a greatly reduced majority. As the only Labour ex-cabinet minister in the attenuated party, George Lansbury was elected leader, and Attlee his deputy. Thus unexpected electoral fortune raised him from the position of junior minister to deputy leader of His Majesty's Opposition. In this position his industry and versatility served him well, and he won the respect of his party. For nine months in 1933, while Lansbury was incapacitated by illness, Attlee as acting leader discharged his responsibilities with credit. When Lansbury resigned the Labour leadership in Oct., 1935, on the issue of pacifism, with a general election imminent, Attlee was elected acting leader for the period of the election. This leadership was subsequently confirmed by a substantial majority.

In Dec., 1937, during the Spanish Civil War, he visited Spain to encourage the Republican forces; and to mark their appreciation the Republican leaders named a battalion of the international brigade the Attlee battalion.

Deputy Prime Minister

In May, 1940, when the Labour party accepted Winston Churchill's invitation to join his new government, Attlee became lord privy seal and a member of the war cabinet. He held this office until Feb., 1942, when, on a reconstruction of the government, he became secretary of state for Dominion Affairs and deputy prime minister. In Sept., 1943, he became lord president of the council, continuing as deputy prime minister. These offices he held until the Churchill National government ended in May, 1945.

The general election held in July, 1945, resulted in an overwhelming victory for the Labour party, which obtained for the first time a large majority over all other parties in parliament. Attlee thus became, on July 26, prime minister and minister of defence in the first Labour government supported by a large parliamentary majority. His immediate task was to take Churchill's place at the Potsdam conference with President Truman and Marshal Stalin. On Aug. 14, 1945, he announced the end of the war with Japan. In Nov., 1945, he flew across the Atlantic to confer with the U.S. president and the Canadian prime minister on problems arising from the

Atomic Bomb (*q.v.*). During his visit he addressed the U.S. congress and the Canadian parliament. See N.V.

Ernest Thurtle

Attock. District of W. Punjab, Pakistan, in the Rawalpindi division. Bounded on the W. by the river Indus, it contains 519,000 people within an area of 4,025 sq. m., of which only two-fifths are cultivated. Attock Fort was built by Akbar to protect the passage of the Indus, and it still has great strategic value. The Attock Bridge at this point is also of commercial and military importance. Oilfields are worked near by. Most of the people are Mahomedans.

Attorney (late Lat. *attornatus*, turned to). In English law and kindred systems, one who acts as agent for another, especially in matters of legal moment. As a rule, an agent is not now called an attorney, unless he is appointed under a deed, called a power of attorney, to act in the absence of his principal abroad or in similar circumstances. An attorney-at-law is a public officer who conducts legal proceedings on behalf of others. Before 1873 an attorney was a person entitled to conduct proceedings on behalf of his clients in the common law courts, while one who conducted suits in chancery was called a solicitor. Many practitioners were both. The Judicature Act, 1873, abolished attorneys-at-law in England, and made them all solicitors of the supreme court, entitled to practise in any branch of the high court and the court of appeal. In the U.S.A. and in some of the overseas dominions of the British Empire, legal practitioners are still "attorneys and counsellors at law."

Attorney-General. Chief law officer of the British Government, and head of the English bar. Chosen from among the prominent lawyers who belong to the party in power and sit in the house of commons, he is a member of the government of the day, but only in exceptional cases is he a member of the cabinet. He conducts cases on behalf of the crown, advises the various departments of state on legal matters, and, if necessary, defends such advice and action in parliament. His salary is £10,000, professional fees being set off.

There is also an attorney-general in Northern Ireland. The various British Dominions and the duchies of Lancaster and Cornwall have each an attorney-general, those in the crown colonies being civil servants, and

those in self-governing dominions politicians, the duties of all being to advise on legal matters. In the U.S.A. the attorney-general has a seat in the cabinet, and nearly every state has a similar official. In Scotland the lord advocate is the equivalent of the attorney-general, first appointed in England in the reign of Edward I, when there was a king's attorney to look after his interests in the law courts.

Attornment. An acknowledgement by one person that he is the tenant of another. When a man mortgages a house in which he dwells, he generally makes an attornment, by which he acknowledges that he is the tenant of the mortgagee. When the property changes hands, and the tenant acknowledges (generally by paying rent) the title of the new landlord, he is said to "attorn tenant" to him; and after that he cannot deny the new landlord's title, and the new landlord can distrain. See Mortgage.

Attraction (Lat. *ad*, to; *trahere*, to draw). Force that draws one material body or particle to another. The most important forces of attraction are gravitation, electrical attraction, and magnetic attraction. Gravitation is the force that keeps the sun, moon, earth, and other planets in their relative positions and causes a body in the air to fall to the surface of the earth. It was suggested by four people in the second half of the 17th century that this force varies inversely as the square of the distance separating the two bodies concerned. Between 1684 and 1687 this was proved by Newton and the proof was published; it was experimentally confirmed by Cavendish in 1798 and by subsequent men of science.

The unit of electrical attraction is the electron, a tiny body that sometimes behaves as a minute particle having a definite position and a definite mass or weight, and at other times seems to be a vibration capable of travelling through space with the velocity of light. The attraction of one chemical atom to an atom of a different chemical element is a special variety of electrical attraction, and regulates the formation of chemical compounds. Chemical attraction varies between the very strong and the very weak; the attraction between an atom of one element and another atom of the same element is frequently a comparatively weak attraction. The attraction between an atom of one element and an atom or atoms

of another element may be a strong attraction or a weak one. Some of these weak attractions are called van der Waals forces and are believed to account for the cohesion of groups of atoms to each other in solid bodies. A crystal of common salt consists of an equal number of sodium atoms and chlorine atoms uniformly spaced so that each sodium atom is surrounded by and attracted by six chlorine atoms and conversely each chlorine atom is surrounded and attracted by six sodium atoms. It appears from such structures that the attraction of one atom to another atom is frequently only a fractional part of the unit of attraction, the electron. Capillary attraction, by which water rises inside a glass tube against the pull of gravity, is probably a variety of van der Waals forces or cohesion. The attraction of the magnet to iron filings is electrical. See Atom; Gravitation; Matter; Motion.

Attribute (Lat. *attributum*, something ascribed). In metaphysics, a real, essential quality of any being or substance, the presence of which makes it what it is. Thus, sense and intelligence are attributes of man; length, breadth, and thickness, of body. In logic, an attribute is that which is affirmed or denied of the subject of a proposition.

Attu. Most westerly of the Aleutian Islands, in the N. Pacific, lat. 52° N., long. 173° E. of Greenwich. Belonging to the U.S.A., it was invaded by Japanese forces, June 13, 1942: it was heavily bombed, most of the buildings being destroyed, and evacuated by the enemy on Oct. 7. They occupied it again, Nov. 29, and received further bombing attacks. On May 11, 1943, U.S. troops landed and by the end of the month had annihilated the Japanese garrison.

Attwell, MABEL LUCIE (b. 1879). English artist. She was born in London, June 4, 1879, and was educated at Coopers' Company School. She studied art at the Regent Street Art School and Heatherley's. Her drawings of chubby-cheeked and rosy-faced children became immensely popular, and appeared in

Typical drawing by Mabel Lucie Attwell

many periodicals, creating a new style in child studies. Children's books which she illustrated included editions of *The Water Babies*, *Alice in Wonderland*, *Andersen's Fairy Tales*. The *Mabe Lucie Attwell Children's Annual* was for many years very popular.

Attwood, THOMAS (1765–1838). English composer. Born in London, Nov. 23, 1765, he became a chorister at the Chapel Royal. He attracted the attention of the prince of Wales, who sent him to study in Italy, whence he moved to Vienna to become a pupil of Mozart until 1787. He was organist at St. Paul's, London, in 1796; musical instructor to the royal family, and a founder member of the Philharmonic Society and of the Royal Academy of Music. Organist to the Chapel Royal in 1836, he died at Chelsea, March 24, 1838. Attwood's fame rests on such sacred compositions as the coronation anthems, *I was glad*, 1820, and *O Lord, Grant the King a Long Life*, 1830. He was one of the first English musicians to recognize the genius of Mendelssohn.

Attwood, THOMAS (1783–1856). English reformer. Born at Halesowen, Worcs., Oct. 6, 1783, he was educated there and at Wolverhampton. Settling in Birmingham, he was chosen to represent that city in London in the demand for more industrial freedom. In 1815 he made public the theory of inconvertible paper currency to which he devoted his life. The Birmingham Political Union, founded by Attwood in 1830, fought keenly for the first Reform Bill, on the passing of which, in 1832, Attwood was almost a popular hero. He died at Malvern, March 6, 1856.

Attwood's Machine. Device for verifying by experiment the velocities and accelerations of falling bodies, invented by George Atwood (1746–1807). It consists of a light pulley of aluminium, balanced very truly on its axis, and supported on a set of anti-friction wheels to reduce friction. A cord passes over it and carries two equal weights, one of which passes in front of a graduated vertical scale. At the top of the scale is a hinged platform, which holds up one of the weights and is released electrically by a second-beating clock. Attached to the vertical scale are two movable platforms, the lower of which will bring the descending weight to rest; the upper is ring-shaped and can detach small weights—consisting of brass slips—placed on the top of the main

Atwood's Machine. (a) Pendulum beating seconds. (b) Anti-friction gear. (c) Upper platform. (d) Stop platform

platform is now automatically detached, and the weight moves on with constant speed until it reaches the lower platform. This constant speed can be calculated by means of a stop-watch, and thus the acceleration due to the brass slip may be measured. From this it is easy to deduce the acceleration of a body falling freely (g), but there are many causes of error in Atwood's machine, and more reliable determinations of g are obtained from pendulum experiments. See *Gravitation*.

Atys or **ATTIS**. In Greek mythology, a shepherd beloved by Cybele, the Great Mother of the Gods. Driven mad by her in revenge for his amour with a nymph, he mutilated himself and died. Atys was originally a Syrian divinity, and the myth, like that of Adonis, symbolises the death of vegetation in winter and its revival in spring. His cult early made its way into Greece and was introduced into Rome with that of Cybele. Consult *Adonis Attis*, Osiris, J. G. Frazer, 1906.

Aubade (Fr. *aube*, dawn). In music, a song of awakening or morning serenade; an instrumental piece of similar style.

Aubagne. Town of France, in the dept. of Bouches-du-Rhône. It stands on the Huveaune, 10 m. by rly. E. of Marseilles. It has leather, pottery, earthenware, and cloth manufactures, and around it are vineyards and orchards.

Aubaine, DROIT D'. An obsolete French law. An *aubain* was a stranger, an unnaturalised resident in the land, and the *droit* was the right of the king to any property he might leave. It was the law from the early days of the monarchy, was repealed in 1790, revived by Napoleon, and abolished in 1819.

weights, but too long to pass through the ring platform.

The brass slip, when placed on one of the main weights, makes that side heavier and causes it to descend with a uniform acceleration; thus, when this weight reaches the upper platform, it has attained a certain velocity.

The brass slip is now automatically detached, and the weight moves on with constant speed until it reaches the lower platform. This constant speed can be calculated by means of a stop-watch, and thus the acceleration due to the brass slip may be measured. From this it is easy to deduce the acceleration of a body falling freely (g), but there are many causes of error in Atwood's machine, and more reliable determinations of g are obtained from pendulum experiments. See *Gravitation*.

Aube. River of France. Rising on the plateau of Langres, it flows W. to the Seine near Romilly. Its length is about 150 m.

Aube. Department of France. In the N.E. of the country, it is an agricultural district watered by the Seine and the Aube. Much of it is sterile soil, but the vine, vegetables, wheat, and other cereals are grown. Fruit is cultivated and cattle and horses are reared. Troyes is the capital. Area about 2,326 sq. m. Pop. 239,563.

Aub pine OR **ANISIC ALDE YBIE** (Latin *alba spina*, white thorn). Artificial perfume with the odour of hawthorn. See *Perfumery*.

Auber, DANIEL FRANÇOIS ESPRIT (1782–1871). French composer. Born Jan. 29, 1782, at Caen,

D. F. E. Auber, French composer

he succeeded Cherubini as director of the Paris Conservatoire in 1842, and was appointed imperial *maître-de-chapelle* in 1857. Of his operas, nearly 50 in all, the best known are *La Muette de Portici*, generally familiar as *Masaniello*, 1828; *Fra Diavolo*, 1830; *Le Domino Noir*, 1837; *Zanetta*, 1840; *Les Diamants de la Couronne*, 1841; *La Sirene*, 1844. He died in Paris, May 13, 1871.

Aubergine. Plant of the family Solanaceae. It is a half-hardy annual growing to a height of 2 ft.–3 ft., with blue flowers and white or purple fruit shaped like an egg, whence its familiar name egg-plant. It prefers light rich soil and sunny positions, but may be grown as a greenhouse plant. The so-called eggs are edible, and while in India they are curried, in England they are prepared by cutting off the ends, removing the centre or seeds of the fruit, and replacing it with chopped seasoned meat. The fruits are then either fried or cooked in a casserole.

Aubergine, showing fruit

Aubervilliers. Town of France, in the dept. of Seine. It lies near the river Seine and on the canal St. Denis, and is a N.E. suburb of Paris. It manufactures chemicals, fertilisers, glass, rubber, and perfumes. In the Middle Ages it was the resort of pilgrims. Pop. 55,871

Aubigné, JEAN HENRI MERLE D' (1794-1872). Swiss ecclesiastical historian. Of Huguenot stock, he was born at Eaux-Vives, near Geneva, Aug. 16, 1794, and studied at Geneva and Berlin. In 1818 he was appointed pastor of the French Protestant Church at Hamburg, and in 1823 became court preacher at Brussels. He returned to Geneva in 1831 to assist in the foundation of the new Evangelical Church and to occupy the chair of church history in its theological college. The rest of his life was spent at Geneva, where he died Oct. 21, 1872. His most popular work was the *History of the Reformation in the 16th Century*, 1835-53.

Aubigné, THEODORE AGRIPPA D' (1552-1630). French historian, soldier, and poet. Of noble Huguenot

T. A. d'Aubigné
French author

family, he was born Feb. 8, 1552, near Pons, in Saintonge. At Geneva he studied under Beza. In 1567, eager to serve the Protestant cause, he enlisted under Condé, and rendered distinguished services to Henry IV. The last years of his life he spent in exile at Geneva, pursuing his studies and superintending the fortifications of Berne and of Basel. He died April 29, 1630. He wrote a realistic novel, *The Adventures of Baron de Foranesté*, 1617, and some satirical poems depicting the horrors of war—*Les Tragiques*, 1616. But he is best known by his *Universal History* from 1550-1601 (1616-1620), the third volume of which was so outspoken that it was burnt by the common hangman in Paris.

Aubin. Town of France, in the dept. of Aveyron. It stands on the Enne, 25 m. N.W. of Rodez. Its chief industries are connected with the mining of coal and iron.

Aubrey, JOHN (1626-97). English antiquary. Born at Easton Pierse, Wiltshire, March 12, 1626, he was educated at Blandford Grammar School and Trinity College, Oxford. He described the stone circle at Avebury, 1649, but his voluminous notes upon the antiquities of Surrey and Wiltshire were not utilised until 1718 and 1847. He published his *Miscellanies* in 1696, and furnished *Minutes of Lives for the Athenae Oxonienses* of Anthony à Wood. Dying at Oxford, he was buried in the church of S. Mary Magdalene.

Aubrietia. Genus of annual and perennial herbs of the family Cruciferae. Native to S. Europe, it is much grown in English rock-gardens, flowering May-June.

Aubry de Montdidier. French courtier in the episode of the "dog of Montargis." According to the story, Aubry was murdered by Macaire in the forest of Bondy, near Paris. Suspicion being aroused by the ferocity of Aubry's dog towards Macaire, a judicial combat between the dog and Macaire was held. The dog was victorious, and Macaire confessed and was condemned to death. The scene is usually laid in 14th century Paris, Macaire being represented with a large club, and sometimes buried to the waist. In some accounts the dog has a cask for shelter.

The dog came to be known as the "dog of Montargis" from the 15th century picture of the duel in the château at Montargis. The story occurs as early as the 12th century, Macaire being the title of a *chanson de geste*, or epic chronicle, in which in the time of Charlemagne a dog detects his master's murderer. A similar story is found in Plutarch.

Auburn or LISSEX. Village in co. Westmeath, Eire, 7 m. N.E. of Athlone. The name is derived from the popular association of Lissoy with the "sweet Auburn" of Goldsmith's poem, *The Deserted Village*.

Auburn. City of Maine, U.S.A., the co. seat of Androscoggin co. It stands on the Androscoggin river, which supplies it with water-power, 34 m. N. of Portland, on the Grand Trunk and Maine Central rlys. It has manufactures of boots and shoes, cotton goods, and furniture. Settled in 1786, it became a town in 1842. Pop. 19,817.

Auburn. City of New York, U.S.A., the co. seat of Cayuga co. It is 24 m. W.S.W. of Syracuse, on the New York Central and other rlys., and has important manufactures of woollens, cottons, twine, and farming implements. It has a state prison, which adopts the Auburn or silent system of treatment, an asylum, a theological seminary founded 1818, and a state armoury. Water-power is supplied by Lake Owasco, situated a little to the S., on an outlet of which the city stands. Pop. 35,763.

Aubusson. Town of France, in the dept. of Creuse. It stands on the river Creuse, 24 m. by rly. S.E. of Guéret, and is noted for its manufacture of carpets, an industry at least 400 years old, but now suspended. Earlier still it was the chief town of a viscounty.

Aubusson, PIERRE D' (1423-1503). The grand master of the Knights Hospitallers of S. John of

Pierre d'Aubusson,
defender of Rhodes

Jerusalem and defender of Rhodes. Born of a noble French family, after distinguished military service he became grand master of the Knights of Rhodes, 1476.

In May, 1480, after two months' siege, he inflicted a crushing defeat on the Turks and drove them from Rhodes. His policy was to create an alliance of the Christian nations against the Turks, and in 1501 he was appointed commander-in-chief of a great army which was to be raised by the pope and the sovereigns of Spain, Castile, Portugal, Hungary, and France, but in fact was not. He was known as the shield of the church.

Aucassin and Nicolette. 12th or 13th century French romance, named after its hero and heroine. Written in alternate prose and verse, it is one of the most celebrated of the old French *fabliaux*. It tells of the love of Aucassin, son of a count of Provence, for the supposedly humble Nicolette. The story, which is the theme of an opera by Grétry (1779), has been translated into English by Andrew Lang, 1887; L. Housman, 1902; F. W. Bourdillon, rev. ed. 1919.

Auch. City of France, capital of the dept. of Gers. It is picturesquely placed on a hill and along both banks of the river Gers, 55 m. by rly. W. of Toulouse. The seat of an archbishop, its chief buildings are the magnificent Gothic cathedral and the episcopal palace. It manufactures cotton and woollen goods, and trades in wine and fruit. Auch, a very old city, takes its name from a Celtic tribe, the Ausci. It was an important place under the Romans, and in the Middle Ages was the capital of Armagnac and later of Gascony.

Auchinleck. Town of Ayrshire, Scotland. It stands $4\frac{1}{2}$ m. S.E. of Mauchline on the railway, in a rich coal district. Auchinleck House was the ancestral home of the Boswells, lairds of Auchinleck, one of whom (buried here) was James Boswell, the biographer of Johnson. Sir Alexander Boswell established in 1815 the Auchinleck Press for printing rare works in early Scottish and English literature. The Auchinleck MS., consisting of old English poetry, was

presented by Alexander Boswell to the Faculty of Advocates, and is in their library at Edinburgh. Pop. of parish, including Lugal district, 6,626. *Pron. Affleck.*

Auchinleck, SIR CLAUDE JOHN EYRE (b. 1884). British soldier.

Son of Col. John Claude Auchinleck he was born at Aldershot and educated at Wellington. From Sandhurst he was commissioned in the 62nd Punjabis and served with distinction in Egypt, Aden, and Mesopotamia, 1914-19. He was awarded the D.S.O., Croix de Guerre, and O.B.E.; and promoted to brevet colonel. He received the C.B. in 1933 and C.S.I. in 1935 for campaigns against the Upper Mohmands. Instructor at the staff college, Quetta, 1930-33, and commander of the Peshawar brigade, 1933-36, he became deputy chief of staff, Indian army headquarters, 1936-38, and commander of Meerut district, 1938.

Gen. Auchinleck returned to England early in 1940 and was appointed a corps commander. When Germany invaded Norway he was placed in command of the Allied forces at Narvik, organizing the subsequent withdrawal in June. Returning to India in Dec. as C.-in-C., in March, 1941, he drew up plans for a man-power survey of India to include all areas and classes, and raised four new Indian regiments. On July 2 he succeeded Sir Archibald Wavell as C.-in-C. of the new Middle East Command. Like his predecessor, Auchinleck failed to defeat Rommel, but he did much to build up the desert army that finally drove the Axis out of Africa. Despite difficulties of supply and communications, he reorganized the whole fabric of the army and improved cooperation between the various arms—tanks, artillery, and infantry. He initiated the system of using transporters to carry tanks to the front line, and overhauled the organization for recovering and repairing armour disabled on the battlefield. He also founded the Desert Commandos, or Jock Columns (*q.v.*), which ranged the desert and did much damage in the enemy's rear.

Upon the British withdrawal from Sollum and Sidi Omar, Auchinleck assumed personal command of the 8th army and moved

his headquarters from Cairo to the desert. But he had neither sufficient troops nor enough heavy armour and artillery to stop Rommel and was therefore forced to retreat to Egypt.

At the time Auchinleck was severely criticised for his retreats: but later authorities on strategy inclined to the view that his conduct had no alternative, in face of an enemy superior in manpower and equipment and operating over shorter lines of communication. Had the Germans made a successful landing in Syria and spread east, the whole defence of the desert would have collapsed, and the Middle East might have been lost. By keeping the 8th army intact Auchinleck saved a nucleus for the fighting force that later was built up for the counter-attack at Alamein and the clearance of Egypt. As one authority declared, Auchinleck lost Tobruk, but later events proved he had saved Egypt.

During 1943-47 he was again c.-in-c. India and, under the defence council, supreme cmdr. in India and Pakistan. Knighted 1945, he became F.-M. next year.

Auchmuty, SIR SAMUEL (1756-1822). British soldier. Born in New York, of Scottish descent, he joined the British army in the War of Independence. On the conclusion of peace he came to England, and in 1783 exchanged into a regiment about to proceed to India, where he distinguished himself at the siege of Seringapatam, 1792. He played a conspicuous part in Egypt in 1800-3, in Baird's famous march across the desert and the passage down the R. Nile, and in the disastrous Buenos Aires expedition of 1806. He served also in India and Java and was knighted on his retirement in 1815. He died suddenly in Phoenix Park, Dublin, Aug. 11, 1822.

F.M. Auchinleck,
British soldier

Auckland. Province of New Zealand. It occupies the N. part and nearly half of North Island is about 370 m. long and 185 m. broad, and covers an area of 25,400 sq. m. Its surface is hilly and well wooded, and its coastline measures 1,200 m. It is watered mainly by the Waikato and Waioira rivers which, with the rly. system, the highways, and the air lines, afford means of inland communication. The thermal district about Rotorua and Taupo contains hot springs and geysers and a number of mud volcanoes. It is a popular tourist resort as well as the site of a Government sanatorium. Noted for dairy products, timber, and kauri gum, the province produces also maize, potatoes, New Zealand flax, grapes, oranges, and other fruit. It engages largely in sheep and stock raising and dairy farming, and has important gold mines in or near the Thames valley. Auckland is the capital. The pop. of the prov. was estimated in 1948 at 698,056, of whom 80,326 were Maoris.

Auckland. Largest city of New Zealand. On North Island, the capital of the province of Auckland and formerly of the dominion, it is on the S. side of Waitemata harbour and only about 6 m. from Manukau harbour on the opposite coast of the island. The former harbour, accessible at low tide to the largest vessels, has two graving-docks, the Calliope and the Auckland, two patent slips, and ample wharf accommodation. The Calliope dock is the largest in Australasia. Auckland stands on an isthmus of volcanic formation. A great yachting centre, it is connected by rly.,

Arms of
Auckland, N.Z.

Auckland. View of this important New Zealand city looking towards the entrance to the harbour

Courtesy of the High Commissioner of New Zealand

highway, and air line with Wellington, and is the dominion's terminal for overseas air services. The seat of a bishop, it has Anglican and R.C. cathedrals; also an art gallery, a fine museum, and a free library; also among educational institutions a university college with 17 professors, and schools for the blind and the deaf. Albert Park is the chief open space in 15 sq. m. of parks. Queen Street contains great public buildings.

The industries include shipbuilding, sugar refining, and the manufacture of paper, glass, bricks, and rope. There is a large trade in timber; and butter, cheese, meat, kauri gum, wood, coal, and gold are exported. Founded in 1840 by Governor Hobson, the city was named after the earl of Auckland (1784-1849), then governor-general of India. Wellington superseded it as the seat of government in 1865. The pop. of the urban area in 1945 was 263,575.

Auckland Islands. Volcanic group of uninhabited islands in the S. Pacific. Situated 200 m. S. of New Zealand, to which they politically belong, they have an area of 234 sq. m., the largest, Auckland Island, being 27 m. long and 15 m. broad. They have a number of good natural harbours, Port Ross on the N. coast of Auckland Island being one of the best. On this island the New Zealand Government maintains a provision and clothing depot for the use of shipwrecked mariners. The islands were discovered in 1806 by Captain Bristow, and proclaimed within the jurisdiction of New Zealand in 1863.

Auction Bridge. Card game for four players, the child of bridge and the parent of contract bridge, which largely superseded it. Originating in India about 1903, it was made the subject of laws by the Portland and Bath Clubs in 1909, and during the 1920s was among the most popular card games in Great Britain. See Bridge.

Auctioneer. One licensed to sell property by public auction. In England an auctioneer pays £10 a year for his licence, which is renewable every July 5; no licence is required for selling under an order of the court, or for fish when landed. An auctioneer is responsible to his client, and is liable for negligence in the custody of goods or misrepresentations in particulars of sale. When selling he must show a notice with his name and address.

Auctioneering (Latin *auctio*, increase). System of selling property of all kinds by offering it to

the competition of prospective purchasers, who are encouraged to bid against one another until no higher offer is made or the reserved price is reached.

In the case of real estate, land, houses, leases, shares, mining or fishing rights, etc., particulars are printed and distributed beforehand, together with the "conditions of sale." The signing of the memorandum of sale accompanying this paper by purchaser and auctioneer constitutes a legal binding sale. A bid may be withdrawn any time before the fall of the hammer. Usually the auctioneer receives the full purchase money only for chattels; in other cases he takes a deposit as settled by the "conditions," generally 10 p.c. on the price. For an account of this he is responsible to the vendor. If the purchase be not completed by the bidder the latter forfeits his right to the money. The auctioneer cannot buy for himself "under his own hammer," nor may he bid, unless such right is expressly reserved in the conditions of sale, when he can bid either for the owner or for an absent or present buyer. The vendor may bid if this right is reserved.

In the case of goods, chattels, and portable property, the auctioneer receives the full purchase money, the buyer paying a deposit during the sale and completing his purchase before receiving the goods. Articles such as jewelry rare books, etc., are often sold for "cash," when the buyer pays down the full price and is at once handed the article. In all cases a vendor may fix a reserved, or an "upset" price, below which he refuses to sell; but this fact must be expressly stated in the particulars of sale.

During the Second Great War a maximum price was fixed for most goods even at auctions. No higher bid could be accepted. If several persons bid this price it was necessary to decide the purchaser by drawing from a hat.

A mock auction is a sale by persons who illegally act together to make the public believe it a genuine auction, and by "puffing," etc., obtain higher prices than the articles are worth. A "knock-out," which is now illegal, is an arrangement by a number of buyers who depute one to bid, and afterwards privately dispose of the property among themselves. Auctions have been held by the running of a sandglass, or "by candle," when the last bidder before the

small piece of lighted candle goes out becomes the purchaser. Scottish auctions are called "roups," and the vendor is the "exposer," and upset prices are usual. Auctions were known in Babylon and practised by the Romans.

Auctioneers' Institute. Senior and largest professional society representing auctioneers and estate agents in Great Britain. Founded in 1886, it has 6,500 members, with headquarters at 29, Lincoln's Inn Fields, London, W.C. 2. Members undertake valuations for any purposes; sales by auction or private treaty and the letting and management of all kinds of property; and agricultural valuations, sales, lettings, and management. Fellows and Associates are entitled to use the letters F.A.I. and A.A.I. respectively. The Institute publishes a monthly journal; has a library, appointments bureau, and benevolent fund; and arranges regular meetings for the discussion of subjects affecting the profession. It has established auction marts in London, Liverpool, Manchester, Newcastle-upon-Tyne, and Belfast, at which only members of the Institute may sell. There are 25 branches in the U.K. The Institute founded the College of Estate Management in 1919.

Aucuba Japonica. Evergreen shrub of the family Cornaceae, a native of Japan.

Aucuba Japonica
garden shrub

The large elliptical leaves are of a leathery texture, pale green in colour, variously spotted and blotched with yellow. The inconspicuous flowers have petals and sepals in fours, some bearing pistils only, others stamens only. These two

forms of flowers are borne on separate plants; only those with pistillate flowers bear the red berries.

Audacious. British battleship, the 27th Dreadnought added to the British fleet. Launched in 1912, she displaced 23,000 tons, and had a speed of 21.5 knots. On Oct. 27, 1914, the Audacious was sunk off the N. coast of Ireland by enemy mines. Her loss was not officially admitted until the end of 1918.

Aude. River of France. Rising in the Pyrenees, it flows 130 m. N. and E. through the dept. of Aude

to the Golfe du Lion near Narbonne. Its tributaries include the Fresquel and the Cesse, and the Canal du Midi is alongside the river E. of Carcassonne.

Aude. Department of France. Formerly part of the old prov. of Languedoc, it is bordered E. by the Mediterranean and has an area of 2,448 sq. m. Comprising mainly the valley of the Aude, the S. contains the slopes of the Pyrenees. From Carcassonne westwards a lowland gap, the gate of Toulouse, followed by the Canal du Midi, separates these hills from the S.W. corner of the Cévennes. The coast line is flat and marked by a number of lagoons. Aude is noted for its wine, corn, fruit, and honey; slate and marble quarrying are engaged in. Carcassonne is the capital. Pop. 285,115.

Auden, WYSTAN HUGH (b. 1907). English poet. The son of G. A. Auden, distinguished physician and antiquarian, he graduated from Christ Church, Oxford, where he was an exhibitioner. He became associate professor of English literature at Ann Arbor university,

W. H. Auden.
English poet

Michigan, and held the Guggenheim research fellowship in 1942. Later he was professor of English literature at Swarthmore university, Pa., and was awarded the American Academy of Arts and Letters prize in 1945. An outstanding figure in the poetry of the 1930s, he published *Poems* in 1930, and followed it with *The Orators*, 1932, and *The Dance of Death*, 1933. He collaborated with Christopher Isherwood (*q.v.*) in three remarkable poetic plays, *The Dog Beneath the Skin*, 1935; *The Ascent of F.6*, 1937; *On the Frontier*, 1938; and in a travel book, *Journey to a War*, 1939, the war being the China-Japan conflict. Auden collaborated with Louis MacNeice (*q.v.*) in *Letters from Iceland*, 1937. Later works include *Another Tune*, 1940; *For the Time Being*, 1945; and *The Age of Anxiety*, a Baroque Eclogue, 1948, a philosophical conversation in verse.

Audenshaw. Urban district and parish of Lancashire, England. It is 5 m. E. of Manchester, has engineering works and cotton mills, and makes hats. The church of S. Stephen is Early English. Pop. 8,460. See Manchester.

Audhumla. A cow in Norse mythology. She lived upon salt rime-stones, and the giant Ymir, the first being in human shape, fed upon her milk. The first day she licked the stones a man's hair appeared, the second a man's head, and the third his whole body. He was Buri, whose son was Bor, father of Odin (*q.v.*).

Audiometer. Apparatus for measuring sound, or giving a visual indication of sound waves; also similar apparatus for testing hearing. The electrical inventor David Edward Hughes gave the name audiometer in 1879 to a device for obtaining a balance of induction between two coils, in conjunction with a third coil; he used a telephone receiver as the detector. The modern audiometer, in one form, is an appliance for obtaining an indication of the amplitude, etc., of a sound wave. A thermionic oscillator valve is used to produce the desired sound, which is fed into a microphone, the shape of the wave being delineated on an oscillograph (*q.v.*). By another type of apparatus it is possible to test the hearing of a subject. The sound is fed to a telephone receiver applied to the ear, and the intensity varied by means of a calibrated attenuator, which indicates the minimum intensity at which the subject can perceive the sound. By substituting a gramophone with a suitable record for the valve oscillator, a group of subjects can be tested, by supplying them with headphones connected to the reproducing appliance. Audiometers are used also for testing the acoustics of a building such as a concert hall.

Audit (Lat. *auditus*, a hearing). In early times, a hearing of complaints or a judicial inquiry; later, an examination of accounts, at first chiefly oral, which gradually became almost entirely documentary. Today an audit is specially the annual examination of the accounts of a company, society, or other undertaking by a person or persons appointed for the purpose. The periodical payment of rent and settlement of accounts between landlord and tenant is also known as an audit, in many cases celebrated by a dinner or festivity (hence the strong "audit ale" brewed for audit-day feasts at colleges at Oxford and Cambridge). In the United Kingdom the public accounts are audited by officials under the comptroller and auditor-general, and his department is sometimes known as the audit office. It developed from the

audit board of five commissioners established in 1785.

Auditor (Lat., hearer). In English law, a person whose duty is to examine the accounts of a company, firm, or person. An auditor is liable for negligence if he fails in his duty. Under the Companies Acts every limited liability company is bound to have an auditor, appointed by the shareholders. This auditor must examine the company's books and report thereon annually to the shareholders, and must, in such report, state whether in his opinion the balance-sheet is a proper one and exhibits a full and fair account of the company's position. Such an auditor is bound to examine the books and vouchers of the company. Building societies, friendly societies, industrial societies, various public bodies, such as municipal corporations, county and district councils, and the like, are also bound to have auditors. See Accountancy.

Auditory Nerve. Nerve which springs by two roots from the brain and passes through an aperture in the skull termed the internal auditory meatus. Its function is to supply the internal structures of the ear. See Brain; Ear. Nervous System.

Audley. Urban district of Staffordshire, England. It is 4 m. N.W. of Newcastle-under-Lyme, on the railway, and has a mining industry. Pop. 13,619.

Audley, BARON. English title, created 1313, therefor among the oldest peerages in the U.K. The 23rd baron, Thomas Percy Henry Touchet-Tuchet-Jesson, was born Sept. 15, 1913, and succeeded to the title in 1942.

Audley of WALDEN, THOMAS AUDLEY, BARON (1488-1544). English lord chancellor. He studied at Cambridge and the Inner Temple, was elected to Parliament 1523, and in 1529 was chosen speaker of the house of commons. In 1532 he was knighted and made keeper of the great seal, being appointed lord chancellor the following year. He supported Henry VIII's divorce from Catherine of Aragon and marriage to Anne Boleyn, presided at the trials of Bishop Fisher and Sir Thomas More, and tried Anne Boleyn in 1536. In 1538 he was created Baron Audley of Walden. In 1540 he carried through Parliament the attainder of Thomas Cromwell, earl of Essex, and the divorce of Anne of Cleves. He rebuilt Buckingham College, Cambridge, and changed its name to Magdalene 1542. He died April 30, 1544.

Audley End, near Saffron Walden, Essex. The mansion, built on the site of a 12th century Benedictine priory, is the seat of Lord Braybrooke

From a drawing by C. G. Harper

Audley, SIR JAMES (d. 1386). English soldier, one of the knights of the Order of the Garter on its institution in 1344. Bravery at Poitiers in 1356 brought him special reward from the Black Prince. In 1367 he was governor of Aquitaine and in 1369 great seneschal of Poitou.

Audley End. Hamlet of Essex, England, 1½ m. S.W. of Saffron Walden. Here is Audley End, seat of Lord Braybrooke, ascribed to John Thorpe in the 17th cent., and from 1948 National Trust property.

Audoux, MARGUERITE (c. 1880-1937) French novelist. In 1910 she published *Marie Claire*, the autobiography of a poor provincial girl, which won the Femina Vie Heureuse prize, and was translated into English by J. N. Raphael, as was *Valserine*, 1912. She died Feb. 3, 1937.

Audran, EDMOND (1842-1901). French composer. Born at Lyons, his earliest dramatic composition was *L'Ours et le Pacha*. Later he found his vocation in comic opera, starting in 1879 in Paris with *Les Noces d'Olivette*, which had a successful run at the Strand Theatre, London, as *Olivette*, and was followed by *The Grand Mogul*, *La Mascotte*, *La Cigale*, and *La Poupée*. He died Aug. 16, 1901.

Audran, GÉRARD (1640-1703). French engraver. Born at Lyons, Aug. 2, 1640, he studied at Paris and Rome, engraved after Raphael, Nicholas Poussin, Annibale Caracci, Domenichino, and other painters, but was at his best in translating the works of Le Brun. He died in Paris, July 26, 1703.

Audubon, JOHN JAMES (c. 1780-1851). An American ornithologist. Born at Mandeville, Louisiana, he became a planter in Pennsylvania. He explored the forests in search of birds, his art training enabling

him to make valuable drawings.

His *Birds of America*, 1827-38, made his reputation. His later years were devoted to a study of the mammals of America. He died at New York, Jan. 27, 1851. *Consult*

Audubon and His Journals, M. R. Audubon, 1898; *Life and Times*, F. H. Herrick, 1938.

Aue. Town of Saxony. At the junction of the rivers Mulde and Schwarzwasser, 20 m. by rly. S.W. of Chemnitz, it manufactures cotton, lace, linen, machinery, tin, and furniture, and has technical schools. Pop. 24,702.

Auerbach, BERTHOLD (1812-82). German novelist. Born Feb. 28, 1812, of Jewish parentage, at

Berthold Auerbach, German novelist

by his *Schwarzwälder Dorfgeschichten*, *Village Tales of the Black Forest*, 1843-6, that Auerbach became most widely popular. Later he returned to the philosophical and didactic novel with *Auf der Höhe*, 1865, Eng. trans. F. E. Bunnnett, 1867; and *Das Landhaus am Rhein*, 1869, Eng. translation *The Country House on the Rhine*, 1870. His best work is in stories of simple people, such as *Edelweiss*. He died at Cannes, Feb. 8, 1882.

J. J. Audubon ornithologist

Auersperg, ANTON ALEXANDER. COUNT VON (1806-76). Austrian poet and politician. Born at Laidach, April 11, 1806, he was educated at Graz and Vienna. His opposition to the rigour of the Austrian government brought him into prominence. He attended the Frankfort parliament of 1848, and from 1860 was a member of the Austrian Reichsrat. He died at Graz, Sept. 12, 1876. Under the pseudonym of Anastasius Grun, Auersperg wrote many poems inspired by liberal ideas.

Auerstädt. Village in Saxony 25 m. from Weimar. It was the scene of the victory of the French with a single corps under Davout over the Prussians, Oct. 14, 1806. Napoleon, advancing towards Jena, ordered Davout to close up with the main army. While crossing the Saale at Kosen, Davout came into touch with a body of Prussians, under Charles, duke of Brunswick, whom he attacked although greatly outnumbered, about 30,000 men against 50,000. In a few hours both sides had suffered severely, but the Prussians had reserves available, while the French had none, although Bernadotte's corps was not far away. Brunswick, however, had been fatally wounded, and, as rumours of the disaster at Jena were being circulated, the commander of the Prussian reserves declined to advance and a retreat was ordered. The French lost about 7,000, the Prussians perhaps double that number. Davout was made duke of Auerstädt. *See* Jena, *Battle of*.

Aufidena. Ancient city of Italy, in the prov. of Aquila, dept. of Abruzzi and Molise. Situated just N. of the modern Alfidena, the city was built on two hills, the walls, of rough Cyclopean work, being more than a mile in circumference. Some 1,400 tombs of the advanced Iron Age have been examined in the necropolis below the town. Alfidena was captured by Allied troops on Nov. 23, 1943, after its destruction by Germans defending the central sector of the Italian front.

Aufidius, TULLUS. Semi-legendary leader of the Volscians against the Romans. A wealthy man of Antium, he "had the respect and privilege of a king," according to Dryden's translation of Plutarch's *Lives*. When the Roman general Coriolanus sought revenge on Rome for ingratitude, Aufidius made alliance with him. In Shakespeare's *Coriolanus*, Aufidius joins the hero against Rome, and then causes his murder.

Augean Stables. In Greek legend, stables belonging to Augeas a king in Elis. One of the twelve labours imposed on Hercules was the cleansing of these stables, which contained stalls for 3,000 oxen. He accomplished his task in one night by turning through them the rivers Alpheus and Peneus. As a reward Augeas had promised Hercules 300 oxen, and on his refusal to keep his word he was slain by Hercules. The phrase Augean stables is used in political language for a hotbed of corruption. See Hercules.

Augengneiss (Ger., eye-gneiss) Gneiss in which certain crystals, e.g. those of felspar, garnet, etc., are larger than the other components of the rock. These crystals, owing to the shearing that the rock has undergone, have assumed a lenticular or eye-shaped outline.

Augereau, PIERRE FRANÇOIS CHARLES DUKE OF CASTIGLIONE (1757-1816) French soldier. Born in Paris, Nov. 11, 1757, the son of a frunterer, he joined the French Revolutionary army in 1792. He distinguished himself at Lodi, Roveredo, and in other battles of Napoleon's Italian campaign, particularly at Castiglione. In 1804 he was made a marshal and rendered valuable service at Jena and elsewhere. At the restoration of the Bourbons in 1814 he made his peace with Louis XVIII. When Napoleon escaped from Elba in 1815 he endeavoured in vain to join his old master. He died June 12, 1816.

Aughrim, BATTLE OF Fought July 12, 1691, between the English and the Irish. It takes its name from a ruined castle about 4 m. S.W. of Ballinasloe, in co. Galway. The Irish, about 20,000 strong, under a French general, Saint Ruth, were in position at Aughrim; the English, under Ginkel, marched from Athlone to attack them.

The position of the Irish was well defended by a bog and a breastwork, against which the English advanced several times without success. Just before nightfall the English horsemen found a path across the bog, and turned the Irish flank. Saint Ruth was killed, and, encouraged by the success of the horsemen, the English infantry again assailed the breastwork, this time successfully. The defeat soon became a rout, covered by Sarsfield, who was leading the cavalry. Galway was taken by Ginkel and soon Limerick alone remained a refuge for the supporters of James II. The Irish lost from 4,000 to 7,000 men. Out of 25,000 men the English lost under 2,000.

Augier, GUILLAUME VICTOR ÉMILE (1820-89). French dramatist, one of the founders of the modern realistic comedy of manners.

Augier

Born at Valence, Sept. 17, 1820, he began by writing plays in verse of the older classical type (e.g. *La Cigüe*), but soon passed to the prose drama of modern life with *Le Gendre de M. Poirier* (in collaboration with Sandeau), 1854, followed by *Les Effrontés*, 1861, *Maitre Guérin*, 1864, *Les Fourchambault*, 1878, and many others. His plays are noteworthy for their characterisation, robust morality, and satire on society. He died at Croissy, Oct. 25, 1889.

Augite (Gr. *augê*, lustre). In geology, the commonest member of the monoclinic pyroxene group. It is a calcium, iron, magnesia, aluminium silicate, and as a rock-forming mineral enters largely into the composition of basalts and other lavas, gabbros, and dolerites. Generally black when in large crystals, it exhibits various shades of yellow or brown when in thin splinters or sections. See *Pyroxene*.

Augmentation (Lat. *augmentum*, increase). Addition to armorial insignia granted specially by royal licence. Such additions may be placed in small shields, as in the cases of the dukes of Marlborough and Wellington, in cantons or chiefs, or may merely be extra charges—a crest or supporters. In blazoning arms these are always described last, “and for augmentation” being prefixed. See *Coat of Arms*.

Augmentation. In music (1) the presentation of a musical theme or motive in notes of greater value; a device used chiefly in fugal movements. Fugue subject:

etc. The same augmented:

etc.; (2) the increasing of a major or perfect interval by a semitone, through raising its upper note or through flattening its lower note; e.g. Major sixth. Augmented sixths:

See *Interval*.

Augmentations, COURT OF. An English court of law established by Henry VIII in 1536, after the dissolution of the monasteries. Its function was to hear cases arising out of the disposal of monastic lands, the object being to augment the revenues of the crown. Its records were kept in the Augmentation Office, and it was dissolved in 1553.

Augsburg. City of Bavaria. Capital of the district of Swabia, it stands high, about 40 m. by rly. N.W. of Munich, and between the rivers Lech and Wertach. The seat of a bishop, and formerly one of the wealthiest of the free cities of Germany, it contains some interesting buildings. These include the cathedral, partly dating from the 10th century, the churches of S. Ulrich and S. Anna, the episcopal palace, now used as public offices, and the 17th century town hall, which was heavily damaged in the Second Great War.

Augsburg, Bavaria. General view (1939), showing the town hall on the right and the cathedral in the left background.

Other features are Maximilian Street, the main thoroughfare, and some fine old fountains. Around the old town are new suburbs with fine streets and modern buildings. Cotton, linen, and silk goods are made, and the main Messerschmitt aircraft works were here. Pop. 185,704.

Augsburg, the ancient Augusta Vindelicorum, was early occupied by the Vindelici, and was settled by the Romans before the opening of the Christian era, the name Vindelicum being later changed to Rhaetia. Its present name is a corruption of Augustburg, or the city of Augustus, which it received about 800. It owes its early importance and its later commercial prosperity, when part of Swabia, to its situation at the junction of several roads, much of the trade from Italy to the N. passing through it. Like Venice, it suffered from the discoveries and consequent changes in the trade routes of the world of the 15th and 16th centuries. It was a free city from 1276 to 1806, when it became part of Bavaria. During the 14th and 15th centuries it was the great money market of Europe. Its situation and wealth made it also a favourite place for diets and other meetings of importance, its prosperity being at its height during the Reformation period. The town was captured by the Swedes in 1632, and the league of 1686 against France was signed here. On April 17, 1942, R.A.F. Lancasters made a low-level attack in daylight on the M.A.N. Diesel-engine factory. The city was captured by Gen. Patch's U.S. 7th army on April 28, 1945.

Augsburg, CONFESSION OF. A statement of the Lutheran doctrine drawn up in 1530 and presented to Charles V during the diet of Augsburg. It was the work of Melancthon, was approved by Luther, and signed by all the original Protestant princes and by the representatives of Nuremberg and Reutlingen. It has been described as an *apologia* rather than a creed, for its earlier articles aimed at showing how close were the Lutheran doctrines to those of the Church of Rome. Its later sections dealt with the reformation of abuses.

Zwingli and his followers, regarding the Confession as unsatisfactory, issued a statement of their own faith, and leading Roman theologians also opposed it. Alterations were made in the various editions, one being known as the *variata* and another as the *Invariata*, but one or other re-

mained the authoritative statement of Lutheran faith throughout Germany. See Lutherans. Reformation.

Augsburg, LEAGUE OF. Coalition of European princes formed at Augsburg in 1686 against Louis XIV. Louis, who had just gained possession of Strasbourg and other parts of Alsace, also claimed part of the Palatinate, and the alliance was the reply. The members of the alliance included the emperor Leopold I, the king of Spain, the king of Sweden, and the Dutch republic. The elector of Bavaria, the dukes of Saxony and Savoy, and some Italian princes joined later, and secretly Pope Innocent XI promised support. In 1688 William of Orange became king of England and brought this country into the alliance which conducted against France the War of the League of Augsburg, 1688-97, ended by the treaty of Ryswick (*q.v.*).

Augur (Lat. *avis*, bird; *garrire*, to chatter). Member of a college of priests in ancient Rome. In late Republican times consisting of sixteen members, its functions included the inauguration of temples, priests, etc., and the taking of auspices from observations of the manner of flight and of the cries of certain birds before important public business. A report of unfavourable manifestations to the president of the assembly made it necessary to adjourn the meeting.

August. Eighth month of the Christian calendar, named after the Roman emperor Augustus. In the old Roman calendar it was the sixth month and originally called Sextilis. Augustus gave it his name because it had been his lucky month. To make it equal in length to July (named after Julius Caesar), he added a day from February. See Calendar.

Augusta. Name of several cities built by or in honour of the emperor Augustus and his successors: e.g. Augusta Caesarea, Saragossa; Augusta Taurinorum, Turin; and Augusta Allobrogum, Geneva.

Augusta. A city of Georgia, U.S.A., the co. seat of Richmond co. It stands on the Savannah river, at the head of navigation, 231 m. from its mouth, and is 132 m. N.W. of Savannah, on the Southern and other rlys. It is a popular winter resort. Its buildings include the Medical College, attached to the state university, and Richmond Academy, the oldest chartered school in Georgia. Augusta is the chief cotton manufacturing centre of the southern states, and one of the largest cotton markets.

Lumber, flour, silk, and cottonseed oil are produced. Founded in 1735, and named after the daughter of George II, it was captured by the British in 1779, 1780, and 1781. Pop. 65,919.

Augusta. Capital of Maine, U.S.A., and the co. seat of Kennebec co. It stands on the Kennebec river, at the head of navigation, 44 m. from its mouth, and is 62 m. by rly. N.E. of Portland. The Maine Central rly. crosses the river here, and steamers call from Boston and other large ports. The state house contains a large library; the city hall and the Lithgow Library are noteworthy. Lumber, cotton, pulp, and paper are produced. Pop. 19,360.

Augusta (or AGOSTA). Fortified seaport of Sicily, in Syracuse prov. It stands on an island connected with the mainland by a bridge, and is 19 m. by rly. N. of Syracuse. It has a spacious harbour, a fishing industry, and exports salt, oil, wine, and sardines. It was founded 1232 by the emperor Frederick II, and was devastated by earthquake in 1693 and 1848. Off here, in 1676, in a fight between the French and a Spanish-Dutch fleet, De Ruyter was killed. Pop. 17,000.

During the Second Great War Augusta became important as a base for Italian seaplanes and German U-boats. On July 12, 1943, after the Allied invasion of Sicily, a British and a Greek destroyer entered the port, to find it had been evacuated by the enemy. A German counter-attack on July 14 was beaten off.

Augusta. Name of two German empresses. Augusta (1811-90), wife of the emperor William I, was a daughter of Charles Frederick, grand duke of Saxe-Weimar. She was born and brought up at Weimar; in 1829 she married William, crown prince of Prussia, who in 1871 became German emperor. She was an intimate friend of Goethe. Augusta Victoria (1858-1920), wife of William II, was a princess of Schleswig-Holstein. She was born Oct. 22, 1858, and married in 1881. After the downfall of the empire Nov. 9, 1918, she retired to Doorn, in Holland, with the ex-Kaiser, and died there April 11, 1920.

Augustan Age. Name given to a period of literary excellence during the reign of the Roman emperor Augustus. The writers included Virgil, Horace, Ovid, Propertius, and Livy. The reigns of Anne in England and of Louis XIV in France have been also described thus. See Latin Literature.

Augustine (354-430). Father of the Church and bishop of Hippo Aurelius Augustinus. formerly

known in England as S. Austin and now more generally as S. Augustine, was born Nov. 13, 354, at Tagaste (modern Sùk Aghâs) in the prov. of Numidia, to the W of modern Tunis in N

Africa. His parents were Patricius, a pagan, and Monica, a Christian. both Latin-speaking citizens of the Roman empire. Augustine's education began at his native town and was continued at Madaura and Carthage. His ability marked him out for a professorship of the art of rhetoric, and he taught as such in Carthage, Rome, and Milan. After his conversion to Christianity in 386 he returned to his native land and went into a retreat, where he studied Scripture and philosophy. In 391 he was called against his will to be a presbyter, and in 395 to be bishop of Hippo Regius. In that place and office he remained until his death, Aug. 28, 430, preaching, teaching and writing.

Of Augustine's numerous works, the most interesting to moderns are two that take rank among the world's classics, the *Confessions* (*Confessiones*) in thirteen books, and the *City of God* (*De Civitate Dei*) in twenty-two books. In the *Confessions*, Augustine traces his progress from childhood to conversion. The last three books deal with the Book of Genesis. The *City of God* is an elaborate answer to the charge that the Christians were responsible for the fall of Rome in 410. This great work marks on the one hand the end of the ancient, and on the other hand the beginning of the medieval world.

Among other works of Augustine are his copious *Explanations of the Psalms* (*Enarrationes in Psalmos*) and his *Homilies* (*Tractatus*) on S. John's Gospel. His *Sermons*, of which some hundreds are preserved, are written in a popular style. His correspondence, represented by some 300 letters, is concerned entirely with scriptural and doctrinal questions. S. Augustine was a thinker rather than a scholar. He knew no Hebrew and comparatively little Greek, but knew where to go for information.

No writer ever more absolutely asserted the entire dependence of man on God. He is also strong on the practical side of religion, such

as almsgiving. He was an orthodox member of the Catholic Church, accepting the decrees of general councils as binding and infallible. He regards them as above the bishop of Rome, though he, as occupant of Peter's chair, is superior to any other bishop.

Augustine was the first to transform the authority of the Church into a factor in religion. He changed the current conception of piety into a deep and firm trust in God by faith. His doctrines are those of S. Paul reaffirmed and developed, and, after S. Paul, he has had the greatest influence on the theology of the West. In the 19th century Archbishop Trench of Dublin and Dom Odilo Rottmanner of Munich were probably the chief authorities on his works. Thirty-three hitherto unknown sermons of S. Augustine were discovered by the French monk, Dom Germain Morin, who edited them in 1918. Augustine's festival is Aug. 28. A new translation of the *City of God* was published in Everyman's Library, 1946.

Alexander Souter

Bibliography. S. Augustine and His Age, J. McCabe, 1902; S. Augustine, A. Hatzfeld, Eng. trans. E. Holt, 2nd. ed., 1903; S. Augustine, H. H. Lessaer, Eng. trans. T. Pope Arkell, 1931.

Augustine OR AUSTIN, SAINT (d. 604). The first archbishop of Canterbury. He was prior of the Benedictine monastery of S. Andrew at Rome when chosen by Pope Gregory I to lead a band of missionaries for the conversion of England. He set out in 596 and reached the Isle of Thanet in the spring of 597. Accompanied by forty monks, he had a courteous reception from Ethelbert, king of Kent, whose wife Bertha was a Christian. The king gave protection to the missionaries, permitted them to preach, and himself received baptism.

Augustine then went to Arles to receive consecration

from Virgilius as bishop. In 601 he received from Gregory the pallium giving him jurisdiction as archbishop over England. He was at liberty to adopt from the usage of other churches whatever should prove pleasing to God. He was instructed also to divide the country into dioceses, though the new religion actually extended but little beyond the borders of the kingdom of Kent. In the interests of Christianity an effort was made to come to an agreement with the Welsh bishops, and a conference was held at Malmesbury: but they refused to yield about observing Easter on the date fixed by Rome and other matters. On the failure of the conference they withdrew to Wales, leaving England to Canterbury. Augustine died May 26, 604, and was buried at Canterbury. His bones were later translated to the N porch of the abbey, a site now occupied by a hospital. His festival is May 26. Consult *Mission of S. Augustine to England*, ed. A. J. Mason, 1897.

AUGUSTINIAN. Monks of this order from the St. Bernard hospice
Courtesy of Swiss Federal Railways

Augustinian. Full name of the Austin canons, a religious order of R.C. clergy. The Augustinians follow the rule of Augustine, and while living in community are occupied with ordinary clerical work. Traditionally of apostolic origin, claiming S. Augustine as reformer and not as founder, they included S. Patrick and S. Columba and were reorganized in the 12th century, and in the 15th century were entitled canons regular. Early in the 13th century there were various small communities of hermits in central Italy all observing different rules. About 1250 a number of them were united to form a single religious order, living according to the Rule of S. Augustine. Special constitutions were drawn up for its government, which closely resembled that of the Dominicans and other mendicants. There followed a tendency to relax the rules; and the subsequent reaction led to a number of reforms being made within the order and produced upwards of a hundred different congregations.

The Reformation and later revolutions destroyed most of the Augustinian houses in England. Of some 90 existing then, 60 were included in the greater monasteries suppressed in 1538-40. The houses are still relatively numerous in the S. of Eire, while on the continent the hospices on the Great St. Bernard and the Simplon are served by monks of this order.

The canonesses regular of S. Augustine, communities of women living by rule, are of similar origin.

The name is also given to the Austin Friars, a religious order of mendicants dating from the 5th century. Their habit was black, and the site of their house in the City of London is commemorated by the street, Austin Friars (*q.v.*). This street was seriously damaged by bombing during 1940-41 and the Dutch Reformed church, sole remaining link with the friars, was totally destroyed.

Augustów. Town of Poland, in the district of Białystok, formerly in Russia. The town is in the lakes region W. of the Niemen, and has canal connexions with this river and by the canalised Biebrza (Bobra) with the Vistula. It is 18 m. S. of Suwalki, and has cattle and horse markets and a timber trade. It was founded in 1557 by Sigismund II. A battle of the First Great War was fought here between the Germans and the Russians, Sept. 14-Oct. 3, 1914. The former failed to maintain a vigorous advance and lost about 60,000 men, after which the Russian line ran through the town for a few months.

Augustulus, ROMULUS. Last Roman emperor of the West. He was the son of the powerful Pannonian Orestes, who with the help of the *foederati* (barbarian irregulars in the Roman army) deposed the emperor Julius Nepos and set his own son on the throne (475). The young emperor proved utterly incompetent, and the Romans expressed their contempt by changing his name from Augustus to the diminutive Augustulus. Refusing the demand of the *foederati* for a third part of Italy, Orestes was besieged in Pavia by Odoacer, his shield-bearer and former ally, and slain (476). Augustulus abdicated, and was permitted to retire to Campania with an annual pension of 6,000 pieces of gold.

Augustus. Masculine Christian name, meaning venerable or revered. As a mark of respect it was given to Octavius, the great-nephew of Julius Caesar, known later as the emperor Augustus. The name has been popular since the Revival of Learning. Augustine, or little Augustus, is a variant. The French form is Auguste and the feminine is Augusta.

AUGUSTUS: FIRST EMPEROR OF ROME

A. D. Innes, Author of *A General Sketch of Political History*

This account of Julius Caesar's great-nephew and successor describes the part taken by Augustus in founding the Roman Empire. See also Rome, and the biographies of Julius Caesar and other great Romans

Gaius Octavius, most commonly known as Augustus, the first of the long series of Roman emperors, was born Sept. 23, 63 B.C. He was the son of another Gaius Octavius by a niece of Julius Caesar, who by his will made the boy his adopted son and heir. Hence, according to the Roman custom, the name Gaius Octavius was changed to Gaius Julius Caesar Octavianus, and during the years between the murder of Julius (March 15, 44) and his own assumption of the imperial dignity in 27, he is generally named Octavian.

The murder of Julius Caesar threw the Roman world into chaos. It was the work of men who wished to restore the republican constitution which the dictator had overthrown. On the other hand, Mark Antony, a lieutenant and a favourite of the murdered dictator, was bent on avenging his death and on securing the supremacy for himself. The young Octavian, who had been absent from Italy, returned at once to Rome, accompanied by his friend and counsellor Agrippa, to claim his inheritance

—and to seek for something more. Self-contained, determined, and inscrutable, he completely concealed his intentions from the triumphant conspirators, who imagined that he would be a tool in their hands. Caesar's partisans were already in arms under the leadership of Antony, who at first imagined that Octavian could be disregarded; but the veterans soon gave their allegiance to Caesar's adopted son. Octavian dropped the mask. An alliance was made between him and Antony: the two had a common cause, at least until the republicans should be overthrown. For the time policy demanded that they should act in concert.

Under the Roman system nearly all the Roman armies were in the provinces, under the control of the proconsuls, the provincial governors, not in Italy proper. Antony, the governor of two provinces, marched into Italy at the head of an army. The Roman world was in a state of open civil war, and the official government at Rome was compelled to appoint Antony

and Octavian, with Marcus Lepidus, as triumvirs—a commission of three with almost unlimited powers for the restoration of order (Nov 27, 43). The triumvirs proscribed a large number of their personal enemies, of whom as many as were seized were put to death.

In 42 Antony and Octavian carried their armies from Italy to the Balkan Peninsula to fight the two chiefs of the republican party, Brutus and Cassius, who had taken up the governorships of the E. provinces of the republic. The victory of Philippi (42) made the Caesarians all-powerful. Octavian and Antony in effect divided the Roman world between them, Octavian taking the west and Antony the east, while Lepidus was relegated to obscurity. During the next ten years the two were more than once on the verge of open war, but a formal reconciliation was effected by a marriage between Antony and Octavia, his colleague's sister. Meanwhile, Octavian was organizing his supremacy in the W. In 31 the arrogance of Cleopatra, the Egyptian queen whose fascinations had made Antony her slave, provided the excuse for an attack upon her which was in effect an attack upon Antony. Octavian's great minister Agrippa won a decisive victory over Antony's fleet at Actium (Sept. 2, 31); and when Octavian advanced against Egypt in the following year Antony and Cleopatra committed suicide, and Octavian at the age of 33 stood without a rival in the Roman world.

The Roman republic, based upon what had been the organization of merely a city state, had gradually acquired first an ascendancy and then an effective dominion over Italy; had conquered Carthage and annexed her empire; had extended her dominion over the Hellenic world, over Asia up to the Euphrates, over Egypt, and finally over Gaul. Thus its boundaries were in effect the Rhine, the Danube, the Euphrates, the deserts of Africa, and the ocean; but it had not adapted its city-state organization to its imperial expansion. Its provinces were governed by proconsuls, appointed for a term of years, virtually irresponsible to any authority and having entire control of the armies in their respective provinces. Such a system could not last. The primary necessity was the establishment of a supreme central authority to which the provincial governors should be responsible. This had been fully realized by Julius Caesar, who had made himself the supreme central authority. But Caesar had openly

grasped his authority as a master of armies—a claim wholly incompatible with the republican idea; and since he could obviously crush any open resistance, he had fallen beneath the daggers of assassins. It was the work of Octavian to accomplish Julius Caesar's work by avoiding his error; to centralise

pate); though the Roman world spoke of him as Caesar, the name which was appropriated to all his successors, from whatsoever family they might have sprung. But the effective control was conveyed through the bestowal upon him by the Senate of the specific powers constitutionally belonging to par-

Augustus, first of the long series of Roman emperors. He was the great-nephew and adopted son of Julius Caesar, whom he succeeded

Vatican, Rome

authority in himself, but to do so through strictly constitutional forms by nominally maintaining a republic.

After the fall of Antony, Octavian returned to Rome, but continued officially to act as an extraordinary minister of the state, holding his appointment from the legal authorities, merely that he might deal with an emergency; and in 27 he resigned his position. But a real retirement was obviously impossible. The Senate proceeded to confer upon him titles of honour which in themselves did not imply power: *Augustus*, the name by which he is known to posterity; *pater patriæ*, father of his country; *princeps*, first citizen (whence it is now customary to refer to the new constitutional system as the Princi-

ticular officials, notably the tribunician power (*tribunicia potestas*) and the *imperium*, the absolute military authority over the armies, which belonged to the proconsuls. Hence came the title of *Imperator*, Emperor the actual use of which Augustus himself deliberately avoided. Both these powers were conferred upon Augustus for a term of years, but with the practical certainty that they would be extended to him for life. Thus Augustus was in effect made a tribune for life, with the power of initiating and of vetoing legislation, and also proconsul for life in all the provinces. The actual governors were no more than his subordinates or lieutenants, responsible to him. The officers of state continued to be appointed by election in accordance with republican forms, and to

pass automatically into the Senate, the official governing body. but since Augustus was authorised to nominate candidates and his nominees were invariably elected. the practical result was that officers and Senate were his own creatures. The permanence of the system was ensured by the practice of conferring the tribunician power and the *imperium*, during the lifetime of the *princeps*, upon the successor chosen by him.

Augustus reigned from 27 B.C. to A.D. 14, when he died, Aug. 19. He did not aim at any extension of the empire, though there were frequent and sometimes serious wars with the German and other barbarian tribes upon its confines, in the course of which there occurred one grave disaster, the annihilation by the German leader Arminius of a great Roman army under Quintilius Varus (A.D. 9). Within the empire itself, Augustus established the *Pax Romana*, the Roman Peace, of which a world long devastated by ceaseless wars was profoundly in need. The provinces were for the most part admirably governed under well-chosen administrators. Italy flourished greatly; of the city of Rome itself it was said that Augustus "found it of brick and left it of marble." Under him the intellectual and literary life of Rome attained its zenith; historians and poets found their theme in the glorification of Rome and Augustus. Virgil, in his great epic, the *Aeneid*, went back to ancient legend, but used it partly to emphasise the mythical glories of the house of Julius and still more to celebrate the grandeur of the qualities that had raised Rome to be the mistress of the world. The name of Horace is a household word. Catullus and Propertius, Tibullus and Ovid are among the famous poets of the Augustan Age; Livy's great history told the immortal story of Rome's heroes. The name of Maecenas, the minister and friend of Augustus, has become typical for patrons of art and literature. Finally it was in the reign of Augustus that "there went out a decree from Caesar Augustus that all the world should be taxed," and a Child was born in Bethlehem of Judaea—an event of more importance to the world than the establishment of the Roman empire.

Pelham, 5th ed. 1909; Augustus J. Buchan, 1937; Augustus Caesar B. M. Allen, 1938; Augustus: The Golden Age of Rome, G. P. Baker, 1938

Augustus (1526-86). An Elector of Saxony. Younger son of Duke Henry of Saxony and brother of the elector Maurice, whom he succeeded in 1553, he beautified Dresden and encouraged agriculture and trade. Brought up a Calvinist, on his marriage with Anna of Denmark, in 1548, he became a Lutheran, and after his succession to the throne placed the Calvinists under penal laws. He died at Dresden, Jan. 21, 1586.

Augustus (1670-1733). King of Poland and elector of Saxony, known as the Strong. Born at Dresden, May 12,

Augustus II,
King of Poland

1670, he was the second son of John George III, elector of Saxony. In 1694 he succeeded his brother John George IV as elector, and in 1697 was elected king of Poland. In 1702 he was defeated at Clisow by Charles XII of Sweden, who forced him to give up the Polish crown, which he regained in 1709 after defeating Charles at Pultowa. Marshal Saxe was the most famous of his many illegitimate children. He is described both as Augustus II, king of Poland, and as Frederick Augustus I, elector of Saxony. He died at Warsaw, Feb. 1, 1733. In his later years he became a Roman Catholic.

Augustus (1696-1763). King of Poland and elector of Saxony. Son of the elector Augustus the Strong, whom he succeeded in Saxony in Feb., 1733, he was elected king of Poland in Oct. of the same year. During the Seven Years' War, in which he sided with Austria, Saxony was occupied by the Prussians and Augustus lived in Poland, returning to the electorate a few months before his death, Oct. 5, 1763. From 1746 Count Heinrich von Brühl, whom he made prime minister, was the real ruler of Saxony.

Augustus III,
King of Poland

Auja. River of Palestine. It flows into the Mediterranean about 4 m N. of Jaffa. On Dec. 20-21 1917, Scottish troops crossing the river surprised the Turks and drove them from Jaffa, enabling Allenby to advance.

Aujila. An oasis of Libya. On Nov. 24, 1941, it was captured by a

mobile column or the 2nd Punjab and 6th South African armoured car regiments. The British forces withdrew when Rommel counter-attacked in Jan., 1942.

Auk. Name of two birds of the family Alcidae, which includes also the guillemots and puffins. *Alca impennis*, the great auk or gare-fowl, as it was commonly called, was the only bird of the northern hemisphere incapable of flight, its wings being little more developed than those of the penguin, which it somewhat resembled in general appearance. It was about as large as a goose, and had black plumage on the head and back, with white beneath. As its legs were placed very far back, it had the appearance of sitting on its tail when on land.

Auk. Extinct Great
Auk and egg

It formerly ranged from the Bay of Biscay to Greenland, but was found in greatest numbers on certain rocky islands near Iceland and off Newfoundland. The bird was quite helpless against enemies when on land, and was killed in vast numbers for the sake of its feathers. The last known example in Europe was killed in 1844. Eggs of the great auk are highly valued by collectors, as much as 315 gs. having been given

for a fine specimen. Only about 70 examples are known. (Consult 'The Great Auk, S. Grieve, 1885.)

The little auk (*Mergulus alle*) is a small bird of the same family. It is only about

Auk. The Little Auk

8 ins. in length and is provided with flying wings. It resembles a small guillemot, and is a winter visitant to the northern shores of Scotland. The word auklet is used for still smaller birds of this kind.

Auldearn, BATTLE OF. Fought May 9, 1645, between Royalists under Montrose and Covenanters under John Hurry. The village

from which it takes its name is about 3 m. E. of Nairn. Montrose, after his brilliant retreat from Dundee, found that his pursuers had divided their forces. Thereupon he turned against Hurry's detachment, then near Inverness. But Hurry lured on Montrose, who, on May 8, reached Auldearn.

During the night the Covenanters sought to surprise their foes but they failed, and early on the 9th the battle began. The cavalry of the Covenanters were routed; of the infantry some fled, but in the centre they stood firm and were killed almost to a man. The forces engaged were only a few hundred.

Auld Lang Syne. Song by Robert Burns, written 1789 and based on popular verses then current in many versions. The tune, to which it was set many years later, is claimed to be by an Englishman, Wm. Shield (1748-1829), though it is possible that he only adapted a Scottish air. The ceremony of singing Auld Lang Syne as a parting song with hands linked in a circle has spread from Scotland throughout the British Empire, though usually only Scots observe the correct ceremonial, which is to delay the linking of hands until the final verse.

Auld Lights (Old Lights). Minor branch of Scottish Presbyterianism. On Dec. 6, 1733, there was formed the Associate Presbytery, a handful of dissenters from the Established Church of Scotland. But in 1747 a controversy over the oath administered to burghers arose. Some saw in these words, "the true religion presently professed within this realm and authorised by the law thereof," a submission to the Established Church from which they had seceded; others did not. So they split into two sects known as Anti-burghers and Burghers. Again, in 1799, each of these bodies divided into two on a dispute about making the Solemn League and Covenant a term of communion, the objectors being dubbed Auld Licht Burghers and Auld Licht Anti-burghers. Although Burghers and Anti-burghers united, Sept. 8, 1820, the Auld Lights of both bodies held aloof from each other and from all other sects until they coalesced in 1842 as the United Original Seceders, later adopting the style of the Original Secession Church. The Auld Lights have received world-wide fame in the stories of Sir James Barrie. See Presbyterianism.

Auld Reekie. Nickname for Edinburgh, from the smoke or

"reek" of the crowded buildings of the old town.

Aulic Council (Gr. *aulē*, court). Court of justice of the Holy Roman Empire, known in Germany as the Reichshofrat. Established as a kind of privy council by the emperor Maximilian I in 1497, the duties of its members were to assist him in governing his dominions, Germany and Austria. In 1648, by the treaty of Westphalia, its constitution and powers were defined. From this time onwards its work was almost solely judicial, and its members heard cases of importance till 1806. See Empire, Holy Roman.

Aulie-ata. Fortified town of Russian Turkistan, in Kazakh S.S.R. It stands on the river Talas, 150 m. N.E. of Tashkent, and has celebrated fruit gardens and cattle and horse markets. It is peopled chiefly by Kirghiz.

Aulis. A seaport of ancient Greece, in Boeotia. It stood on the Euripus, the channel separating Euboea from the mainland. It was here that the Greek fleet assembled before it set out for Troy, and Agamemnon prepared to sacrifice his daughter Iphigeneia.

Aullagas or **Lago Poopó.** Salt lake of Bolivia. Situated in the dept. of Oruro, W. of the Cordilleras, it is 70 m. long by 28 m. broad, and receives with the Desaguadero the outflow of Lake Titicaca.

Aulos (Gr., flute, pipe; in Lat., *tibia*). Greek and Roman musical instrument, a pipe or flute. The Latin word *tibia* means shin-bone, and these instruments, made of bone or other materials, were named from this fact or possibly from their shape. They were of various kinds. The *monaulos*, a reed instrument with one hole, was like a flageolet; the *plagiaulos* (cross-flute) was a bassoon or an ordinary flute. Some *tibiae* were straight, others bent. Again, they were called *dextrae* or

sinistrae, according as they were held in the right or left hand, when pairs of flutes were used blown through one mouthpiece.

Aulularia. Latin comedy by Plautus. The central figure is a miser named Euclio, who has discovered a little pot (*aulularia*) of gold originally buried in the garden by his grandfather, and always fears it may be stolen. The Aulularia supplied Molière with the character of Harpagon in *L'Avarice*.

Aumale. Town of N. France, in the dept. of Seine-Inférieure. It stands on the river Bresle, 47 m. by rly. N.E. of Rouen, has a 16th century church, and manufactures glass, cloth, leather, and steel. Known variously as Aubemale, Aumerle, and Albemarle, Aumale has since 1850 given the title of duke to a son of the duke of Orléans. It came under German occupation, June, 1940-Aug., 1944. The English titles of earl and duke of Albemarle were derived from it.

Aumale. Town of Algeria. It is 57 m. S.E. of Algiers, on the site of the ancient Roman town of Auzia. Named after the duc d'Aumale (1822-97), governor of Algeria, it is a military post.

Aumale, CHARLES, DUC D' (c. 1554-1631). French politician. He was a zealous supporter of the Guises in the wars of religion against the Huguenots, and after the murder of the duke of Guise in 1588 was joint leader of the League with the duc de Mayenne. After his defeats at Arques and Ivry, he allied himself with Spain and surrendered several towns to the Spaniards. For this he was sentenced to be broken on the wheel, 1595. He escaped from France, and died in exile at Brussels, the last duc d'Aumale of the old line.

Aumale, HENRI, DUC D' (1822-97). French soldier and politician. Fourth son of Louis Philippe, born

in Paris, Jan. 16, 1822, he joined the army in 1839 and served with distinction in Algeria, of which he was made governor in 1847. In 1873 he was president at Marshal Bazaine's court-martial, and in 1879 became inspector-general of the army. He was expelled from France in 1886, but this decree of exile was revoked 1889. He died at Zucco, in

Auld Lights. The Original Secession church of Kirriemuir, made famous by the stories of Sir James Barrie. This structure made way for another in 1893

Sicily, May 7, 1897. His writings include an unfinished History of the Princes of Condé, and the Letter on the History of France protesting against a Bonapartist attack on the Orléans family. He was a member of the French Academy, and bequeathed his estate and collections at Chantilly to the Institute of France. See Chantilly.

Henri, duc d'Aumale
Winterhalter

Aumonier, STACY (1887–1928). English author. He was the son of a sculptor and was educated at Cranleigh. He became a landscape painter and interior decorator, exhibiting at the principal London galleries. In 1908 he began a new career, as entertainer, giving recitals of his own sketches. In 1913 he turned to writing, and, after serving in the First Great War, quickly established himself as an author, with a reputation resting chiefly on his masterly short stories. His volumes include *The Love-a-Duck*, *Odd Fish*, *Miss Bracegirdle and Others*, and *The Baby Grand*. He also wrote two novels, *Olga Bardel* and *The Querrils*. Aumonier died in London, Dec. 21, 1928. His wife was the pianist, Gertrude Peppercorn.

Stacy Aumonier,
English author

Dec. 21, 1928. His wife was the pianist, Gertrude Peppercorn.

Aune (Lat. *ulna*, elbow). Medieval European measure of length, about 47 ins., corresponding to the English ell (*q.v.*). In France, up to 1812, it equalled 1·885 metres, in Belgium one metre, and in Jersey 4 ft. Its use still lingers in Switzerland.

Aura. Term used for any subtle emanation. In medicine, it is applied to symptoms which may precede an epileptic attack or attack of hysterical fits, such as flashes of light, odours, sounds or voices, peculiar sensations in the pit of the stomach, twitching of the muscles, and psychic changes such as irritability or depression.

In theosophy the aura is defined as a subtle invisible essence that emanates from and surrounds all creatures and things, to well-marked but variable limits, the limits depending upon the state of conscious development. The human being is said to have five distinguishable

interpenetrating emanations, including the finest spiritual, the intuitional, mental, emotional, and physical aspects of his nature. See *Aureole*; *Halo*.

Aurangabad. A district and city in the N.W. of the Indian state of Hyderabad. The district is a highly cultivated area, chiefly for cotton and native food grains. The city stands on the Dūdha, an affluent of the Gōdāvari, 235 m. by rly. E.N.E. of Bombay. Built by Aurungzebe, it has ruins of the emperor's palace, and a fine mausoleum erected by him to receive the remains of his favourite daughter. It has cotton mills and trades in cereals. Most of the people in the district are Hindus; in the city there are almost equal numbers of Hindus and Mahomedans. Pop. of city, 36,876.

Aurantiaceae. Family of trees and shrubs, mostly natives of Eastern Asia. Its members have fragrant, edible, pulpy fruits, e.g. orange, lemon, citron, and lime. The leathery leaves have transparent dots—cells filled with volatile oil; the leaf-blade is jointed to the stalk. The flowers have four or five sepals and petals. They are now usually referred to as Rutaceae.

Auray. Town and harbour of France, in the dept. of Morbihan. It is a road and rly. junction near the mouth of the Auray river, 12 m. by rly. W. of Vannes. It has two churches, one, that of S. Esprit, being no longer used for religious worship, and a Carthusian monastery, now an establishment for the deaf and dumb. There are valuable oyster-beds, and fishing is carried on. The church of S. Anne d'Auray, in the neighbourhood, is a famous place of pilgrimage. Auray was the scene of an English victory over Charles of Blois in 1364.

Aurelia. Name of a Roman plebeian gens or clan. The chief family name is Cotta. Gaius A. Cotta (c. 124–74 B.C.), governor of Gaul, was a well-known orator and one of the interlocutors in two dialogues by Cicero. His brother Lucius, a friend of Cicero, is known for a law (70 B.C.) named after him, which effected an important alteration in the composition of the jury courts.

Aurelian. Roman emperor A.D. 270–275. Born about A.D. 213, the son of a Pannonian peasant, his full name was Lucius Domitius Aurelianus. He became one of the chief officers of his predecessor Claudius, upon whose death he was proclaimed emperor by the soldiers. At this time barbarians were pressing hard upon the north-

ern defences; a separate empire had arisen in revolted Gaul; while in the east Zenobia, queen of Palmyra, designed to set up a kingdom of her own.

Aurelian first attacked the barbarians and obtained a decisive victory (271) over the combined forces of the Juthungi and Alamanni in Umbria. He then returned to Rome, quelled a serious sedition, and began the building of the wall named after him. He next turned his attention to Zenobia and the East (272), and a brilliant campaign ended in the capture of Zenobia and the destruction of Palmyra. The defeat of Tetricus, the rival emperor of Gaul, in a battle near Châlons (273), brought the whole empire again under Aurelian's rule. The title of *Restitutor Orbis* (Restorer of the World) was conferred upon him,

Aurelian, Roman
emperor
British Museum

and his triumph in 274 was the most splendid ever celebrated in Rome. As a ruler he was an uncompromising believer in absolutism, but the financial and other reforms introduced by him in the rare intervals of peace show that he possessed a statesmanlike grasp of political affairs and great administrative gifts.

Aurelian's Wall. Defensive wall in ancient Rome. Begun by Aurelian A.D. 271, it was completed by Probus in 280, and frequently repaired by later emperors. Erected after the invasion of Italy by the Alamanni and Juthungi, it was more than 12 m. in circumference, about 60 ft. high, and had some

Aurelian's Wall. Remaining portion of the great wall built for the defence of ancient Rome

hundreds of towers. Much of the original circuit is still standing.

Aurelianus, CAELIUS (5th century A.D.). Greek physician of Sicca in Numidia. He was the author of two extant medical works, one on acute, the other on chronic diseases. They are valuable as a source of information on the "methodic" school.

Aurelian Way. Ancient highway in Italy. Beginning at the foot of the Palatine Hill at Rome, it left the city at the Aurelian Gate, and after traversing Latium, Etruria, and Liguria along the coast, ended at Arelat̄s (Arles) in Gallia Narbonensis (Narbonne).

Aureole (Lat. *aurculus*, golden). Name given in Christian art to the radiance encircling the entire figure of divine and holy personages. It is distinguished from the nimbus, which surrounds the head only, though the two terms are often interchanged. Originally it referred only to the persons of the Holy Trinity and the Blessed Virgin Mary. See Nimbus; Saint.

Aures. Mountain range in the S.E. of Algeria. The ancient *Mons Aurasius*, it forms part of the Saharan Atlas and extends east from Biskra for about 80 m. Jebel Shellia, 7,611 ft., is the highest peak and the culminating point of Algeria. The intervening valleys are fertile and peopled by a Berber tribe, the Shawia.

Aureus. Gold coin in ancient Rome. Introduced during the second Punic War (218-201 B.C.), its average weight was 120 grs. and its value about £1. After the time of Constantine it was replaced by the solidus. See Numismatics.

Auricle (Lat. *auricula*, little ear). Medical term for upper right and left chambers of the heart (q.v.).

Auricula (*Primula auricula*). Perennial Alpine herb. A native of the Swiss Alps, it has a thick root-

Auricula. Swiss Alpine perennial from which the familiar garden flowers are derived

stock and a rosette of smooth, fleshy leaves, dusted on both surfaces with white powdered wax. The yellow flowers are borne, like those of its relative the cowslip, in a small cluster at the top of a leafless stem. The auriculas of the garden are cultivated varieties produced from an original hybrid

between *P. auricula* and *P. hirsuta*, the hairy primrose.

Auriga. Driver of a chariot in the races in the Roman circus. The charioteers were divided into four parties or "factions"—the Blues, Whites, Greens, Reds—who in imperial times exercised an important political influence.

The name is also applied to one of the northern constellations. Figured as a kneeling charioteer—no chariot is visible—it is described in Ptolemy's star list as a shepherd carrying a goat on his shoulder and leading a pair of kids by the hand. Its Greek name was Heniochus, bearer of the reins.

The main stars are easily found, for the chief, the great Capella, with its yellowish light, almost balances bright Vega on the opposite side of the Pole Star, and at midnight in winter is the brightest star in the zenith. The four chief stars form a cross, Beta Aurigae, "the holder of the reins" being the head of the cross and Capella at the point of the western arm.

Aurignacian. The early period of the Upper Palaeolithic Age in Europe. The last glacial epoch was retreating when the Cro-magnon race entered Europe and subdued the Mousterian. The flint implements—gravers, awls, and spoke-shaves—are associated with bone shaft-straighteners and personal ornaments. The graphic prehistoric arts were developed. Named from a grotto at Aurignac in Haute Garonne, the stations, extend from S. Wales (Bacon Hole and Paviland) to the Danube. See Anthropology.

Aurillac. Town of France, the capital of the dept. of Cantal. It stands on the river Jordanne, 135 m. by rly. N. by E. of Toulouse, on the slope of a hill crowned with an old castle. It is on the road and rly. across the southern end of the Auvergne Mts. Aurillac was noted in the Middle Ages for its abbey, the church of which, rebuilt in the 17th century, still remains. Another fine building, once a college, houses a museum and a library. Pop. 22,174.

Auriol, VINCENT (b. 1884). For biography of this French president, elected 1947. see N.V.

Aurochs (Gr. *ouros*, buffalo; Ger. *ochs*, ox). Wild ox of Europe. Progenitor of the various breeds of domesticated cattle, it is mistakenly identified with the European bison, which still lingers in Lithuania and Caucasus. It was a huge animal, as is proved by the bones found in many parts of Britain. One example measured about 50 ins. from the tip of one horn to the other. By the 15th century it was found only in

certain forests of Lithuania, where the last survivors died early in the 17th century. It is represented in Great Britain by the half-wild cattle of Chillingham and Cadzow, which appear to have retained its general features, but are greatly reduced in size.

Aurora. Latin name for Eos, the Greek goddess of the dawn. She dwelt in the East and every morning rose from the ocean or from the couch of her husband Tithonus and traversed the sky in a chariot drawn by two horses. She was also the goddess of youth and beauty.

Aurora. City of Illinois, U.S.A., in Kane co. It stands on Fox river, 39 m. W.S.W. of Chicago, on the Chicago and North-Western and other rlys. It has a college, a Carnegie library, smelting-works, cotton mills, and carriage and wagon works, and is said to have been the first town in the U.S.A. to use electricity for street lighting. Pop. 47,170.

Aurora Borealis or **NORTHERN LIGHTS**. Luminous phenomenon seen in the sky chiefly at night and in northern latitudes. It exists in almost identical forms in the Antarctic (*Aurora Australis*), and some beautiful effects were recorded by E. A. Wilson, who accompanied Captain Scott on the voyage of the Discovery. The most striking were the auroral curtains, so called from their resemblance to great folds of drapery.

In general, the Northern Lights appear as either a whitish arc of light or quivering, rapidly moving beams. Sometimes a faint illumination without definite form is seen, and again it takes the form of clouds or patches of light. The quivering beams, in N. latitudes, generally come out of the N., and usually follow the direction of the magnetic N. and S. line. Sometimes the colour has a reddish, yellowish, or greenish tinge. It is sometimes carmine, rarely violet. An auroral display generally begins early in the evening and lasts a few hours, though it may last for days and occur at any time. Aurora is most frequently seen in a belt of country which stretches from the N. of Norway S. of Iceland and Greenland. In the British Isles it is most common in the late evenings about the equinoxes, but in Norway and Greenland in mid-winter. The mean height is about 70 m., and although heights beyond 125 m. are unusual, one of 166 m. has been measured.

The association of these Northern Lights with Polar regions has led to the theory that they are electro-magnetic phenomena which are most strongly manifested at

Aurora. Wonderful effect of the aurora curtain (*Aurora Australis*), manifestation of the luminous phenomenon observed in the sky during Capt. Scott's first Antarctic expedition. It is almost identical with the *Aurora Borealis*
By permission of the Royal Society

either end of the great magnet the earth. The spectrum consists of a number of lines and bands due to oxygen and nitrogen. Changes in the relative strengths of the red and green oxygen lines in particular cause the different colours seen at different times.

The fact that aurorae occur near the poles may be explained by supposing that the luminosity is caused by charged particles reaching the earth from outer space, most probably from the sun. These particles are deflected towards the poles by the earth's magnetic field, according to the known laws of electromagnetism. There, as they enter the atmosphere, they collide with the atoms and molecules of the upper air and cause them to emit light, in much the same way as the electrons passing through a neon sign cause the gas inside to become luminous. Magnificent displays were seen over S. England on Jan. 27, 1938, and Sept. 18, 1941. See *Light*; *Spectroscopy*; *Sun*.

Bibliography. The *Aurora Borealis*, A. Angot, ed. F. Legge, 1896; *Photographic Atlas of Auroral Forms*, International Geodetic and Geophysical Union, 1930; *Meteorological Glossary*, Air Ministry, 1939; *Geomagnetism*, S. Chapman and J. Bartels, 1940.

Aurungzebe (1618-1707). Mogul emperor of India. His original name Mahomed was changed by his father to Aurungzebe, or throne-ornament. A rigid Mussulman, he was made governor of the Deccan in 1655, and in 1658 he seized the throne. Crowned emperor in 1659, he assumed the title of al-amgir (world-conqueror).

His reign is often regarded as a kind of golden age, but the distrust and suspicion that were

fostered under his despotic rule brought about the decay of the Mogul empire. By alienating the Rajputs he lost his best fighting men, and the strength of the empire was undermined by incessant

Aurungzebe,
Mogul emperor
British Museum

struggles against the Mahrattas. He died at Ahmadnagar, Feb. 21, 1707. Consult *Short History*, Sir J. Sarker, 1930.

Auscultation (Lat. *auscultatio*, listening). Method of listening to sounds in various parts of the body, either by direct application of the ear or by the stethoscope. It is most often employed for examination of the heart and lungs, but can also be used for listening to the heart-beat of the infant in the womb and to sounds made by aneurisms or pulsating tumours.

Ausgleich. A German word, meaning compromise or compact, specially applied to the agreement made in 1867 between Austria and Hungary. It settled the financial and other relations between the two parts of the Dual Monarchy, and in a slightly altered form it continued until 1919.

Ausonia. Town of Italy, in Campagna. In the Second Great War it was captured on May 14, 1944, by French troops when they breached the Gustav Line.

Ausonius, DECIMUS MAGNUS (c. 310-394). Roman poet. Born

at Burdigala (Bordeaux), he was tutor to the emperor Valentinian's son, Gratian, and consul in 379. His best-known work is *Mosella*, a description of a trip up the Moselle, written in a style reminiscent of Virgil and noted for its appreciation of the beauties of nature.

Auspicia (Lat. *avis*, bird; *spicere*, to see). Observations made by the augurs in ancient Rome from the flight and cries of birds. Auspices were also taken by observing the manner in which the *pulli*, or sacred chickens, ate their food. If they devoured it so greedily that pieces dropped out of their mouths, the omen was regarded as favourable; but if they were unwilling to leave their cage, it was unfavourable.

Aussee. Town of N.W. Styria, Austria. It stands on the Traun, 8 m. N.E. of Hallstatt, and 63 m. by rly. E.S.E. of Salzburg. It is a health and pleasure resort, visitors being attracted by its saline baths and magnificent scenery. The vicinity produces much salt and has several beautiful lakes.

Aussig. Town of the Bohemian portion of the republic of Czechoslovakia, formerly in Austria, and transferred to Germany as part of Sudetenland in 1938. It is situated amid mountains at the union of the Biala and Elbe, 68 m. by rly. N. of Prague. It has a town hall and an old church, is a centre of the chemical industry, and trades in coal and other products. It is a railway centre and carries on an active river trade.

Aussig was fortified in the Middle Ages. In 1426 a German army was routed by the Hussites outside its walls, and the town destroyed. On the restoration of Czechoslovakia in 1945, the large German pop. was expelled.

Aust-Agder. Fylke or county of S. Norway, formerly called Nedenes, bordering the Skagerak. Area, 3,607 sq. m. Pop. 73,816. Arendal is the chief town.

Austen, JANE (1775-1817). English author. The seventh child of the Rev. George Austen, she was born in his rectory at Steventon, Hampshire, Dec. 16, 1775. In early childhood she had some brief experience of school, when she and her sister Cassandra attended a seminary at Reading, but her education was chiefly obtained at home: her accomplishments including music, dancing, French, and a little Italian. Her knowledge of mankind was for the most part derived from keen observation.

The limitations of her work, freely recognized by herself, were fixed by her environment. She

never left England. She paid occasional visits to London, but Bath, Winchester, and Southampton were the only towns in which she ever resided, and her life was mainly spent, whether at

J. Austen

Chawton, Hants, or in country houses, with people whose "comfortable" incomes were derived from rural rent rolls, or tithes.

Her novels, which have tended to become increasingly popular, require a considerable sense of humour for their appreciation, but they contain no incidents properly to be described as sensational, and there is scarcely a page of passion in any of her simple plots. Suicide and murder have no place, and the one or two girls who have a "past" are almost as much in fault as their lovers. Indeed, for the reader sparsely endowed with imagination there is not a thrill in the whole of Jane Austen's work. Nor are there even descriptions to fill the gaps for the unthinking. Here and there a house or its surroundings may be sketched, but material conditions are usually presented just sufficiently to convey general impressions.

Jane Austen was almost wholly concerned with the minds of men and women, and her people are not to be confined by mere dates. "Old-fashioned" is a term which only a superficial intelligence would be inclined to apply to her books. Creations like Mr. Collins, the sycophantic parson, Miss Bates, the garrulous, inconsequential spinster, Mrs. Norris, the parsimonious widow, or Lady Catherine de Bourgh, the pompous patroness, are as much of our own time as of hers. Her special triumph, however, was in the realization of young women of her own class, and her masterpieces are Elizabeth Bennet, the heroine

of *Pride and Prejudice*, and Anne Eliot, the heroine of *Persuasion*, whose vivacity is reflective of the author's own nature.

Of Jane Austen's six "authorised" novels *Pride and Prejudice* was completed in 1797, and *Sense and Sensibility* in 1798, in which year much of *Northanger Abbey* also was written, as a satire, in great part, on Mrs. Radcliffe's "horror" stories. *Mansfield Park* was completed in 1813, *Emma* in 1815, and *Persuasion*, her most mature novel, in 1816. The first to be published was *Sense and Sensibility*, which came out in 1811. She left two uncompleted novels, *The Watsons* and *Sandford*.

An epistolary novel *Lady Susan*, written before she came of age, was published in 1871. *Love and Freindship*, a schoolgirl's attempt at satire, was published in 1922.

During her life her name was never printed on her title pages. Her life was uneventful, and so little was she influenced by the movement of the world that, though the French Revolution and the Napoleonic wars passed in her time, there is but the merest allusion to foreign affairs in her novels or her correspondence with her sister. This is all the more strange since two of her brothers were on active service in the navy. Nor does love appear to have played any serious part in her own experience; her philosophy of quiet irony seems to have been due as much to her temperament as to any marked habit of reflection.

In appearance, she was tall and slight, with small, regular features, hazel eyes, dark curling hair, and a fine complexion. The evidence goes to show that her life of forty-two years, which ended at Winchester, from rapid decline, on July 18, 1817, was one of intelligent happiness, usually spent in those easy circumstances which, on her own showing, were essential to her contentment. She is buried in the N. aisle of Winchester cathedral.

Austenite. Name given in metallurgy to a compound of iron and carbon formed when steel solidifies from the molten state. Named after the British metallurgist, Sir W. Austen, it is a non-magnetic solid solution of iron carbide, Fe_3C , in gamma-

iron. This, like all other solid solutions, has a homogeneous structure, but in ordinary carbon steels cannot be retained in a pure state by any known quenching methods. In alloy steels, however, austenite may be obtained by slow cooling. Austenitic steels are of great industrial importance, the most widely known being "Hadfield's Manganese Steel," containing 12 to 14 p.c. manganese. This, having enormous resistance to abrasion, is used for railway and tramway catchpoints. Another group includes the stainless steels containing 18 p.c. chromium and 8 p.c. nickel and their derivatives. All austenitic steels are non-magnetic. Austenitic cast irons contain high proportions of nickel, and sometimes chromium and copper also. When cooled slowly to ordinary temperatures they consist chiefly of austenite. The most important is "Niresist" (12-15 p.c. nickel, 5-7 p.c. copper, 1.5-4 p.c. chromium, 1-2 p.c. silicon, 2.75-3 p.c. carbon). This alloy is non-magnetic and possesses high resistance to corrosion by sea water, caustic liquors, acid mine waters, and other corrosive media. It has excellent resistance to scaling and growth up to a temp. of about 800°C. It is used chiefly for pump parts, marine castings, boiler fittings, etc. See Iron; Metallurgy; Steel.

Auster. Name given, particularly in Roman times, to a warm, dry, south or south-westerly wind. When very hot, dry, and dustladen it is called *sirocco*. See Wind.

Austerlitz, BATTLE OF. Fought between the French and the combined Austrians and Russians, Dec. 2, 1805. It was one of Napoleon's greatest victories. The small town from which it takes its name is in Moravia, about 14 m. from Brunn. The battlefield lies to the S.W. of this; the ground is mainly hilly, but to the S. it slopes to a region of lakes and marshes.

After a series of victories over the Austrians, that at Ulm being the most important, Napoleon marched to Vienna, which had just passed into his possession. Thence he led his army towards the enemy, who were assembling around Olmutz and had arranged for assistance from Prussia. The two forces came into contact on Nov. 28. On the night of Dec. 1 the French were drawn up behind the little river Goldbach, Davout's corps having just arrived from Vienna, and the allies were between that stream and Austerlitz.

Austerlitz. On Dec. 2, 1805, Napoleon overwhelmingly defeated the Austrians and Russians at Austerlitz, in Moravia, a victory followed by the peace of Pressburg. From an aquatint of the battlefield by Duplessis-Bertaux

The allied plan was to throw their full weight on the French right wing near Telnitz and cut off the retreat to Vienna which Napoleon was thought to have in contemplation, leaving only slender forces to guard the road that led to their base at Olmütz. This manoeuvre suited the French emperor admirably, for he immediately saw its weakness—the probability of a division of the enemy's forces. He accordingly prepared a counterstroke, meeting the enemy's main effort with only a thin line of men, while from his centre a stronger body assailed the flank of the allies at the critical moment.

Early on the morning of Dec. 2 the allies were on the move, four columns advancing to the main attack on the French right, where Davout was. The three leading columns were soon engaged near Telnitz, and heavy fighting ensued. The French, much inferior in numbers, were worsted, but they only yielded a little ground.

As the last and most northerly of these four allied columns advanced, Napoleon delivered his main attack, striking at the Russian flank. The latter turned unhesitatingly towards the foe, and on the plateau of Pratzen, really the centre of the field, there was a desperate struggle; other Russians arrived to support their comrades,

but at length they were beaten back. With this plateau in their possession, the French were able to move forward to the help of their right wing, capturing Sokolnitz, a village on the Goldbach, and with it a number of Russians.

In the third section of the battlefield the French left, under Murat and Lannes, was engaging the Russian reserves under Bagration. Here cavalry were used on a considerable scale, but eventually the French succeeded in driving their enemies back on to Austerlitz and in seizing the road that led to Olmütz. The allies meanwhile were striving to recover the plateau, but were beaten everywhere and soon received the order to retreat. The French guns swept the road to the S. which the allies were obliged to take; moreover, they broke the ice on the ponds, thus causing many to be drowned.

The numbers engaged were about 83,000 Russians and Austrians and 65,000 French. The former lost about 35,000, of whom half were prisoners, and the victors about 7,000. The result of the battle was the end of the coalition against France. Austria signed the treaty of Pressburg, while the Russians withdrew.

Austin. Capital of Texas, U.S.A., and the co. seat of Travis co. It stands on the Colorado

river, 145 m. W.N.W. of Houston on the Missouri, Kansas and Texas, and other rlys. It is the seat of the co-educational state university, 1883, and has a number of colleges and other educational institutions. The state capitol is a red granite structure which cost over £700,000. The city exports livestock, hides, cotton, wool, and grain, manufactures leather, cotton-seed oil, furniture, and agricultural implements, and has an important lumber industry. Pop. 87,930.

Austin, HERBERT AUSTIN, BARON (1866–1941). British motor manufacturer. Born at Missenden,

Lord Austin, British motor manufacturer

Bucks, Nov. 8, 1866, and educated at Rotham grammar school, he emigrated to Australia and studied sheep-shearing machinery. Returning to England in 1893, he was set in charge of production of the Wolseley Sheep Shearing Machine Company. He experimented with motor cars from 1895 and began to manufacture on his own account at Longbridge, nr. Birmingham, in 1905. By 1939 his works covered 220 acres,

Austin. Original "baby Austin" car, as introduced in 1922

employed 20,000 workers, and had made 750,000 cars, among which the 20 h.p. and 12 h.p. models were world-famous and the 7 h.p. or "baby" car was at first unique. Austin was Unionist M.P. for King's Norton, 1919-24, was knighted in 1917 for his services in making munitions, and raised to the peerage in 1936. From that year he helped to organize the "shadow" factory scheme. He gave £250,000 to Cambridge university for scientific research. As his only son was killed in action, 1915, the peerage became extinct on Austin's death, May 23, 1941.

Austin, ALFRED (1835-1913). English poet. Born at Headingley, Leeds, May 30, 1835, and educated at Stonyhurst and at Oscott, he graduated at London university in 1855 and was called to the bar. Editor of *The National Review*, 1883-93, he was for many years on the staff of *The Standard* newspaper. In 1870 he brought out a poor, uncritical attack on Tennyson, Browning, Matthew Arnold, and Swinburne, called *The Poetry of the Period*. Later he published many volumes of mediocre verse, lyrical and dramatic, none of which, save perhaps one or two sonnets, possesses any permanent value. He had, however, a genuine love of nature, and expressed this happily in prose works such as *The Garden that I Love*, 1894. He succeeded Tennyson in the laureateship, after a vacancy, in 1896 and died June 2, 1913. *Consult* Autobiography, 1911.

Alfred Austin, English poet
Elliott & Fry

Austin, FREDERIC (b. 1872). British singer and composer. Born in London, March 30, 1872, he came of a musical family and began his career as an organist. He studied singing under Charles Lunn, making his debut in London in 1902, and started his operatic career in 1908 as Gunther

in Wagner's *The Ring* at Covent Garden, London. He joined the Beecham opera company when it was established in 1915. He arranged the melodies for the 1920 revival of *The Beggar's Opera* (q.v.), and acted the part of Peachum in this production.

Austin, HERBERT WILFRED (b. 1906). British lawn tennis player. Born at Norwood, Aug. 20, 1906, he was a schoolboy champion while at Repton and captained the Universities team while at Cambridge in 1928. In 1932 he became the first Englishman for many years to reach the final at the Wimbledon tournament, but lost to H. E. Vines (U.S.A.). He helped England to regain the Davis Cup in 1933, and was a mainstay of the team for several years, possessing classic strokes but being sometimes handicapped by want of stamina. In 1938, ranking as England's No. 1 amateur, he again lost the final at Wimbledon, this time to J. D. Budge (q.v.).

H. W. Austin, British lawn tennis player

The following winter he became a keen propagandist for the Moral Re-armament movement, then acted with the Buchmanites in the U.S.A., opposing military service until called up by the U.S. army authorities in 1943. Austin, who was widely known as "Bunny," married the actress Phyllis Konstam, 1931. He wrote *Lawn Tennis: Bits and Pieces*, 1930.

Austin, JOHN (1790-1859). British jurist. He was born near Ipswich, May 3, 1790, and was the son of a prosperous miller. As a youth an officer in the army, he was called to the bar at Lincoln's Inn in 1819, married in 1820, and included Bentham and James and John Stuart Mill among his friends. Professor of jurisprudence at University College, London, 1826-32, he went to Malta in 1836 to study its institutions, but was obliged to return to England owing to ill-health. He died in Dec., 1859.

His lectures, published in 1832 as *The Province of Jurisprudence Determined* and as *Lectures in Jurisprudence*, are authoritative. His definitions of legal and juristic terms were famous, one of the best known being that of sovereignty. He sought to find the essential distinction between law and morals,

and according to his conception all law comes from the command of the sovereign. His theory is opposed by the historical school, which regards customary law as existing quite independent of sovereignty and anterior to it. His *Province of Jurisprudence* was re-issued in 1861 with a preface by his widow, and a later edition of his *Lectures*, edited by Robert Campbell, in 1869 (new ed. 1911). *See* Jurisprudence; State; *consult also* The Austinian Theory of Law, W. J. Brown, 1906.

Austin Friars. Thoroughfare in the City of London. On the W. side of Old Broad Street, near the Bank of England and Stock Exchange, its name is derived from an Augustinian monastery founded 1253. At the dissolution in 1536-8, the house and grounds passed to the first marquess of Winchester, and in 1550 the church was granted by Edward VI to Protestant refugees, mostly Dutch. Of this building, known as the Dutch Reformed church, the spire and transepts were demolished in 1600, and the nave was restored in the 19th century. The church was destroyed during the bombing of 1940-41. Within were interred the remains of its founder, Hubert de Burgh, and Edward Stafford, duke of Buckingham.

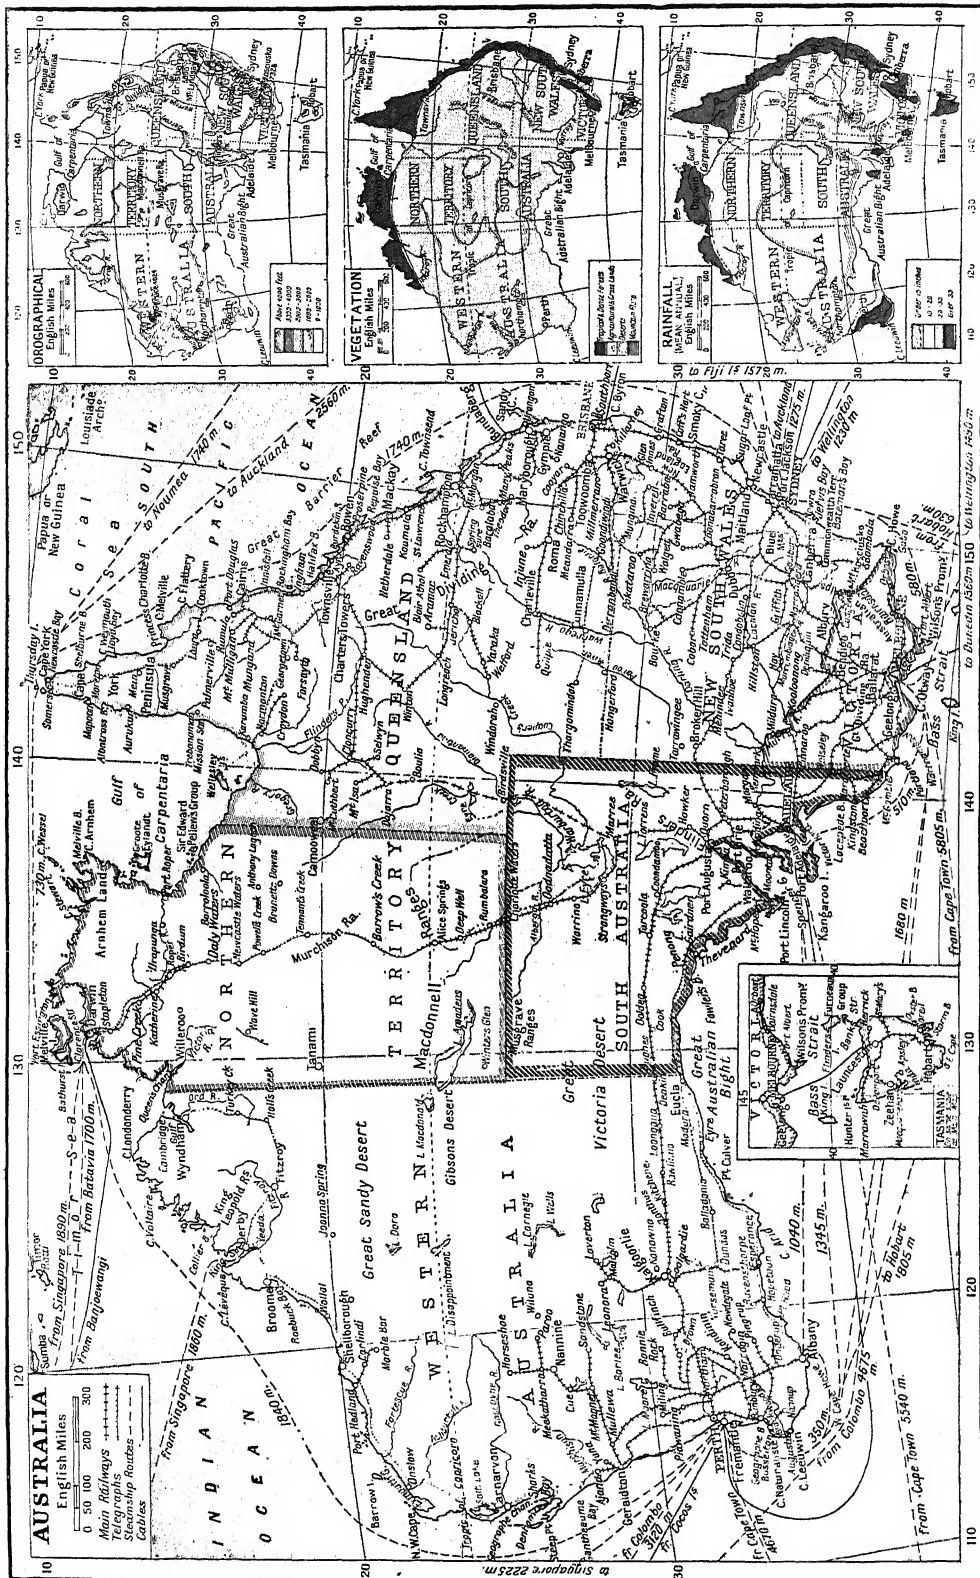

Austral, FLORENCE (b. 1894). Australian operatic singer. Born at Richmond, Melbourne, April 26,

Florence Austral, Australian singer

1894, she studied singing at the University Conservatorium, Melbourne, and later studied opera at the London School of Opera and in New York under Sibella. She made her debut in grand opera at Covent Garden as Brünnhilde in Wagner's *Valkyrie*, 1922, and was recognized as a great exponent of Wagnerian operas, appearing at many concerts throughout Great Britain. She first toured America in 1926, subsequently making six tours in U.S.A. and Canada, two in Australia, and several in Holland; and also appeared as Brünnhilde in *Siegfried* at the State Opera House in Berlin, 1930. She married the flautist John Amadio.

Australasia. Term comprising the Commonwealth of Australia, the Dominion of New Zealand, and their dependencies. *See* Australia; New Zealand; Fiji Islands, etc.

Larger scale maps of the different States that make up the Commonwealth of Australia will be found under their respective headings : New South Wales, Queensland, Victoria etc.
To face page 785

AUSTRALIA: ITS HISTORY AND RESOURCES

H. L. HARRIS, Author of *Australia in the Making*, etc.

This general description of the continent and Commonwealth of Australia deals with its discovery, its colonisation, and its subsequent political, economic, and industrial history, including the part its people have played in two Great Wars. See the articles on the various states of the Commonwealth, and on Canberra, Adelaide, Melbourne, Sydney, and other cities. See also N.Y. for later information.

As a political and constitutional entity Australia includes the island continent of that name, the island of Tasmania, and certain small adjoining islands. It is situated on the distant south-eastern fringe of the great Eurasian land mass between long. 113° 8' E. and long. 153° 39' E. and between lat. 10° 41' S. and lat. 39° 8' S., or (including Tasmania) 43° 39' S. The greatest width of the continent (from Steep Point in Western Australia to Cape Byron in New South Wales) is about 2,400 m. Its greatest length (from Cape York to Wilson's Promontory) is about 1,970 m.

Arms of Australian Commonwealth

The area, including Tasmania, is 2,974,581 sq. m., almost the same as that of the United States, about six times that of the Union of South Africa, twice that of the Indian sub-continent, and nearly 25 times that of the U.K. As

the Tropic of Capricorn passes through the continent at almost its greatest width, about 40 p.c. of its area lies within the tropics, and much of the centre is too dry for any but a very sparse and probably nomadic population.

TOPOGRAPHY, CLIMATE, FLORA AND FAUNA. Australia is roughly kidney-shaped, with the gulf of Carpentaria as the only large indentation in the northern convex. The concave southern coast-line is broken but not very deeply indented by Spencer and St. Vincent's gulfs. Vast areas are remote from the seas in a continent which lies in one of the world's dry belts.

The contours of Australia are remarkably uniform. The highest point, Mt. Kosciusko, is about 7,350 ft., but only about 5 p.c. of the whole continent is above 2,000 ft. West of a line from the gulf of Carpentaria to Spencer gulf, the country is a vast plateau or pene-plain from 600 to 1,500 ft. high. The backbone of eastern Australia is a tilted plateau or cordillera called the Great Divi-

ing Range, about 2,000 ft. high. Between them lies the Great Central Plain.

The western plateau comprises the central desert area, the tropical region in the N., and the S.W. corner. The central area is an almost waterless country of desert sandhill and desert steppe carrying some porcupine grass with mulga and saltbush on the outskirts. The northern tropical region includes the Kimberleys and Arnhem Land, where, although much of the soil is leached and podsolised, there are river flats of rich alluvium.

The characteristic vegetation is eucalyptus forest and tropical grasses in the N., with savannah and acacia scrub (mulga, myall, etc.) in the S. towards the desert. The S.W. is a temperate tableland region with a coastal fringe. Its easterly section is a mallee (scrub eucalyptus) belt, but towards the south there are wide belts of forest country with magnificent stands of jarrah and karri.

With the eastern cordillera must be considered the coastal

Australasia. Showing all the chief islands of the S. Pacific ocean, including Australia, comprised in this term. See page 784

strip and the western slopes. This region, extending from Cape York to the Murray mouth, has an average width of about 150 m. Much of the cordillera is really tableland country entirely lacking the more rugged contours of typically mountain country.

The coastal strip is well watered, and contains a number of valuable rivers, e.g. the Burdekin and Fitzroy in Queensland, and the Richmond, Clarence, Hunter, Hawkesbury, and Shoalhaven in New South Wales, as well as many lesser streams. Much of the western slope is savannah woodland with stretches of brigalow and Mitchell grass. Most of it is fairly well watered (15–30 ins. annual rainfall).

The Central Basin

The Great Artesian basin and Murray-Darling basin form the central plain into which many of the rivers that drain the western slopes disappear. The eastern margins are fairly well watered, but on the W. this area merges into the desert. The eastern section, with the western slopes of the tablelands, forms the vast grazing country of Australia—cattle in the north, sheep from Southern Queensland through New South Wales and Victoria. Since about 1870 considerable use has been made of the artesian water not only in these but in at least four other basins. Much of it is heavily impregnated with mineral salts, but most is fit for stock. Of recent years evidence has accumulated that these basins can be drawn upon too heavily.

The most important irrigation works are in the Murrumbidgee and Murray river valleys. For the large-scale irrigation scheme started in 1949, see Australia in N.V.

A map of the average annual rainfall shows a roughly elliptical area of over one million sq. m. with less than 10 ins. This area extends from near Wilcannia in New South Wales across South Australia and Western Australia, where the elongation of the ellipse is cut by the coast line around Shark's Bay. In the centre of the broadest part of the ellipse, i.e. around Lakes Eyre and Torrens in South Australia, there is a region where the average annual rainfall is less than 5 ins.

Around this arid centre are concentric belts of progressively wetter country as one moves outwards to the coasts. Less than 7 p.c. of the whole area has an

annual average of over 40 ins. There is a stretch of country along the north-eastern coast of Queensland where the isohyets do not conform to the general pattern and seem to belong to a different system. Between Port Douglas and Cardwell the annual average is from 142 to 165 ins.

N. of a line which cuts the continent transversely from just above Exmouth gulf in Western Australia to a point near Newcastle in New South Wales, most of the rain falls in summer, and S. of it in winter. Along the eastern coastal district the rainfall is distributed over the whole year. Over northern Australia, although the rainfall is sufficient, the fact that it falls in the summer months makes this part of the continent uncomfortable to live in and ill-suited for the crops and animals upon which Australian economy is built. Evaporation is relatively high over the whole continent in summer, so that in the northern regions the value of the rainfall is further reduced by this factor. Over the centre the potential evaporation is much higher than the actual precipitation.

The reliability of the rainfall is lower in Australia than in England and over about 80 p.c. of the continent is lower than in any part of Europe. Variability tends to increase with the distance from the coast, so that the central regions suffer not only from lack of rainfall but from its unreliability.

Native Fauna

Marsupials are to be found in every part of the continent. In the drier areas is the marsupial mole; over the grassland slopes and tablelands, kangaroos and wallabies. In the bush are the leaf-eating opossums and native bears. Bandicoots and wombats exist over most of the continent outside the tropics and away from the towns. The native cat is found all along the coast. Tasmania has two carnivorous marsupials in the Tasmanian wolf and Tasmanian devil, an animal that resembles a badger in size and shape.

The birds most peculiar to Australia are the emu, the bowerbird, and the lyre bird. The emu is the only one of these to be found in all parts. Other birds which do not confine themselves to any one region include the black swan, the bronze-wing pigeon, the wedgetail eagle, and the black duck. It is generally recognized, however, that the continent has three rather distinct ornithological regions, the N. and N.W., the S.E. (which in-

cludes the climatically similar south-western corner), and the interior.

Various species of bird and animal have been introduced. Some, most notoriously the rabbit, have become pests. The rabbit has destroyed the native shrubs and grasses and helped to turn wide areas into dust bowls.

Trees and Plants

The flora is immensely varied, and comprises over 10,000 species. Trees, predominantly eucalyptuses, of many kinds are often of enormous size. Shrubs, under-shrubs and herbs, parasites and saprophytes, and climbers, are to be found throughout the adequately rainy areas, while the desert is covered at times with brilliantly coloured flowers. The largest genera are *Acacia*, *Eucalyptus*, *Grevillea*, *Styphelia*, *Eriostemon*, *Melaleuca*, *Candollea*, *Hakea*, and *Hibbertia*. The most popular bush flowers are *Boronia*, wattle, flannel flowers, and waratah.

DISCOVERY. After much controversy it may now be taken as settled that the first discovery of any part of the continent was made when the Dutch vessel *Duyfhen* sailed along the W. side of the northern tip in 1606. Later the same year Torres, approaching from the Pacific side, discovered Torres Strait, but it is by no means certain that he ever caught a glimpse of the mainland of "New Holland."

In 1616 the Dutch E. India Co. prescribed "Brouwer's route" for ships sailing to Java. The use of the prevailing westerlies after leaving the Cape made it inevitable that sooner or later their vessels would come in sight of or run aground on the W. coast of the continent. By 1697 the S. coast from Cape Leeuwin as far as Nuyt's Archipelago (just beyond the border of Western and South Australia) and the whole of the W. and N.W. coasts had been seen by the Dutch. The most important voyage made for discovery during the period was that of Abel Janz Tasman in 1642. Sailing from Java, he discovered Tasmania, which he named Van Diemen's Land, and New Zealand.

The English or English-French period in the history of Australian discovery began with Dampier's visit to the N.W. coast in 1688. His *New Voyage Round the World* was a great travel book, but his account of Australia was not calculated to attract settlers. A second visit in 1697 added nothing to what was already known.

The Endeavour, Lieut. James Cook, was dispatched by the British government in Aug., 1768, ostensibly and primarily so that a group of scientists might observe the transit of Venus from a favourable spot. But Cook had instructions to make discoveries in the S. Pacific Ocean. After leaving Tahiti he circumnavigated New Zealand, then set out on a course which brought him in sight of the E. coast of New Holland on April 20, 1770.

COLONISATION. After the British loss of the American colonies a proposal was made to send United Empire Loyalists to the country Cook had discovered. This came to nothing; and it was the urgent necessity of relieving the overcrowded gaols of the United Kingdom that led eventually to the settlement of New South Wales (as Cook named the E. part of New Holland).

The instructions to the first governor, Capt. Arthur Phillip, specified Botany Bay as the most eligible situation known to the authorities, but Port Jackson was found to be a much better harbour, and Phillip landed his party of convicts and marines on the shores of Sydney Cove on the S. side of that harbour, Jan. 26, 1788.

Phillip's commission invested him with authority over all New Holland E. of 135° E., apparently because this seemed to be the line accepted by the Dutch as the eastern limit of their discoveries, although in fact their ships had been much further E. In 1824 Capt. Bremer in H.M.S. Tamar took formal possession of the N. coast between 129° E. and 135° E.; and in 1829 Capt. Fremantle took possession for the British crown of all New Holland not included within the territory of New South Wales. For some time there was a practice of referring to the continent east of 135° E. as New South Wales and to the rest of it as New Holland. Flinders seems to have been the first to urge the use of the name Australia, and governor Macquarie adopted the suggestion. The name came into official use gradually after 1820.

Van Diemen's Land, which was called Tasmania after 1856, was first settled when posts were established on the Derwent and Tamar Rivers in 1803 and 1804 to forestall the French, following Baudin's visit to Sydney in 1802.

Brisbane, later capital of Queensland, was established in 1824 as a subordinate penal settlement for hardened offenders from Sydney.

Australia. Some of the flowers indigenous to the continent. 1. Swainson pea (*Swainsona coronillifolia*). 2. Victorian Christmas bush (*Prostanthera lasiantha*). 3. Yellow kangaroo paw (*Anigozanthos flavidus*). 4. Black wattle, one of many species of acacia.

A small military post, to warn off the French, was established at King George's Sound in Western Australia in 1826, but the real foundations of that colony were laid when settlements were formed at Perth and Fremantle on the Swan River in 1829 by settlers from England. Abortive attempts were made in 1804 and 1826 to establish settlements in the Port Phillip district (Victoria after 1850), but the first permanent settlements were made at Portland in 1834 and at Melbourne in 1835 by people who crossed from Tasmania. South Australia grew up from the small beginnings at Adelaide in 1836 of a colony established on the Wakefield principles. (See Wakefield, E. G.) Its northern boundary was fixed at 26° S., but in 1863 the Northern Territory was added to it.

The first settlers in Australia were the convicts and their guards. Transportation to New South Wales was abolished in 1840, although a few shiploads of Pentonville "probationers" continued to arrive until 1850. Transportation to Tasmania ended in 1853. Western Australia did not receive convicts until 1849, and transportation to that colony continued until 1868. South Australia was never at any time a convict colony. From first to last possibly a little over 160,000 people entered Australia as convicts.

Some immigrants arrived in New South Wales as early as 1793, but

while the war with Napoleon lasted emigration was not encouraged. Until 1816 one might be sent to Australia if one were bad enough (and got caught), but to go of one's own accord required the production of evidence of character and substance. In 1819 the colonial secretary began to advertise New South Wales as a suitable place for immigrants, and land grants were offered as a bait. Assisted passages were first made available in 1831, and gradually a fairly steady stream of immigrants arrived each year. The policy of assisting immigrants was abandoned during the latter years of the 19th century, but was revived after the establishment of the Commonwealth.

The gold discoveries brought about the second colonisation. At the end of 1850 the population of the Australian colonies was 405,356. By the end of 1860 it had considerably more than doubled, at 1,145,585. The diggings attracted men with initiative, courage, and enterprise from all classes. The Australian of today is what results from a mixture of all the types of all the classes of the British Isles, with a very slight dash of the foreign element.

ABORIGINALS. From the various settlements established around the periphery the conquest of the interior was carried on by a process of infiltration or (largely peaceful) penetration. To this process the aboriginals could make

1. Large-scale shearing of sheep by mechanical clippers. 2. Rounding up some of the 100 million sheep of the Australian pastures. 3. Cattle, seen fording a river, are a valuable source of wealth. 4. Bags of wheat being stacked at Port Melbourne for shipment; a

mechanical elevator is used to make an enormous stack of 150,000 bags. 5. The auto-header harvester a machine invented in Australia, takes off the heads of the crop automatically, threshes and cleans it, and then pours it into 200-lb. bags on the machine

very little effective resistance. There may have been 150,000, but they were scattered in small groups over the whole continent. Occasionally they speared sheep or cattle or attacked a homestead, but stone-age nomads could not stand up against the white man's firearms. Their social code was very complicated and highly efficient, but it disintegrated rapidly after contact with the whites. Pure-blooded aboriginals are almost extinct except in Queensland, the Northern Territory, and Western Australia, where there may be 50,000 left.

The aboriginal is not a negroid but a Dravidian, with some affinity to the Veddahs of Ceylon. The Tasmanians, now quite extinct, were negroid and more given to concerted hostile action. In 1890 governor Arthur tried to round them up, but the attempt proved a costly failure. (See Australian Aborigines).

INLAND EXPLORATION. The main geographical features of south-eastern Australia were known by about 1840 and of all eastern Australia by about 1863. The continent was not crossed from South Australia through the Northern Territory until 1862, and large areas remained unknown in Western Australia until 1880 or later. Until 1813 the settlers in New South Wales were confined to the coast district. Then the Blue Mountains were crossed, and the way was open to the drier interior. There were about 50,000 sheep in the colony in 1812. By 1821 the number had increased to 290,000. The merino had found his natural habitat.

Explorers of the Interior

In the gradual unveiling of the interior the most prominent parts were played by Lieut. Oxley, Allan Cunningham, Capt. Sturt, Maj. Thomas Mitchell, E. B. Kennedy, Ludwig Leichhardt, and Burke and Wills in Eastern Australia; by Sturt, E. J. Eyre, and McDouall Stuart in South and Central Australia, and by Capt. George Grey, J. S. Roe, the Gregory brothers, the Forrest brothers, and Warburton and Giles in Western Australia.

As hydrographic survey still continues, it may be argued that the detailed exploration of the Australian coast line is not yet complete, but maritime exploration on anything like the grand scale ended with the voyage of 1841 of H.M.S. Beagle. Tasmania was proved to be an island when George Bass and Matthew

Flinders sailed through Bass Strait in 1798. In 1801 Flinders, as commander of the Investigator, examined the S. coast and circumnavigated the continent. Much that he left to be explored on the N. and N.W. was visited by Capt. P. P. King between 1818 and 1821, and the small stretches still unknown were examined by the Beagle between 1837 and 1841.

POLITICAL HISTORY. New South Wales being established as a penal settlement, the early governors had wide powers; but as the number of free settlers increased, either by immigration or by expiration of sentences, these powers became increasingly inappropriate. Apart from a convict outbreak in 1804, easily suppressed, the only "rebellion" occurred when the officers of the New South Wales Corps and some of the free settlers deposed governor Bligh ("Bounty" Bligh). From 1819 to 1821 a special commissioner resided in the colony to report upon the system of government, and in 1823 an Act for the Better Administration of Justice not only remodelled the courts but provided for a small legislative council to advise the governor.

Legislative Councils

By an Act of 1828 the legislative council was enlarged to include non-official members. Van Diemen's Land had been promoted into a separate colony in 1825, and provision was now made for its own legislative council. Western Australia and South Australia were established, the former in 1829, the latter in 1836, under separate Acts. Western Australia did not obtain a council until 1832. South Australia was not converted into a crown colony possessing its own legislative council until 1842.

In 1842 representative government was introduced into New South Wales, and the Port Phillip district was given separate representation. As the control of the public lands was withheld and a part of the expenditure was reserved from the control of the legislature, agitation for responsible government began almost at once. An Act of 1850 provided for the establishment of a separate colony S. of the Murray River, and the Port Phillip district became Victoria. The same act empowered the local councils to draw up their own constitutions. By the end of 1855 constitutions drafted in the colonies came into operation in New South Wales, Victoria, and Van Die-

men's Land, and in 1856 in the colony of South Australia.

As the Moreton Bay district, Queensland remained part of New South Wales until 1859, when it became a separate colony with a constitution similar to that of the present colony. Western Australia received representative government in 1870 and responsible government in 1890.

These colonial-made constitutions were broadly similar in that they all provided for local self-government through a bi-cameral legislature and responsible executives. The legislative council was abolished in Queensland in 1922 and was made elective by both Houses voting as one constituency in New South Wales in 1934.

Land Settlement

Between 1860 and 1880 attempts were made to settle small farmers on the land by means of free selection. As a result, it was made evident that instead of a large number of small farmers the west and middle west (the drier areas) could carry only small numbers on large farms. One of the good results of the land agitation of the sixties was the introduction of the Torrens system of lands titles registration first adopted in South Australia in 1863.

Pastoral holdings in the low rainfall areas are usually held under lease with almost nominal rentals, while land suitable for agricultural purposes is mostly freehold or is being acquired by some form of conditional purchase.

One of the outbreaks of mob violence during the period of the gold rush is given a kind of symbolic importance by certain elements in Australia. Mainly because they objected to the payment of fees for a gold digger's licence, quite a formidable body of men camped behind a stockade on Bakery Hill, Ballarat, in Oct., 1854. One incident led to another, and they declared for the establishment of a republic of Victoria. Five soldiers and 20 or more miners were killed and a good many others injured when at length the military attacked the stockade and dispersed the rebels.

Other outbreaks of mob violence occurred when Chinese appeared in considerable numbers on some of the diggings. After the abolition of transportation in 1840, attempts had been made to import Chinese and other Asiatics, and popular feeling had been aroused. The White Australian policy was not therefore born on the diggings, but it was well nourished there.

Acts were passed in all the colonies from time to time between 1856 and 1880 to restrict Chinese immigration, and in 1896 it was decided to apply to all Asiatics the restrictions hitherto applicable only to the Chinese. The Bills were reserved, and at the Colonial Conference held in London in 1897, Joseph Chamberlain expressed sympathy with colonies that had to live in close proximity to hundreds of millions of Asiatics, but recommended the method of the dictation test incorporated in the Natal Act No. 1 of 1897 as less likely to be offensive.

One of the first Acts passed by the newly constituted Commonwealth parliament was the Immigration Restriction Act of 1901, and Chamberlain's suggestion was adopted. Representations by the Japanese government led to an amendment in 1905 whereby "any prescribed language" replaced "any European language." As the law stands, any intending immigrant may be required to write at the dictation of an officer 50 words in any prescribed language and there have been occasions on which Europeans have been required to satisfy the test.

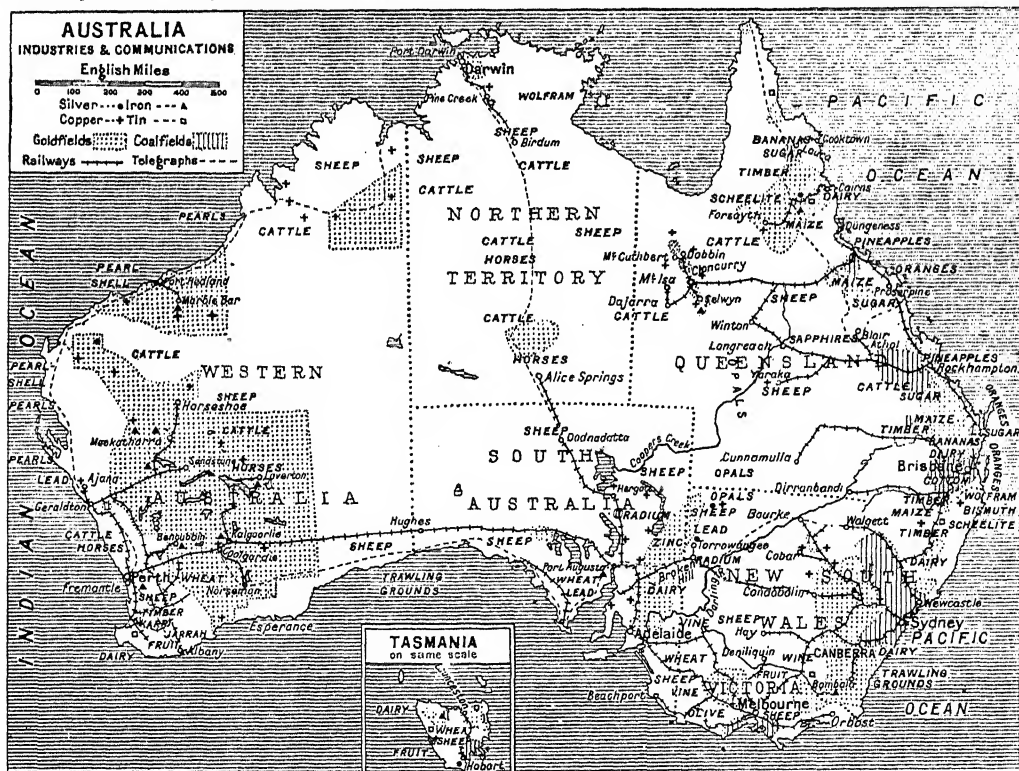

Although the workers demonstrated against the importation of coloured labour and there were small unions as early as 1830, the continuous history of trade unionism in Australia begins about 1850 among the craftsmen of the building trade. By 1874 trade unionism on English craft lines was well established, and it was possible to form an Australian-wide association of miners. In 1894 the Australian Workers' Union was formed, a union which ignored craft lines, and was as wide as the continent. In the meantime, William Lane had made his influence felt on labour thought and a Trades and Labour Council had been formed in Brisbane. Gradually the unions in each main industrial centre were linked together, and in 1927 the Australasian Council of Trade Unions came into existence to function on behalf of all unions in dealing with inter-state industrial disputes or those affecting the movement generally.

The failure of the maritime strike of 1890 led the unions to attempt political action. In 1891 the New South Wales Labour Electoral League formulated the

first labour platform, and on the first opportunity thereafter Labour candidates were offered at the elections. The Labour party has proved itself to be a power to be reckoned with ever since.

The Australian colonies grew up apart, and in course of time vested interests were established in things as they were. In spite, therefore, of the obvious advantages of some form of union for purposes of defence and the removal of trade barriers, various attempts to bring the colonies to accept a common authority failed until a popular movement forced the hands of the politicians and a constitution was drafted. On its first submission to the people this constitution failed to secure the prescribed majority and had to be amended, mainly to ensure that although the Federal Capital might be in New South Wales, it should be at least 100 miles from Sydney. Even after the Commonwealth was established, over 26 years elapsed before the Parliament sat in Canberra, the Federal Capital.

PRESENT CONSTITUTION. The Commonwealth of Australia was established by proclamation as from Jan. 1, 1901. The Federal

Australia. Map of the great southern continent indicating localities of the chief industries, railways, and telegraphs

Parliament consists of the King and two Houses, a Senate and a House of Representatives. The original states have equal representation in the Senate, and in the House of Representatives they are represented proportionately to their populations, except for a proviso that no original state may have fewer than five members. The Northern Territory has a representative without a vote except on matters directly affecting the Territory. Parliaments are triennial, but Senators are elected for a six-year term on a rotational system whereby half the representatives of each state must retire every three years. In the event of a deadlock between the two Houses the Governor-General may dissolve both Houses simultaneously. Executive power is vested in the King and is exercisable by the Governor-General and an executive council responsible to parliament—in other words, the cabinet system, closely modelled on the U.K. pattern, operates in the Commonwealth as it does in the individual states. The judicial power is vested in the High Court of Australia, such other federal courts as the parliament creates, and such other courts as it invests with the federal jurisdiction.

Commonwealth's Veto

The constitution provides for the transfer of certain powers to the Commonwealth, the residuary powers remaining vested in the states. The transferred powers are specifically enumerated or exist by necessary implication. Some are exclusive, *i.e.* exercisable only by the Commonwealth, *e.g.* the power to levy customs and excise and to pay bounties; but most are concurrent, *i.e.* exercisable by the Commonwealth or states, subject to a provision that where a law of a state is inconsistent with a law of the Commonwealth, the latter shall prevail.

The constitution is alterable by referendum after the proposed amendment has been passed by both Houses of the Parliament or twice by one House with an interval of not less than three months between the two passings. At the referendum the proposed amendment must be acceptable to a majority of all the voters in the Commonwealth and to a majority of voters in a majority of the states. Numerous proposals for amendment have been placed before the people with very little result. One important amendment of which the implications were imperfectly realized was made in

1928 when the Commonwealth was empowered to enter into financial agreements with the states and a loan council was established.

In the first Federal parliament Edmund Barton was prime minister and leader of the Liberal protectionists. G. H. Reid was head of the official free trade opposition. There were also 16 Labour members prepared to employ the old tactics well tried in the colonies (now states), of support in return for concessions. This policy was particularly effective after Alfred Deakin succeeded Barton in 1903, but after two very brief terms in office in 1904 and 1908, Labour came to both office and power in 1910. Since then, federal politics has meant the same struggle between Labour and anti-Labour as goes on in the states.

Political Parties

Until 1917 the opponents of Labour were Liberals (or Independents). In that year the Labour party split over the conscription issue and its prominent leaders joined with the opposition members to form the national war government, and a Country party appeared for the first time in Federal politics. In 1931 the national party, anxious to allay any suspicion that it was a class party, renamed itself the United Australia party, and for some time was able to hold office in coalition with or with the support of the Country party. The U.A.P. has now reverted to the old title, and once more there is a party calling itself Liberal.

No party in Australia will call itself Conservative, and few people admit that they ought to be so described. The Communist party is active and influential rather than numerous.

Labour defeated the U.A.P. and Country party in 1929 just in time to inherit the depression. The Labour premier of New South Wales adopted a policy which seems to have reacted adversely on Labour everywhere, and in 1932 the other parties came to power. In Oct., 1941, two months before the Japanese attack on Pearl Harbour, the Labour party returned to office under John Curtin (*q.v.*), who was succeeded after his death in 1945 by J. A. Chifley. The elections of 1946 confirmed Labour's power for a further term.

The constitution, said Alfred Deakin, left the states financially tied to the chariot wheels of the Commonwealth. How true this was, time has increasingly revealed, and the revelation is not

yet complete. The Commonwealth may levy any form of taxation, whereas the states may not levy duties of customs and of excise. The states therefore lost one of their principal sources of revenue, but retained many of the very expensive functions of government, such as education, police, etc. For the first ten years the states were to receive not less than three-fourths of the net revenue from customs and excise, and by Section 96 the Commonwealth may grant financial assistance to any state or states. When the ten years' period expired, the Parliament passed the Surplus Revenue Act, providing for payments to the states of 25s. per head of population. These *per capita* payments continued until the financial agreement by which the Commonwealth took over state debts as at July, 1929, and made a large annual contribution towards the interest bill. Future borrowing was placed under the control of a loan council, on which the Commonwealth has two votes and casting vote.

In 1942 the uniform income tax plan was imposed by parliament. Under this plan the Commonwealth collects the income tax and the states receive specified annual amounts so long as they abstain from imposing an income tax. The plan was in effect imposed upon the states, and the ensuing litigation has served to make it at least probable that the Commonwealth can, if it wishes, continue the plan after its need as a defence measure has ceased.

Disadvantages of Federation

Federation brought incalculable benefits, but its burdens do not fall with equal weight upon all the states. High protection, for example, helps the industrialised larger states more than the primary producing smaller states. The Navigation Act operated, so it is generally agreed, to the special detriment of Tasmania. For many years Western Australia, South Australia, and Tasmania have been chronically unable to balance their budgets without the special grants the Commonwealth is able to make under Section 96 of the constitution. There is, however, a tendency on the part of the weaker states to blame federation for all the shafts of fate. This is well illustrated by the Secession Referendum of 1933 in Western Australia. The state was suffering from the depression and voted for secession. But as the depression passed, the people tended to forget

that they had ever cast a vote against federation with their fellow Australians.

Quite early in its history the Labour party wanted a national bank. The Commonwealth Bank was established in 1911 with an original capital of £1,000,000, to be raised by the issue of debentures. In fact, the bank began operations on a small loan from the government, and the debentures were never issued. The bank was remodelled from time to time until in March, 1945, the Treasurer introduced a bill to make it a true central bank, although a separate division of the bank was to be permitted to engage in general business. It can now control the volume of credit, bank interest rates, foreign exchange, and the gold reserve. The administration rests with the governor, who is assisted by an advisory council on all matters concerning monetary and banking policy.

The question of the financial relations between Commonwealth and the states has attracted but intermittent popular attention. But the tariff has been almost constantly dragged before public notice, for particular interests are vitally affected. The important feature of the first federal tariff (1902) was that it was essentially a revenue tariff, the schedules being arranged to provide some protection for infant industries.

"New Protection"

The first important revision was made in 1908. To secure Labour support for a thoroughly protective tariff, Deakin put forward his scheme of "new protection," whereby some of the benefits conferred on manufacturers by the tariff should be passed on to consumers and workers. The Industries Preservation Act of 1906 provided for high duties on agricultural machinery. The Excise Tariff Act provided for duties on locally made agricultural machinery, which could be remitted if the manufacturer could produce a certificate from the federal arbitration court that he was paying "fair and reasonable" wages. The whole scheme broke down eventually when tested before the high court, but in the meantime, Mr. Justice Higgins, of the federal arbitration court, had been asked to give a certificate to one of the manufacturers of agricultural machinery and had had to decide what was "fair and reasonable." He took as his standard "the normal needs of the average employee regarded as

a human being living in a civilized community." This was not the first, but it was in many ways the most important, declaration of the principle of the living wage as the basic wage below the level of which wage rates could not be allowed to fall.

Until the Ottawa agreements were ratified, the tariff level rose at each revision. A special committee appointed by S. M. Bruce in 1929 had warned that "excess costs" were considerable, but soon afterwards the depression came to dominate economic policy. As a result, since 1932 many duties have been reduced.

Free trade is not an issue in Australia. There is general agreement that the tariff should be used to foster local industry but that its level should be determined only after parliament has considered in detail the careful reports and recommendations furnished by the tariff board.

INDUSTRIAL ARBITRATION. The maritime strike of 1890 showed the people and the colonial parliaments that union affiliation on the one hand, and concerted action among employers on the other, had developed to the point where an industrial dispute was apt to become an event of national importance. During the 1890s the parliaments intervened merely to the extent of providing machinery for conciliation, although an ineffective Act embodying the principle of compulsory arbitration was passed in South Australia in 1894, mainly as the result of the efforts of C. C. Kingston, afterwards a distinguished member of the Commonwealth parliament. By 1901 it had become quite apparent that conciliation did not secure industrial peace, and an Act for compulsory arbitration was passed in New South Wales. Gradually the principle of compulsory arbitration was adopted, with or without wages boards and other machinery for conciliation, in all the states.

Conciliation Courts

The Commonwealth court of conciliation and arbitration began to function in 1905. The Commonwealth's power is limited by the constitution to "conciliation and arbitration for the prevention and settlement of industrial disputes extending beyond the limits of any one state." The court therefore has jurisdiction only where there is a dispute, and where the dispute involves parties in two or more states. Its awards bind only the parties to the dispute since the

court has no power to make a "common rule" except for industries in Federal territory.

Employers and employees not bound by Commonwealth award are subject to state control, but any state law, or award of a state court, that is inconsistent with a Commonwealth award, is invalid to the extent of the inconsistency. In other words, a Commonwealth award is paramount.

As a result of this dual system, there is some conflict of industrial authority, and there was at one time a good deal of overlapping. Most of the worst difficulties have been overcome. If the system breaks down, it will not be because it is too intricate or too clumsy, but because one side or the other challenges successfully the power of the state to enforce the decisions of the courts.

EDUCATION, ETC. Each state has its university, and there is a university college at Canberra. The universities are supported partly by grants from the governments, partly by fees and endowments. Control is vested in a senate or council for each. Before the outbreak of war the total enrolment was in the vicinity of 12,000. Between 75 and 80 p.c. of all children attending school are enrolled in public (i.e. state) schools. These are of all grades, nursery or kindergarten, primary, various types of post-primary, and secondary and technical. Education is free, compulsory, and non-sectarian. The school-leaving age in New South Wales is 15 years, in all other states 14 years. Illiteracy is almost unknown. Public interest in the school system is keen, and a great deal of thought is devoted to making it efficient.

Social Services

Social services are varied and well developed. The states are mainly responsible for assisting or establishing hospitals, infant welfare centres, and schools. Old age pensions, invalid pensions, maternity endowment, etc., are provided by the Commonwealth. The Commonwealth also makes itself responsible for certain important branches of research, e.g. the Council for Scientific and Industrial Research, the Australian Institute of Anatomy, the Commonwealth Solar Observatory, and the Commonwealth Bureau of Meteorology. The Australian Council for Educational Research has a Commonwealth endowment. There is no established or state-aided church in any state of the Commonwealth.

LITERATURE, ART, MUSIC. When it is realized that a little over a hundred years ago Australia was a penal settlement and that for the greater part of its short history the national energies have been absorbed in the struggle with a strange and intractable environment, Australian contributors to art and literature will be seen in better perspective. The early artists, of whatever medium, endeavoured to see Australia through English eyes and to judge its life by English standards. The result may have been art, but it was not Australian. Kingsley's *Geoffrey Hamlyn* (1859) and Marcus Clarke's *For the Term of His Natural Life* (1870-72) are usually recorded as the first great Australian novels. Rolf Boldrewood's *Robbery Under Arms* is not as good a book, but has more of the Australian landscape. A number of Australian writers have enjoyed a considerable vogue, and some have produced work of lasting value. Steele Rudd's *On Our Selection*, though not strictly a novel, is a humorous presentation of life as it was lived on the small selections in the pioneering "free selection" days. Mrs. Aeneas Gunn's *We of the Never Never* and *The Little Black Princess* are good studies of life in the Northern Territory. Ada Cambridge, Tasma, Ethel Turner, Edward Dyson, Katherine Susannah Pritchard, Brent of Bin Bin, Henry Handel Richardson, and the two women who write under the name of M. Barnard Eldershaw all deserve mention.

The best known of the early attempts at poetry were those of Barron Field, friend of Charles Lamb, the judge of the New South Wales supreme court, but the earliest true poet born in Australia was Charles Harpur. His best work was *The Creek of the Four Graves*. Henry Kendall was a musical lyrist, but over-imitative of the English models. Adam Lindsay Gordon's *The Sick Stock-rider* was one of the best of the earlier ballads, though never so popular as those of A. B. Paterson and Henry Lawson. The latter

will also be remembered. Christopher Brennan is a contemporary poet of the elect whose symbolism makes him incomprehensible to the many.

It is only within comparatively recent times that painters have been able to reveal the peculiar beauties of the Australian landscape. Art in Australia owes much to Tom Roberts, Conder, and Streeton and to such teachers as Bernard Hall, Max Meldrum, and Julian Ashton. Hans Heysen, Blamire Young, J. J. Hilder, and Elioth Gruner have produced landscapes of great charm and delicacy. Etching has been practised with skill and distinction by Sydney Ure Smith, Lionel and Norman Lindsay, and others, and portrait painting by Lambert, Longstaff, McInnes, and William Dobell. The best known Australian sculptor was Sir Bertram MacKennal, R.A. Phil May, though not an Australian, did some of his best work in Australia, and Will Dyson, born at Ballarat, and David Low, a New Zealander, first established their reputations in the Commonwealth.

Several Australian singers have attained fame. The most famous name is that of Dame Nellie Melba, but Florence Austral, Marjorie Lawrence, Peter Dawson, and John Brownlee are also worthy of note.

Population, Commerce, Communications

The following were population figures estimated in 1945:

N.S.W.	2,893,656
Victoria	2,010,927
Queensland	1,075,787
South Australia	627,490
West Australia	489,691
Tasmania	247,379
Northern Territory	5,220
Federal Capital Territory	14,691
Commonwealth	7,364,841

The immense developments which took place during the Second Great War render many pre-war statistics largely obsolete, while statistics of the war period are of uncertain significance as pointers for the future. Certain lists have been selected as representative of the pre-war position. External trade for year ended June 30, 1939:—

Imports Sterling	Exports Sterling	Total Sterling	Value per inhabitant		
			Imports £ s. d.	Exports £ s. d.	Total £ s. d.
£99'3 mill.	£96'4 mill.	£195'7 mill.	14 6 9	13 13 3	28 5 0

was not only a genuine poet but a short-story writer of outstanding talent. Bernard O'Dowd, John Farrell, and George Essex Evans

As to exports, normally about 90 p.c. of the wool, 80 p.c. of the wheat, and appreciable proportions of meat, dairy produce,

dried fruits, and other primary produce have to be marketed outside Australia. About 50 p.c. of all Australian exports go to the United Kingdom; 16-20 p.c. normally go to other European countries; 11-14 p.c. to U.S.A., Canada, New Zealand, and South Africa; about 5 or 6 p.c. to other countries. Of the principal exports, from 30 to 40 p.c. of the wool, from 50 to 60 p.c. of the wheat, and from 80 to 90 p.c. of the butter and cheese exported go to the United Kingdom.

Of imports, about 40 p.c. of all kinds come from the United Kingdom; Australia usually ranking third among all countries buying British goods. About 5 p.c. of Australian imports used to come from Japan and about 12 p.c. from the United States.

Comparative figures of revenue and expenditure in the pre-war quinquennium are shown in the table on page 795.

In these years there were 27,165 m. of rly. open and 562,271 motor vehicles registered. There were 296 air line aircraft, flying 14 million m. a year and carrying 147,919 passengers, 1,734,644 lb. of goods, and 470,375 lb. of mail.

In 1938-39 the wool crop totalled 985 million lb., valued at £43,700,000. from about 113 million sheep. Australia has about one-sixth of the world's sheep, and provides about one-quarter of the world's wool and about half its fine quality merino wool.

THE FIRST GREAT WAR. The first Commonwealth Defence Act, 1903, made all males between 18

and 60 years of age liable for military service. In 1911, universal military training

was introduced following a report by Lord Kitchener. Until 1913 Australia had paid a naval subsidy to Great Britain, but in that year the battle cruiser *Australia* and two cruisers, *Sydney* and *Melbourne*, arrived to form the nucleus of the Royal Australian Navy.

At the outbreak of war in 1914, therefore, Australia had a fairly complete military establishment and a small but up-to-date fleet, and was able to render valuable aid to the Empire. The ships served in every quarter of the globe, about 328,000 men served overseas. Casualties sustained represented 68 p.c. of enlisted men. War expenditure exceeded

£600,000,000. German colonial possessions in the Pacific were occupied. The German raider Emden was destroyed in a duel with H.M.A.S. Sydney. The Australians served with their

part in patrol work, mine-sweeping, coastal bombardment, etc. Australian airmen in British planes were over the beaches at Dunkirk and took part in the battle of Britain.

Australia. Revenue and Expenditure for five years before the Second Great War

brothers - in - arms from New Zealand as the Anzacs at Gallipoli. They fought at Pozzières, Mouquet Farm, the Ypres Salient, Bullecourt, Messines, Passchendaele, and Villers-Bretonneux. As a compact army under their own general, they shared in the final great offensive which broke through the Hindenburg line. Meanwhile, the Anzac mounted division was fighting in Sinai and Palestine, and small detachments were in Mesopotamia, N. Russia, and the Caucasus.

THE SECOND GREAT WAR. In 1939 Australia had little more than a skeleton of a military establishment, and a navy consisting of 5 modern cruisers (including H.M.A.S. Perth, just then being taken over), 1 old cruiser, and 5 last-war destroyers. The country had no really modern aircraft. In June, 1945, the effective strength of the Australian forces (army, navy, and air force) was estimated at 548,000; by that time 92,000 casualties had been sustained.

Australian troops were in the Middle East early in 1940. They fought in North Africa, Greece, and Crete, and played a notable part in the siege of Tobruk and at the battle of Alamein.

The Royal Australian Navy was in the Mediterranean and Indian Ocean before fighting against the Japanese. In the Mediterranean H.M.A.S. Sydney destroyed the Italian cruiser Bartolomeo Colleoni by gunfire and damaged the Barde Nere, a sister ship. The Australian destroyer Stuart sank two Italian cruisers in a midnight attack near Matapan. Others took

After the entry of Japan into the war Australian troops fought in Malaya, at Singapore, in New Guinea, Timor, New Britain, the Solomons, Borneo, and elsewhere.

The navy took an important part in the defence of Indonesia and assisted the American fleets in all parts of the south-western Pacific. H.M.A.S. Sydney was mysteriously lost in 1942 after or while destroying a German raider. The cruiser Perth was sunk during a battle in the Strait of Sunda and the Canberra was lost in the Solomon Islands. The sloop Yarra and the corvette Armidale were also lost after doing good service. H.M.A.S. Australia was badly damaged in the Philippines.

What there was of the Australian air force was nearly destroyed when the Japanese attacked New Guinea and New Britain; but a considerable force well equipped with modern planes was in existence when the war ended, having harried the Japanese wherever they could be reached. Australia also contributed her quota to the Empire Air Training Scheme.

The war led to an immense development of Australia's secondary industries. At the cost of £250,000,000, 45 new factories and 178 government controlled annexes were built and it is estimated that 900,000 people were engaged in industries directly related to the war effort. Australia produced field guns, anti-tank guns, 4.7-inch naval guns, anti-aircraft guns, 20-mm. aircraft cannons, Bren guns, and mortars. Australian types produced were the 25-pdr. short field gun for

jungle use, the Austin sub-machine gun, the Owen sub-machine gun, and the Australian cruiser tank. New industries established included the manufacture of ball-bearings, extraction of nitrogen from the air, production of magnesium, optical glass, stainless steel, tungsten carbide tool tips, zircon for steel hardening, aero-engines and aircraft. The cost of the war to Australia was £2,111 millions. In 1947 it was announced that the Australian forces would be: navy, 26 ships in commn. (79 in reserve); army, 19,000 men; air force, 16 sqdns. Research on rocket weapons was begun at Woomera (*q.v.*).

Australian Aborigines. Primitive race found inhabiting the Australian continent by its European discoverers. The present number of these "blackfellows" probably does not exceed 50,000. Their arrival in a remote past is deduced from their physical characters, primitive culture, diverse and undeveloped speech, and the absence of words for numbers beyond four. There are no stratified remains, but extensive kitchen-middens are not unknown.

In Australia a primal occupation by an Eolithic race, entering from the N. before the frizzy-haired Papuan was specialised, seems to have been followed by a Palaeolithic race, perhaps Mousterian, who crossed pre-Dravidian India and left the Veddas behind them. They brought with them no pottery, bow and arrow, domesticated plant, nor animal—except, perhaps, the warrigal or dingo—and no specialised tool except the womera, or spearthrower, and another weapon afterwards developed into the boomerang. They drove the older people into the S.E., with some intermingling, but no serfdom, until these crossed Bass strait and survived as the Tasmanians. The northern tribes were influenced culturally from Malaysia.

The uniformity of the physical type supports this view. Prominent brow-ridges, receding forehead

broad-based nose with notched root, thick lips, long-headed skull, small brain, tall stature, are paralleled in prehistoric Europe; chocolate-brown skin, wavy or nearly straight black hair, and other Caucasian attributes may also be palaeolithic. The flat-headed skull and other primitive characters are most marked in the south.

The food quest of these nomadic hunters was conditioned from the first by the lack of domestication. Wild roots need no implement but the women's digging stick. Moths and grubs are of importance in the dietary. Fish and emu may be poisoned by pituri, from a narcotic plant allied to tobacco, whose place it takes in the aboriginal life. While human flesh was never a regular article of food, all the motives for cannibalism are represented. Ignorant of metals, the local technologist developed some neolithic features, such as the polished axes of the Arunta, bone awls, shell cutters, wood shields, and fanged spears. Clothing, if used, may comprise a hair net and a fur tassel or a shell, held in place by a grass or hair cord, although even these may be used only at the corroboree.

In the S. a winter cloak of bark or skin may be used. Ornament includes a film of fish oil or a pattern of ochre, a kangaroo-tooth necklet, or a bushy tail in the hair. Savage ornament easily passes into mutilation, such as the nose-pin and the removal of teeth, both affecting language by eliminating such consonants as f and s. Dwellings are usually little more than wind-screens, barked or leaved, with the occasional use of caves. The seamless bark canoe is characteristic; the sewn bark canoe, like the outrigger, is due to Melanesian infiltration.

The "Bora" Ceremonies

Initiation into adult life occurs at the 'bora' ceremonies. To the mutilations already mentioned should be added scar-tattooing, circumcision, and for the central area a severer rite unknown elsewhere. The bora ground is specially prepared with earth reliefs of tribal animals and other devices, whose secret meaning is disclosed to the novices, the women being warned to avoid the mysteries by the divine voice of the bull-roarer. The tribal areas are small, and may exceed 200, each having its headman and informal council, hereditary chiefs being rare. Most tribes are divided into two phratries, whose members may not intermarry, and the further subdivision of each phratry into two or four classes limits the marital choice still more. These classes

may have been designed to secure, not exogamy as such, but a fair distribution of the food stock.

Each member of a tribe has a totem usually chosen from the animal world, but in the N. tending to include plants, and the rule forbidding the indiscriminate use of one's totem as food reflects its animistic side. For invitations to bora or corroboree message-sticks are used whose memory-aiding signs suggest the threshold of writing. The ground-drawings prepared at initiations have a magical intention, like the designs that adorn the churinga. But in several places mural paintings of animal and human forms, with scenic compositions—some recent, some of unknown age—together with stencilled hands, recall the art of prehistoric Europe.

Practice of Infanticide

The practice of infanticide, under the impulse of hunger or tribal usage, is not inconsistent with kindness and affection. Woman is a chattel, and owes little to ancestral matriarchy. The customs attached to the disposal of the dead—in tree, earth, or cave—with smoke preservation and cremation here and there, attest an inherent belief in an after-life. The religion is a low animism with some magical adjuncts, which find their expression, as among the Warramunga, in much ceremonial pantomime. There is no fetishism, prayer, or sacrifice; but a copious mythology has been claimed, especially in the S.E., to betoken a more or less inarticulate recognition of an All-Father. See *Anthropology*; Man. See illus. p. 41.

Australian Alps. Mt. range in S.E. Australia. It extends for roughly 300 m. from Melbourne to the federal capital at Canberra. The S. portion, in Victoria, to which the name is more strictly applied, is a wide plateau with heights, Bogong 6,508 ft., Feathertop 6,300 ft., Hotham 6,100 ft., Buller 5,930 ft.

N. of the border within New South Wales the plateau narrows, and the names Snowy Mts. and Kosciusko Massif are applied to the more elevated S. portion. Here Kosciusko, 7,328 ft., and Townsend, 7,260 ft., near the head-waters of the Murray river, are the main heights. The whole area is snow-

capped in winter, and snow lies in the sheltered hollows near the tarns most of the year. Overlooking Canberra, Bimberi rises to 6,264 ft. The S.W. portion is known as the Great Dividing Range, and still further W. as the Pyreneces.

The whole system is due to erosion, the mountains being technically known as residuals or mountains of circumdenudation. The uppermost rocks of the present peaks are the remnants of a plain that was formerly continuous between them. This plain gradually rose and, as it rose, the original river system carved out valleys, which were cut down steadily as the plain was elevated. The Australian Alps are thus a dissected peneplain, and in this regard resemble the Grampians of Scotland. They form part of the Main Divide, which forms the watershed between the short rivers, such as the Snowy river, which flow to the E. and S.E. coasts, and the great fluvial system of the Murray-Darling. Both the Murray and the Murrumbidgee have their source in the Kosciusko Massif.

The range has many forested areas, chiefly yielding giant eucalypts, and provides Australians with opportunities for winter sports, while the scenic beauties, limestone caverns, and other natural attractions make the Australian Alps a popular resort of tourists.

Australian Bight, GREAT. An opening of the ocean S. of Australia. From Cape Arid in W. Australia to Eyre Peninsula in S. Australia the bight forms an arc 1,600 m. in length, although the distance straight across the water is but 700 m. In S. Australia, W. of the head of the bight, the coast is a limestone scarp varying in height between 150 and 250 ft.; eastwards to Fowler's Bay there are hills of blown sand which reach a height of 180 ft.; in all this stretch of over 300 m. there is neither anchorage nor landing place. E. of Fowler's Bay the coast consists of a series of headlands, bays, islands, and inlets with submerged reefs. Here is Streaky Bay, the only safe anchorage in the bight. In the bight itself the continental shelf is wide, extending roughly 200 m. from the coast; beyond it the ocean floor drops in the next 200 m. from 100 to more than 3,000 fathoms to a great ocean trough, Jeffrey's Deep. Eucla, Eyre, Elliston, and Flinders are small settlements.

Australian Feather-Palm (*Archontophoenix*). A small genus of tall palm trees with straight, unarmed stems and large feather-like leaves. The Ilawarra Palm (*A. Cunninghamia*), a native of Queens-

land and New South Wales, grows to a height of 70 ft. to 80 ft. *A. Alexandrae*, a native of Queensland, closely resembles the first species, but differs in having pink flowers; in *A. Cunninghamia* they are dull yellow.

Australian Flights. The first aeroplane flights to Australia from the U.K. and America were made by Australians. The initial flight was made by Capt. Ross Smith, Lieut. Keith Smith, Sergeants W. H. Shiers and J. M. Bennett, in a Vickers Vimy bomber. Leaving Hounslow airport, London, on Nov. 12, 1919, they reached Port Darwin on Dec. 10, winning the prize of £10,000 offered by the Australian government for the first flight by Australians between England and Australia within 30 days. Flying in 24 stages, they averaged 82 m.p.h. over the 11,060 m. Both officers received the K.B.E., and the sergeants the A.F.M. The aircraft flew on to Sydney, Melbourne, and Adelaide.

The first double flight between the U.K. and Australia (5 weeks) and return (27 days) was made in 1926 by Alan J. Cobham (afterwards created K.B.E.) and a mechanic, in a D.H.50.

The first passenger light aeroplane flight to Australia was made between Oct. 14, 1927, and March 19, 1928, by Capt. W. N. Lancaster in an Avro Avian, with Mrs. Keith Miller as passenger. Meanwhile, in Feb., 1928, H. J. L. (Bert) Hinkler made the first solo flight, also in an Avian, establishing a new record of 15½ days from London to Darwin.

Between May 31 and June 10, 1928, Capt. Chas. Kingsford-Smith with C. T. P. Ulm, Lieut. H. Lyons, and J. Warner made the first flight from America to Australia in a Fokker F.VII, flying from Oakland, Calif., via the Hawaiian and Fiji Is. to Brisbane. Six years later Kingsford-Smith with Capt. Taylor made the first flight in the reverse direction in a Lockheed Altair, leaving Brisbane Oct. 22 and arriving Oakland on Nov. 4. Kingsford-Smith was knighted, 1932.

In May, 1930, Amy Johnson, flying a D.H. Moth, made the first solo flight by a woman, reaching Australia from England in 19½ days (created C.B.E.). In Oct. of the same year Kingsford-Smith, flying an Avian, reduced the time for the flight to 9 days, 21 hrs. 40 min. In April, 1931, C. W. A. Scott, in a Moth, reduced this time by 17 hrs. 29 min., and six months later C. A. Butler, in a Comper Swift, brought the time

down to 9 days, 2 hrs. Next year Scott made the journey in 193 minutes under 9 days. In 1933 Kingsford-Smith, flying solo in a Percival Gull, cut the time to 7 days, 4 hrs. 44 min., but 8 days later Ulm, with G. V. Allen, P. G. S. Taylor, and J. Edwards, made the passage in an Avro Ten in 6 days, 17 hrs. 45 min.

Australian Flights. Crew of the first flight: left to right, Sgt. W. H. Shiers, Lieut. Keith Smith, Capt. Ross Smith, and Sgt. J. M. Bennett. Above, Amy Johnson at Port Darwin after her historic solo flight in May, 1930

For the England-to-Melbourne MacRobertson air race de Havillands produced a remarkable new aircraft, the Comet, in one of which Scott and T. Campbell Black left Mildenhall, Suffolk, on Oct. 20, 1934, and reached Melbourne 71 hrs. 18 sec. later.

Following experience gained in two experimental air mail trips in 1931, regular air transport for passengers, mail, and freight between London and Australia began on Dec. 8, 1934, with Imperial Airways operating westward and Qantas Empire Airways eastward of Singapore. At first mainly a landplane service, this became a through seaplane route on June 26, 1938, using Short Empire flying boats. The time schedule was 9½ days between London and Sydney, with three services weekly; unsurcharged mail was carried from July 28, 1938.

During the Second Great War when the Mediterranean route was closed, the western terminus of the Australia air route was located at Durban, Natal, with a sea connexion thence to England. Air traffic passed via Palestine and Singapore on a route known as the horseshoe route. Japanese occupation of Malaya, the Nicobar Is., and Indonesia cut the route completely until Catalina flying boats and Liberator and Lancasterian landplanes spanned the 3,563 m. between Ceylon and Australia non-stop.

In the summer of 1945 the B.O.A.C.-Qantas air service between England and Australia was the fastest long-distance air route, with a twice-weekly service in each direction in 63 hrs., stopping at Lydda, Karachi, and Ceylon.

Re-opening of the Singapore-Darwin route was found possible in 1946.

In Aug., 1946, the famous Lancaster Aries, with an R.A.F. crew captained by Sqdn. Ldr. J. E. Aldridge, broke all records to Australia and on to New Zealand. The time from Blackbushe (Eng.) to Darwin (Austr.) was 46½ hrs.

Air transport services between the U.S.A. and Australia were long delayed through failure to agree on reciprocal rights for the combine formed from the British, Australian, and N.Z. governments' chosen instruments. But by 1946 U.S. and Australian lines had begun a joint regular service between San Francisco and Sydney. For later information see N.V.

Australian Wines. Wines produced from European plants, but naturally influenced by local soils and climate. The soil being largely virgin and often ferruginous, and the climate dry and warm, the wines are usually harder and stronger than their European prototypes. The growers have given them distinctive titles, such as Tintara, Kangaroo, Emu, etc. As lighter varieties cannot stand the lengthy sea-voyage to Europe, only the heavier, stronger varieties as a rule reach England.

Austrasia. Name given in the 7th century to a kingdom of the Franks, including much of the E. part of modern France, and also a certain part of modern Germany. Metz was its capital. For over a hundred years the country had its own line of petty sovereigns. In the 8th century it was united with Neustria to form the larger kingdom of the Franks.

AUSTRIA: HISTORY OF THE REPUBLIC

Robert Spira, LL.D. (Vienna), B.A. (London)

The writer deals with the political significance of this European state from its first creation as a duchy to its re-emergence as an independent republic after the Second Great War. See also Vienna and other Austrian towns, and under Austria-Hungary; Germany; Russo-German Campaign, etc. For later information see N.V.

Though Austria has been a recognizable entity in Europe since the 12th century, the Austrian republic is a 20th century state, formed out of the fragments of the Austro-Hungarian empire. Its frontiers were provisionally defined in the treaty of St. Germain, Sept. 10, 1919. It includes the provs. of Salzburg, Upper and Lower Austria, Vorarlberg, Burgenland, Tirol, Carinthia, and Styria. Some districts amputated from the three last-named provs. went partly to Italy and partly to Yugoslavia.

The boundary between Austria and Switzerland remained unchanged; to Italy was given part of Tirol (south of the Brenner) and the Sextenthal and the parts south of it: a small part of Southern Carinthia was given to Yugoslavia as well as Styria south of the Drave with the territory near Maribor. In the E., Austria gained at the expense of Hungary the greater part of the prov. of Burgenland: the new frontier runs from a point N. of Radkersburg to the S. of the Neusiedler See, and thence to the Danube just W. of Bratislava.

POPULATION AND INDUSTRIES. Austria consists of two parts, one lying astride the Middle Danube and a second one, the Alpine

region which is traversed by mt. ranges. It is watered by tributaries of the Danube, Inn, Enns, Muerz, Mur, and Drave.

It includes approximately 32,000 sq. m. with a population of about 6,500,000. Nearly all speak German as their mother-tongue. Before the Anschluss of 1938, 94 p.c. were Roman Catholics, 3 p.c. Protestants, and 3 p.c. Jews (the last-named were nearly exterminated by Hitler).

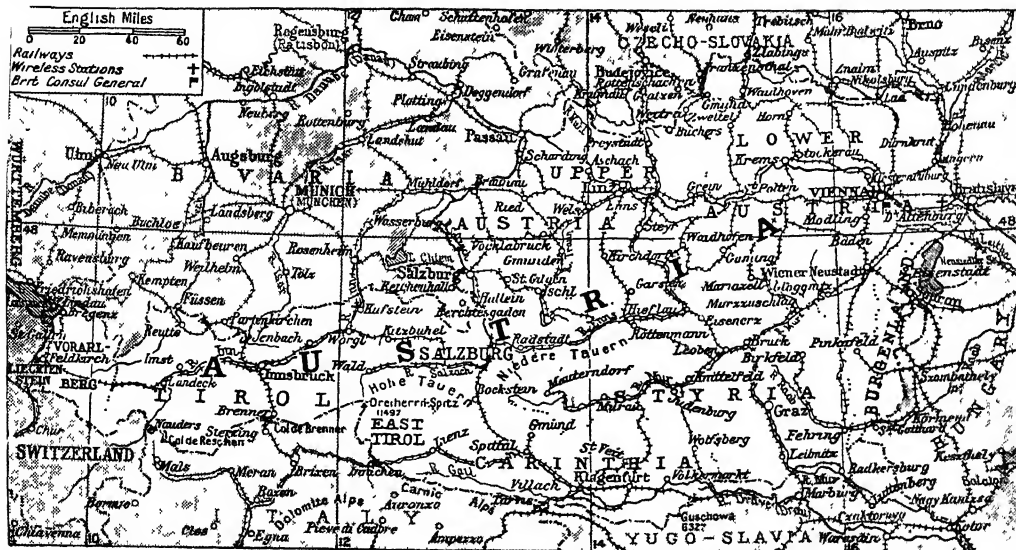

The chief towns and their populations as estimated in 1945 are Vienna, 1,418,900; Graz, 152,841; Linz, 108,970; Salzburg, 63,231. Innsbruck, 61,005. The percentage of arable land is generally low and grain and meat are imported. The forests are extensive and produce large quantities of timber. The chief minerals are iron, lead, zinc, and magnesite. Coal is only to be found in small quantity and poor quality. The oil production is now considerable. Lower Austria, especially Vienna, is the centre of manufacturing industries. Austria is now quite cut off from the sea.

HISTORY BEFORE THE HAPSBURG. When Augustus brought these provs. under Roman rule they were inhabited by Celtic tribes. Under the successors of Augustus, Vienna, then known as Vindobona

became an important frontier post of the Pannonian prov. Pillaged by the Huns of Attila, Vindobona disappeared in the 6th century, when the plain of the Middle Danube was overrun by the Avars. Meanwhile the South Slavs had made their appearance between the Danube and the Adriatic in the 8th century, and occupied Styria, Carinthia, and E. Tirol.

In 791 Charlemagne created the Ostmark in the land between the Enns and the Wiener Wald. It was given in 973 by Otto the Great to a Franconian family, the Babenbergs. This dynasty extended its territory E. to the rivers March and Leitha, and N. to the fringes of the Bohemian and Moravian mts.; on the S. it acquired Styria in 1192. The Ostmark was made a duchy by Frederick Barbarossa in 1156; from that time it was known as Austria (the vernacular Ostarreich). Vienna, which had been resettled as early as 1030, became the residence of the first duke.

After the extinction of the Babenbergs in 1246 their lands were annexed by Ottokar II of Bohemia, with Carinthia and Carniola. But this union between the Czechs and the South Slavs was soon destroyed. Rudolf I, the first Hapsburg to obtain the German empire, defeated Ottokar and bestowed Austria, Carniola, and Styria upon his sons. From 1282 to 1918 the Hapsburgs ruled continuously in Vienna. The remaining provs. of German Austria fell into their hands at various

Austria. Map showing the boundaries of the Republic as defined by the Peace Treaty of 1919, including the south portion which, after a plebiscite of the inhabitants, remained Austrian territory

dates: Carinthia in 1335 and Tirol in 1363. This area of about 50,000 sq. m. was the inheritance passed by Charles V in 1556 to his brother Ferdinand. In 1779 Joseph II extorted from the Wittelsbachs of Bavaria the district of the Innviertel. Salzburg was given by Napoleon to the emperor Francis II in 1805.

The Hapsburgs, rulers of Austria, were at the same time (1273-1804) nearly uninterruptedly the emperors of the Holy Roman Empire of the German nation; for this reason the history of Austria is interwoven with that of Germany. Francis II, however, discarded in 1804 the title of a German emperor and proclaimed himself emperor of Austria. By this resignation the fact was acknowledged that the Hapsburgs' (and Austria's) influence on the German states was on the decline. During the years 1804-1866 the Austrian emperors tried in vain to keep part of this influence in different ways. This issue—the struggle for the supremacy in Germany between Austria and Prussia—was brought to a decision by war. Austria was defeated by Prussia in 1866 and lost her voice in German affairs.

The Austrian emperor Francis Joseph (1848-1916) had to confine himself to the task of uniting 12 different nations in Central Europe. To this end he created in 1867 the Dual Monarchy of Austria-Hungary which was to last until the end of the First Great War in 1918. Austria, which in 1914 had a population of more than 30 millions consisting of 9 nations, apart from Hungary, was in most respects self-sufficient. (See Austria-Hungary.)

Constitution of 1867

Austria herself received in 1867 a new constitution and parliament. But the regime remained at least partly autocratic and the hegemony of the German aristocratic, military, and bureaucratic ruling class over the other eight nationalities was left untouched. The resistance of these nations against this hegemony grew in strength from year to year. Some attempts were made to find a compromise between the different nations but failed chiefly because the parliament was not the true expression of the will of the people, who were mostly disfranchised. Universal suffrage was not granted before 1907, and then it was apparently too late to solve the national problems in a democratic way. The empire broke up into several states as an immediate consequence of defeat in war.

THE REPUBLIC UNTIL THE TREATY OF GENEVA. The last emperor Charles I tried towards the end of the war to give the nations autonomy on a federal basis. But the Polish, Czechoslovakian, and Yugoslavian provs. were already about to establish their independent status. On Oct. 21, 1918, the German members of the Austrian parliament constituted themselves a provisional national assembly declaring the right of self-determination for the German-speaking provs. of Austria. On Oct. 30 they selected a council of state consisting of Social-Democrats, Christian-Socialists, and Pan-Germans which elected the government with the Socialist leaders Karl Renner as chancellor and Victor Adler as foreign minister (Adler died shortly afterwards and was succeeded by Otto Bauer). The provisional assembly declared for the establishment of a republic and for union (later renounced) with Germany. On Nov. 11 Charles renounced all participation in the business of state, left Vienna, and went to Eckartsau, an old castle which he left in March, 1919, for Switzerland.

On Nov. 12 the republic of Austria was proclaimed. On Feb. 16, 1919, elections for a constituent assembly took place on a proportional basis. The Social-Democrats received 69 seats, the Christian-Socialists 63, and the Pan-Germans 24. A coalition ministry was formed with Renner as chancellor. In June, 1919, Renner left for the peace conference at St. Germain. The treaty reduced the territory of Austria to one-eighth that of the former Dual Monarchy. Austria was declared an independent state, which meant renunciation of the Anschluss with Germany. In Sept., 1919, the assembly authorised Renner to sign the treaty of St. Germain. Next year the Socialists cancelled the coalition and asked for a new election. A new constitution was accepted in Oct., 1920, conveying the main power in directing the affairs of the state to the national assembly. The second chamber, the federal council, was more or less meaningless. The state was to be a democratic federation, consisting of the 8 provs., to which was to be added the capital Vienna, each with a separate legislative right which, however, was under a certain control of the central power. The rights of the federal president were very limited.

The national assembly was elected in Oct., 1920. The Christian-

Socialists became the strongest party (without obtaining the majority) and received 82 seats, the Socialists only 66, and the Pan-Germans 26. Hainisch, a non-party economist, was elected first president of the republic. After a short-lived ministry (under the Christian-Socialist Mayr) the police president of Vienna, Schober, formed, in June, 1921, a cabinet chiefly of non-party members. He resigned in May, 1922, and the Christian-Socialist prelate Seipel formed a Christian-Socialist government with the support of the Pan-Germans. As economic conditions became unbearable owing to the irresistible decline of the Austrian currency, he succeeded in obtaining a loan from the League of Nations of £30,000,000 to stabilise the Austrian currency. Great Britain, France, Italy, and Czechoslovakia guaranteed this sum in the protocol of Geneva (Oct., 1922) and Austria was placed under strict financial supervision. These continual governmental changes reflect the unstable political and economic conditions in the post-war period.

Economic Depression

The Austrian republic was a disabled organism. The economic, industrial, and administrative apparatus of Austria and especially of Vienna was planned for the needs of fifty million people and so Vienna became a head without a body. Austria was severed from her former markets and sources of raw material. All national states erected economic barriers against her to make themselves economically self-sufficient. The Allies did not give up the economic blockade. Even the provs. of the new republic separated themselves economically from the socialist capital. The food situation in Vienna became hopeless: industrial production almost came to a standstill through lack of raw material and coal. The home coal production was only one-half p.c. of the requirement. Only through the help of the Allies could the country be fed. Added to this was political unrest, the struggle between Socialists and Communists, which the Socialists finally won. The Socialist leader Deutsch founded a people's bodyguard which became afterwards the bulk of the federal army.

But owing to the help of the Allies and the general economic prosperity in Europe after the war, these adverse conditions were to be overcome in less than two years. Whereas in May, 1919, the

number of unemployed was 185,000, it fell in the autumn of 1920 to 15,000. The economic reconstruction and the political situation enabled the government to carry out a number of social reforms such as the establishment of the 8-hour working day, of works councils, chambers of labour, unemployment insurance, etc. These figures show the upward movement of exports:

	2nd half of 1919	1920	1921
	Centners (hundredweights)		
Paper goods	310,680	957,056	1,144,300
Machines	125,441	411,642	538,015
Imports rose in similar proportions to exports.			

But the world prosperity was followed by a crisis which affected Austria as well. The increasing devaluation of the Austrian currency produced a heavy adverse trade budget which could only be overcome by increasing the number of banknotes issued, so that devaluation was aggravated from month to month and even from day to day. This is shown in the rise of the Swiss franc compared with the Austrian crown. The Swiss franc, having risen at the end of 1919 to 33 crowns, reached on June 1, 1922, 2,150 crowns; on July 14, 5,248 crowns; on August 25, 15,993 crowns. Then the devaluation of the crown stopped owing to the loan given by the Geneva agreement. But the consequences were already disastrous. Most fortunes were destroyed. This made the bourgeoisie hostile to the workers, who were comparatively better off; hence the political rallying of the middle class round the Christian-Socialists, who grew in number and political power.

Democracy and Fascism

Seipel remained in power from 1922 to 1929 (with a two-years' interruption). In March, 1925, the now stabilised Austrian currency was based on the Austrian schilling (about two-thirds of the British shilling). This period saw a certain economic prosperity in accordance with the general European development. But the political divergence between the Socialists and their opponents increased. Both built up their already existing armed guards: the bourgeoisie the Heimwehr, and the Socialists the Republikanischen Schutzbund. Both armed forces held their parades near one another, which led to skirmishes, with dead and wounded. In 1927 on such an occasion two Socialists were wounded and a boy killed, but the accused were acquitted by a jury

in Vienna. The workers in Vienna became embittered; there were riots throughout the city on July 15, 1927. The Socialist leaders proved powerless and the main law court in Vienna was set ablaze; 84 were killed and many wounded by the police. A general strike was put down with the help of the Heimwehr, which from then onwards increased extraordinarily in power. The tension grew between government and Socialists, and Seipel resigned in April, 1929. After a short interval Schober formed a chiefly non-party government and tried to bring about a disarming of Heimwehr and Schutzbund. Prince Starhemberg was made chief of the Heimwehr, threatened a *coup d'état*, and refused disarmament. Schober had to give way in Sept., 1930, to the Christian-Socialist Vaugoin, who formed a government with two members of the Heimwehr (now a political party as well).

In Nov., 1930, the last elections of the republic took place. The Socialists now received 72 seats, the Christian-Socialists 66, the Heimwehr 8, and the Pan-Germans (headed by Schober) 19. Vaugoin was replaced by the Christian-Socialist Ender, who appointed Schober as foreign minister.

Customs Union with Germany

By 1929 an economic crisis confronted all Europe, including Austria, where by 1934 the number of unemployed had risen to 400,000. Austria looking round for help, Schober concluded in March, 1931, a customs union with Germany. The Allies were opposed to this as being a first step to the forbidden Anschluss. In May, 1931, the Credit-Anstalt, the biggest bank in Austria, collapsed. Vaugoin was replaced by the Christian-Socialist Buresch, who renounced the customs union. Internal tension grew. The head of the Styrian Heimwehr, Pfiemer, tried a "putsch" to seize power; but after being a "half a day dictator of Austria," he failed.

In May, 1932, the Christian-Socialist Engelbert Dollfuss formed a cabinet consisting of Christian-Socialists and Heimwehr members. The Pan-Germans refusing support, the government had a majority of one vote only. With the increasing power of the Nazis in Germany, the Nazi party in Austria grew in numbers and still more in noisy propaganda. They opposed Dollfuss and asked for new elections. Dollfuss with his precarious majority in parliament declined this, knowing that it

would mean the end of his power. He declined as well to conclude a coalition with the Socialists which would have ended the deadlock and saved the democratic parliamentary system. He preferred instead the fight on two fronts, against Nazis and Socialists. This was only possible by abandoning the democratic parliamentary system altogether and choosing a fascist regime. This was in line with his foreign policy. Declining any other combination, he chose to lean externally towards Italy. Mussolini himself, whom Dollfuss frequently met, supported his anti-democratic internal policy.

The Patriotic Front

In June, 1933, Dollfuss banned the Austrian Nazi party and in Sept. founded the Patriotic Front which was to replace all political parties. He outlined his intention to abandon all democratic institutions and curtailed the rights of free press, free assembly, and many rights of the workers. He made use of an old overlooked war emergency law which enabled him to rule without consulting parliament. When the workers' opposition to this dictatorial regime grew, the Heimwehr took the offensive and tried to storm the Socialist strongholds to capture their arms and to seize power in all local governments where there was a Socialist majority. The Socialists resisted this attack by force of arms.

On Feb. 12, 1934, the revolt spread to Vienna, and a general strike was proclaimed but succeeded only partially. The police, the army, and the Heimwehr were mobilised against the revolting workers. Their quarters, especially the enormous newly built council flats, were besieged and shelled with heavy artillery guns. The government forces were well equipped, the workers only poorly armed. The unequal fight lasted four days. Casualties were stated as follows: on the side of the government 128 dead, 409 wounded; civilians 193 dead, 300 wounded.

The leaders of the revolution, Deutsch and Bauer, fled abroad; the remaining Socialist chiefs were arrested, many received heavy penalties, some were sentenced to death. The party and all their organizations and trade unions were dissolved and their property confiscated. In April a new constitution was proclaimed by Dollfuss. The freely elected parliament was replaced by representation of professional corporations.

Though the workers were silenced, the Nazis were not, because they had the support of an external power Nazi Germany. After local outbursts, on July 25, 1934, a small Nazi armed force seized the inadequately guarded chancellery where Dollfuss and his Heimwehr minister Fey stayed. Dollfuss was assassinated by the Nazi Planetta. The Nazis tried to make the Christian-Socialist Rintelen (who was secretly Nazi) chancellor, but the putsch was put under control. Planetta was sentenced to death; Rintelen received a life sentence.

Austria. On March 13, 1938, following an ultimatum by Hitler two days earlier, German troops entered Austria. Here they are seen at Innsbruck, being greeted with the Nazi salute by an enthusiastic crowd.

LAST YEARS OF THE REPUBLIC. Kurt von Schuschnigg took over the chancellorship and followed the Dollfuss policy of eliminating the parliamentary system. Relations between Austria and Germany remained very strained, though von Papen was appointed ambassador in Vienna. The latter brought about an Austrian-German agreement (July, 1936) to settle differences in a friendly way, and Hitler recognized the full sovereignty of Austria. But the Nazi activities did not stop and became even more violent. Papen persuaded Schuschnigg to meet Hitler at Berchtesgaden. On Feb. 12, 1938, the former was presented with an ultimatum asking him (among other demands) to take prominent Nazi leaders into his cabinet, otherwise Austria would be invaded. Schuschnigg gave in. Two important ministries were given to Nazi leaders (one of them Seyss-Inquart) and a free hand was given to all Nazi organizations. But soon Schuschnigg recognized that this meant Nazi-fication from within and the end of Austria's independence. He tried to turn the tide and ordered a plebiscite to be held on March 13 over the question of Austria's independence. But it was too late. On March 11 an ultimatum was given by Hitler; if the plebiscite were not called off, German troops would march in. The plebiscite was cancelled and Schuschnigg resigned, but in spite of all that he was arrested. Seyss-Inquart

took over the chancellorship. The German army marched in. Thus ended the first Austrian republic.

Under Hitler's regime (1938-1945) Austria remained only a German province called Ostmark. In the spring of 1945 Austria was liberated by the Allies. The Russians occupied Vienna on April 13; the other provinces were liberated by British, American, and Russian troops. On April 29 a provisional coalition government was formed consisting of Socialists, Communists, and a people's party headed by the veteran Renner, which was recognized by the Allies on Oct. 21. This party, led by Dr. Figl, won elections in Nov., and Renner became president. In June, 1945, Austria was divided into four zones, under British, U.S., Russian, and French control. For subsequent history see Austria in N.V.

CULTURAL ACHIEVEMENTS. The closing years of the empire saw the culmination of Austrian science and art. Vienna proved to be an excellent fostering soil for this culture, which represented a blending of aristocratic and middle class elements. These criteria proved so strong that they outlived the empire and spread on to the republican era. The famous schools of medicine, chemistry, and physics flourished. Some scientists won the Nobel prize. The modern psychological school (Sigmund Freud and Alfred Adler) attained world fame. In literature the truest expression of the Austrian

genius with its sense of musical harmony and poise was in the work of Hugo von Hofmannsthal, Arthur Schnitzler, Beer-Hoffmann, Stefan Zweig, and Karl Kraus, the satirist. In music the great Austrian tradition was taken up in a modern and abstract way by Schönberg, Alban Berg, and Wellesz. The production of operettas (Lehar, O. Strauss, etc.) went on. Festivals at Salzburg were created to show what Austria has accomplished in music and drama. In painting Klimt and Schiele were followed by Kokoschka, the great visionary artist. Otto Wagner, Hoffmann, and Loos became pioneers for a new architecture of social significance. In this connexion should be mentioned the housing policy of the socialist municipality of Vienna, which followed unorthodox lines. They provided the funds by taxing luxuries heavily, thus raising more than £8,000,000 with which monumental blocks of flats were built: the rents could be kept very low as only the cost of upkeep had to be covered.

Austria-Hungary. Empire which existed from 1867 to 1918. It consisted of the empire of Austria, then including Bohemia, and the kingdom of Hungary with its dependent province of Croatia-Slavonia. It was therefore often called the Dual Monarchy.

Austria-Hungary
arms

In addition it included after 1908 the provinces of Bosnia and Herzegovina, annexed from Turkish suzerainty. In 1910 the area was 261,259 sq. m. and the pop. 51,356,465, with at least a dozen races represented.

By the Ausgleich or compromise of 1867, the two states remained independent of each other, having each a constitution with legislative and executive bodies. Connexion was by the crown (Francis Joseph of Austria being emperor until his death in 1916, and his nephew Charles succeeding), and by certain departments of state. Administered jointly were foreign affairs, military affairs, and financial matters associated with them. Ministers in charge of these departments were responsible to a delegation for each country, chosen by its legislature, elected for a year and meeting together alternately in Vienna and Budapest. The foreign minister acted as premier and chief medium between the emperor and delegations. The active army was under joint control, service being compulsory and including two years with the colours; in 1914 the peace strength was 400,000, organized into 15 army corps. There was further a commercial union, with a single system of customs, common weights and measures, joint state bank, state industrial monopolies, and one consular service.

Diplomatic Successes

The first chancellor was Beust, who was succeeded in 1871 by Andrassy. Feeling towards Prussia passed from hostility to friendship, good relations were established with Italy, and the foreign interests of Austria-Hungary gravitated towards the Balkans. A diplomatic success was gained at the congress of Berlin, 1878, after Russia's victory over Turkey, when the Dual Monarchy was granted administrative rights over Bosnia and Herzegovina although they remained nominally Turkish for 30 years. Treaties

with Germany, 1879, and Italy, 1882, brought about the famous Triple Alliance which determined European diplomacy up to the First Great War. In 1885 Austrian action ended the Bulgarian advance into Serbia, but thereafter there was some coolness towards Russia and often danger of war.

In 1897, Badeni being chancellor, serious agitation and racial difficulties in Hungary placed the Ausgleich itself in jeopardy; yet it was renewed in 1899 and 1907. Magyars and Czechs continued to seethe with discontent. From 1908, however, foreign affairs dominated all other considerations, the Dual Monarchy throwing in its lot with that of Germany, which it had been the only power to support at the conference of Algeiras. The chancellors Aehrenthal and Borchardt continued to strive for good understanding and peaceable relations with the western powers, but throughout the Balkan wars of 1912-13 the Dual Monarchy saw threats on the east from the ambition of Serbia to possess a coastline, and more remotely from Russian desires of expansion; and steps towards mobilisation were at once taken. In the chain of events leading to war in 1914 the Dual Monarchy must bear some responsibility for having assured itself that full German support would be forthcoming for any action, however high-handed, against Serbia, and it was the assassination of the Austrian archduke Francis Ferdinand by an Austrian subject of Serbian blood at Serajevo on June 28 which provided cause for an ultimatum.

The Austrians had the worst of heavy fighting against the Russians in Galicia; but they overran Serbia and gained successes in Poland, and their victory over the Italians at Caporetto in Oct., 1917, was a resounding one. But cumbersome governmental machinery, the perpetual racial troubles, and the stringency of the Allied blockade more than counterbalanced any gains in the field. Austria-Hungary was the first of the Central Powers to approach the Allies for peace and had to accept unconditional surrender on Nov. 3, 1918. Nine days later the emperor abdicated and the realm was in disruption.

Austrian Succession, WAR OF THE. European struggle waged between 1740 and 1748. Charles VI, by the Pragmatic Sanction of 1713, settled his hereditary possessions in Austria, Hungary, Bohemia, and Sicily upon his daughter,

Maria Theresa, queen of Hungary, and in 1731 Great Britain guaranteed that settlement. She did so in pursuance of her policy of resisting the ambitious enterprises of France and Spain. Strategical reasons, and in the case of Spain commercial considerations also, prompted her opposition to those Powers. The emperor died in 1740, and his death was the signal for an outbreak of intrigue against the queen, and of eight years of fighting by land and sea, much of which had but a remote relation to the Austrian succession.

Cession of Silesia

An obligation to support Maria Theresa rested upon Great Britain. Frederick of Prussia, afterwards called the Great, demanded from her the cession of Silesia, and Walpole counselled her to accede and thus bring Prussia to her side, but his advice was rejected. Prussia thereupon entered into sullen alliance with France, and became England's enemy. Walpole knew the importance of a strong confederation against Britain's rivals, and Carteret, his successor, pursued his policy of bringing Austria and Prussia together. Maria Theresa ceded Silesia to Frederick by the treaty of Breslau, 1742. France claimed the Netherlands and would have broken up Austria into a group of countries too weak to resist aggression. Spain aimed at the possession of the Milanese, and Bavaria claimed the Austrian duchies. By the Family Compact of 1733 Louis XIV and the Spanish king had undertaken to secure from Britain the return of Gibraltar to Spain, and the transfer to France of the commercial privileges which England enjoyed in the trade of Spanish America. English merchants were seeking to exceed the trading limits fixed by the treaty of Utrecht, and feeling became so strained, mainly by the incident of "Jenkins's Ear" (see Jenkins, Robert) and other tales of barbarities, that war with Spain was declared in 1739, and an English fleet blockaded Cadiz.

Far more important to England was the strategic route through the Mediterranean. In the War of the Spanish Succession it had been her purpose to secure means of maintaining a fleet permanently in that sea, and with that object to possess Minorca. Now the grouping of the Powers was different, but the purpose was the same, and both Minorca and Gibraltar were menaced. Spain was seeking to aggrandise her position in Italy,

and France turned her eyes to Egypt as the key of the short route to the East, where Dupleix was building for France an empire in southern India.

War was not actually declared between France and England until 1744, but the declaration was a formality. The ships of the two Powers had been fighting already, and English troops had taken part as allies of Maria Theresa at Dettingen, June 27, 1743, where King George and the earl of Stair, endeavouring to drive the French out of Germany and to enter Alsace and Lorraine, had a happy escape from the strategic grasp of the duc de Noailles and the duc de Grammont. But Maria Theresa won the enthusiastic support of Hungary by her internal policy, marched with an army to the rescue of Vienna, and drove back Frederick in Moravia.

In the Mediterranean the naval operations against Spain had been ineffective, but by a threat to bombard Naples the Bourbon king of the Two Sicilies was compelled to withdraw the troops he had sent against Maria Theresa. She thereupon dispatched an army to Naples with the object of seizing it and transferring it to the Bavarian emperor, whose hereditary dominions were to be ceded to her in return.

Victories of Anson and Hawke

The French came into the naval war in 1743, and in Feb., 1744, off Hyères, took place the action of Admiral Mathews against a combined French and Spanish squadron, in which that dull and clumsy officer made an ineffective attack, while Lestock, his second in command, held aloof. Only the action of Captain Cornwall in the Marlborough, and Captain Edward Hawke (afterwards the famous admiral) in the Berwick saved the engagement from being a complete reproach to the British naval service. But regeneration of the navy was in progress under Anson, and on May 3, 1747, he inflicted a severe defeat off Finisterre upon La Jonquière, who was about to carry help to the French settlements in America, where Louisburg had been captured. On Oct. 14, 1748, Hawke, off Belle Isle, defeated L'Etenduère.

But it was rather the weakness and unreadiness of the French and Spaniards than her own strength, readiness, and vigour that saved England from disaster. The campaigns included attempts of the French to invade England in support of the Jacobites, the

defeat of English, Hanoverian, and Dutch forces at Fontenoy, May 11, 1745, French conquests in the Netherlands, Austrian successes in Italy, and much fighting in India, where the French captured Madras in 1746. The Pelhams, alarmed by defeat abroad and a rebellion at home, made peace with Prussia by the convention of Hanover, and the war ended with the peace of Aix-la-Chapelle, Oct. 18, 1748, by which the French gained nothing material, while England surrendered her conquests at sea. Spain obtained the duchies of Parma and Piacenza, and Prussia gained possession of Silesia. But the international difficulties still remained, and the peace was merely a truce. Austria was not content, Spain was still inimical, and France still had her ambitions in two hemispheres. The Seven Years' War, 1756-63, was the result.

Austriac. Generic term denoting two related families of agglutinative languages. Widespread over S.E. Asia and Oceania, they extend from Madagascar to Easter Island, from the Punjab to New Zealand. W. Schmidt introduced the term to mark the organic relationship of the Austroasiatic—preferably Austroasian—and the Austronesian language families. Austroasian embraces the Munda and Mon-Khmer sub-families, spoken in India and Indo-China. Austronesian, formerly called Malayo-Polynesian and Oceanic, embraces the Indo-

nesian, Melanesian, and Polynesian sub-families. As with Aryan, community of speech implies no identity of racial origin. See Language; Philology.

Autarky (Gr. *autos*, self; *arkein*, to suffice). Self-sufficiency of a country or empire. Distinguished from autarchy (*autos*; *archein*, to rule), the term was much used during the economic depression of the 1930s, when each country was striving to protect its own markets and secure exclusive sources of vital raw materials.

Auteuil. Suburb and residential district of Paris. S.W. of the city, between the Seine and the Bois de Boulogne, it is connected with Paris by rly., and can be reached by river. It is famous for its racecourse and railway viaduct. Boileau and Molière lived here.

Auto (Spanish, act). A form of morality play which flourished in Spain and Portugal, being especially represented at the festival of Corpus Christi. The characters were personifications of virtues and vices and other allegorical figures, and the religious nature of the pieces was emphasised by the full name, Autos Sacramentales (Sacramental Acts). Lope de Vega wrote about 400 autos and Calderon nearly 100. The performances were forbidden in Spain in 1765. See Morality Play.

Autobahn. German state motor road. In 1933 the construction was inaugurated by Hitler of a network of high-speed motorways linking the principal German cities. It had three professed objects: relief of unemployment, encouragement of the German motor industry, and promotion of international tourist traffic. Railway crossings were eliminated, bicyclists and pedestrians were forbidden to the Autobahnen, and about 120,000 men were kept permanently at work. The completion of the scheme was disrupted by the Second Great War. The plan was based on six principal roads—two running N.-S.,

Autobahn. Section of a high-speed motor road near Darmstadt, Germany, showing arrangement of junction

This public ceremony was in medieval times and as late as the early eighteenth century a common sight in Spain. Criminals and heretics were tried by a religious court of inquisitors at which the King and Queen, either in person or in effigy were present, as well as the great nobles and their ladies and officers of state. The victims were dressed in quaint garbs with high hats like the old fool's cap, and effigies of others whom the inquisitors could not capture or who were already dead were also brought for trial. In the centre of the picture a victim stands in the dock while a priest in the witness-box alongside gives evidence of the accused's heresy. In the foreground other prisoners are being brought forward by priests who hold crosses before the eyes of the heretics, and on the left a penitent kneels before an altar. On the right are many others alive and in effigy awaiting trial, surrounded by their guards. Death at the stake was the common doom, the effigies also were burned, as well as the bones of persons who had died outside the pale of the church.

AUTO-DA-FE CELEBRATED IN THE PLAZA MAYOR, MADRID, JUNE 30, 1680 : AFTER THE PAINTING BY FRANCISCO RIZI (1608-85). PRADO MUSEUM, MADRID

and four E.-W. The E.-W. roads were: (a) Hamburg-Stettin, with a complementary section in E. Prussia, Danzig-Konigsberg; (b) Cologne - Hanover - Berlin; (c) Cologne - Dresden - Breslau; (d) Karlsruhe - Stuttgart - Munich. These highways were linked with other districts by smaller trunk roads, a total mileage of 4,500 having been planned. The first section (Frankfort - Darmstadt) was opened in May, 1935. The entire network was put under the direction of Fritz Todt (*q.v.*). The standard road was 78 ft. wide and divided into two one-way carriage-ways, each 25 ft. wide, with a central island strip.

Autobiography (Gr. *autos*, self; *bios*, life; *graphein*, to write). Account of any man's life written by himself. The term is less accurately used of books in which some portions of the writer's own experiences are given in the general narrative. Letters and diaries, though providing much autobiographical material, can be classified as autobiographies only with a qualification that applies to many of the memoirs or reminiscences in which the individuality of the writer is subordinated to the events or people of whom he writes. Some autobiographies are concerned more with the writer's spiritual than with his material life, as the Confessions of S. Augustine and the Apologia Pro Vita Sua of Cardinal Newman. Others are mainly presentations of that part of the writer's life connected with some outstanding event or significant period of his career, such as Silvio Pellico's account of his life in prison.

Notable autobiographies are those of Cellini, Gibbon, Casanova, Chateaubriand, Cobbett, De Quincey, Leigh Hunt, J. S. Mill, and Trollope. Modern autobiographies include, among literary names, those of W. H. Davies (the "Super-tramp"), H. G. Wells, G. K. Chesterton, and Rudyard Kipling, and people famous in other spheres have written their life-stories, *e.g.* Sir Henry Wood, Isadora Duncan, Axel Munthe (The Story of San Michele), Ely Culbertson, the Countess of Oxford and Asquith.

Novelists often make use of their own autobiographical materials in their stories, *e.g.* Charles Dickens in David Copperfield and George Borrow in Lavengro and the Romany Rye. See Biography.

Autochthones (Gr. *autos*, self; *chthōn*, earth). Term used by some Greek peoples, especially those of

Athens, Argolis, and Arcadia, to suggest that their first ancestors were sons of the soil, and not immigrants from another land. The word aborigines has acquired a relative meaning, connoting peoples, themselves admittedly immigrants, *e.g.* the Tasmanians, found in a distant land by its European discoverers.

Autoclave (Gr. *autos*, self; Lat. *clavis*, key). Steam-tight cooking vessel or apparatus wherein substances may be heated under pressure. It consists of a strong metal body, with a removable airtight cover, generally provided with a safety valve to prevent the danger of explosion through the internal pressure generated being higher than the resisting powers of the walls of the vessel. The autoclave is an important item of laboratory equipment, and a wide variety of models is available.

Autocracy (Greek *autos*, self; *kratein*, to rule). Term used for a form of government in which the ruler acts on his own authority without responsibility to any other person. See Dictator.

Autocrat of the Breakfast Table, THE. Discursive essays interspersed with poetry, by Oliver Wendell Holmes (*q.v.*), published, after serial appearance in The Atlantic Monthly, in 1858. Touching upon all subjects with shrewd insight, lambent wit, and poetic fancy, The Autocrat ranks among the finest of its author's writings.

Auto-da-fé (Port., act of faith). Name of a public ceremony associated with the Spanish Inquisition. It followed the passing of sentence on heretics and others, and took the form of a procession and a service. The chief figures were the familiars of the Inquisition, the condemned persons, and those who had recanted. The

service usually included the celebration of the Mass, the taking of an oath of obedience to the Inquisition, a sermon, and the reading of the sentences pronounced by the inquisitors.

The term auto-da-fé is also applied to the carrying out of the sentence of the Inquisition, and more especially so when that sentence was the public burning of the heretic or heretics who had been so sentenced. It is thus used by Voltaire in the sixth chapter of Candide, which tells how on June 20, 1756, "the Portuguese made a beautiful auto-da-fé to prevent any further earthquakes." The first auto-da-fé took place in Spain in 1481, the last in 1813. Autos-da-fé were most frequent and impressive in the 15th century, after the 16th they became less so, partly because they were held in secret. They were also held in Spanish America, and one is recorded in Mexico in 1815. See Inquisition.

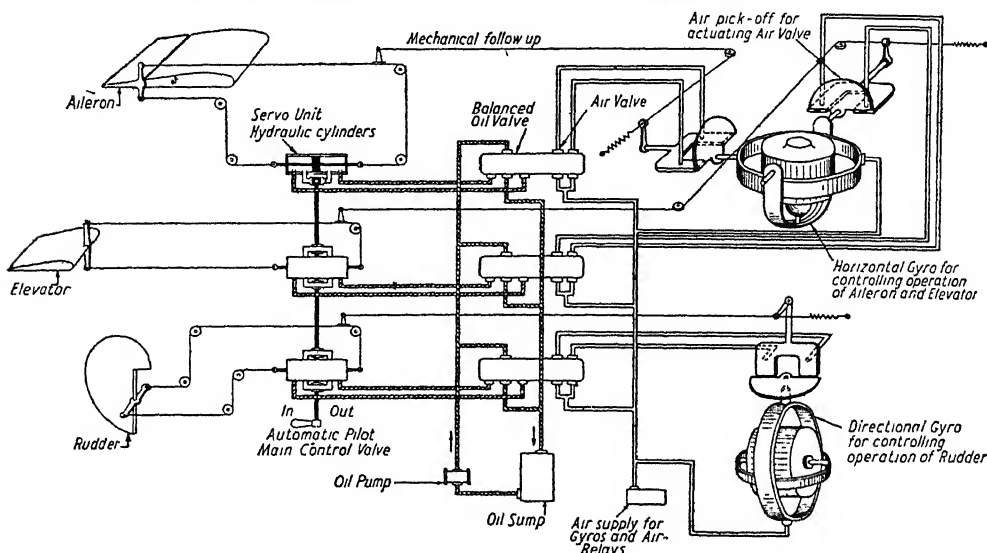

Autogiro. Type of aircraft with revolving rotor, designed to become airborne without the necessity of an initial run or take-off along the ground. Since Leonardo da Vinci (1452-1519) described his plans for "a hovering aerial carriage," inventors have experimented with various types of vertical-lift flying machines. The first gyroplane was invented in 1920 by the Spaniard Juan de la Cierva (*q.v.*). As developed, it has a large rotor, with two, three, or four articulated blades, mounted on a column above the cockpit and replacing the fixed wing of the orthodox aeroplane. When in flight the rotor is not, as in a helicopter (*q.v.*), driven by the engine, but is revolved by forward movement. There is also an engine-driven airscrew in the nose of the fuselage. The Autogiro is not

ruddered in the ordinary sense, and it is without the foot rudder-bar of the ordinary aeroplane. The pylon supporting the rotor can be slightly tilted in any direction so that the rotor may rotate on an inclined axis; by varying the inclination of the rotor's axis, the direction of flight is changed.

One of the principal difficul-

Autogiro. Cierva's first experimental machine appeared in 1920; above is the C40, a model of 1939
Photo, "Flight"

Automatic Pilot. Sectional drawing of the Sperry automatic pilot, showing how the gyros work the rudder, elevators, and ailerons. This remarkable but reliable mechanism proved its value particularly in record-breaking long-distance flights

ties in designing an Autogiro that would be stable in flight or during its lift from the ground was that the blades of a horizontally rotating rotor move faster through the air on that side in which they are moving in the direction of travel than on the opposite side. Thus they have a greater lift on one side than on the other, and unless corrected would give lop-sided lift. An Autogiro can remain airborne and in horizontal flight at any height even when travelling forward at less than 10 m.p.h. Hence it was adopted for military purposes as an army cooperation aircraft and proved particularly valuable as an artillery spotter. Autogiros have also been extensively used by police in the control of land traffic: by hovering over a congested area they give the pilot a bird's-eye view and enable him to transmit radio instructions to the ground. See Helicopter.

Autograph (Greek *autos*, self; *graphein*, to write). General term for a document or signature in the author's own handwriting. Strictly, a document written throughout in one person's handwriting is a holograph (Gr. *holos*, whole). The Greeks and Romans, and also the Chinese, were eager collectors of autographs. In Germany in the 14th century autographs began to be collected in little books known as *alba amicorum*, albums of friends—the forerunners of the modern visitors' book—and such collections became popular in Europe generally in the 16th century. A large num-

ber of facsimiles of the autograph signatures of celebrated persons appear under their portraits in this work. In Great Britain the finest public collection is in the British Museum. in the U.S.A. the Emmet collection in the New York Public Library. Of private British collections the catalogue, printed for private circulation 1883-92, of that formed by Alfred Morrison, 1865-82, runs into six volumes large 4to.

Autolycus. In Greek mythology, a famous thief, son of the god Hermes. Detection of his robberies was difficult, as he had the faculty of transforming the articles he stole. He was overreached at last by Sisyphus (q.v.). In Shakespeare's *The Winter's Tale*, Autolycus is a pedlar, "a snapper-up of unconsidered trifles."

Automatic Machines. In popular usage in Great Britain, this term is limited to various types of automatic vending machines, weighing machines, and machines which provide automatic games on the insertion of a coin, which releases a catch or spring.

Automatic machines which offer some reward to a player if he pays money and can manipulate the machine in a particular way may result in an offence against the Betting Act, 1853 (see Betting), if played solely for the purposes of gain and not with the object of enjoying a game of skill. If no skill is involved in manipulation an offence against the Gaming Houses Acts, 1845 and 1854, may also be committed. See Gaming.

Automatic Pilot. Instrument enabling an aircraft to fly on an even keel and in a set direction without the agency of a human pilot. The automatic pilot is based upon the principle of the gyroscope (q.v.): when a symmetrical body is set revolving about an axis, the latter tends to maintain its position in space unless some external force is applied. A gyroscope installed in an aircraft with its spinning axis along the keel, or fore-and-aft line, of the fuselage will, by virtue of its inertia, keep its axis in a constant position relative to the earth.

An aircraft flying freely in air can deviate around three axes. It can roll from side to side; it can yaw, or swing from right to left or left to right; and it can pitch up or down. Movement round these three axes is controlled by the ailerons, the rudder, and the elevators. The ordinary aeroplane has a high degree of stability round the rolling axis, a somewhat less degree round the pitching axis, and only a low degree of stability round the yawing axis. Consequently, as long as the rudders and elevators are correctly operated by the pilot, it is hardly necessary to move the ailerons in level flight. The gyroscope provides an ideal fixed system whereby an aircraft's flight path can be automatically controlled. The gyroscope cannot of itself exert direct action on the controls when the aeroplane's flight path deviates from the true course as represented by the gyroscope's axis. But it is a comparatively

simple matter to devise a method whereby the gyroscope operates an auxiliary system sufficiently powerful to exert an influence over the controls.

The most efficient automatic pilot employs two gyroscopes: one to operate the rudder and elevators, and another to operate the ailerons. The instrument is air-driven: air being continuously removed from the containing case by a vacuum pump, and new air entering through jets to replace that exhausted by the pump. The jets are positioned to play upon the wheels of the gyroscope and revolve them at an average speed of 10,000 revolutions per minute.

When the aircraft yaws, the stationary portion of the gyroscope moves with it, but the spinning portion continues to revolve along the original fore-and-aft axis of the fuselage. This relative movement of the fuselage to the gyroscope causes a small piston attached to the gyroscope to move inside a cylinder connected to the framework. The piston thereupon operates a valve which admits compressed air to one side of a pneumatically operated servo motor (*q.v.*) linked to the rudder. This automatically applies the rudder and returns the aircraft to its original course. The piston and valve linkage are so arranged that the rudder movement is just sufficient to ensure that the off-course deviation is instantly made good by a turn in the opposite direction: immediately the aircraft returns to its original course, the turn is automatically taken off. The elevator and aileron controls operate in exactly the same manner. Some types of automatic pilot, such as the Sperry gyro control, use oil under pressure instead of compressed air to actuate the servo motors moving the controls.

Besides keeping the aircraft on a straight course and even keel, the automatic pilot can be set to hold an aeroplane in a long glide or a steady climb at any angle, or to put the aircraft into a banked turn of any steepness.

The principles of the automatic pilot were first adopted by Hiram Maxim, who incorporated a gyroscope driven by compressed air in a flying machine he built, but never flew, in 1890.

The first automatic pilot to take the air was installed in an American aeroplane in 1909. A year later Robert Blackburn, the British designer, fitted an automatic pilot in one of his early monoplanes.

Until about 1930 most appliances of the kind were too heavy for practical purposes, but today there are instruments in use weighing with full equipment little more than 50 lb. Automatic pilots now form normal equipment of all commercial air liners and of many private aircraft. They are fitted to all bombers of the Royal Air Force, and proved invaluable during the Second Great War. In conjunction with the bomb sight (*q.v.*), the automatic pilot did much to ensure the accuracy of precision bombing. By setting the automatic pilot for the most suitable angle of the bomb run, the bomb aimer was ensured of a stable platform for sighting his target.

Automatic Rifle. Rifle that fires continuously so long as the trigger is kept pressed; cocking,

Auto-matic Rifle. Handy weapon largely used in the Second Great War, especially by airborne forces

loading, firing, and ejection of empty cases being repeated automatically and mechanically as a cycle of events. The source of power actuating the automatic loading and firing mechanism is derived from the surplus energy of discharge of the explosive gases generated by the ignition of each cartridge. In some types of automatic rifle the gases directly operate a piston and spring mechanism. In other types the gases only act indirectly by assisting recoil of the barrel. In yet others, the ejection of the empty cartridge-case actuates mechanism which loads a fresh round into the chamber and releases the firing-pin. Automatic rifles can be clip or drum-fed, the magazines holding from ten to one hundred rounds.

One of the features of the war of 1939-45 was the extensive use of automatic rifles by all the belligerent armies. Most airborne parachute and assault units were entirely armed with these weapons. For accurate and rapid fire, the U.S. army developed a semi-automatic rifle called the Garçon.

This rifle fires a clip of eight .300 bullets, but requires pressure on the trigger for each shot. Ejection of the empty case and loading of a fresh round into the breech are carried out automatically by a piston actuated by pressure from the explosive gases, which assists recoil. See Rifle; Sten Carbine.

Automatic Writing. In psychological research, term used for words written without the conscious direction of the writer. It may be produced either in a state of apparent wakefulness, in trance, or in hysterical or other morbid conditions. The matter written ranges from scraps of words or sentences to long documents, and not infrequently on subjects of which the writer is not known to have knowledge. Occasionally the handwriting differs from the normal writing, being in

some cases reversed—"looking-glass" writing. The practice came into prominence in America in the middle of the 19th century and quickly spread to England. Among American automatic writings are The Great Harmonia of Andrew Jackson Davis and The Arcana of Nature

of Hudson Tuttle, both written in early youth and containing allusions to scientific facts then unknown. The Spirit Teachings of William Stainton Moses is an English example. The Rev. G. Vale Owen (1869-1931) claimed that a series of his books produced from 1921 were the result of automatic writing. See Spiritualism.

Automatism. Theory of Descartes that animals are mere automata and their actions involuntary. In physiology the term "automatic" is applied to movements which originate in the nerve-centres and are entirely uninfluenced by the will, such as the circulation of the blood and the palpitation of the heart. See Animal Intelligence.

Automaton. Literally, any automatic mechanism. Thus, a watch, a fire alarm, a motor-cycle, and many other forms of mechanical combination provided with internal motors are automata. The word, however, is generally applied specifically to an automatic machine constructed to resemble a human being or an animal and

capable of self-movement. Sometimes the name *androides* (Gr. *anēr*, man : *eidos*, form) is used to designate an automaton resembling a human figure.

So far back as 400 B.C. Archytas of Tarentum is credited with having made a wooden pigeon capable of flying. Throughout the Middle Ages there are many records or legends of automata, but it was not until the 18th century that details become sufficiently definite to allow of their being examined.

In 1738 Jacques de Vaucanson showed in Paris an automatic flute-player, a tambourine-player, and a duck which is said to have imitated faithfully the natural quack of the actual bird, and to have been able to eat and drink. Many automata were musical, and the automatic singing bird that is not uncommon today may be regarded as the commercial resultant of these early efforts to produce automatic figures. The cuckoo of the cuckoo clock may also be mentioned.

J. N. Maskelyne, the London entertainer, excelled all other producers of automata, the most remarkable being his "Psycho," produced in 1875, that played cards, chess, and draughts, and worked arithmetical problems, and "Zoë," produced in 1877, that drew portraits of any celebrity suggested. See Robot.

Automobile Association. A British society founded in London in July, 1905, to protect and

Automobile Association badge

advance the legitimate interests of motorists. The first activity of the A.A. was to overcome the indiscriminating speed traps employed by the police to enforce the arbitrary speed limit of 20 m.p.h. then operating throughout Great Britain. The famous road patrol and roadside telephone box organization came into existence; and new benefits of membership, such as free legal defence, home and foreign touring service, advice about hotels and garages in an annual handbook, mechanical assistance on the road, were rapidly introduced until by the outbreak of the First Great War the A.A. had become the world's largest motoring organization. Total membership exceeded 700,000 on Sept. 3, 1939. The head office is at Fanum House, New Coventry Street, London,

W.I. Sir Stenson Cooke (1874-1942) was secretary of the Automobile Association from its inception until his death.

Autonomy (Gr. *autonomia*, self-government). Originally the right of a state to govern itself and make its own laws. In philosophy the term is specially applied by Kant to the capacity of the reason to make moral laws for itself, as opposed to heteronomy, by which is meant the reception of its laws from some other source.

Autoplasty (Greek *autos*, self; *plassein*, to mould). Surgical operation for mending or replacing a diseased, injured, or lost part from a sound part of a patient's body. Practised in India from time immemorial, autoplasty is usually employed to remedy facial disfigurement, the operation for the nose called rhinoplasty (*q.v.*) or the Taliacotian operation being the best known. During both Great Wars great advances were made in autoplasty, and hospitals for facial wounds were opened, bone as well as skin and flesh being successfully grafted.

Autopsy (Gr. *autos*, self; *opsis*, sight). Internal examination of the body after death. A doctor may perform an autopsy or post-mortem examination to find out the exact pathological condition for purely scientific purposes, provided he has the consent of the relatives of the deceased.

Auto-Suggestion. Term used in psychology and psychotherapy. It connotes a mental process by which an idea is formulated in the subject's own mind, either involuntarily or voluntarily and deliberately, and accepted without awareness of logical grounds for its acceptance. The results may be harmful, as with a subject who convinces himself so strongly that he is diseased or injured that in effect he becomes so; or beneficial, as with one who, by convincing himself of his good health, secures it. As an exponent of the beneficial effects of auto-suggestion Emile Coué (*q.v.*) achieved repute in Great Britain during the early 1920s. Auto-suggestion and Couéism became synonymous terms, and his formula, "Every day and in every way, I am getting better and better," no doubt induced in many who repeated it a better state of mental and physical health. Though the suggestion was originally external, the idea of well-being was established by auto-suggestion.

In all ages efforts have been made to alleviate suffering by the

power of the mind, and in oriental countries, especially, auto-suggestion has been practised to a remarkable degree. The Indian yogis take flight from the burdens of existence into a world of self-absorption and remain for long spells in a self-induced trance. See Hypnotism; Suggestion.

Autotransformer. A transformer in which a single coil is utilised for both the primary and secondary windings. In addition to two end connexions there is a third tapping, at a point in the coil to give the desired voltage ratio, this tapping being common to both windings. See Transformer.

Autumn (Latin *augere*, to increase). Third season of the year. North of the equator it extends astronomically from the autumnal equinox on Sept. 23 to the winter solstice on Dec. 21 or 22; but in Great Britain, as in N. America where it is called the fall, it popularly comprises Sept., Oct., Nov. S. of the equator autumn occurs during the northern spring.

Autun. City of France, in the department of Saône-et-Loire. It stands on the river Arroux, 62 m. by rly. S.W. of Dijon. The ancient Augustodunum, it is a bishop's see (Talleyrand being bishop 1789-91), and has a cathedral begun in 1060, but mainly of the 12th and partly of the 15th century, two magnificent gateways, Porte d'Arroux and Porte St. André, dating from Roman times, and remains of walls, a temple, and a theatre.

The manufactures of Autun include cloth, machinery, and leather, and it is a market for the produce of the neighbourhood. A fair is held in Sept. on the feast of St. Lazare, the city's patron saint. In Roman times Autun was a large and important place, its rhetorical schools being especially celebrated.

Autun, France. The cathedral, notable for its fine 15th century spire

Later it became part of Burgundy. It was ravaged by the Saracens and Normans, and was burned by the English in 1379. It was part of German-occupied France from June, 1940, until liberated by French forces, Sept. 9, 1944.

Auvergne. Former prov. of France. It is now represented by the departments of Cantal, Puy-de-Dôme, and part of Haute-Loire. The district was named after a Gallic tribe, the Arverni, who were conquered by Julius Caesar. Later it was part of Aquitaine and under the Carolingians became a county with its own ruler. For a time its overlord was Henry II of England.

By the 13th century Auvergne was divided into four parts. One of these was ruled by a dauphin and called the Dauphiné of Auvergne; the second, called the Terre d'Auvergne, was added to the crown lands by Philip Augustus; the third was the county of Auvergne, and the fourth the county of Clermont. King John II made the Terre a duchy, with his son John as duke, and later the Dauphiné and the duchy passed to the Bourbons, reverting to the crown when in 1531 the constable of Bourbon, the last dauphin of Auvergne, was declared guilty of treason. The county became crown property in 1615, having been held for two centuries by the family of La Tour. Until the Revolution Auvergne was a government in two parts, Upper and Lower, with their respective capitals at Aurillac and Clermont.

The W. contains the Auvergne Mts. which rise from the general level of the great plateau of central France, and are of volcanic origin. Enormous streams of lava cover many sq. m. of country. The peaks, Puy de Dôme, 4,800 ft., Plomb du Cantal, 6,093 ft., Pic de Sancy, 6,188 ft., are extinct volcanoes, and mainly composed of ashes and lava blocks; in some cases the crater is well preserved, in others it has been completely broken away on one side. The E. slope drops somewhat steeply to the valley of the Upper Allier.

Aux Cayes. Seaport of Haiti. On the S. coast, 93 m. S.W. of Port-au-Prince, it is a bishop's see, and is the port from which Bolivar set out in 1816 to liberate the S. American colonies from the Spanish yoke. It exports coffee and logwood. Cargo is landed by means of lighters. Pop. 11,875.

Auxerre. Town of France, the capital of the department of Yonne. The ancient Autissiodorum, it stands on the river Yonne, 105 m. by rly. S.E. of Paris. Until 1790

Auxerre, France. General view of the capital of the department of Yonne, as seen from the river Yonne

Auxerre was the seat of a bishop, and its Gothic cathedral, known as the church of S. Etienne, dates from the 13th-15th centuries. It has finely sculptured portals, magnificent rose windows, an exquisite Gothic choir beneath which is an 11th century crypt, and contains many fine pictures. The church of S. Eusebius dates in part from the 12th century, the nave and steeple being of that period. The W. façade was added in the 13th century, and the choir, which has some beautiful painted glass, was begun in 1530. The church of S. Pierre dates from the 17th century. Other buildings are the episcopal palace, now the prefecture, the old law court, and a 15th century gateway and tower. Remains exist of the abbey of S. Germain, but the fortifications have been replaced by boulevards. S. Germanus, a 5th century bishop, won in Britain a victory for the Christians over the Picts. Wine, ochre, woollen goods, leather, and bricks are made. Pop. 22,900.

Auxiliary Air Force. This R.A.F. equivalent of the Territorial Army became in 1947 the Royal Auxiliary Air Force (*q.v.*).

Auxiliary Ambulance Service. British civil defence unit. It was set up in 1938 to deal, in conjunction with existing civil ambulance services, with the anticipated large number of air raid casualties in the event of war. Vehicles were requisitioned and improvised as ambulances, but on Jan. 10, 1939, the ministry of Health circularised local authorities detailing the types of vehicle to be employed, and by the end of 1940 a high standard of equipment had been attained. The ambulances used for collecting casualties took two or four stretchers; for the transfer of large numbers from one hospital to another,

specially converted single-decker buses were used. Every ambulance had first aid and anti-gas kit and both driver and attendant were qualified in first aid.

At the height of the German air raids, the service operated some 15,000 ambulances for stretcher cases and 18,500 private cars adapted to carry sitting cases. Personnel numbered 32,867 men (9,348 full time) and 43,940 women (13,765 full time). All drivers received a course of night driving without lights and in respirators, and were also given instruction in direction finding. See Ambulance.

Auxiliary Cruiser. Passenger liner taken over in time of war by the Royal Navy and fitted out as an unarmoured warship for contraband control and patrol and escort duties. The most suitable types of vessels are liners of 15,000 to 20,000 tons, with a speed of 16 to 20 knots. Armament usually consists of a main battery of 6-in. guns, the number mounted depending upon the size of the ship. Auxiliary cruisers in the Second Great War carried a secondary armament of 4.5-in. A.A. guns, together with Orlikons and multiple machine-guns. The ships normally carried a mixed crew of merchant seamen and reservists and pensioners of the Royal Navy, R.N.R., and R.N.V.R. Being unarmoured, auxiliary cruisers had to depend for protection upon their somewhat limited speed. After 16 of these ships had been lost in 1939-42. they were nearly all refitted as transports, etc. See Armed Liner; Defensively Equipped Merchant Ship; Jervis Bay; Rawalpindi.

Auxiliary Military Pioneer Corps. This unit of the Second Great War is described under the heading Royal Pioneer Corps.

AUXILIARY TERRITORIAL SERVICE

Chief Controller Dame Leslie Whateley

This important women's service was in 1949 given the name Women's Royal Army Corps. Its development and activities during the Second Great War are here described by a former director.

As a direct result of the contribution made by Queen Mary's Army Auxiliary Corps in the First

Badge of the Auxiliary Territorial Service

Great War discussions took place in 1937 about the formation of a women's peacetime service, the object being to release as many soldiers as possible from non-combatant duties, in the event of war, in units other than field force formations. In 1938 these discussions turned to the actual lines upon which such a service should be organized, and the following major decisions were reached:

(1) To raise through the Territorial Army Associations a voluntary peacetime women's service entitled the Auxiliary Territorial Service. (2) The Parliamentary under-secretary of state for War would be the responsible member of the Army Council with the assistance of the deputy director-general Territorial Army and an Advisory Council. (3) Women would undertake a general or local service obligation, the former implying service anywhere at home or abroad the latter in the neighbourhood of their homes, as cooks, clerks, orderlies, storewomen, and drivers. (Local service enrolments ceased early during the Second Great War owing to their impracticability. The Women's Transport Service (F.A.N.Y.) were to supply motor driver companies for the transport side of the A.T.S. In 1940 these were incorporated in the A.T.S.). (4) Women would be enrolled, not enlisted. Officers would not be commissioned. Special rank badges and titles would be introduced. (5) Age limits would be 18 to 43 years with an extension to 50 for ex-service women. (6) Companies would be raised on a county basis under a woman commandant nominated by the president of the County Territorial Association and appointed by the War Office—these companies to be affiliated to military units. (7) A number of companies would be formed for work with the R.A.F. In July,

1939, these companies ceased to be A.T.S., and formed the nucleus of the new service, the Women's Auxiliary Air Force.

The Munich crisis considerably precipitated action and on Sept. 9, 1938, the formation of the A.T.S. was proclaimed by Royal Warrant and publicly announced on Sept. 27, at the height of the crisis.

On Oct. 10, 1938, an officers' school of instruction was set up. Courses of one week's duration were run until the outbreak of war. By that time over 1,000 officers had passed through. Other ranks undertook to attend a minimum of ten evening "drills" and one week's summer camp in alternate years. The first camps took place in the summer of 1939, but many were curtailed by the outbreak of war; and when the service, some 17,000 strong, was mobilised, training came to an end. Within two to three months, however, officers' and n.c.o.s' schools were set up under A.T.S. instructors, and recruit training centres opened to deal with the steady flow of volunteers.

In June, 1939, the War Office had decided that the appointment of a woman as director and head of the service should be made under the director-general Territorial Army. At the outbreak of war the appointment of D.G.T.A. ceased to exist, and the A.T.S. directorate came directly under

the Adjutant-General. This staff was augmented as the service grew. Accordingly on July 3, 1939, Dame Helen Gwynne-Vaughan had assumed office with the rank of chief controller, equal to a major-gen. Her staff was to consist of one assistant director with the rank of chief commander, equal to a lieutenant-col., and two junior officers. Pay was agreed at two-thirds the male rates, but this decision was not published until after mobilisation had begun.

Soon after war was declared H.M. Queen Elizabeth accepted the office of commandant-in-chief with the corresponding rank of lieutenant-gen. In Feb., 1940, H.R.H. the Princess Royal, who had joined the service soon after its inception, became hon. col. with the rank of chief controller.

It became evident in 1940 that the A.T.S. would benedict in ever-increasing numbers and in more employments than the original five laid down. Women were already being trained to take over many duties performed by the Royal Corps of Signals. In the spring the first A.T.S. units were posted to France. They included bi-lingual switchboard operators who left Paris only as the Germans entered that city.

In Great Britain the A.T.S. met the emergency caused by the return of the men from Dunkirk by working day and night to feed and re-equip them. As a direct result demands poured in from all branches of the army for more A.T.S.

In April, 1941, the A.T.S. received recognition by being given equal military status with the men of the army, and becoming part of the armed forces of the crown. Their officers received the royal commission. All ranks wore the same badges of rank as the army, and other ranks had the same titles, whilst officers assumed the following:

Chief Controller	=	Major-Gen
Senior "	=	Brigadier
Controller "	=	Colonel
Chief Commander	=	Lieut.-Col
Senior "	=	Major
Junior "	=	Captain
Subaltern	=	Lieutenant
2nd Subaltern	=	2nd Lieut

In the House of Commons on April 10, 1941, the secretary of state for War said:

The Auxiliary Territorial Service has proved so valuable to the army in replacement of men that the government have decided to increase its numbers greatly and to enlarge the range of duties which it per-

Chief Controller L. E. Whateley, Director of the A.T.S. 1943 to 1946, and made D.B.E. Jan. 1, 1946

1. Girls of the A.T.S., working on an A.A. gun-station as spotters, use an identification telescope; they wear a special winter outfit. 2. Some searchlight batteries were worked entirely by A.T.S. personnel. 3. Convoy driver taking over a new lorry from a

factory for delivery to a distant depot. 4. A.T.S. trainees learn how to march. 5. Physical training class. 6. Drivers in training receive a lesson in road sense. 7. Class of officer cadets is here being given instruction on the composition of the British army

AUXILIARY TERRITORIAL SERVICE · WOMEN IN TRAINING AND IN ACTION

forms. Members of the service are already discharging important functions connected with the air defence of Great Britain as well as with the rest of the forces at home, and these are of a character which renders it desirable that the volunteers performing them should be definitely declared members of the armed forces of the crown. The whole service will accordingly be given full military status. Women will, of course, be employed only on work for which they have a special aptitude, but the House should know that such work includes duties at searchlight and gun stations. The service will remain a women's service under the general direction of women, and the disciplinary code of the army will be applied to it only in so far as the wider responsibilities now envisaged necessitate.

The first of many heavy anti-aircraft mixed batteries (Royal Artillery) was formed in 1941, the women taking an equal share in all duties except actually firing the guns. On July 21, 1941, the first chief controller retired, and was succeeded by Mrs. J. M. Knox.

Conscription Introduced

The problem of man power was increasingly acute in 1942, the need for more men in the fighting lines growing correspondingly. So came for the first time in history conscription for women. The Army Staff College opened a wing for training A.T.S. officers who were later to serve in almost every theatre of war in replacement of male staff officers.

By Oct., 1943, when Chief Controller Knox retired, to be succeeded by the deputy director, Senior Controller L. E. Whateley, the strength of the A.T.S. had risen to 214,000, serving throughout the U.K., Middle East, Africa, U.S.A., and N. and S. Caribbeans.

The types of work had steadily increased to include 88 army trades and 36 non-tradesmen employments. The following abbreviated list gives an idea of the scope: A.A. operational and non-operational, A.T.S. administration, bakers, chiropodists, cinema projectionists, clerks (all types), cooks, dispensers, draughtswomen, drivers, education instructors, hairdressers, kine theodolite operators, masseuses, mess stewards, orderlies (general duties, medical, nursing, dental, railway), provost duties, R. Signals duties, and storewomen.

A.T.S. were posted to N. Africa in 1944, proceeding later to Italy to form the nucleus of a large contingent. In Aug., A.T.S. once more landed in France and later in Belgium. At the beginning of

1945 H.R.H. Princess Elizabeth joined the service as a 2nd subaltern, later being promoted to the rank of junior commander. A.T.S. commitments increased to include service in the Far East and with the armies of occupation.

Demobilisation was on precisely the same lines as for the army, with the exception that married women could obtain early release.

The A.T.S. had a special status because of its composition, the general policy being to preserve the feminine qualities of its members.

The A.T.S. regulations (1941) stated that the D.A.T.S. had the right of appeal direct to the secretary of state for war; that all matters affecting only the A.T.S. as a women's service should be dealt with solely through A.T.S. channels; that any matter affecting the A.T.S., however technical, should not be dealt with through exclusively military channels; that in all matters affecting both the A.T.S. and the military there should be the closest cooperation between the A.T.S. officer and the military commander concerned.

On Feb. 1, 1949, the A.T.S. was renamed the Women's Royal Army Corps.

Auxins. Substances which regulate the growth of plants. They are formed especially in meristems and diffuse to the regions where cell enlargement takes place. Their presence accelerates elongation of stems and retards that of roots. By their differential distribution under the influence of gravity or one-sided light they bring about curvatures which occur in geotropism (*q.v.*) and heliotropism (*q.v.*).

Auxonne. Town of France, in the dept. of Côte d'Or. The ancient Assonum, it stands on the Saône, and is 20 m. by rly. S.E. of Dijon. The 14th century church of Notre Dame, built on the site of an 11th century building of which only one tower remains, has a fine 16th century porch. Other buildings are the hôtel de ville, the arsenal, now used as a market, and a fortified château, now the barracks. It has an interesting gateway, and remains of fortifications restored by Vauban in 1673. In the Place d'Armes there is a statue of Napoleon I, who as a sub-lieutenant was quartered here in 1788. The trade is mainly in agricultural produce, and the manufactures include textiles, leather, bricks, and plaster of Paris. In the later Middle Ages Auxonne belonged to Burgundy. Besieged by the Allies in 1814, it capitulated to the Austrians in 1815. Pop. 21,000.

Ava OR KAVA. Root of *Macropiper methysticum*.

A native of Polynesia, it is used as a medicine in rheumatic complaints. The juice fermented becomes an intoxicating drink, and if used to excess produces various diseases of the skin. In the Sandwich Islands a similar drink with the same

Ava. Plant of Polynesia

name is produced from the root of a species of the genus *Cordyline*.

Ava. Ruined city of Burma. It stands on the Irawadi river, here about 4,000 ft. wide, opposite Sagaing, and 10 m. S.W. of Mandalay. Founded in 1364, it became the capital of the Burman empire, and remained so until Amarapura superseded it in 1782. In 1823 it again became the capital, but 14 years later the seat of government was again established at Amarapura. Although Ava is now an insignificant place with few inhabitants, at the height of its prosperity it had a circumference of about 10 m. and a pop. of more than 45,000. It is surrounded by walls, and has several Buddhist temples, crowned by gilded domes, which give it a false appearance of grandeur when viewed from a distance. Its temples and palaces were destroyed by earthquake in 1839. Lord Dufferin, Viceroy of India, 1884-88 took the title of marquess of Dufferin and Ava.

Ava was taken by the Japanese in their drive towards Mandalay at the end of April, 1942. It was recaptured by British troops of the 14th army on March 19, 1945, when they crossed the Ava road-rail bridge (1,200 yds. long) and took up positions along the S. bank of the Myitnge river.

Avalanche (Lat. *ad*, to; *vallis*, valley). Fall of masses of snow or ice or large quantities of earth from mountain slopes to the valleys. Snow which falls on steep mountain slopes evaporates, melts, and runs away as water, or remains as snow. That which remains is in so unstable a condition that when a further fall occurs the additional weight sets the whole mass in motion and sends the snow, accompanied by loose earth and rocks, crashing into the valley. Such avalanches are common in all

high mountainous districts. It is estimated that one-third of the total snow fall in the S. Gotthard region disappears in this manner.

An avalanche also occurs when quantities of ice break away from a glacier and rush down the valley. Such a slide in 1901 overwhelmed a village on the road over the Simplon Pass and killed all the inhabitants. Rock avalanches occur when large masses of rock fragments slide down mountain slopes. See Glacier.

Avallon. Town of France, in the dept. of Yonne. On the river Cousin, on the slopes of the mts. of Morvan. It is 34 m. by rly S.E. of Auxerre, and contains the 13th century church of S. Lazare, a 15th century gateway with tower, and remains of fortifications. Its industries include woollen manufactures, tanning, and distilling. As Aballo, Avallon was a Roman town; it was afterwards part of Burgundy. Pop. 5,900.

Avalon. In Celtic mythology, place of rest and reward for departed heroes, similar to the Valhalla of the Norsemen. In it were magical apples, recalling the golden apples of the Hesperides, and a mystic fountain. Thither, according to the Arthurian legend, King Arthur was taken to be cured of his wounds. Ancient legend described it as a green isle in the west; one conjecture identifies it with Glastonbury in Somersetshire. Tennyson terms it the island valley of Avilion. See Arthur.

Avare, L' (The Miser). Five-act comedy by Molière. A free handling of the *Aulularia* of Plautus, the plot is subordinated to the characterisation of Harpagon (the Euclio of Plautus), the wealthy usurer in whom avarice usurps the place of natural affection. The play was produced at the Palais-Royal, Paris, Sept. 9, 1668, Molière taking the part of Harpagon. See Molière.

Avaris. Ancient city of Lower Egypt. Sometimes identified with Tanis, it stood E. of the Nile delta. Long a stronghold of the Hyksos or shepherd kings, it was captured by Aahmes (Amasis) I, the founder of the XVIII dynasty. See Egypt: Ancient History.

Avars. People belonging to Asiatic races commonly called Tartar, Mongolian, or Turanian, who poured in succession into Europe during the early Middle Ages. The Avar group became powerful during the 6th century, and disappeared in the 9th. As with the Huns before them and the Magyars after them, the seat of their dominion was on the middle Danube and in Hungary. In the 6th century Justinian paid them to guard

Avalanche. Fall of snow and rock from a mountain height into an alpine valley. Avalanches sometimes overwhelm whole villages.

the northern frontiers of the empire; they joined hands with the Lombards in destroying the Teutonic Gepidae; at the end of the century they repeatedly raided over the Danube. In 610 they burst into the Lombard plain of N. Italy, but were content to ravage and retire. In 618 they were in Bulgaria, and in 626 unsuccessfully besieged Constantinople. They were pushed back across the Danube, but continued to dominate a great part of central Europe, though they failed to organize a consolidated empire.

In 788, shortly after Charlemagne became king of the Franks, Avar chiefs broke over both the Italian and Bavarian borders. The challenge was accepted by Charlemagne, who was bringing both Bavaria and Lombardy under his own supremacy. Charlemagne himself invaded their territory, and

by 805 their resistance was completely broken. The emperor set up one of their own chiefs as khan of the Avars and vassal of the empire; but after his death his successors could not maintain their control, and the Avars were wiped out or absorbed by the Magyars, who set up their own empire. See Hungary.

Avatar (Skt. *avatāra*, descent). In Hindu mythology, an earthly manifestation or incarnation of a deity. The word also expresses the embodiment of an idea.

Avatcha. Bay on the S.E. coast of Kamchatka. It is the finest harbour of the peninsula. On an inner bay stands Petropavlovsk, and N. is the active volcano of Avatcha, with two peaks, 10,000 ft. and 8,500 ft. high.

Avebury or **ABURY.** Parish and village of Wiltshire, England, 7 m. W. of Marlborough. It contains the ruins of a supposed Druidical

temple, a large outer circle of stones and two lesser inner circles, forming one of the most remarkable examples of stone monuments in the United Kingdom. The stones vary from 5 ft. to 20 ft. in height, and from 3 ft. to 12 ft. in thickness, and the diameter of the outer circle is about 1,400 ft. Late Neolithic is the period suggested. Sir John Lubbock took his title from here. Pop. 561.

Avebury, JOHN LUBBOCK, 1ST BARON (1834-1912). British banker and scientist. Born in London,

Century

April 30, 1834, the eldest son of Sir John William Lubbock, Bart., and educated at Eton, he entered the banking house of Robarts, Lubbock & Co. in 1848 and succeeded his father as head of the firm in

1865. He was Liberal M.P. for Maidstone, 1870-80, and for London University 1880-1900, sitting as Liberal-Unionist from 1886. In 1900 he was raised to the peerage.

His chief work in Parliament was the Bank Holidays Act, 1871, but he was also mainly responsible for the Shop Hours Regulation Act, 1886, and the Bills of Exchange Act, 1904. He was president of the British Association, 1881, vice-chancellor of London university, 1872-80, chairman of the London County Council, principal of the London Working Men's College, 1890-92, and president of the Central Association of Bankers. His many writings on popular natural history include *Ants, Bees, and Wasps*; *On the Senses, Instincts, and Intelligence of Animals*; and *Flowers, Fruits, and Leaves*. His most popular works were *The Use of Life* and *The Pleasures of Life*. He died at Kingsgate, Thanet, May 28, 1912. *Consult* Life and Work, ed. Mrs. A. G. Duff, 1934.

Aved, JACQUES ANDRÉ JOSEPH CAMELOT (1702-66). A French painter. Born at Douai, of Flemish parents, Jan. 12, 1702, he studied first at Amsterdam under Bernard Picart the engraver, and afterwards at Paris under Alexis Simon Belle. Among his more notable portraits are those of Louis XV, the stadtholder William IV, J. B. Rousseau the poet, the marquis of Mirabeau, Mme. Crozat, Mme. de Tencin, and the Marshal Clermont-Tonnerre. Aved died in Paris, March 4, 1766.

Aveiro. Town and episcopal see of Portugal, in the old prov. of Beira. Capital of the district of Aveiro, it is on the river Vouga, 40 m. by rly. S. of Oporto, and is connected by canal with the Atlantic. It exports salt, sardines, fruit, wine, and oil. It was the birthplace of John Affonso, the Newfoundland navigator, and at one time sent 60 ships yearly to the fishing-grounds of that coast. In 1919 it was concerned in the futile attempt to restore the monarchy. Pop. 10,357.

The district of Aveiro, formed from the N.W. part of the prov. of Beira, has an area of 1,065 sq. m. and a pop. of 429,870.

Avellaneda. Town of Argentina, in the prov. of Buenos Aires. On the river Riachuelo, it is connected by rly. with Buenos Aires. An important manufacturing town, it has a handsome town hall, a fine market hall for agricultural produce, and cold storage and meat-canning industries. It gives its name to a dept. with a pop. of 394,787.

Avellino. Province of Italy, in Campania. It contains the highest portion of the Neapolitan Apennines, has an uneven surface, and covers 1,165 sq. m. In its fertile valleys large quantities of chestnuts and hazel-nuts are grown. The capital is Avellino. Pop. 422,743.

Avellino. City and episcopal see of Italy, capital of Avellino province. It is 59 m. by rly. E. of Naples and has a ruined 10th century castle, a cathedral, and a college. It manufactures linen, hats, boots, paper, and sausages, and is noted for hazel-nuts. Founded in the 9th century, it is named from the ancient Abellinum, some 3 m. to the N.E., with ruined town walls and amphitheatre. On Monte Vergine, at the base of which Avellino stands, is a 12th century convent, the church of which contains a miraculous picture of the Virgin. Pop. 29,091.

Ave Maria (Hail, Mary!). Latin form of the opening words of the Angel Gabriel's salutation of the Virgin Mary (Luke 1), and the familiar name of the prayer or form of devotion, known also as the Angelical Salutation, introduced as it now stands into the Roman Catholic breviary in 1568. Schubert, Gounod, and other composers have set the prayer to music. *See* Rosary.

Avanches. Town of Switzerland, in canton Vaud. The ancient Aventicum, it is 5 m. S.W. of Morat, and contains a medieval castle, a museum, and remains of

Roman walls and an amphitheatre. One of the chief towns of the Helvetii, Avanches became a Roman colony, but was destroyed by the Huns in 447.

Avenger of Blood. Ancient Hebrew institution based on the words in Gen. 9: Whoso sheddeth man's blood, by man shall his blood be shed. The execution of the sentence was held to devolve on the nearest male relative of the person slain. If this relative, called the Goel, failed, the duty passed to the next-of-kin, who was known as the Megol. To provide protection for those guilty of accidental homicide, cities of refuge were provided (Num. 35). Similar institutions to Goelism, or obligations of kinship, existed among the Greeks, Scythians, and Teutonic tribes. The custom of retaliation for bloodshedding still prevails among the Arabs, being sanctioned by the Koran (Sura 2). *See* Blood Feud; Kinship.

Avenol, JOSEPH (b. 1879). French economist. While still young he established a reputation as a financial and economic expert, being appointed secretary-general of French finances in 1905. From 1916 to 1923 Avenol was financial delegate for France in London. In 1923 he became deputy secretary-general of the League of Nations, being sent by the League to advise the Nanking government on financial reconstruction. He became secretary-general of the League in July, 1933, resigning on July 26, 1940.

Avens. Name of two species of Geum, common avens or herb bennet (*G. urbanum*) and water avens (*G. rivale*), perennial plants of the order Rosaceae. The first named is a common plant in copses and hedgerows in Britain, and has boldly dissected leaves from the rootstock, the uppermost leaflet of which is much larger than the others. The bright yellow, buttercup-like flowers are succeeded by a head of nutlets, each ending in a long hooked awn. Water avens, which grows beside streams and in damp copses, has much larger, drooping flowers with dull purple calyx and orange petals.

Aventine Hill (Latin *Mons Aventinus*). One of the seven hills of ancient Rome, inhabited chiefly by plebeians. *See* Rome.

Aventinus (1477-1534). Latinized name of the Bavarian historian Johannes Thurmayer. The name Aventinus is derived from Aventinum, the Latin name of his birthplace, Avensberg, in Bavaria. The son of a publican, he was educated

at Ingolstadt, Vienna, and Paris, and taught at Vienna and Cracow. In 1509 the duke of Bavaria, Albert the Wise, made him tutor to his two sons. In Munich Aventinus composed the seven books of his History of Bavaria (Annales Boi-orum), publ. 1554. He died Jan. 9, 1534, at Regensburg (Ratisbon), where a monument was erected to him in 1861.

Aventurine (Italian *avventura*, chance). Variety of naturally occurring silica used as an ornamental stone. It consists of chalcedonic silica or crystalline quartz, traversed by innumerable minute fissures that reflect light and produce a spangled appearance, and is usually reddish-brown or greyish-brown in colour. Artificial aventurine is made in the form of coloured turbid glass in which are enclosed spangles of finely divided mica. It is called aventurine from having been accidentally discovered.

Avenue Theatre. Former London theatre, in Northumberland Avenue, W.C. It was opened March 18, 1882, with a revival of Madame Favart. Here, in 1890, George Alexander made his first entry into management. The theatre was largely wrecked in 1905 by the fall of part of Charing Cross railway station. It was rebuilt and is now known as The Playhouse (*q.v.*).

Average. Business word used in two distinct senses. Ordinarily, an average is the mean proportion, or the arithmetical mean, of a number of figures. Thus, the average number of hours of sunshine or the average earnings of a workman over a certain period, are calculated by adding the whole together and then dividing the sum by the number of days or weeks, the answer being so many hours a day or so many pounds a week *on the average*. The whole business of insurance is based on averages: life insurance on the average ages at which a number of persons may be expected to die, fire insurance on the average number and size of the fires which experience tells may be expected in a certain area and period. A dealer in stocks and shares calls it averaging when he buys more of a particular share at a price lower than that which he gave for his previous holding.

Common instances of averages are exemplified in the following statements: the annual net profits exceeded 25 p.c.; the density of population lies between 200 and 250 per sq. m.; the consumption of coffee in Sweden exceeds

that of the United Kingdom per head of the population. In using averages it is important that the values averaged should be strictly comparable; it is of little use to say that the average height of a man, a horse, a rabbit, and a mouse is 3 ft., but it may be so to know that the average height of Scandinavians exceeds that of Italians.

In international maritime law the term originally meant the contribution made by all to the loss sustained by one. The case arose when, to lighten a ship in a storm, certain goods had to be cast overboard to save the ship and the rest of the cargo. The owners of ship, freight, and cargo saved had to contribute *pro rata* to make good the loss of the cargo jettisoned. Average is either general or particular. General average acts are always acts of man, and must be done by or with the authority of the master of the ship, *e.g.* cutting away the masts in a storm. Such acts must be for the common good of the whole adventure and to avert the loss of it, and must be done under imminent danger. Again, certain expenditure is general average, to be borne by all interested, *e.g.* payments made to another ship for towing the ship out of a position of great danger. Particular average applies to every kind of partial loss happening to either ship or cargo, *e.g.* if masts snap by force of the sea and winds.

In fire insurance average means that if the value of the goods covered at the time of the fire exceeds the amount of the policy, the assured only receives an amount in proportion to the value of the goods. Thus, if one insures his furniture for £1,000, and has £2,000 of furniture in the house, and £500 worth is destroyed, he receives as 2,000 : 1,000 :: 500 ; that is, he receives £250. Policyholders should make a condition, "general average excluded."

The word, from late Lat. *averagium*, is probably ultimately connected with Lat. *habere*, to have; in Fr. *avoir*, Ital. *avere*.

Averno or **AVERNUS**. Lake of Italy, in Campania. The ancient Lacus Avernus, it is 10 m. W. of Naples, and stands at the N.W. foot of Monte Nuovo. An old volcanic crater, about 2 m. in circumference, 212 ft. deep, and only 2 ft. above sea level, it now has a wall all round it. Agrippa, in 37 B.C., made it a naval harbour, connecting it with the sea by a canal to Lake Lucrino (*q.v.*). The upheaval of Monte Nuovo in 1538 destroyed the canal and harbour,

and altered the face of the surrounding district. The lake was regarded by the ancients as the entrance to the infernal regions, and the steepness of its banks gives point to Virgil's *facilis descensus Averno* (easy is the descent to Avernus).

Averroës (1126-98). Name given to the Arabian philosopher and physician Abul ibn Roshd. Born at Córdoba, he was cadi of his native city and a favourite of the emperor of Morocco. Suspected of heresy, he was exiled, but again summoned to Morocco, where he died Dec. 12, 1198.

Well known as a commentator on Aristotle, he combined religious belief with a philosophy compounded of Aristotelianism and neo-Platonism. He explains everything by a series of emanations, the last of which is the divine intellect, the active intelligence which enters into contact with man's passive intelligence (the soul). Thought is the result of the union of these two principles. See Philosophy.

Avers or **AVERSER** **THAL**. Valley of Switzerland, in the canton of Grisons. It is 6,397 ft. high and is one of the highest inhabited valleys in Europe. Cresta-Avers, the chief village, has a sanatorium. The Averser Rhein is one of the Rhine head-streams.

Aversa. Town of Italy, in Naples prov. Connected by rly. with Naples 12 m. S., it is the seat of a bishopric. Its cathedral and church are both partly Norman, and it is noted for wine and oranges. It was the scene in 1345 of the assassination of Andrew of Hungary, husband of Joanna, queen of Naples. Pop. 23,203.

Avery, CHARLES HAROLD (1867-1943). British writer of juvenile stories. He was born at Head-

Harold Avery,
British author

less Cross, Worcestershire, and educated at New College, Eastbourne. His works were almost wholly boys' school tales, of conventional type, unexceptionable in moral tone, and rich in humour. Through a period of almost 50 years his output of books and of short stories contributed to magazines for boys was remarkably large. The Dormitory Flag, 1905, was long a juvenile "classic." He died Sept. 25, 1943.

Aveyron. Department of southern France. It forms the southern portion of the central plateau, and the rivers Lot, Tarn, Viaur, and Aveyron flow through it to the Garonne. The limestone plateau is typical Causse country, with sink holes, subterranean streams, and caves rich in stalactites. The rivers flow in cañons and the promontories are called *causses*. The chief industries are mining, the making of cheese and wine, and the rearing of sheep, mules, and cattle. Owing to the poverty of the soil its corn crops are not rich. Coal is the mineral chiefly worked, while lead, iron, and zinc are also found. Rodez is the capital, and the area is 3,385 sq. m. Pop. 314,682.

Aviary (Lat. *aviarium*). Cage or enclosure for keeping birds in captivity. Aviaries have been in use at least since the days of the Roman empire, and have been popular in most civilized nations. They range in size from the small wire cage to large netted enclosures containing trees and shrubs, where a large number of birds can live under fairly natural and healthy conditions. Every aviary should afford sufficient opportunity for exercise, and if possible should admit of flight. Whether large or small, an aviary should be constructed entirely of metal, which can be easily cleaned and affords no harbour for vermin, and should contain a number of perches of such thickness that the birds can comfortably grasp them. When practicable, growing shrubs are far preferable to artificial perches. An abundant supply of frequently changed water should be provided for bathing and drinking. The birds should be protected from cold draughts, and when the aviary is exposed to sunshine care should be taken to provide shady corners.

In the matter of food, the natural habits of the inmates should be studied and vitamins provided. It is wrong to associate birds which are natural enemies, and it is inadvisable to place small birds with larger ones.

From 1933 almost all British wild birds have been protected and may not be taken, bought or sold, or put into captivity (see *Birds: Protection*, p. 1170). Only birds bred in captivity can therefore be introduced into or kept in an aviary in the U.K. When foreign birds, such as parrots, mynahs, and the tropical finches, are kept in aviaries special care is needed to protect them from the weather in winter.

AVIATION, CIVIL : FLYING & GLIDING

Captain Norman Macmillan, M.C., A.F.C., A.F.E.Ae S

This is a survey of all that is involved in the development of civil flying, not including the great air lines for passengers and freight, which are dealt with under Airways. A guide to the identification of civil aircraft by the registration markings is added. See also Aeronautics; Aeroplane; Air Law; Air Transport; Flight

There are ten main groups of air operation in civil aviation. These are: (1) test and research; (2) school and club (power flying and gliding); (3) private; (4) passenger charter; (5) freight; (6) ambulance; (7) national air lines; (8) continental air lines; (9) intercontinental air lines; (10) transoceanic air lines. For the last four groups see *Airways*.

On the non-flying side, civil aviation covers an even wider field: (1) technical research; (2) design; (3) manufacture of aircraft and ancillary parts; (4) lecturers; (5) ground engineers; (6) airfield hands; (7) airfield operational staff; (8) customs and excise; (9) government and operating companies' technical divisions; (10) government and operating companies' control staffs; (11) medical staff; (12) fuel supply; (13) surface transport to connect with air; (14) hotel and catering for air travellers; (15) airfield architects and constructors; (16) air consultants; (17) air journalists.

There is scarcely any industry or form of transport with which civil aviation is not interconnected in some part of its complex structure.

Combining for Development

In the test and research branch of civil aviation, manufacturers and operating companies combine to develop and produce aircraft most suitable to meet the needs of a group of operating companies, or sometimes of a principal monopoly organization. With few exceptions the most successful aircraft have been developed when there has been competition in the operational field, but with the increasing size of aircraft and the consequent rise in costs for research and prototype production, the tendency, even in the U.S.A., has been for operating companies to pool their experience and resources when a new transport aircraft is to be developed. The necessity for this collaboration is indicated by the high initial cost of large modern aircraft: for example, the Douglas DC-7 86-passenger 70-ton air liner prototype cost £250,000 to produce (the type was never manufactured).

Occupations in civil aviation are varied. Test pilots are almost

exclusively employed by aircraft and engine manufacturers, but some instrument manufacturers also employ test pilots to carry out research work in flight. Salaries vary in accordance with the risk to be run and the technical skill required (e.g. for prototype research against production flight test). In the larger aircraft test crews include observers and flight engineers in addition to pilots. Experienced air line pilots are sometimes called upon to carry out operational test flights.

Educational Schemes

Civil flying schools employ flying, navigation, and engineering instructors who give training for all occupations connected with the air and ground operation of civil aircraft. Some are run as colleges with resident students. The Society of British Aircraft Constructors offers well-paid scholarships annually to young people who normally could not afford to study for careers in civil manufacturing aviation; this scheme brings into the industry the best brains from a wide section of the people.

The school of aeronautics at London university, enabling aeronautical students to take a B.Sc. degree in aeronautics, was closed during the Second Great War, but in 1942 alone 1,400 American men and women took aeronautical degrees in the U.S.A.

In 1943 the British government asked the Aeronautical Research committee to explore the possibility of founding a school of aeronautical science, to train for civil aviation; and in 1945 the College of Aeronautics was duly founded.

The private aircraft owner provides scope for the smaller manufacturer and the person who is prepared to serve in the capacity of personal or company's pilot, possibly for a firm that maintains its own air communication service for the transport of directors and staff. The technical development of aviation and the raising of safety standards demand a high degree of skill and knowledge from pilots who undertake this work.

Charter flying is mostly run by private companies, seldom in the hands of the individual pilot, not even on the basis of hire on a sharing basis often employed for city motor taxi businesses. The

stringent regulations governing civil aircraft operation almost preclude the successful operation of a one-man air taxi business.

Air freight may be run on a charter basis on regular routes, or on a pick-up basis carrying freight anywhere to customers' requirements. The second enterprise is similar to air ambulance work, which depends on the incidence of illness and the difficulties of removing cases by surface transport. The ambulance service to the Hebrides has saved many lives by taking patients swiftly to the hospitals of the large Scottish cities.

The headings denoting non-flying activities in civil aviation indicate sufficiently the wide range of allied ground work, wherein a great number of specialists are required. To the list given might be added flying salesmen and flying maintenance crews of the larger companies making aircraft and associated equipment. These men must be prepared to travel and live wherever their services are required: they have exceptional opportunities for seeing the world both from the air and on the surface. They are usually recruited from persons having long experience with the firms employing them, or with similar concerns.

Increase of Civil Aircraft

(Civil aviation covers the widest field in operational aeronautics, from gliders costing about £200 to £300, up to the largest air transports costing tens of thousands of pounds. Before the U.S.A. entered the war in 1941 there were 500 air transport aircraft and 25,000 privately owned aircraft in service with U.S. citizens. Such was the immediate growth in civil aviation after the war that even by mid-1946 there were 5,500 aircraft registered for non-scheduled (charter) operation in that country; the number of aircraft in private ownership increased in much the same proportion. Yet to produce the aircraft estimated for 1950, a one-shift manufacturing industry, representing only from 10 to 15 p.c. of the 1944 war-inflated aircraft industry in the U.S.A. (i.e. about five times greater than the pre-war industry), would suffice.

It is unlikely that British output of private aircraft can reach the same scale of production, for the U.K. market is much smaller, both in population and in territorial suitability for private flying.

The shrinkage of the British aircraft industry from war to peace was estimated in 1943 by Sir Stafford Cripps, then minister of

aircraft production, as a fall to 10 p.c. of wartime workers remaining in the industry. Expansion in the operational side of public air transport and private flying, and rapidly growing opportunities for employment in both branches, are thus accompanied by a reduction on the industrial side.

Licences for Air Crews

All persons and aircraft operationally employed in civil aviation are registered and licensed by a government department, or a body appointed by the government. The issue of licences to all pilots and other operational members of air crew is subject to medical examination, and the production of a certificate of competency or the passing of appropriate examinations. Conditions governing the issue of a transport licence are much more stringent than those governing the issue of a private pilot's licence. Licences issued in civil aviation to air crews in the U.K. are: pilot—student, private, commercial, senior commercial, airline transport; flight navigator; radio operator; flight (aircraft, or operational) engineer. Licences are also issued to ground (maintenance) engineers: A, inspection of aircraft before flight; B, inspection of aircraft after overhaul; C, inspection of aero engines before flight; D, inspection of aero engines after overhaul; X, special duties.

The Royal Aero Club aviator's certificate is a certificate of competency in the pilotage of a heavier-than-air aircraft. It is issued by the club under the regulations of the Fédération Aéronautique Internationale, and is accepted by the ministry of Civil Aviation (*g.v.*) as a certificate for the issue of a pilot's licence.

Flying instructors in the U.K. must have their pilot's licences endorsed by the ministry of civil aviation. The Guild of Air Pilots and Air Navigators is the body appointed by the ministry to conduct the examination.

Certificates in respect of the registration of aircraft and their airworthiness are issued in the U.K. by the ministry of civil aviation or the air registration board, and in the U.S.A. by the civil aeronautics board.

There are six glider pilot's licences—A, B, C, Silver C, Gold C, and Diamond C, corresponding to stages of competence. Issued only after practical tests, they are in effect certificates of competency. They are issued by the Royal Aero Club in the U.K., and are interna-

tionally standardised under the Fédération Aéronautique Internationale. (See also under Glider.)

AVIATION (CIVIL) REGISTRATION MARKS. When civil aviation was resumed in Great Britain after the First Great War, on May 1, 1919, all aircraft bore standardised registration marks for the first time. Great Britain was thus a pioneer in this matter, anticipating the agreement of the international air navigation convention of July, 1919. Annex A of this convention became the basis of the law governing the marking of civil aircraft owned by states (or their nationals) who ratified the convention. In 1949 the regulations were redrafted.

Identity of civil aircraft is distinguishable by a nationality letter or letters, followed by a hyphen, which is in turn followed by a further group of letters indicating the national registration of the particular aircraft. Aircraft of countries that are members of the I.C.A.O. (International Civil Aviation Organization) use identification markings of groups of five letters, either single letter—hyphen—four letters, or two letters—hyphen—three letters. The following countries are exceptions: Russia (a non-signatory), USSR, printed СССР, and a number; U.S.A., which has different lettering for the several categories, using NX followed by a number (aircraft with experimental licence), NC followed by a number (aircraft with commercial certificate), or NR (restricted licence).

Situation of Marks

The national and registration marks making up the five letters are painted in Roman capital letters of uniform size and shape in black or a standard colour, on the lower surface of the lower main planes, and/or on the upper surface of the top main planes, the tops of the letters being towards the leading edge, and again along each side of the fuselage, or on the vertical tail unit. A gyroplane or helicopter carries the marking only on the fuselage or nacelle.

Combinations of three letters used in wireless abbreviations or codes were not allowed as registration letters. These include such combinations as SOS, PAN, TTT, RPT, and TXT, as well as all combinations beginning with Q, which would be confused with the Q code for aircraft W/T.

F-, G-, D-, I-, and J- are the identification letters for France

and French colonies and Protectorates (except Morocco), Great Britain, Germany, Italy and Japan respectively.

All remaining countries are identified by double letters, viz.:

AP-Pakistan	PI-Philippine
CC-China	Republic
CF-Canada	PJ-Neth. W. Indies
CL- or CM-Cuba	PK-Indonesia
CN-Morocco	PP-Brazil
CP-Bolivia	PZ-Surinam
CR-Portuguese	(Neth. Guiana)
Colonies	RV-Persia
CS-Portugal	SA-Saudi Arabia
CX-Uruguay	SE-Sweden
EC-Spain	SP-Poland
EL-Eire	SU-Egypt
HA-Hungary	SX-Greece
HB-Switzerland	TC-Turkey
HC-Ecuador	TF-Iceland
HH-Haiti	TI-Costa Rica
HT-Dominican	TP-Transjordan
Republic	VH-Australia
HK-Colombia	VT-India
HS-Siam	XA- or XB-
IG-Guatemala	Mexico
IN-Norway	XH-Honduras
LB-Lebanese	XT-China
Republic	XY-Burma
LY-Argentina	YA-Afghanistan
LX-Luxemburg	YI-Iraq
IZ-Bulgaria	YJ-New Hebrides
OB-Peru	YN-Nicaragua
OH-Finland	YR-Rumania
OK-Czechoslovakia	YU-Yugoslavia
OO-Belgium	YV-Venezuela
OY-Denmark	ZK-New Zealand

VP-, VQ-, VR-represent, with varying combinations of the three succeeding letters, Brit. colonies and protectorates.

Avicbron OR **SALOMON IBN (IBN) BIROL** (1020-69). Spanish-Jewish philosopher and poet, a native of Malaga, wrongly called an Arabian by the scholastics. His philosophy, which is contained in his *Fountain of Life or Wisdom*, combined Jewish views with Aristotelianism and neo-Platonism. He assumes that everything in the world, with the exception of God, consists of matter and form, dependent upon the divine will, a divine creative power emanating from God.

Avicenna OR **IBN SINA** (980-1037). An Arabian philosopher and physician. Born in the Persian province of Bokhara, he was minister to the prince of Hamadan, but was imprisoned as the result of political intrigue. Having escaped to Ispahan, he became court physician and lectured on medicine and philosophy. He died at Ispahan from overwork and riotous living. Avicenna wrote commentaries on Aristotle, whose works he was one of the first to introduce to the Eastern world. Matter, the principle of plurality, is eternal, and contains in itself all possibilities. It is not an emanation from the Deity. All individual things proceed indeed from God, but not directly; the first and only direct product of the Unchangeable (God) is intelligence.

Avicenna also wrote medical treatises, which were in general use in European universities and are still text-books in the East.

Avicennia. Genus of small trees of the family Verbenaceae. Natives of tropical sea-coasts and tidal rivers, they are known as white mangroves.

Avigliana. Village of N.W. Italy, Turin province. It is on the Dora Riparia and is 24 m. W. of Turin on the Mont Cenis route. It has a large dynamite factory.

Avignon. A city of France, capital of the dept. of Vaucluse. It stands on the left bank of the Rhône, 53 m. N.W. of Marseilles, and on the rly. from that city to Paris. It has several industries, chiefly in silk, and a trade in country produce, especially wheat, but is chiefly known for its historical associations and picturesque situation. It stands on a rock above the river, and several parks add much to its beauty.

Avignon is still surrounded by massive walls, built in the 14th century, and studded with towers and gateways, the whole being one of the most perfect examples of medieval fortifications extant. In the 12th century Romanesque

passed from one ruler to another and was for a short period an independent city. In 1309, when driven from Rome, Pope Clement V chose it as his residence, and here the popes lived for seventy years. Their palace, an enormous building not unlike a fortress, still survives; it has been used as a barracks and a prison. Pope Clement VI bought Avignon in 1348, and it remained papal property until its annexation to France in 1791. It was the first meeting-place of Petrarch and Laura. John Stuart Mill died here.

During the Second Great War Avignon came under the control of the Vichy government after the capitulation of France in 1940, remaining in unoccupied France until the occupation of the whole country by the Germans in Nov., 1942. Railyards were targets for Allied bombing attacks on May 27, 1944, and on July 17 bridges were bombed by U.S. heavy bombers. The town was liberated by French troops of the Allied 7th army on Aug. 25, 1944. Pop. 60,053. See Papacy.

Ávila. Prov. of central Spain. It is bounded S. and E. by the Sierra de Gredos and the Sierra de Guadarrama, and has an area of 3,042 sq. m. Flat and barren in the N., it is mountainous in the centre and S., and agriculture is confined to the fertile valleys of the Aberche, Adaja, and other rivers. Silver, lead, copper, and other minerals abound in the mountains, but are little worked. Livestock is reared, and the production of merino wool is one of the chief industries. Ávila is the capital. Pop. 241,508.

Ávila. City of Spain, capital of Ávila province. It stands on the Adaja, 54 m. by rly. N.W. of Madrid, on the route to Paris. Almost surrounded by mts. and encircled by well-preserved granite walls, with 9 gates and 86 towers, its buildings include a Gothic cathedral and Moorish castle. The ancient Abula, it flourished under the Moors, but declined after the expulsion of the Moriscos in 1610. There is a convent named after S. Teresa, who is supposed to have been born here. Pop. 15,223.

Avilés OR **SAN NICOLÁS DE AVILÉS**. A seaport of Spain, in Oviedo prov. The Roman Flavionavia, it stands on Avilés Bay, an arm of the Bay of Biscay.

Avignon. The fortress palace of the Popes and the 12th century Romanesque cathedral

cathedral of Notre Dame des Doms is the tomb of Pope John II, and outside a gilt statue of the Virgin. S. Pierre is a fine Gothic church. The hôtel de ville is modern, and the city has a fine library, a valuable museum, and a picture gallery. Part exists of its old bridge, made famous by the song *Sur le pont d'Avignon*.

Avignon, the ancient Avenio, was a town of the Gauls, and later became an important Roman settlement. Its bishopric was founded in the 3rd century, and it became the seat of an archbishop in 1475. In the Middle Ages it

24 m. by rly. W. of Gijón. It is a fishing and coasting port, exports coal, and manufactures woollens, linen, and glass. Pop. 15,000.

Avion. Town of France, in the department of Pas-de-Calais. It is a great rly. junction, 1 m. S. of Lens, and was captured by the British in the battle of Lens, June 29, 1917.

Avitus, MARCUS MAECILIUS (d. A.D. 456). West Roman emperor. While holding a military command he was sent by the Roman general Aëtius to Theodoric the Visigoth, whom he persuaded to join the Romans against the Huns. He fought by the side of Aëtius at the Catalaunian Plains in 451, and in 455 was proclaimed emperor. In 456, defeated by Ricimer at Placentia (Piacenza) he was deposed.

Avoca or **OVACA.** River of co. Wicklow, Eire. Formed by the union of the Avonmore and Avonbeg, it flows 9 m. S.E. to the Irish Sea at Arklow. It traverses a beautiful glen, the "sweet vale" of Moore's poem. A rly. and lead and copper mines detract from its beauty. The district is the richest mining area in Eire.

Avocet (*Recurvirostra avosella*). Bird related to the snipe, characterised by its long upward-curved beak. Formerly common in the fen districts of England, it is now rare.

Avogadro's Law. (Chemical law named after its discoverer, the Italian chemist and physicist, Count Amadeo Avogadro (1776-1856). A gas is supposed to consist of molecules all of which are moving in paths, the movement being considered as a motion of translation, and these molecules continually collide with one another. On account of these collisions, the velocities of each and every molecule differ from time to time; and for convenience it is usual to speak of the mean or average velocity of the molecules, and to assume that they all move with the mean of their actual velocities. In the same way the length of the path traversed by each molecule between successive collisions varies, but there is a mean free path, and it is assumed that this mean free path will be the same for any large number of molecules, if the conditions of temperature and pressure are the same.

The pressure exerted by a gas against the sides of a vessel containing it is due to the movements of its molecules. Now, according to Boyle's Law, the volume of a gas multiplied by its pressure is always the same, and from this it is deduced that in a gas the mean velocity of

the molecules is also constant. If two gases are under the same pressure and at the same temperature, the mean value of the energy developed by the collisions of their molecules must be the same. Hence it can be deduced that the number (though not the size) of their molecules is the same. This leads to what is called Avogadro's Law: that under the same conditions of pressure and temperature equal volumes of all gases contain an equal number of molecules. See Boyle's Law.

Avoidance (Lat. *viduus*, widowed, bereft). Term used in ecclesiastical law for a benefice without an incumbent and so void or empty.

Avirdupois. The English and American system of weighing all substances except precious metals and stones, and medicines. It comes from the old French *avoir de poids*, more correctly *avoir de poais*, goods of weight. The basis is the grain, originally a wheat corn taken "from the midst of the ear": 7,000 grains making 1 lb. . 27½ grains one dram. 16 drams one ounce: 16 oz. 1 lb. . 112 lb. one hundredweight: 20 cwt. one ton. See Weights and Measures.

Avola. Town of Sicily, in Syracuse prov. It is 22 m. by rly. S.W. of Syracuse, and occupies the site of a former town destroyed by earthquake in 1693. Almond trees and sugar-canes flourish, their produce, with wine and straw-matting being exported. Pop. 16,500.

Avon (Welsh *afon*, river). Name of several rivers in England and Scotland. The word is akin to the Latin *aqua* (water) and *amnis* (river), both from the same Sanskrit root *ap*=water.

Avon, EAST. River of Wiltshire, England. Rising near Devizes, it flows S. past Salisbury to the English Channel at Christchurch. It is about 50 m. long and is navigable to Salisbury.

Avon, LOWER. River of England, known also as the Bristol Avon. Rising on the Cotswold Hills, in Gloucestershire, it flows through Wiltshire and Somerset past Malmesbury, Chippenham, Bath, and Bristol, to the Severn estuary at Avonmouth. It is

75 m. long, and is navigable as far as Bath by small and as far as Bristol by large vessels.

Avon. Reaches of the Upper Avon at Bidford, Warwickshire, between Stratford-on-Avon and Evesham

Avon, UPPER. River of England, known also as the Warwickshire Avon. Rising near Naseby, in Northamptonshire, it flows through Leicestershire, Warwickshire, Worcestershire, and Gloucestershire, to the Severn at Tewkesbury. It is 96 m. long and is navigable to Evesham. It is noted for its prospect of Warwick Castle and for Stratford, the birthplace of Shakespeare, the "Sweet Swan of Avon."

Avon. River of Banffshire, Scotland. Rising in Loch A'an, it flows 30 m. N. to the Spey near Ballindalloch.

Avon. River of Lanarkshire, Scotland. It rises at the foot of Waddell Hill, flows 29 m. N.E., past Stonehouse, to join the Clyde near Hamilton.

Avonmouth. Seaport of Gloucestershire, England. It stands at the mouth of the Lower Avon, 6 m. N.W. of Bristol, on two rly. lines. Dating from 1877, it is the outport of Bristol and forms part of that city. See Bristol, Port of.

Avory, SIR

HORACE EDMUND (1851-1935). British judge. Born Aug. 31, 1851, he was educated at King's College, London, and Corpus Christi College, Cambridge. Called to the bar in 1875, he became junior counsel to the Treasury at the Old Bailey in 1889 and K.C. 1901. A judge of the King's Bench Division from 1910, when he was knighted, he was associated with great criminal

Sir Horace Avory. British judge

trials, either on the bench or as member of the court of criminal appeal, until his death, June 13, 1935. Outstanding among his trials were those of Casement for high treason, 1916; Mahon and Vaquier, both for murder, 1924; Browne and Kennedy for the murder of P.C. Gutteridge, 1927; and Hatry for fraud, 1930. *Consult* Lives, S. Jackson, 1935. G. Lang, 1935.

Avranches. Town of France, in the department of Manche. On the river Sée, 87 m. by rly. S. of

Avranches, France. Spot where Henry II of England promised expiation for the murder of Thomas Becket

Cherbourg, it is on the coast road from St. Malo to Granville. Formerly an important place in Normandy, it had a magnificent cathedral wherein Henry II was absolved of all complicity in the murder of Thomas Becket and promised expiation, withdrawing, at the same time, all his demands on the church (Concordat of Avranches, 1172). An inscribed stone in the open square marks the spot where he knelt.

The cathedral was destroyed in the Revolution and the bishopric was abolished. The town stands on a hill overlooking Mont St. Michel, has three modern churches, a town hall, and botanic gardens. It has leather, brewing, and dyeing industries, and trades in agricultural produce, flowers, and fish. Dating from Roman times, it underwent several sieges and suffered in the peasant revolt of 1639. After the Franco-German armistice in June, 1940, Avranches became part of German-occupied France. Heavily damaged during the fighting on the Normandy front in 1944, it was liberated by U.S. forces on July 31, this enabling the Allies to thrust swiftly S. towards Brittany.

Avro. Aircraft designed by the firm of A. V. Roe & Co., Ltd. This was founded by the pioneer A. V. Roe, now Sir Alliott Verdon-Roe (*q.v.*), in 1910, and for much of the First Great War and thereafter concentrated on the type 504, a standard biplane trainer turned out in huge numbers. In the

Second Great War, Avro produced the twin-engined Anson reconnaissance and training plane, the Manchester, Lancaster (*q.v.*) and Lincoln bombers, and the similar Lancastrian and York transports etc. In 1945 appeared the first Tudor for the air lines, and in 1946 the first experimental jet airliner (the Nene-Lancastrian).

Awaji or **AVANISI.** Island of Japan. At the E. end of the Inland Sea, between Honshu and Shikoku, it is 33 m. long, 16 m. broad, and 229 sq. m. in area. Very fertile and low, it has a dense population and many ferry and steamer services with the main island. It is a favourite tourist resort, and manufactures pottery.

Award (Old Fr. *esgarder*, to adjudge). In English law, the finding or decision of an arbitrator or arbitrators, corresponding to the judgement of a court of law. The award, which must be made within time fixed by the agreement, states the decision of the arbitrator or arbitrators by whom it is signed. It must be stamped, the cost varying from threepence to 10s. Unless the award has been improperly procured, or the arbitrator has misconducted himself or the proceedings, its validity will be recognized and, if necessary, supported by the courts of law. *See* Arbitration.

Awe. A river of Argyllshire, Scotland, draining Loch Awe into Loch Etive. Traversing the deep gorge of the picturesque Pass of Brander, it is noted for its salmon and sea-trout. It is 5 m. long.

Awe. Lake or loch of Argyllshire, Scotland. The longest freshwater lake in the country, it extends N.N.E. for 22½ m. from Ford to the foot of Ben Cruachan, is from ½ m. to 3 m. broad, and covers an area of 15½ sq. m. It has very diversified scenery and contains many islands, including Fraoch-Eilean, with remains of castle (1267), and Inishail, with ruined convent and church. The ruins of Kilchurn Castle, a Macdonald stronghold stand on an island at its N.E. end.

Axbridge. Town of Somerset, England Between the river Axe and the Mendip hills, it is 8 m. S.E. of Weston-super-Mare and has a station on

the rly. Built round a square, it has stocks and a bull-baiting post. The church has some fine ornamental roofs, one having been executed in 1636 by a native, and several memorials to the Prowse family. Pop 1,017.

Axe (Gr. *arinē*). Implement used for felling timber or cutting wood. It is a hand tool with a head, usually of iron, and having a hardened steel cutting edge. In the process of manufacture, an eye is punched in the solid metal of the head for the reception of a helve or shaft cut from hickory, ash, or other resilient wood. The cutting edge, commonly secured to the head by welding, is set in the plane of swing of the shaft, thus distinguishing it from the adze, in which the cutting edge is at right angles to the plane of swing. Bronze axes were used in England, and also by the Egyptians, who split the handles to receive blades secured by pins and leather thongs.

Axe. Name of two rivers of England. One, 25 m. long, rises in the Mendip Hills, Somersetshire, and flows past Cheddar and Axbridge to the Bristol Channel at Uphill, near Weston-super-Mare. The other, 21 m. long, rises in Dorset and flows S. past Axminster to the English Channel near Seaton.

Axel Heiberg. An island of Canada. In the Arctic region, it lies W. of Ellesmere Island in lat. 78 to 81 N., long. 88 to 92 W.

Axenstrasse. Road in Switzerland, the part of the St. Gotthard carriage road which is carved out

Awe. View of the north-eastern end of the Argyllshire loch, with the ruins of Kilchurn

of, or tunnelled through, the rocky cliffs on the Bay of Uri, Lake of Lucerne. The road was made in 1822-30 except for this portion, which was not opened until 1866.

Axholme, ISLE OF. Level tract of land in Lincolnshire, England. Between the Trent, Idle, Torne, and Don rivers, it was formerly afforested and later became a marshy swamp, which was drained (1625-34) at the command of Charles I by Cornelius Vermuyden, a Dutchman. It covers 48,000 acres and is of great fertility.

Axil. Botanical term for the angle formed above a leaf where it joins the stem.

Axi'la (Latin). Space between the upper part of the side of the chest and the upper part of the arm, more commonly known as the armpit. It is bounded in front by the pectoral muscles, which pass from the front of the chest to the arm, and behind by muscles attached to the shoulder blade and by the tendon of the *latissimus dorsi*, the great muscle running up from the back. The outer wall of the *axilla* is formed by the *humerus* or upper arm bone and a tendon of the biceps muscle, and the inner wall by the upper four or five ribs with the muscles between them.

Axim. Town of the Gold Coast Colony, British W. Africa. It lies E. of the mouth of the Ankobra river, 70 m. W. of Cape Coast, has a good harbour, and exports timber. Built by the Portuguese, it was taken by the Dutch in 1642 and ceded to the U.K. in 1872.

Axiom (Gr. *axioma*, something thought worthy). Self-evident proposition which may be used as the basis of proof for other propositions. Such are the laws of identity and contradiction in logic. In a narrower sense axioms are principles which depend upon direct intuition, such as those of mathematics and physics. The word is also used for a condensed, instructive saying, or aphorism.

Axis (Lat., axle). In geometry, any line in a figure which divides

Axis Deer. Indian species (*Axis axis*), somewhat like the fallow deer

the figure into two symmetrical parts. In analytical geometry, an axis of reference is either of two intersecting straight lines by reference to which the position of any point in a curve is determined.

In conic sections, the axes of the curves have a specific meaning. For example, the axis of a hyperbola bisects the curve at its origin and, passing through both branches of the curve, extends to infinity in either direction; the axis of a parabola stretches to infinity in one direction; but the ellipse has two axes, a major and a minor axis, symmetrical as to the curve and bounded by it. See Geometry.

Axis, BERLIN-ROME. Political collaboration of Nazi Germany and fascist Italy, inaugurated 1935-36. At this time Italy was angered at the imposition of economic "sanctions" by the League of Nations because of her aggression upon Abyssinia; while Germany was reoccupying the Rhineland in defiance of the Versailles treaty. The collaboration developed into a full political and military treaty of alliance signed May 22, 1939. It was then stated that Germany and Italy "join forces for securing their living space and maintaining peace, so as to make the foundations of European civilization safe amid a world of unrest and disintegration." The treaty was valid for 10 years. On Sept. 27, 1940, Japan joined the Axis by signing the Berlin pact (*q.v.*) whereby she promised to assist the two European powers to set up a new order in Europe while they in turn undertook to assist her in the establishment of a new order in Greater Asia. Hungary signed her adherence to the Axis on Nov. 20, 1940, Rumania and Slovakia on Nov. 23, Bulgaria on March 1, 1941. Yugoslavia on March 29 (which led to revolt), and Croatia on June 14, 1941.

Axis Deer. Species of Indian deer, somewhat resembling fallow deer, but with short sharp antlers. Its fawn-coloured coat is abundantly spotted with white. This species is easily domesticated.

Axle. Shaft or spindle on which or with which a wheel revolves. Properly the term is applied only to axles of vehicles, the name shaft or spindle being used for the corresponding members in other wheels. In carts, etc., the wheels are carried upon and kept at the proper distance by an axle-tree, and the cylindrical ends of the axle-tree are then termed the axle. A live axle, in motor vehicles and the like, is one driven by the engine. The wheel-and-axle is one of the mechanical powers. See Wheel.

Axminster. Parish and market town of Devon, England. On the Axe, 27 m. E. of Exeter, with a rly. station, it was famed for its carpets until 1835, and now makes tooth and nail brushes and has flour, corn, and saw mills and an iron foundry. The church of S. Mary the Virgin was restored in 1871. Axminster's midsummer fair dates from 1246. Market day, alternate Thurs. Pop. 2,327.

Axolotl. Larval form of *Amblystoma*, a kind of salamander common in Mexico. In appearance it usually resembles a large black newt with external branching gills. It lays eggs freely, even

Axolotl. *Gyrinus* *edulis*, the larva form of a Mexican salamander

in captivity, and was long supposed to be a mature animal of the newt tribe; but it is now known that, if deprived of water, or treated with extract of thyroid gland, it loses its gills and changes into the typical salamander known as *Amblystoma*.

Axum or **AKSUM**. Ruined town of Abyssinia, in the prov. of Tigré. It was once the capital of an Ethiopian kingdom and contains monoliths, apparently associated with Semitic sun-worship, and ruins of a Christian church. Pop. 5,000. Consult The Sacred City of the Ethiopians. J. T. Bent, 1893.

Ayacuchio. Department of S. Peru. A mountainous and somewhat barren region of 18,185 sq. m. it is watered by the Apurimac and

axes of reference XOX' and YOY' , by which the positions of P and R are determined. See text

its affluents. Silver and other minerals are worked, sheep and cattle are reared, and coffee, cocoa, cotton, and grain produced. Capital, Ayacucho. Pop. 358,991.

Ayacucho. City of Peru, capital of the department of Ayacucho. It stands on a plateau, at an altitude of 9,000 ft., 145 m. W.N.W. of Cuzco. It is the seat of a bishopric, has a cathedral and a university (founded 1677), and trades in cochineal. Founded by Pizarro in 1539 as San Juan de la Victoria, its present name, meaning the corner of death, was adopted after Peru gained its independence. Dec. 9, 1824. Pop. 20,000.

Ayah. A word of Portuguese origin meaning a nurse or governess, feminine of *aio*, a tutor. By the Portuguese it was introduced into India, where it is used for a native nurse or lady's maid.

Ayala, PEDRO LOPEZ DE (1322-1407). Spanish writer and statesman. He held several high offices in Castile, becoming grand chancellor in 1398. He was taken prisoner at Najera in 1367 by the Black Prince, and at Aljubarrota in 1385. His reputation rests on his chronicles of the Castilian kings.

Ayamonte. Frontier town and harbour of Spain, in Huelva prov. On the Guadiana, 2 m. from its entrance into the gulf of Cadiz, and 80 m. W.S.W. of Seville, it has a good harbour, sardine and tunny fisheries, and makes silk.

Aycliffe. Proposed new town of co. Durham, England. See N.V.

Aye-Aye. Native name of *Cheiromys madagascariensis*, an animal allied to the lemurs found only in Madagascar. A highly aberrant member of the Primates, its teeth resemble those of the rodents. It is about the size of a cat with a very bushy tail and prominent, almost hairless ears. Its hands are very like those of monkeys, except that the third finger is curiously long, slender and withered.

looking, and is believed to be used for extracting insects from crevices. Nocturnal in its habits, little is known of it. Probably it lives mainly on grubs, but the fondness of captive specimens for sugar-cane suggests that it also feeds on fruits and succulent vegetables. The first specimens were brought to England in 1860

Ayesha. The favourite wife of Mahomet, the prophet of Islam. Born at Medina about A.D. 611, the daughter of Abu-Bekr, she married Mahomet when nine years old and obtained great influence over him. On his death in 632 she opposed the claim to the succession of Ali, husband of the prophet's daughter, in favour of her own father, who became the first caliph. She died at Medina about 678. Though childless, she was honoured with the title of 'mother of the believers.' Ayesha is also the name of the immortal woman in Rider Haggard's romances *She* and *Ayesha*. See Mahomet.

Aylesbury. Mun. bor., market town, and county town of Buckinghamshire, England. Occupying an

Aylesbury arms

an elevated site in the Vale of Aylesbury, it is 38 m. W.N.W. from London by steam and elec. rly. and Green Line. Industries include book-binding, engineering, manufacture of velour hats, felt processing, cheese

making, and butter blending. The Early English church of S. Mary, county hall, and 15th century King's Head hotel with a splendid window, are among the chief buildings. Market days, Wed. and Sat. Pop. 18,072

Aylesbury was wrested from the Britons by the Saxons in 571. A charter was granted by Queen Mary in 1554, but the rights and privileges were not enjoyed for long, and only in 1917 was the charter restored.

Aylesbury, Buckinghamshire. Market place and clock tower of the old county town

Although Aylesbury returned two members to Parliament down to 1885, it now gives its name to a county division with one member. In the vicinity is Hartwell House, where Louis XVIII resided during his exile (1810-14).

Aylesbury Duck. Large white duck, deriving its name from the district in which it is mainly bred. It is known all over the world for its superior table qualities. Specimens are frequently produced weighing from 4 lb. to 5 lb. when only eight weeks old. Its distinguishing features are its weight, varying from 6 lb. to 10 lb., its pure white plumage, flesh-coloured beak and bright orange shanks and feet. The tail of the drake has characteristic curled feathers.

Aylesford. Parish and village of Kent, England, on the Medway, 38 m. S.E. of London, with a rly. station. Here are Kit's Coty House, a cromlech of three perpendicular stones and a covering stone, and a larger group close by the Countess Stones. There are remains of a 13th century Carmelite friary, and at Horsted is the supposed tomb of Horsa, slain in

Aylesford Kent, showing portion of the beautiful old bridge across the Medway

battle with the British king Vortigern in 455. Pop. 3,644. See N.V.

Aylesford, EARL OF. British title borne since 1714 by the family of Finch. Heneage Finch, a younger son of the 1st earl of Nottingham, was the first holder. He was solicitor-general under Charles II. and lived until 1719. In 1688 he was leading counsel for the seven bishops. In 1885 Charles Wightwick Finch (1851-1924) succeeded as 8th earl; he was the first who did not bear the Christian name of Heneage. The 10th earl (b. 1886) succeeded his nephew in 1941. The family estates are in Warwickshire and Kent, the earl's eldest son is known by the name of Lord Guernsey.

Aylmer, BARON. An Irish title borne by the family of Aylmer

since 1718. Its first holder, Matthew Aylmer, was an M.P. and an admiral, being commander of the fleet in 1709. He was made an Irish peer in 1718, and died in 1720. Matthew, the 5th baron, a general, was governor-general of Canada in 1830. The 7th and 8th barons made their homes in Canada. The 9th baron (b. 1880) succeeded his father in 1923.

Aylmer, FELIX (b. 1889). British actor. Born at Corsham, Wilts. Feb. 21, 1889, he went to Exeter College, Oxford, and first appeared on the stage in 1911.

Later he joined the Birmingham repertory company. In 1923 he took the title part in Robert E. Lee at the Regent Theatre, London. In *Yes and No*, 1937, and *Scandal at Barchester*, 1944, he had the principal part, each time as a clergyman. From 1936 he was seen in countless British films and became almost an automatic choice for any supporting character such as a bishop, cabinet minister, or magistrate. He was a regular broadcaster of poetry. He married the actress Cecily Byrne.

Aylmer, JOHN (1521-94). English prelate. Born in Norfolk, of an old county family, he graduated at Cambridge in 1541, and became chaplain to the duke of Suffolk and tutor to Lady Jane Grey. Made archdeacon of Stow in 1553, he declared in Convocation against the doctrine of transubstantiation, and on sentence of deprivation retired to Strasbourg and Zurich, returning on the accession of Elizabeth. His archdeaconry was restored to him, 1559. Archdeacon of Lincoln, 1562-76, he was made bishop of London in 1577. His episcopate was distinguished for its severity against Catholics and Puritans. He died June 3, 1594.

Aymara. A South American Indian people in Bolivia and S. Peru. Their proper name is Colla; the other was incorrectly transferred to them from a Quichua-speaking tribe who were settled among them by the Incas and acquired the Colla language. This pre-Incan people apparently came under immigrant influences which introduced megalithic building and advanced industrial arts.

The Aymara remains include rock-cut seats, colossal statuary, stone cists, sometimes two-storeyed,

cylindrical towers or *chullpas* up to 40 ft. high, dolmens, and massive sepulchral chambers erected against cliff-sides. At Tiahuanaco, S. of Lake Titicaca, stands a pyramidal mound 83 ft. high, with remains of a cyclopean palace, monolithic stairway, five rows of menhirs, and a portal formed out of an andesite block 10 ft. high and 13½ ft. wide, which bears in relief the hero Viracocha and convergent rows of winged warriors and condors. The Colla physical type, established by long residence at high altitudes—lighter-tinted, sturdier than the Quichua—still dominates the indigenous Bolivian population, and cultural survivals lurk under their nominal Christianity. See American Indians.

Aynesworth, ALLAN (b. 1865). British actor. Born at Royal Military College, Sandhurst, April 14, 1865, the son of General Abbot Anderson, he was educated in France and Germany. His first appearance was at the Comedy Theatre in 1887, after which he played in London until 1912, when he entered on the management of the New Theatre with Ready Money. He subsequently managed several London theatres, appearing in popular plays, such as *The Circle*, 1921; *The Dover Road*, 1922; *Counsel's Opinion*, 1931; *Living Dangerously*, 1934; *Tovarich*, 1935; *Victoria Regina*, 1937.

Ayr. Mun., parl., police, and royal burgh, seaport, and county town of Ayrshire, Scotland. It stands at the mouth of the river Ayr, 31 m. S.S.W. of Glasgow by the railway. Five bridges cross the river; the Auld Brig (15th century) and the New Brig (1788, rebuilt 1879) are the celebrated "twa brigs" of Robert Burns.

Ayr has an academy, founded in 1764 and rebuilt in 1880, a Carnegie library (1893), a fine town hall, and a Burns and other statues. The Wallace Tower, 115 ft. high, was erected in 1834 on the site of a former building of that name. The church of S. John, where Bruce's parliament was held in 1315, was rebuilt in 1655, and retains part of its old tower. The town and castle were closely associated with the war for Scottish independence and with the exploit of Sir William Wallace, who razed the barns of Ayr, temporary barracks erected for the troops of Edward I.

There are commodious docks and harbour, carpet, lace, and woollen manufactures, chemical and engineering works, iron foundries and shipyards. Coal is exported and metals and ores are imported. Shipping trade is mainly with Ireland. Market day, Tues. One member is returned to Parliament. Four race meetings are held yearly. During the Second Great War important aerodromes were established nearby. Pop. 41,600.

Ayres, RUBY MILDRED (b. 1883). English novelist. As a child she wrote fairy stories and later contributed serials to newspapers and magazines, most of which were published in book form. She also wrote for the films both in England and in America. Her books, chiefly light romantic fiction, include *Richard Chatterton, V.C.*, *Castles in Spain*, *Silver Wedding* (produced as a play, 1932), and *Still Waters*.

Ayrshire. South-west maritime county of Scotland. It is popularly divided into three ancient districts, Cunningham, Kyle, and Carrick, and has a greatest length of 78 m., extreme breadth of 29 m., 70 m. of coast, and an area of 1,132 sq. m. Off the coast is Ailsa Craig (*q.v.*). The surface, mainly undulating, is mountainous S. and S.E., the highest summit being Black Craig, 2,298 ft.

Rugged in the S., the coast is low and unrelieved above Ayr, and quite destitute of natural harbours. Loch Doon is the largest lake, and the Garnock, Ayr, Irvine, Doon, Girvan, and Stinchar, all unnavigable but picturesque, are the chief rivers. Agriculture is progressively important, Ayrshire being noted for its breed of cows and for its dairy-farming. Cheddar cheese, produced in large quantities, has supplanted the once celebrated Dunlop cheese. Coal, iron, limestone, and sandstone are worked, and numerous blast furnaces and the manufacture of woollens, cottons, earthenware, and ironware give it industrial importance. The co. is well served by railways. Ayr is the county town, and other towns are Kilmarnock, Irvine, Saltcoats, Troon, Ardrossan, Prestwick and Girvan.

Ayrshire unites with Bute to return three members to Parliament.

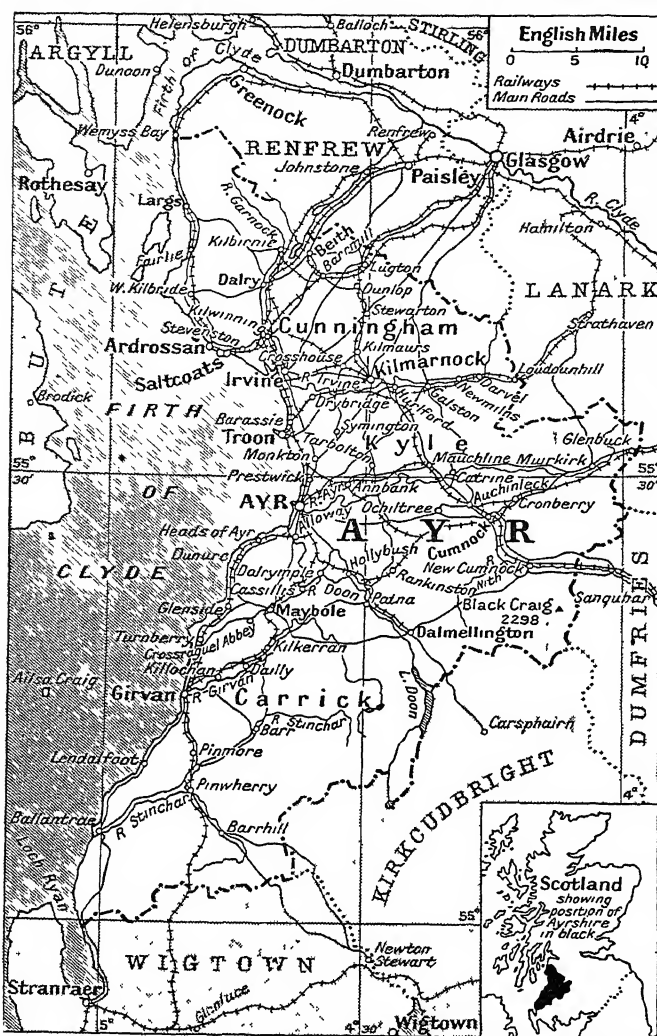

Felix Aylmer,
British actor

Ruby M. Ayres,
English novelist

Ayr burgh arms

Ayrshire. Map of this S.W. county of Scotland. It stretches along the Firth of Clyde, and is an important industrial and agricultural area

Pop. est. 298,700. Antiquities include ruins of Crossraguel and Kilwinning abbeys and of castles at Turnberry and Dunure.

LITERARY ASSOCIATIONS. The county is rich in literary associations. Two early Scottish poets belonged to Ayrshire, Walter Kennedy of the 15th century, and Alexander Montgomerie of the 16th. But in poetry the pre-eminent position belongs to Robert Burns, who was born at Alloway, where a museum and monument commemorate him. James Montgomery, who sang of The Common Lot, was born at Irvine, as also was John Galt, author of *The Annals of the Parish*. James Boswell, the biographer of Johnson, was one of the Boswells of Auchin-

leck. Ochiltree was the birthplace of George Douglas, and scene of his best-known story *The House with the Green Shutters*.

Ayrton, WILLIAM EDWARD (1847-1908). British scientist. He was educated at University College, London, devoted himself to the study of electrical physics, and spent some years in the public service of India and teaching in Japan. In 1879 he became professor of applied physics at the City and Guilds of London Technical Institute, Finsbury, and in 1884 professor of electrical engineering at the Central Technical college, South Kensington, where he made a great reputation as an electrician. He died in London, Nov. 8, 1908. In 1885 Ayrton

married Hertha Marks (1854-1923), who assisted him greatly in his experimental work. Her special subject of research was the electric arc, and she invented an anti-gas fan which was used by British troops in 1916.

Ayr Water. River of Ayrshire, Scotland. Flowing in a W. direction for 38 m., and finally falling into the Firth of Clyde at Ayr, it divides the county into two almost equal parts.

Ayscough, JOHN (1858-1928). Pen-name of Monsignor Francis Browning Drew Bickerstaffe-Drew, British novelist and priest.

John Ayscough, British novelist Russell

Educated at Lichfield, Denstone, and Oxford university, he was received into the Roman Catholic church, 1878, and ordained priest in 1884. In 1886 he became a chaplain to the British forces, and served with them in the First Great War. He received numerous honours from three popes, and was created monsignor in 1904. His literary work consists mainly of novels, of which Marotz, 1908, San Celestino, 1909, and Gracchus, 1913, are most notable. He died July 3, 1928.

Aytoun or Aytoun, SIR ROBERT (1570-1638). Scottish poet. Born at Kinaldie, Fife, he was educated at St. Andrews and at Paris. The double recommendation of being a Scot and of having addressed a Latin panegyric to James on his accession to the English throne, secured him the royal favour, and he became in succession a gentleman of the bedchamber, private secretary to the queen, and ambassador to the German princes, and was knighted in 1612. He was one of the first Scots to write pure and graceful English. His principal English poem, however, *Diaphantus and Charidora*, like his Latin poems, is poor. He succeeds best in love poems, such as *Inconstancy Upbraided*. He died in Feb., 1638, and was buried in Westminster Abbey.

Aytoun, WILLIAM EDMOND-STOUNE (1813-65). Scottish poet. Born in Edinburgh, June 21, 1813, the son of a lawyer, he was educated at Edinburgh academy and university. He published his first volume of verse in 1830. After studying in London and Germany, he became a lawyer, but devoted much time to literature. He did

many translations from the German, but the Bon Gaultier Ballads, in which he cooperated with Sir Theodore Martin, are better known. Nearly as popular were his own Lays of the Scottish Cavaliers. His drama Firmilian may be mentioned, also his Bothwell, and his collection, Ballads of Scotland. In 1845 he was made professor of rhetoric at Edinburgh, and in 1852 sheriff of Orkney. He died Aug. 4, 1865.

Ayub Khan (1855-1914). An Afghan prince. He was the younger son of Shere Ali, ameer of Afghanistan, and was governor of Herat. In 1879 he claimed the sovereignty of Afghanistan, and gained a victory over Gen. Burrows at Maiwand July 27, 1880, but was utterly defeated Sept. 20 at Kandahar by Sir Frederick (later Earl) Roberts after his famous march from Kabul. In 1881 Ayub captured Kandahar, but he was driven out by the ameer Abd-ur-Rahman and forced to flee to Persia. Later he surrendered to the British.

Ayvalik. Seaport on the W. coast of Asiatic Turkey. On the Gulf of Adramyti, 66 m. N.N.W. of Izmir, it stands near the ancient Heracleia Pontica. Its exports include olive oil, soap, cereals, wood, and skins. The name means quince country. Pop. 17,000.

Azad, ABDUL KALAM. Indian politician. He spent his youth in Arabia and Egypt, and was educated at Al Azhar university Cairo. In 1914 he joined Gandhi's National Indian congress and took a leading part in Khilafat non-cooperation, and civil disobedience movements, and was imprisoned several times, 1921-32. He was Congress president 1940-46. He founded Al-Hila (Urdu Weekly) which was suppressed by the British government.

Azalea (Gr. *azaleos*, dry). Genus of shrubs of the large family Ericaceae. Natives of America and Asia, they have alternate oval or elliptical leaves, and large showy funnel- or bell-shaped flowers in umbels. Most of the garden and greenhouse plants are hybrids, ranged in two classes: American or Ghent azaleas, and Indian or Chinese azaleas. They are supposed to grow best in dry soil.

Azamgarh. Municipality and division of India, in the Gorakhpur district of the Agra Province, United Provinces. The district is part of "the plains" bounded on the N. by the river Gogra, and is traversed by the Tons river, on

which is the municipality, 55 m. N. of Benares by rly. The municipality was founded by Azam Khan in 1665, and was a centre of disaffection during the Mutiny, 1857. The people are mostly Hindus.

Azān OR **ADHĀN** (Arab., call to prayer). Term for the Mahomedan summons to prayer at the five appointed hours. The call is chanted by a crier (*mu'azzin* or *mu'adhdhin*) from the minaret of a mosque.

Azaña, MANUEL (1880-1940). Spanish politician. Born at Alcalá de Henares, he became a barrister and lectured at Madrid university. The author of many political works, dramas, and novels, he specialised in military affairs and was active in the revolutionary movement 1930-31. Minister for War in the first Republican government, Azaña was president from Oct., 1931, until Sept., 1933. Charged with implication in the Catalan uprising of Oct., 1934, he was arrested and imprisoned. He succeeded Zamora as president for the second time on May 10, 1936. He fought throughout the Spanish civil war (*q.v.*) and went to France at the collapse of the republic. On Feb. 23, 1939, Azaña resigned his presidency, being opposed to the policy of continued resistance to Gen. Franco. He died at Montauban, France, Nov. 4, 1940.

Azazel. Hebrew word occurring in Lev. 16, 8, 10, 26, rendered scapegoat (*q.v.*) in the A.V. but ex-

posed, shrivelled, they are a degraded Arab tribe living in tents and pasturing their flocks on the scanty vegetation of upland wadies.

Azeglio, MASSIMO TAPARELLI, MARQUIS D' (1798-1866). Italian statesman and author. Born at Turin of an old noble Piedmontese family, he first became known as a landscape painter in Rome. After publishing two political novels he went round the country preaching patriotism and a national policy. In 1848 he fought in the campaign against Austria, and was wounded at Vicenza. In 1849 he was appointed prime minister by Victor Emmanuel II and in 1852 resigned, recommending Cavour for the post.

Azerbaijan. One of the Soviet Socialist Republics. Bounded N. by the R.S.F.S.R. and Georgia, W. by Armenia, S. by Persia, E. by the Caspian Sea, it includes the Nakhichevan A.S.S.R. and the Nagorno Karabakh autonomous prov., and has an area of 33,460 sq. m. The pop. in 1939 was 3,209,700; the capital is Baku. Azerbaijan was proclaimed independent by the constituent assembly of the Tartars, 1918, became a republic, 1920, formed with Georgia and Armenia the Transcaucasian S.F.S.R. until 1936, then achieved separate status and a constitution.

The country is mountainous with magnificent scenery, but, lying largely on the S. slopes of the Caucasus, has a comparatively kindly climate in which agriculture thrives. Grain, cotton, fruit, vines, and tobacco are grown. Caviare is a product of the Caspian fisheries. Chief industry is the production and refining of petroleum, the centre of both processes being Baku. Wells lie N., S., and W. of that city, and some have been sunk in the sea off Apsheron peninsula. Copper, zinc, and manganese occur. Baku is the terminus of rlys. to Azov, Georgia, Armenia, and Turkey, and of airway and shipping lines to Krasnovodsk in the Turkmen S.S.R. The Azerbaijan Academy of Science was inaugurated at Baku March, 1945.

Azerbaijan. Independent prov. of Persia. Anciently known as Atropatēnē, it is bounded N. by Russia, W. by Turkey and Iraq, S. by Kurdistan prov., and E. by Khamsēh and Gilan provs. A mountainous country, its chief natural features are the volcanic Savian or Sawalan Dagh, 15,814 ft. high, and the saline Lake Urmia, 85 m. by 30 m. There is a scanty rainfall, but the streams are

Azalea. Bloom and leaves of this fragrant flowering shrub

plained as the name of an evil spirit in the R.V. Milton in Paradise Lost makes Azazel one of the fallen angels and standard-bearer to Satan. According to the Mahomedans Azazel was chief of the geni who were imprisoned by the angels and refused to do homage to Adam.

Azazima plural of Azzami). Beduin tribe on the Gobei Magrath plateau, midway between Gaza and Akaba, S. Palestine. Small.

perennial, being fed by the melting snows, the land is therefore parched, except near the rivers and the numerous springs. Lead, iron, copper, and other minerals are found, wool is spun, and the valleys produce wheat, rice, barley, maize, flax, and hemp, while camels, horses and cattle are raised. The pop., some 2,000,000 consists of Turkomans, Kurds, Persians, and Armenians. A dialect of Turkish is spoken, and a large number of the people are Turkish in their sympathies, a fact which led to the occupation of part of the prov. by the Turks before the First Great War. Tabriz is the capital. For the rebellion which broke out in Nov., 1945, and the subsequent disputes, see Persia.

Azides. Salts of azoimide (hydrazoic acid), also known as trinitrides. Azoimide has been given the formula N_3H and possesses similar properties to hydrochloric acid, but is only of about the same strength as acetic acid. It forms compounds with most metals and alkalis and some organic radicals, the majority of which are violently explosive. Lead azide is the most important salt and has been used in place of fulminate of mercury as an initiator. See Explosives.

Azilian. The main period of the Mesolithic Age, transitional between Palaeolithic and Neolithic Europe. The climate, moist and warm, encouraged vast pine and birch forests. Amid these roamed the stag whose bones furnished harpoons, whereof a thousand were obtained from the Pyrenean type station of Mas d'Azil. A contemporary pygmy flint industry, best developed at Tardenois (Aisne), provided toothed edges for harpoons. Magdalenian art, disappearing with the roe deer, was replaced by pebbles painted with conventional designs suggesting picture writing. British Azilian stations include Oban, Settle, and Holderness (pit dwellings).

Azimuth (Arab *as sumut*, the paths). The horizontal angle between a star and the meridian or between a terrestrial object and the N. point of the horizon.

Azo-compounds (Gr *a*, not *zoë*, life). Azo is a short form of azote, the name given by Lavoisier to nitrogen in the late 18th century. The best known compounds are derivatives of azobenzene $C_6H_5-N=N-C_6H_5$. Many important dyestuffs come into this category, including Sudan I, benzene azo β naphthol, also Orange II, chrysoidine, Para red,

Ponceaux fast red, and Bismarck brown. Most of the modern dye stuffs are the sodium salts of sulphonic acids of the azo compounds mentioned. They are soluble in water and are used in the dyeing of both wool and cotton by suitable additions they can be made fast to light and washing.

Azoospermia. Absence of spermatozoa from the seminal fluid. This can be caused by blocking of the passages by inflammation such as may follow gonorrhoea, by inflammation of the prostate gland found in the presence of chronic infection of the sinuses, teeth, or tonsils, or from destruction of the sperm bearing tissue following mumps, or less frequently, the infective fevers. Investigation of the causes of sterility has shown azoospermia to be more frequently present than previously thought.

Azores (Port *Açores* hawk islands). Group of islands in the Atlantic. They belong to and form an integral part of Portugal from which they are about 830 m distant to the W. Extending over some 400 m and having a total area of 922 sq m, they form three clusters, the islands being St. Michael's 297 sq m and St. Mary with Formigas 40 sq m, in the S.E. Flores 57 sq m and Corvo 7 sq m, in the N.W. Terceira 223 sq m, Pico 176 sq m, Fayal 64 sq m, St. George 40 sq m, and Graciosa 18 sq m, in the centre. They form a chain of volcanoes which rise from the Dolphin Ridge

(see Atlantic Ocean and map, p. 753) and are subject to earthquakes and eruptions. They have rocky coasts and mountainous interiors and contain many hot mineral springs. The climate is mild.

The fauna and flora are European in character. The soil is fertile, and large quantities of oranges, pineapples, bananas, and other fruits are cultivated. Tea, coffee, and wine are also produced and fishing is extensively engaged in. The people are of Portuguese descent, with distinct strains of Moorish and Flemish blood. The principal harbour is Angra do Heroísmo, capital of the Azores on Terceira. Ponta Delgada, largest town and cap. of St. Michael's, and Horta, cap. of Fayal. Pop. 484,278.

Known apparently to the Carthaginians, the Azores were first indicated on a map in 1351. Uninhabited before the visit of Gonzalo Cabral in 1431, they were colonised by emigrants from Portugal, which country had annexed the entire group by 1457. In 1591 off Flores occurred the famous encounter between the English vessel *Revenge* and 53 ships of the Spanish fleet.

During the Second Great War Portugal granted to Great Britain the right to establish naval and air bases in the Azores, the British agreeing to withdraw at the end of hostilities and meanwhile to supply Portugal with military material. Fayal and Ponta Delgada are bases for British Overseas Airways and Pan American Airways.

AZTEC. VARIOUS REMAINS OF THIS ANCIENT AND EXTINCT CIVILIZATION

Christy Collection British Museum etc

Azov. Town of Russia, in the Azov-Black Sea region. On the Don, 10 m. from its entrance into the Sea of Azov, it has a fishing industry and trades in grain, but its importance has declined with the silting up of the harbour. The Russians took it in 1696 and the British and French bombarded it in 1855. In the Second Great War German forces under von Bock captured Azov in Aug., 1942, during the heavy fighting S. of Rostov, when the invaders made their drive for the Caucasian oil-fields. By its liberation on Feb. 7, 1943, the Russians cleared the Germans from the left bank of the Don. Pop. 17,500.

Azov, SEA OF. Small interior sea, or more correctly a great gulf, of S. Russia. The Palus Maeotis of the Romans, it forms a N. appendix of the Black Sea, with which it communicates by the strait of Kerch or Yenikale, has a greatest length from the isthmus of Perekop to the mouth of the Don of 220 m., an extreme breadth of 110 m., and an area of 14,520 sq. m. Its greatest depth is about 50 ft., but at some points it does not exceed 10 ft. The narrow N.E. end is called the Gulf of Taganrog, and in the W. a long sandy strip separates it from the Sivash lagoon or Putrid Sea.

In many places the sea is unnavigable even for small vessels, and a variety of currents is set up by frequent storms, while from Dec. to March it is frozen. It receives the Don and other rivers. On its shores are a number of important towns, including Berdyansk, Mariupol, Rostov, Taganrog, and Yenikale. Its comparatively fresh waters abound in fish, the drying of which is a flourishing local industry. Occasional volcanic outbreaks have occurred, and in 1799 an island completely disappeared in this way.

The shores of the Sea of Azov were the scene of heavy fighting between Germans and Russians, 1941-43. The Germans employed large numbers of Italian, Rumanian, Hungarian, and Slovak troops. In Oct., 1941, a German army struck E. towards Rostov, while another invaded the Crimea. The Russian 9th army evacuated Mariupol on Oct. 14, and Taganrog, at the head of the Sea of Azov, was abandoned Oct. 22. The Germans announced the capture of Rostov on Nov. 22, but they were driven out a week later. Yeisk, the Soviet naval base, fell to the Germans on Aug. 7, 1942, and on Sept. 1 the Nazis crossed the Kerch straits from the

Crimea, thus encircling the Sea of Azov. On July 27, 1942, Rostov was evacuated by the Russians, and the Germans completed the clearance of the N. shores. Rostov was recaptured by the Cossack Guards div., Feb. 14, 1943, and the invaders evacuated Taganrog on Aug. 30. Mariupol was liberated on Sept. 10, and by early Dec. the Germans were finally driven from the area.

Azrael. Angel of death and, according to Mahomedan belief, one of the four angels most in God's favour. One of the creation-legends runs that the three other angels had each been sent to get the earth of which Adam was to be formed and returned without it, knowing that man would bring a curse upon the world; but when Azrael was sent he performed his task without remorse, and so came to be appointed by God to separate souls from bodies at death.

Aztec (crane people). American Indian tribe inhabiting the Mexican tableland at the time of the Spanish conquest. Probably of Shoshonian stock and speaking a Nahuatl dialect, their name popularly embraces all ancient Mexican tribes of Nahuatl stock, whose descendants are called Mexicanos.

The primitive Nahuatl, travelling along the Rocky Mt. valleys from the British Columbian coast, found on the tableland, which they called Anahuac, scattered *pueblos* of Otomi, who had driven still earlier peoples into the outlying valleys and hills. Along the coastal fringes lay other tribal groups, and E. of the Tehuantepec isthmus the Maya peoples. Adopting a sedentary life, they came under the influence of an advanced culture, marked by weaving, metal working, temple-pyramids or *teocallis*, and massive architecture.

About the 12th century there arrived at the Texcoco Lake a nomad hunting tribe, who attached themselves to the Tepecanec *pueblos*, by whom they were called Aztec. Their warlike aptitude gained for them, about 1325, the opportunity of fortifying the Tenochtitlan island, now Mexico city. Electing a king in 1376 and defeating the Tepecanec in 1428, they secured the hegemony of the valley. The central *pueblos*, formed into various confederacies, waged war with organized armies upon the outlying peoples. These confederacies had extended to both oceans when Montezuma II (*g.v.*) was deposed by Cortes in 1519.

The Aztec civilization, taken over from subjugated peoples,

embraced several elements clearly due to cultural drift from the Old World. The elective chiefs were held in check by a priestly aristocracy, which exploited the servile peasantry. Taxation was heavy, justice severe; but commerce was honoured, and education advanced. The lack of food-animals adaptable to domestication led to systematic cannibalism under religious sanctions, which governed every aspect of the social life. **E. G. Harmer**

Bibliography. Old Civilizations of the New World, A. H. Verrill, 1929; Archaeological Monuments of Mexico, Dept. of Edn. of Repub. of Mexico, 1934; Archaeological Researches at Teotihuacan, Mexico, S. Linne, 1934.

Azuaga. Town of Spain, in Badajoz province. It is 54 m. by rly. N.W. of Cordova, and has a market for cattle, silver-lead mines, and Roman remains. Pop. 16,600.

Azuay. Province of S.W. Ecuador. A mountainous district about 3,873 sq. m. in extent, it has quicksilver mines, produces cinchona and maize, and rears cattle. Cuenca, the capital, is the seat of the university of Azuay. Pop. (est.) 236,800, mostly Indians.

Azulejos. Square blue-glazed tiles. They were largely employed by the old Moorish builders, notably in the Alhambra at Granada, where they occupy almost the entire lower third of the wall-space. They resemble, in their glazing and colouring, the ancient majolica. Azulejos tiles were, perhaps, made by a similar process, in which an opaque metallic enamel was spread over a basis of calcareous clay. The Spanish word *azulejos*, compounded of *azul*, blue, and *lejos*, remote, rather happily conveys the effect of the subdued colouring of the tiles. *See* Alhambra.

Azure. Name for blue in heraldry. It is represented in uncoloured engravings by a series of horizontal lines. *See* Tincture.

Azymite (Greek *a*, not; *zymē*, leaven). Controversial term of reproach used in the Eastern Churches for those who use unleavened bread in the Eucharist. The practice of the Oriental Churches has always been to use a special form of leavened bread, this having apparently been the custom of the Church in the earliest days. Unleavened bread was habitually used in the Western Church certainly in the 7th century, and probably in the 3rd. In the 11th century this use was made a ground of separation from the Latin communion by the Greek Church. *See* Eucharist.

THE early pictographic symbol corresponding to the letter B in the writing of the ancient Egyptians (c. 5000 B.C.) was in the shape of a bird , eventually simplified in the course of some 200 years until it resembled more the shape of a tent or house . The Phoenicians and Hebrews, adopting the symbol in their own alphabets, named it both, their word for house. The Phoenician form of the letter was , but in the primitive Greek alphabet, based on the Semitic, the compartments of the tent, so to speak, had become doubled, giving the shape of  or . Primitive Latin (c. 800 B.C.) adopted the  second of

these two forms, which became the classic Greek  (beta). The minuscule form (see under  A, page 1) was . The classic Roman alphabet formalised the familiar B of the English alphabet. The modern minuscule b reverts to the ancient practice of bearing only one loop. During the 4th century A.D. the Greek beta began to approximate in sound to the English v, which in modern Greek exactly represents it. The Russian language, based on medieval Greek, has developed similarly; thus the b of Sebastopol is sounded like a v, and Sevastopol is therefore an equally correct, if not better, English spelling.

B Second letter of the English, Latin, and most European alphabets. In English pronunciation B is a soft labial or lip-sound, the corresponding hard sound being P. It always has the same value as in *baby*, but is sometimes not heard when preceded by m or followed by t, as in *dumb*, *debt*, *subtle*. In such cases it may lengthen a preceding vowel, as in *climb*, *comb*. B frequently occurs in words coined to express various sounds, e.g. *baa*, *babble*, *bleat*, *buzz*. It also has its uses as an expletive, as in *bah!*, *boo!*, and such formless expressions as *br-r-r!* See Alphabet.

B. In music, the seventh note of the natural scale of C. It is called in France and Italy *Si*, and H in Germany, where B flat is called B. The most useful of the orchestral and military clarinets, pitched in B flat, is also known as the clarinet in B. See Key Signature; Pitch.

Baal, BEL, OR BEEL. Semitic title meaning possessor, lord, given to various primitive inferior deities. The feminine form is Baalat or Beltis. The supposed god Baal is now regarded as a late theological abstraction, and the term is used for numerous local genii, though the title baal might be bestowed upon any great god, as the possessor of the local shrine. Only in Babylon did it ever become the actual name of an individual god, Bel—the Lord, i.e. En-lil, the chief Babylonian deity. His consort, Nin-har-sag, was known as Belit, the lady. Bel absorbed the identities of many lesser beälim, and his prominence led the Greeks to conclude that these local baals were variants of the chief deity, instead of being entirely independent and of much older origin. Baal has been traditionally identified with the sun-god, but this is true only of certain localities.

These baals have been classified under ten headings, including baals

of springs, trees, animals, mountains, stones, and sanctuaries. When the Hebrews conquered Canaan they came in contact with local beälim, and in spite of the opposition of the prophets eventually absorbed their worship into a debased service of Yahweh. Later the baal of Tyre, Melkart, was introduced by Ahab's marriage with Jezebel. This was the baal-worship that had to be suppressed by fire and sword (1 Kings 18). Melkart was merged into the local baal of Tyre and became an important Phoenician deity and a national emblem. His cult was carried to distant lands and connected with that of other local baals.

The Baal cult represents polydaemonism, a very early stage of religious development. It was in essence a worship of the male forces of nature, frequently co-existent with the cult of Asherah (tree) and of Ashtaroth, the goddess of fecundity. Certain of the local saints worshipped today in Palestine by Jews, Moslems, and others are modern equivalents of the old beälim. The word is incorporated in many names of persons and places, e.g. Jezebel, Baalbek. Consult Religion of the Semites, W. Robertson Smith, 3rd ed. by S. A. Cook, 1927.

Baalbek OR THE CITY OF BAAL. Ancient Syrian city, 35 m. N.N.W. of Damascus. Situate 3,850 ft. above sea level, on the watershed from which the Orontes flows N. to Antioch and the Litani S. to Tyre, it commanded an important Phoenician trade route, and became an early centre of Baal-worship. There are, however, no identifiable remains of pre-Roman age. The assimilation of Baal with the Greek sun-god Helios gave rise to the name Heliopolis, city of the sun.

In the 2nd century A.D. Antoninus Pius began the erection of two great temples which impress the beholder, even in decay, by their massive construction and by their decoration. The great temple of Jupiter-Baal rests upon an artificial terrace, in one wall of which the fourth course comprises six limestone monoliths each 30 ft. long. Upon these rest three others averaging 63½ ft. each, from which the temple acquired the name of the Trilithon. All these stones are 13 ft. high, and probably deeper. In a quarry a mile away an unfinished monolith, 68½ ft. long, and weighing 1,100 tons, is of the exact length of Cleopatra's Needle in London, but six times its bulk. Upon the terrace, and approached by portico, forecourt, and great

Baalbek, the City of Baal, Syria. Remains of the two great Roman temples dedicated by Antoninus Pius in the 2nd century A.D.

court, rose a temple surrounded by 54 columns 60 ft. high, with Corinthian capitals 22 ft. round. Of these only six remain standing, much damage having been done by earthquake in 1759. A smaller Bacchus temple adjoining was surrounded by 46 Corinthian columns 52 ft. high, and entered by a richly carved portal, flanked by two hollow columns containing winding staircases.

The Jupiter-worship at Heliopolis retained many Syrian features, with much licentiousness. In the great court Theodosius built a Christian basilica. The ruins of this and of later Saracenic constructions were cleared away during O. Puchstein's excavations in 1899-1904. Baalbek was captured by Jenghiz Khan, Saladin, and Timur, became Turkish in 1840, and was occupied by the British in Oct., 1918. Pop. 4,600.

Baasha. Son of Ahijah. He seized the throne of Israel after killing Nadab and all the family of Jeroboam I (1 Kings 15, 16). He reigned 24 years, chiefly occupied in war against Judah.

Baba (Turkish, father). Mahomedan title of respect. It is a form of address for religious dignitaries, especially ascetics, such as Indian fakirs, and is sometimes added to names, e.g. Ali Baba.

Baba. Old woman or witch in Slavonic folk-lore: in full, Baba Yaga. Generally represented as a terrible ogress and cannibal, she is a distorted survival of the Berchta (*q.v.*) of S. German myth.

Baba. Headland of Asia Minor. The ancient Laetum, it is the most westerly point of Asia. It stands at the entrance to the Gulf of Adramyti, about 12 m. N. of Mitylene. On its S. slope is a village of the same name.

Baba Budan. A mt. range of India. In the Kadur district of Mysore state, it is in the form of a crescent, 35 m. in length, and its highest point is Mulaingiri (6,317 ft.). Baba Budan is the centre of coffee plantations in S. India. The name is derived from a Mussulman saint, Baba Budan, who took up his residence on the range.

Babahoyo OR BODEGAS. Town of Ecuador, capital of Los Rios prov. On the Guayas river, 40 m. direct and about 75 m. by boat N.E. of Guayaquil, it is in a district producing cotton, cocoa sugar, rice, and tobacco.

Babal OR BALFRUSH. Town of Persia. In the province of Mazanderan, it lies 12 m. S. of the Caspian and about 100 m. S.W. of Tehran, on the unnavigable

Bhawal. It has a large trade, partly by caravan, partly through its port Meshed-i-Sar, and the exports include silk, cotton, and rice. Commerce with Tehran and the interior is also practicable by road. Pop. 30,000.

Babalan Channel. Roadstead in Aroe Bay, N.E. Sumatra. It is lighted at night by gas buoys, has a good anchorage, and leads to the port of Pangkalan-Brandan, which exports petroleum.

Babar OR BABER (c. 1483-1530). Mahomedan conqueror. His real name was Zahir ed-din Mohammed, and he was called Babar, the tiger, from his fighting qualities. When a boy he succeeded his father, a descendant of Timur, as khan of Ferghana. His career of conquest began almost at once, when he took Samarkand, but he lost this and also his own inheritance, finding his real field of adventure in Afghanistan and India. In 1504 he captured Kabul, and in 1511 recovered Samarkand, but was unable to hold it.

Babar next invaded India at the invitation of some subjects of Ibrahim, ruler of Delhi. At Panipat in April, 1526, Ibrahim was defeated and killed, and Babar took Delhi and Agra, making the latter his capital. Another victory (1527) made him ruler of much of N. India, the empire he established being usually known as the Mogul. He was succeeded by his son Humayun. His tomb is at Kabul. *Consult* Memoirs, Eng. trans. J. Leyden and W. Erskine, 1826; Babar, S. Lane-Poole, 1899; Baber, First of the Moguls, F. Grenard, 1931.

Babbacombe Murder. Crime rendered memorable because of three abortive attempts to hang the murderer. John Lee, aged 20, was convicted at Exeter Assizes, Feb., 1885, of the murder of his employer, Miss Keyse, an elderly lady living in a bungalow, The Glen, on Babbacombe Beach, near Torquay. Lee, who had been in Miss Keyse's employment as a boy, was taken back after an interval, during which he had been in the navy and had served six months' imprisonment for theft. On Nov. 16, 1884, early in the day, Miss Keyse's bedroom was discovered in flames, and her body, hacked with an axe, was found in the kitchen. The circumstantial evidence against the prisoner appeared overwhelming, but he steadfastly maintained his innocence. After three abortive attempts to execute him, Feb. 23, 1885, Lee was reprieved

and his sentence commuted to imprisonment. He was released Dec. 18, 1907.

Babbage, CHARLES (1792-1871). British mathematician. Born at Totnes, Devonshire, Dec. 26, 1792, and educated at Trinity College and Peterhouse, Cambridge, he became Lucasian professor of mathematics in the university, and was one of the founders of the Astronomical Society and the British Association. His numerous publications included tables of mortality, a table of logarithms, the ninth Bridgewater Treatise, and an autobiographical work, *Passages from the Life of a Philosopher*, 1864. He is remembered as the inventor of a calculating machine, which is preserved in South Kensington Museum. He died in London, Oct. 18, 1871.

Bab Ballads. Farcical verses written and drolly illustrated by William Schwenk Gilbert (*q.v.*)

Bab Ballads. One of Gilbert's characteristic illustrations to his own verses

They were originally issued in two series, *Bab Ballads: Much Sound and Little Sense*, 1869, and *More Bab Ballads*, 1873. Some of them, notably *The Yarn of the Nancy Bell*, long enjoyed popularity.

Babbitt. Novel by the American writer, Sinclair Lewis (*q.v.*). Published 1922, it secured a reputation on both sides of the Atlantic first established with his previous novel, *Main Street*. The entertaining portrait of George F. Babbitt, a leading estate agent in the flourishing modern city of Zenith, and the story of his social, business, domestic, and cultural aspirations, heroisms, and follies, forms in effect a relentless ironical comment on the limitations of the average contemporary middle-class American citizen.

Babbitt Metal. Alloy, usually of copper, tin, and antimony, belonging to what are known as white or anti-friction metals, named after the American inventor, Isaac Babbitt (1799-1862). It is used for the bearings of shafts. *See* Anti-friction Metals.

Babel. Fragment of the temple of Nabu, marking the site of ancient Borsippa, near Babylon, and known traditionally as the Tower of Babel.

Photo, Royal Air Force Official, Crown copyright

Babel, ISAAC (b. 1894). Russian novelist. Born in Odessa, of Jewish parents, he fought with Budenny's army in Poland against the Cossacks, 1920, and based his famous Red Cavalry, 1926 upon his own experiences. This book is not a novel but a series of vivid impressionistic sketches. Babel's Jewish Tales, 1927, gave a colourful picture of the Odessa Jews, his compatriots. He also wrote plays of which The Sunset and Maria were the most successful.

Babel, TOWER OF. Tower erected after the Deluge by the descendants of Noah, when in their wanderings they reached the plain of Shinar or Babylonia. The plan was to build both a city of brick and a tower reaching to heaven; but Jehovah frustrated it by confusing the language of the builders so that they could not understand one another—hence the diversity of human speech; and by scattering them all over the earth—hence the diversity of human race. The story (Gen. 11) accounts for the name Babylon (Babel), for the high towers which the newcomers saw in Babylonia, and for the difference of language they noted.

It is now known that stage-towers or *zikkurats* were a characteristic feature of the sacred architecture of Babylonia and Assyria, and the ruins of two such towers associated by native tradition with the Tower of Babel, have been discovered at Birs Nimrud (Borsippa, near Babylon) and at Akerkuf farther south. Sir Henry Rawlinson's investigations at Birs Nimrud showed that the tower of

jecting like a fang above the rubbish. In the narrative in Genesis popular etymology connects the name Babel (Babylon), which is really Assyrian and means "gate of God," with a Hebrew root *balal* "to confuse." Consult Digging Up the Past, C. L. Woolley, 1930.

Bab-el-Mandeb, STRAITS OF. Channel separating Arabia from Africa. Called by the Arabs the Gate of Tears because of its difficult navigation, it leads from the Red Sea to the Indian Ocean through the Gulf of Aden. About 15 m. wide. It is divided by the island of Perim into Large and Small Straits, both of which have strong currents.

Bab-el-Mandeb. The straits which divide Africa and Arabia, with inset map of the island of Perim, a British possession

Borsippa was called *E-ur-min-ni-ki*, "House of the seven divisions of heaven and earth," and symbolised the entire universe, connecting the earth, as it were, with the heavens. It consisted at the beginning of the 6th century B.C. of seven stages, one superimposed upon the other and receding in circumference as one proceeded from stage to stage." Of the great tower all that remains is a ruined mass of brickwork, projecting like a fang above the rubbish.

Babes in the Wood, THE. The popular name of a black-letter ballad in the Pepys collection and reprinted in Percy's Reliques. The full title is The Children in the Wood; or, The Norfolk Gentleman's Last Will and Testament. It was first printed in 1595, and the scene is usually associated with Wayland Wood, near Watton, Norfolk; but in an old play, attributed to Robert Yarrington and printed in 1601, it was laid in Padua. The tale has often been adapted to make a Christmas pantomime, in which Robin Hood and Maid Marian appear as principal boy and girl; their introduction dates from a Drury Lane production of the 1880s. Consult The Land of the Babes in the Wood, 1910, and The Ballad of the Babes in the Wood and All About Them, C. Kent, 1913.

Babeuf, FRANÇOIS NOËL (1760–97). French social revolutionist. Born at St. Quentin, Nov. 23, 1760. Babeuf, the son of an officer in

F. N. Babeuf, French revolutionist

poor circumstances, became clerk to a land surveyor. On the outbreak of the Revolution of 1789, he was identified with the extremist section represented by Marat (*q.v.*). From 1793, when he started a paper, *Le Tribun du Peuple*, advocating the displacement of private property by communism, he opposed Robespierre.

In 1794 he settled in Paris, and was imprisoned for anarchist propaganda. His chance came in 1796

with the outbreak of the distress caused by the cessation of the distribution of free food in Paris, and the fall in the value of the assignats. Caius Gracchus Babeuf, as he called himself, demanded a new Reign of Terror and the establishment of communism. Before the rising he had planned could mature the plot was betrayed, Babeuf was arrested, and after a long trial was executed at Vendôme, May 27, 1797. *Consult* The Last Episode of the French Revolution, E. Belfort Bax, 1911.

Babi. Name given to a Persian religious sect, from the title Bab-ed-Din, Gate of the Faith, borne by its founder. Its creed, based upon Mahomedanism, rejects many of the tenets and practices of the orthodox Muslim. It borrows from the pantheism of Buddha and the ethics of Christianity, combined with a mysticism alien to Islam, though akin to the doctrines known among Muslims as Sufism. Babism dates only from 1843.

Bab-ed-Din was opposed by the religious authorities; but his disciples went forth as missionaries, notable among them being a woman of great beauty and noble character known as Gurred-ul-ain (consolation of the eye). The new doctrines were so repugnant to the authorities that the Bab was imprisoned and executed in 1850, and his followers were suppressed by the sword in the reign of the shah Nasr-ed-din. This was not surprising, as the Bab had declared himself to be the "central point" of a new divine revelation, and his followers recognized him as the universal lord.

The sect, however, in spite of prolonged persecution, varied by an attempt on the life of the shah, was by no means completely suppressed, though its followers ostensibly conformed to the doctrines and practices of orthodoxy. It has now many adherents not only in Persia, but in India, China, Japan, and N. Africa. *Consult* A Traveller's Narrative to illustrate the Episode of the Bab, E. G. Browne, 1891.

Babington, ANTHONY (1561-86). English conspirator. He was born at Dethick, Derbyshire, of an old and wealthy family, and was in youth a page to Mary Queen of Scots, during her imprisonment at Sheffield. An ardent Roman Catholic, in 1586 he took a leading part in a conspiracy for the removal of Queen Elizabeth and her ministers and the release of Mary. The plot was made known to Walsingham by his spies, the conspirators were arrested, Aug., 1586, and condemned, Babington being

hanged, drawn, and quartered at Lincoln's Inn Fields, Sept. 20. *Consult* History of England, vol. xii, J. A. Froude, 1856-70.

Babington, CHARLES CARDALE (1808-95). British botanist. He was born at Ludlow, Nov. 23, 1808, and educated at Charterhouse and S. John's College, Cambridge. His Manual of British Botany, 1843, revolutionised British botany by substituting for the Linnaean system the arrangement of De Candolle. In 1861 he succeeded John Stevens Henslow as professor of botany at Cambridge, where he died July 22, 1895.

Babington, SIR JAMES MELVILLE (1854-1936). British soldier. Born July 31, 1854, he entered the 16th Lancers in 1873, served in Bechuanaland 1884-85, and was a staff officer in India. He commanded the 1st cavalry brigade in the Boer War but was removed for extreme caution in 1900. From 1902 to 1906 he commanded the New Zealand defence force. He took the new 23rd division to the western front in 1915. Knighted in 1917, he commanded the 14th army corps, 1918-19. Babington died June 15, 1936.

Babington, WILLIAM (1756-1833). British physician. He was born in co. Antrim, and during his youth became assistant to a doctor in Londonderry, afterwards studying medicine at Guy's hospital, London. After four years at the naval hospital, Haslar, he returned to Guy's, where in 1795 he was appointed physician. He resigned in 1811 and died April 29, 1833. Among Babington's interests was mineralogy; a meeting which he called in 1807 led to the foundation of the Geological Society (*q.v.*), of which he was president in 1822. He was also a founder of the Hunterian Society.

Babirusa (Malay, deer-hog). *Babirusa alfurus*, a wild pig found in the E. Indies. The male is characterised by the extraordinary development of its canine teeth, which grow through the skin of the snout and curve backwards over the forehead. The sow lacks these teeth.

Bablockhythe. Locality on the Thames, England, 6 m. W. of Oxford. A ferry plies between the Berkshire and Oxfordshire banks of the river, which is noted here for boating and angling. The spot is well known from Matthew Arnold's mention of it in The Scholar Gipsy, and Laurence Binyon wrote a poem about it. Bablockhythe is connected by the Long Leys with Cumnor, scene of the death of Amy Robsart in 1560.

Baboon. Monkey of the genus *Papio*, which includes the drill, hamadryad, mandrill, and sphinx.

Baboon. Mother and child of this ferocious breed of monkey

Baboons are ugly and ferocious. Their fore and hind limbs are nearly equal in length, so that they run on all fours with ease. All have brightly coloured bare callosities on the buttocks, and the tail is usually short. The jaws are of remarkable strength, and the formidable tusks make the bite very severe. Most baboons have their home among the rocks, and their predatory habits render them a serious pest to farmer and gardener. All true baboons are natives of Africa and Arabia. *See* Monkey.

Babbie, SIR WILLIAM (1859-1920). British army surgeon. Born May 7, 1859, he studied medicine at Glasgow university. In 1881 he entered the Army Medical Service, and in 1901 became an assistant director-general. Meanwhile he had served in the South African War, and won the V.C. for tending the wounded under fire at Colenso. Director of medical services in India from 1914, he was responsible for the care of the wounded in Mesopotamia, and the breakdown of the arrangements in the earlier part of the campaign was the subject in 1917 of a special inquiry, which did not entirely exonerate him. He was knighted, however, and in 1918 was promoted inspector of medical services. He died Sept. 11, 1920.

Babu. Anglo-Indian name for a native with a smattering of education, generally for a clerk who writes English.

Babul tree, *Acacia arabica*

It was originally a term of respect, like Mr., but is now seldom so used.

Babul. Indian name for *Acacia arabica*, one of the trees which produce gum arabic.

The Ishtar Gate, as first constructed, was not enamelled; but when Nebuchadrezzar raised the level of the sacred way that ran from the gate to the temple of Marduk, the buildings along it were also raised, including the gate, which the king then adorned with relief figures of dragons and bulls in polychrome enamelled brick. Only the lower courses of this later gate have survived

BABYLON: ENAMELLED TILES OF THE REMODELLED ISHTAR GATE

From Koldewey, "Das Ishtar-Tor in Babylon"

In the centre background rises the Temple of Bel, which was also used as an observatory. To the left is seen the terraced Tower of Seven Stages. The Royal Palace, built on both sides of the Euphrates, was connected by a tunnel beneath the river, which was spanned by a bridge 1,000 yards long and 30 feet broad. In the right middle distance appears a part of the famed "Hanging Gardens." Enclosing Babylon was a wall with 100 gates, measuring 36 miles and embracing harvest fields, gardens, temples, and other buildings in keeping with the central part shown above. Canals connected the Euphrates and Tigris and there was a busy trade in trade boats

BABYLON: THE GREAT CITY OF NEBUCHADREZZAR AS IT APPEARED IN THE ZENITH OF ITS SPLENDOUR

Babuyan Islands. A group of small volcanic islands forming part of the Philippines. They lie N. of Luzon and S. of the Bataan group. Of the chief islands Kamiguin has an area of 65 sq. m.; Babuyan Claro, 38 sq. m.; and Calayan, 30 sq. m. Musa, on Musa Island, is the principal town. Grain, rice, and tobacco are grown, and livestock and lard exported. Pop. 11,000.

Baby-Farming. Term for the reception, lodging, and boarding of infants for money considerations. In most countries baby-farming is strictly regulated by law. In 1871 a select committee was appointed by the House of Commons to inquire into the mortality arising from various malpractices in baby-farms, especially as regarded illegitimate children, such as the transfer of babies for a single payment, and without adequate safeguards for their proper treatment.

By the resulting Act of 1872 baby-farming houses had to be licensed and registered, and breaches of the Act visited by heavy penalties. This Act was superseded in 1897 by the Infant Life Protection Act, making notification to the local authorities obligatory. The law is now contained in the Public Health Act, 1936. The Acts of 1872 and 1897 applied only to cases where more than one child was received. The present law, besides imposing stringent regulations, is applicable to cases where a single infant is taken. A notorious criminal baby-farmer was Mrs. Dyer, who was executed June 10, 1896, after she had been convicted of several murders. See Adoption; Children, Law concerning.

Babylon. Ancient city of Asia. It was situated on the Euphrates, in an extensive and fruitful plain, about 60 m. S. of the modern Bagdad. The capital of the Babylonian and then of the Assyrian empire, its period of greatest glory extended from 1800-538 B.C., with a short break about 689, when the city was partly destroyed by Sennacherib.

Its history is to a large extent that of Babylonia.

Babylon was built on both banks of the Euphrates, and consisted of palaces, temples, and fine streets. Its ruins, among which the modern town of Hilla or Hillah stands, extend over an area of 50 sq. m.

The origin of the city is so remote as to be lost, but explorations indicate a date as early as 7000-6000 B.C.

There were two, perhaps three, Babylons superimposed the one above the other. The remains are associated mostly with the temples, for the people of Babylon were very religious, and showed great devotion in the worship of their god Marduk, the Merodach of Jeremiah 1, 2. The huge mound at Borsippa, which was a suburb of the city, is called Birs Nimrod, and commemorated Nimrod, the first great king of Babylon, who built there a temple of Marduk also known as the temple of Nebo.

In the rich plains of lower Mesopotamia there dwelt many

tribes, and somewhere about 2300 B.C. Babylon became their acknowledged capital. That city endured for more than sixteen centuries, and after Sennacherib, king of Assyria, had swept down upon Babylon and reduced it to ruins, it was rebuilt and again became

Babylon. Air view of the partly excavated city. Across the top is the Euphrates, with a modern hamlet of Iraq on its farther bank. Three distinct Babylons have been built upon this site.

Above, towers of the Ishtar Gate, ornamented with bulls and dragons in enamelled relief

Upper photo from Koldewey, "Das Ishtar-Tor"

one of the mightiest cities in the world under Nabopolassar and Nebuchadrezzar.

The ruins of this city have been thoroughly explored. They are in a series of gigantic mounds, and have been divided into sections, of which the chief are Babil, El Kasr, and Amran-ibn-Ali, the names being given by the local Arabs and representing the local tradition. In these mounds German excavators made many discoveries from 1899 to about the outbreak of the First Great War. The Hanging Gardens have been located in the N. part, and in El Kasr the remains of the palace of Nebuchad-

rezzar and the temple of Esagila have been brought to light. Belshazzar succeeded Nebuchadrezzar; then came Cyrus in 538, and Babylon passed to the Persians, who gave way in their turn to Alexander, who died here. From that time the city dwindled, until nothing was left but ruins burned in the sand. These are described in *The Excavations at Babylon*, R. Koldewey, 1914, Eng. trans. A. S. Johns; the *Cambridge Ancient History*, vol. 1, 1923, may also be consulted. L. W. King's *History of Babylon*, 1915, remains a standard work.

Robert Machray

BABYLONIA: 'LAND OF THE CHALDEES'

Rev. T. WITTON DAVIES, Prof. of Semitic Languages

This survey of one of the world's great empires belongs to a group of articles that includes Assyria, Mesopotamia, Egypt, Palestine and Persia. See also Archaeology, Hieroglyphics, Tigris, etc

The word Babylonia comes from a Greek word similarly spelt, and stands for the country as Babylon in Greek stands for the city. The latter is the Greek form of the original Babylonian, *Babil*, or gate of God, or later *Babilani*, gate of the gods. In the earliest age of inscriptions, about 4200 B.C., the country so designated has no name at all. About 2500 B.C. N. Babylonia came to be called Uri or Kiuri, and S. Babylonia Engi or Kengi. Some centuries later the names Akkad (Babylonian *Agade*) and Sumer came to be used for N. and S. Babylonia respectively.

Position and People

Babylonia was as truly the gift of the Tigris and Euphrates as Egypt is of the Nile. It was a low-lying country between these two rivers, made up of alluvial deposits brought down from their sources in the Armenian mountains. It was bounded on the N. by Assyria, S. by the sea land and Kaidu (Chaldea), E. by the mountains of Elam, and W. by the Syrian and Arabian deserts. Through the alluvial deposits the land gains upon the sea at the rate of about 3 m. in 100 years. Eridu, once a busy port, is now 150 m. N. of the Persian Gulf. The country was a network of canals, a source of relief to the rivers when in flood. They were largely used for irrigation and were a valuable means of travel and transport. But the great force with which the rivers overflowed their banks often wrought havoc to the latter, so that they had constantly to be repaired. In their inscriptions Babylonian kings frequently boast of digging new canals or mending old ones.

The oldest inhabitants of the country that came to be called Babylonia were the Sumerians,

who dwelt in the S., spoke a Turanian language, and exhibit types of face and costume wholly un-Semitic; in the N. were the Akkadians, a Semitic race whose original home was probably Arabia. The earliest culture of Babylonia was Sumerian, but the Semites of N. Babylonia took over the cuneiform script, much of their intellectual culture, and their religious ideas. Since the Assyrians were indebted both intellectually and religiously almost wholly to the Babylonians, the relation is the same between Sumerian, Babylonian, and Assyrian as that between Mycenaean, Greek, and Roman, i.e. each in the two triads was greatly indebted to the one that preceded it.

History of the Territory

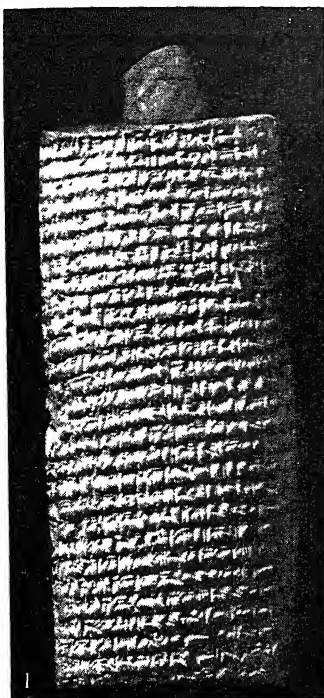

Although the name Babylonia is of comparatively recent origin, the history of the territory so designated and its people can be traced back in written records still existing—some in the British Museum—to at least 4200 B.C., and yet even at this remote period the culture of the people stood at a very high level. Their mode of writing, the cuneiform, is a development from the pictorial or hieroglyphic style, but so different that the original forms cannot be traced except in a few cases, so that there must have been centuries of gradual evolution. Moreover, they had houses, artistically and conveniently built, walled cities, and canals; and the remains of art—sculptural, architectural, etc.—which have come down to us exhibit a remarkably advanced stage of development. It can hardly be an exaggeration to say that between 6000 and 5000 B.C. these Babylonian peoples existed and had entered upon a career of civilization. In S.

Babylonia a pre-Sumerian element is implied in the language, customs, and ideas of the Sumerians, and recent investigators have come to the conclusion that this element was Semitic. In favour of this theory Eduard Meyer, the Berlin historian, points to the features and dress of the Sumerian gods as Semitic in character. These gods have long, thick hair with large, bushy beards. The Sumerians themselves, on the other hand, were clean faced, and their heads usually bare. These gods are dressed in woven woollen plads, not in cloaks in the manner of the Sumerians. And the physical characteristics of the gods are Semitic, not Sumerian. Meyer holds that when the Sumerians conquered the territory north-west of the Persian Gulf and settled in the newly gained country, they took over the gods of the conquered Semites, assimilating to them the gods which they themselves had worshipped.

THE CITY STATES Assyria began its career with one city state only, that of Ashur, which grew to be a kingdom and then an empire; but in early Babylonia there was a large number of independent city states, all more or less in active hostility to one another, each seeking to enlarge its borders at the expense of its neighbour or neighbours. It is not until a comparatively late date that we read of one king exercising sovereignty over a large number of cities, or over an extensive tract of land. The chief ruler of these city states was called *patesi*, corresponding to the Assyrian *ashshakku*, words used of the ruler of a city that was subject to another. When a city state was independent, especially if it had other cities subject to it, the chief ruler was called *sharru* or king. This distinction, however, is not consistently kept up in the existing records, and there are some who hold that *sharru* was simply a more dignified title than *patesi*.

The following were the more ancient city states: in N. Babylonia, Kish, Opis, Sippar, Kutha, Agade (Akkad, Gen. 10), and Babylon; in the S. Lagash, Shuruppak, Ur of the Chaldees, Erech (Gen. 10), Eridu, Umma, and Adab. Each had a tutelary deity, for whom a temple was built. There were in most cities many temples dedicated to as many deities, probably because several tribes made their homes in the same city.

Who founded these cities? Probably they were all or nearly all of Sumerian origin, though some, e.g. Akkad, were founded by Semitic Babylonians. Ruling over several

BABYLONIA: ANCIENT MANNERS AND CUSTOMS REVEALED BY RELICS OF ITS EARLY ART

and his successor Karaindash II (c. 1380 B.C.) and the above-mentioned kings of Egypt.

The dynasty of Pashc (c. 1184-1052 B.C.) produced but one great ruler, Nebuchadrezzar (wrongly spelt Nebuchadnezzar), who lived about 1140 B.C. and revived the declining fortunes of Babylonia. He won victories over the Elamites, restored to Babylon its tutelary god Marduk (Merodach), and also added territory in Mesopotamia, Syria, and elsewhere to the country which he inherited. His attempt, however, to regain the suzerainty over Assyria was a failure, for the Assyrian king Ashurreshishi drove him back just as he had begun the invasion of Assyria. But he handed on to his successor a larger Babylonia than he had received from his predecessor. Those who followed him, however, were weak, and failed to retain it, and under the Assyrian king Tiglath-pileser I (c. 1100 B.C.) Babylonia became a mere dependency of Assyria.

Decline of the Empire

Of the fifth, sixth, seventh, eighth, and ninth dynasties little more is known than the names of some of the kings, but it may be said that during the eighth dynasty (c. 1000-800 B.C.) power gradually passed over to Assyria. In 727 B.C. Tiglath-pileser IV of Assyria became king of Babylon under the name of Pul, just as his son and successor, Shalmaneser V, called himself Wulai; Ashurbanipal, Kandalenu and Sargon II, Shakkanak of Babylonia. When, however, in 625 B.C. Nabopolassar, though a Chaldaean, became king of Babylonia by the help of the Medes, with whom he had fought against Assyria, an era of unsurpassed brilliance for what has been called Neo-Babylonia, or Chaldaean Babylonia, set in.

His son and successor Nebuchadrezzar II (604-562 B.C.) raised the empire to its highest pitch of power and prestige, and it may be said that neither Assyria nor Babylonia did more at any time for the promotion of culture and of the native religion. The inscriptions of his reign which survive are silent with regard to the madness and degradation of this king (Dan. 4). It must be remembered, however, that Babylonian and Assyrian rulers never record incidents discreditable to themselves or their country. It was this king who, in 606 B.C., besieged and conquered Jerusalem, and in 586 B.C. set fire to the city, including the temple, carrying away the best part of the population to his own country.

Under the rule of his successors this great empire gradually collapsed. The last king of all, Nabonidus (555-539 B.C.), was a man of fine character, absorbed in intellectual pursuits and religious exercises. Neither a warrior nor a man of affairs, he spent most of his time at a quiet retreat called Tema. His country was invaded by the great Persian king Cyrus. The Babylonian army, under the king's son and agent Belsharutsur, the Belshazzar of the Bible (Dan. 5), made a show of defence, but was soon vanquished by the Persians, who entered Babylon unopposed, indeed welcomed by the bulk of the inhabitants as deliverers.

Thus Babylon, once the envy of the world, fell in 538 B.C. It fell never to rise again, just as in 607 B.C. its rival, Assyria, vanished for ever from the page of history. Almost immediately after his great victory Cyrus allowed, encouraged, and aided the Jews of Babylon to return to their mother-country, and many availed themselves of the privilege, as is recorded in the books of Ezra and Nehemiah.

CULTURE AND RELIGION. The culture of Assyria being derived almost entirely from Babylonia, there is no need to repeat the details, but a few points of difference may be noted. First, there are hardly any survivals of Babylonian statues, owing to clay having been the only material used. Secondly, as Babylonian art is very old, some specimens going back as far as 4000 B.C., much of it is exceedingly simple, though often more forcible than the bulk of the more elaborate work of later years. Thirdly, the walls of Babylonian palaces and temples were covered with bricks, not with slabs, as in Assyria; consequently the decoration consisted in colouring, enamelling, and the drawing of coloured pictures.

In early times the chief god of Babylonia was Ellil or Bel, called later Merodach, who exercised a softer and more intellectual influence than Ashur, the counterpart of the Greek Arès and Roman Mars, to whom the militarism and ferocity of the Assyrians were due. The magicians were almost as important as the priests, especially in its early history. The pantheon of Babylonia was more extensive than that of Assyria, and finally, in Babylonia it was the priest who became king, not, as in Assyria, the king who became priest.

strong, 1884; Babylonian Life and History, E. A. Wallis Budge, 1884; The Religions of Ancient Egypt and Babylonia, A. H. Sayce, 1902; The History of Babylonia and Assyria, H. Winckler, Eng. trans. J. A. Craig, 1907; History of Babylonia and Assyria from Prehistoric Times to the Persian Conquest, L. W. King, 1910, etc.; Ur of the Chaldees, C. L. Woolley, 1929; Digging Up the Past, C. L. Woolley, 1930; Ur Excavations, C. L. Woolley, 1934-39; Ur Excavations, L. Legrain, 1937; Letters of the First Babylonian Dynasty, trans. T. Fish, 1937; Votive and Historical Texts from Babylonia and Assyria, F. J. Stephens, 1937; Early Babylonian Letters and Economic Texts, ed. J. B. Alexander, 1943.

Babylonian Captivity. Name applied to the period after the deportation of Jews from Jerusalem to Babylon by Nebuchadrezzar II, 586-538 B.C. It has also been used to describe the anti-papal court set up at Avignon in opposition to Rome during the Great Schism, 1378-1417.

Babylonish Garment. Term introduced into Coverdale's version of the siege of Jericho (Joshua 7). The R.V. has "mantle."

Linen and woollen fabrics, dyed and patterned, sometimes of purple with gold embroidery, were among the earliest exports from Babylonia to the Mediterranean. The trade, developed by the Phoenicians (Ezek. 27), contributed greatly to Roman luxury. The elder Cato sold his Babylonish mantle as too splendid for personal wear.

Baca. The name, probably allegorical, of a valley mentioned in Psalm 84, rendered in the R.V. valley of weeping.

Bacau or BAKAU. A town of Rumania, in Moldavia. Situated on the Bistritza, just above its junction with the river Sereth, it is served both by the main railway through Bukarest into the Bukovina and Poland, and by a branch line to Piatra along the Bistritza valley; two main roads go from the town into Transylvania over the Carpathians, one N.W. through Piatra, and the other S.W. It trades in timber, and has petroleum wells. Pop. 31,264.

Baccarat. Gambling card game much played in France, but illegal in the United Kingdom. Probably introduced from Italy into France in the reign of Charles VIII, the origin of the name is unknown. Many of the well-known baccarat clubs in Paris have their own particular rules for playing. The most usual is between a banker and other players termed punters. In baccarat chemin de fer each player is

banker in turn. In all forms the banker uses several packs of cards, shuffled together, and proceeds to deal two cards to each player and two cards to the table (himself). Each round is termed a coup. The value of the cards is reckoned as one for the ace, two for the 2, three for the 3, and so on up to the 9; the 10 and court cards count 0. The maximum number of points is nine.

The banker receives money from all the punters who hold below the value of his own two cards, and also from those players holding over nine, and pays those who are nearer nine than himself. Thus, should the banker have a 6 and 2 (=8), all punters holding less than this number and those holding over nine would pay. In the event of a punter and the banker holding cards totalling the same amount, it is a tie and the stake remains down for the next coup. The game is sometimes played with the option of a third card being given. A punter holding a 3 and a 10 or court card (=0) may demand another card, in the hope of drawing a 6 or a 5. The first two cards are dealt face downwards, the third being exposed.

Baccarat. Town of France, in the department of Meurthe-et-Moselle. On the river Meurthe, 15 m. S.E. of Lunéville, it is noted for its extensive glass works, established in 1765.

Bacchae. Play by Euripides. Produced after his death, it was written at the court of King Archelaus, in Macedonia, where the wild Bacchic ritual was very prevalent. Pentheus, king of Thebes, prohibits the celebration of the Dionysia by the Bacchae, among whom is his own mother Agave, and, dressed as a woman, mounts a tree to watch a ceremony. The enraged god sets the Bacchae on his track, and, mistaken for a wild animal, he is torn to pieces by his mother and her companions.

Bacchiadae OR **BACCHIDAE.** Aristocratic Corinthian family. Having overthrown the original monarchy, they formed an exclusive oligarchy, which ruled the city from 747 to 657 B.C., one of their number being chosen as president. Under them Corinth flourished greatly, sent out colonies to Corcyra and Syracuse, and became a considerable naval power. Their rule came to an end with Cypselus, one of the family, who made himself "tyrant" or absolute ruler.

Bacchides. Comedy by Plautus. A play of intrigue, which takes its name from two girls named Bacchis. The chief char-

acter is one of the tricky and unscrupulous slaves who figure so largely in the comedies of Plautus and Terence. The Greek original by Menander contains the well-known "Whom the gods love, die young," which is also introduced by Plautus. *Pron.* Bak-i-deez.

Bacchus. In Greek and Roman mythology, name of the god of wine and fertility, better known among the Greeks as Dionysus. According to legend, he was the son of Zeus by Semele, daughter of Cadmus, king of Thebes. Hera, jealous of her lord's love for a mortal, persuaded Semele to ask him to appear before her in all his majesty. He unwillingly consented, and when he approached in thunder

Bacchus. God of wine and fertility in Greek and Roman mythology
British Museum

and lightning, Semele was consumed by the flames. A son, Bacchus, prematurely born, was saved by Zeus, who sewed him up in his thigh.

After a second birth the infant was handed over to the nymphs of Mt. Nysa. On reaching manhood he travelled in the East as far as India, teaching the cultivation of the vine and other fruits of the earth to the inhabitants. He returned to Europe by way of Thrace, whence his worship spread to various parts of Greece. On the island of Naxos he found Ariadne, deserted by Theseus, and made her his wife. After his divinity had become fully established, he went down into Hades in quest of his mother, and took her up to Olympus.

Bacchus is frequently represented as attended by frenzied women called Bacchae, Bacchantes,

Maenades, and Thyiades, all meaning frantic; Pan, Silenus, and satyrs were also among his followers. The god was of benevolent disposition, but merciless to those who opposed his worship. The Bacchic rites (Bacchanalia) at Rome, where Bacchus had become identified with his Roman counterpart, Liber, were celebrated with such excesses that they were strictly forbidden in 186 B.C. by a special decree of the senate. Bacchus was also identified with the Egyptian god Osiris. Besides the Greater and Lesser Dionysia the cycle of his festivals included the Lenaea (Gr. *lénos*, vat), a country festival crowned by the drinking of new wine, and the Anthesteria, or three day festival of flowers, at which pitchers of wine were drunk for a wager, and offerings made to the dead. *See* Dionysia.

Bacchylides (fl. c. 467 B.C.). Greek lyric poet. Included in the Alexandrian canon of the nine great lyricists, he was the nephew of Simonides. Born at Ceos, he spent some time at the court of Hiero, tyrant of Syracuse, and lived for many years in exile in Peloponnesus. Only about 100 lines of his poems were known until 1896, when a papyrus containing 20 more or less complete odes were discovered in Egypt and sent to the British Museum. In 1897 F. G. Kenyon published the first edition of these odes. *Consult* Bacchylides, ed. R. C. Jebb, 1905. *Pron.* Bak-killy-deez.

Bach, ALEXANDER ANTON STEPHAN, BARON VON (1813-93). Austrian politician. Born at Loosdorf, Austria, Jan. 4, 1813, he became a lawyer and public official. In 1848 he was active in promoting the revolutionary movement, but soon afterwards joined the party in power and was made minister of justice and then minister of the interior. In the latter position he aimed, but failed, to centralise the system of government. He left office in 1859, and until 1867 was ambassador at Rome. He died Nov. 12, 1893.

Bach, JOHANN CHRISTIAN (1735-82). German musician. Born at Leipzig, he was the eleventh son of Johann Sebastian Bach. After studying at Berlin and in Italy, he was organist at Milan Cathedral, 1760-62, and spent the rest of his life in England. He was master of music to Queen Charlotte and gave concerts in London which were popular for 20 years. His sacred and operatic compositions were greatly admired. He died Jan. 1, 1782. *Consult* Life, C. Terry, 1930.

J. S. BACH: HIS LIFE AND HIS MUSIC

W. J. Turner, Author of *Music and Life*, etc

This article by a distinguished critic, who wrote many books on musical subjects, gives the main facts about the life and work of the great German composer, Johann Sebastian Bach (1685-1750).

See also Music; Oratorio

Johann Sebastian Bach was born at Eisenach, in Saxony, on March 21, 1685—the same year as Handel, the younger Scarlatti, Berkeley, and Gay—of a long line of musicians of Thüringia. He was an orthodox Lutheran, which means that he was laodicean rather than extremist in his religious attitude, and as an artist he was not in sympathy with the puritan pietists of his time. A student at S Michael's convent at Lüneburg in 1703 he became a violinist in the household of Duke Johann Ernst, a brother of the duke of Weimar. Here he came into contact chiefly with Italian music, which was as popular and universal in German courts of that time as German music was in England during the nineteenth century. In 1704, at the age of 19, he became organist of the new (Protestant) church at Arnstadt. While there he obtained a four-weeks' leave-of-absence to visit the famous organist and composer Buxtehude at Lübeck, but he stayed away nearly four months, and over this and other matters had trouble with his employers. In 1707 he obtained his second appointment as organist at S Blasius, Mühlhausen, where on Oct. 17 he married his cousin Maria Barbara Bach. A year later he became court organist to Duke Wilhelm of Weimar, where he spent nine years and composed most of his organ works and many cantatas; his son, Karl Philipp Emanuel, was born there in 1714.

Court Appointment at Weimar

In 1720 his wife died and he married an accomplished musician, Anna Magdalena Wülkens, in whose hand many of his manuscripts were written. The first half of *The Well-Tempered Clavier* and many of his suites were composed about this time. In 1723 he was installed as cantor of the Thomasschule at Leipzig and remained there until his death, July 28, 1750.

Bach's eldest son, Wilhelm Friedmann, was born in 1710; both he and his brother Karl became famous musicians, as did his youngest son, Johann Christian, who became music master to the queen of England and is known as the English Bach.

Bach was a man of very independent character but shrewd and sensible enough to keep his employers as long as it suited him, no mean achievement amid the fanatical religious and political factions of his age. His genius as a musician was hardly realized during his lifetime, although his technical competence could never have been in question, and his personality gained him some powerful friends.

From excessive neglect during the 18th and early 19th centuries, Bach's music at the end of the 19th century moved to and has ever since remained at the other extreme. This is partly due to a reaction against Wagner and to a natural historical development. The historical approach to the work of creative artists, though necessary, can be dangerous because it may lead to a misinterpretation of their work, due to an

Joh. Seb. Bach.

inevitable unconscious bias for or against a particular development in the technique of the art. Thus Rutland Boughton in his lively books on Bach, especially the one published in 1930, is so ardent a supporter of polyphony as against homophony that he is unjust to the music of both Mozart and Beethoven and he considers that Bach was the crest of the last and final wave of polyphony, of which the ripest and greatest period was centuries earlier. It might be truer to say that the opposition found by some

in these two musical forms is in itself almost an essential method of their continuous development. Most of the talented composers of the present day use more polyphony than did Beethoven's contemporaries, but so did Beethoven himself. The fact is that in every art there is a perpetual oscillation from one side to another in technique, and a similarly perpetual struggle by the greatest masters to achieve a richer and more satisfying synthesis. The distinction between polyphony (the combining of tones in horizontal lines) and homophony (the combining of tones vertically in blocks) is itself artificial, for the vertical blocks themselves have to move horizontally to make music; but the mind cannot take in too much at a time or move at too fast a rate and it separates its paths only in order to reunite them, since at each separation the component ways are made clearer and more distinct and one or the other may be lost sight of temporarily to musical advantage.

Clarity of Bach's Music

The great vogue which Bach's music has enjoyed, especially in England, during the 20th century is partly due to the fact that nowadays the construction of his music is much easier to grasp than that of some others because its basic form is more clearly audible. The polyphony of contemporaries such as Bartok and Hindemith is far more complicated by dint of its harmonic enrichment due to the post-Beethoven development of homophony. Popular audiences at the Promenade concerts and the immense public that listens to music over the radio can delight in Bach because they can hear all the musical strands being deftly and intricately woven together. In fact Bach's music has to them the clarity of 18th century painting, in which all the objects which the painter represents are clearly and distinctly recognizable however vivid and contrasted their colours and no matter how subtle and complex the harmony of their forms. But the higher artistic virtues of musician and of painter are apt to be overlooked or missed in this simple immediate delight in mere clear recognition of what they are doing.

Thus Bach's feeblest and most uninspired pieces are apt to be enjoyed as much as are his finest works because what is commonly enjoyed is hearing so distinctly all the wheels going round. Fugues

(which resist turning into music as obstinately as sonnets into poetry, but which as mere skeletons or frameworks are abominably easy to make) seduce the novice because of their formal clarity and intelligibility, and to the average music-listener Bach means fugues. This is true in spite of the popularity of the S. Matthew Passion and the B minor Mass.

Harvey Grace's valuable book, *The Organ Works of Bach*, reveals how very poor and unsatisfactory many of Bach's fugues are, and those who wish to develop their understanding of fugal composition should certainly study that book—especially as many of the best of Bach's organ works are less known and more difficult to obtain on gramophone records than inferior ones. Rarely does the playing of these works do them full justice. The modern organ is a debased instrument, much inferior musically to 18th and early 19th century organs. The same may be said of modern organists. Irregular rhythm is one of their besetting vices. So in spite of Bach's immense and secure reputation as one of the supreme musicians of the world, it is still rare to hear any of his works performed adequately, and a great many of his finest achievements in choral and instrumental music remain virtually unknown. Perhaps Bach's outstanding virtues as a composer—apart from the sublimity of his ideas—are his gifts of invention and construction. He is as intellectual a composer as Mozart and Beethoven, and, like them, has a tremendous power of architectonic design and creative stamina.

Bach's original compositions, apart from his numerous arrangements, fill 52 large volumes in the authoritative edition of the *Bachgesellschaft*, which, beginning its labours in 1850, completed them in 1899. They include a High Mass in B Minor, 4 smaller Masses, a Magnificat and other works to Latin words; 3 Passions, of which the Matthew and John are the chief, with a Funeral Ode, the music of which is partially the same as that of a Mark Passion now lost; 202 church cantatas, some also styled oratorios; 21 secular cantatas; many independent solo songs, chiefly to religious words; 29 concertos and other orchestral pieces; and a vast quantity of music for organ, for clavier (among which the collection of 48 preludes and fugues in all the keys, known as *The Well-Tempered Clavier*,

the 18 suites and partitas, the Goldberg variations, and the Italian concerto stand prominent), and for stringed instruments, notably six sonatas for violin and clavier, and six for violin solo.

Bibliography. Lives, P. Spitta, trans. C. Bell and J. A. Fuller-Maitland, 1884-85; R. Boughton, 1930; C. S. Terry, 1933; C. F. A. Williams, 1934; C. H. H. Parry, 1934; A. Schweitzer, trans. E. Newman, 1935; *Life and Times*, H. W. van Loon, 1942.

Bach, KARL PHILIPP EMANUEL (1714-88). German musician and composer. Born at Weimar, March

K. P. E. Bach,
German musician

14, 1714, the third son of Johann Sebastian Bach, he studied law, but turned his attention to music and settled in Berlin. Before 1740 he had become a musician in the household of Frederick the Great, whose flute solos he accompanied. In 1768 he removed to Hamburg, where he remained as director of church music or Kapellmeister until his death, Dec. 14, 1788. His numerous compositions, which are historically valuable as illustrating the early development of the sonata and the symphony, include 210 solo pieces for the piano, 52 concertos, and many songs. He composed 22 Passions and several oratorios, notably *The Israelites in the Desert*. Mozart and Beethoven valued Bach's genius highly.

Bachelor. Word of uncertain origin, usually with an implied sense of inferiority. It was early used for the holder of a *baccalaria*, perhaps derived from *bacca*, late Latin for *vacca* (cow), which seems originally to have been cattle-land belonging to an inferior vassal. The term has been applied to ecclesiastics at the beginning of their career, to knights of the lowest grade, to subordinate members of a trade guild or city company, to students who have taken the lowest university degree, and to unmarried men. The last-named were penalised in ancient Sparta, Greece, and Rome, and occasionally during the Middle Ages. In England an Act was passed in 1695 taxing bachelors, to raise money for the French war.

Bachelors' Club. London social club. Founded in 1881, its house is 11 and 12, Hamilton Place, W. It has about 1,000 members, who pay an entrance fee of 30 and an annual

subscription of 10 guineas. During the Second Great War, its premises being requisitioned, the club was housed by the St. James's Club.

Bachka. Former prov. of Yugoslavia, now the autonomous region of Voivodina. Prior to 1918 Bachka was part of Hungary, being incorporated into Yugoslavia after the First Great War. Occupied by Hungarian forces in April, 1941 it was liberated in May, 1945, and granted autonomous government, Sept. 6, 1945.

Bachmut or **BAKHMOU**. Town of Ukraine S.S.R. in Donetsk prov. On an affluent of the Donetz, 130 m. E. of Dnepropetrovsk, it possesses soap factories and beds of rock-salt, and is an important market for cattle.

Bacillus (Latin, a small rod). Name of a micro-organism in form like a rod. Bacilli consist of cylindrical cells that multiply by division and by the formation of endogenous spores. See *Bacteriology*.

Back, SIR GEORGE (1796-1878). British explorer. Born at Stockport, Cheshire, Nov. 6, 1796, he entered the navy in 1808, and in 1818 went out with Sir John Franklin to the Arctic. He more than once saved the lives of his companions, and also did good service during Franklin's exploration of the Mac-

Sir George Back,
British explorer

kenzie river. In 1833 Back went out to find Captain Ross, and was away for two years, discovering the Great Fish or Back river. Between his journeys he served in the navy, and in 1835 attained the rank of captain. His fourth and last expedition to the Arctic was made in 1836, the hardships he encountered making him an invalid for many years. He was knighted in 1839, became an admiral in 1857, and died June 23, 1878. He wrote accounts of his expeditions.

Backbone. Name for the vertebrae or bones of the spine. See *Spinal Column*.

Backergunge. Coastal div. of E. Bengal, Pakistan. It forms part of the fertile delta of the Ganges and Brahmaputra, and contains a portion of the jungle region of the Sunderbunds. Backergunge, the former capital, is ruined and Barisal has taken its place. Of the pop., three-quarters are Mahomedans, the rest being Hindus: five-sixths of the people pursue agriculture, growing three rice crops annually.

Back Flash. The technical term for the rush of flame from the breech of a gun when it is opened after firing. Back flash was almost unknown when gunpowder was the propellant universally employed, but has caused considerable trouble since modern smokeless powders became general, owing to the residual products of the latter containing much carbon monoxide. Some of this gas in a highly heated state remains in the gun-barrel, and ignites on coming in contact with the oxygen of the air when the breech is opened. The effect is greatly intensified if a wind is blowing into the muzzle.

Serious accidents have occurred through the back flash igniting charges near the guns, and crews have been poisoned through the carbon monoxide escaping into turrets and casemates. To eliminate this noxious gas, most modern naval guns are fitted with devices for flushing out the barrel with compressed air before opening the breech. See Ballistics.

Backgammon or **TRIC-TRAC.** A game, referred to by Chaucer as tables, played on a special board by two persons. Each player has 15 men, one taking black, the other white. A dice box and two dice for each player are necessary. A backgammon board is square, usually of wood lined with leather, divided into halves, each surrounded with a raised wall or border. Each player has an outer and an inner or home table, each containing six points marked alternately in black and white, and board and men are arranged as indicated in the diagram. The points on the inner tables farthest from the bar or dividing partition are known as the ace points, the next as the deuce points, followed by the trois, quatre, cinque, and six points, the last coming next to the bar or partition. Points on the outer tables are similarly named, but begin at the dividing partition, the ace in the outer tables generally being designated the bar point.

Each player begins by casting a single die, the one who throws higher having the right to start and, if he chooses, to appropriate the numbers thrown by himself and his opponent as his first move. All subsequent throws are made with two dice. The men are moved from point to point, according to the throws of the dice made by the players alternately. White moves from black's inner to black's outer table, and from this through his own outer to his own inner table; all black's moves must be made in

the opposite direction. A player may move any of his men a number of points corresponding to the numbers on the dice thrown by him, providing the point to which such move would bring him is not blocked by two or more of his opponent's men. Or he may move two men, providing each moves to a position in accord with the number on each die.

In case there should be only a single man on a point it is called a blot, and when an opponent throws a number which would bring one of his men to that position, it is called a hit, and the man so hit is taken up and must start again from his opponent's inner table. Also, until the owner can throw a number corresponding to a vacant space or blot to which it can be moved, the

Backgammon. 1. Ace-point of black's home or inner table. 2. Ace-point of white's home or inner table. 3. Bar-point of black's outer table. 4. Bar-point of white's outer table

play of his other men must be suspended. A player getting two men on a given point, that point is said to be "made"; the men in this position being free from capture and impeding at the same time the advance of those of his opponent. When either player has successfully brought all his own men into his own home table, he proceeds to "bear them off," i.e. remove them from the board. For every throw he may remove a man if there is one in a corresponding position. The player who first succeeds in clearing all his men from the board wins the game. Russian backgammon has many points of difference from the above. Consult *Complete Backgammon*, L. W. Richard, 1938.

Backhaus, WILHELM (b. 1884). German pianist. Born at Leipzig, March 26, 1884, he studied at Leipzig and Frankfurt-on-Main, and in 1900 made his first concert

appearances with a repertoire of over 300 works. His extraordinary technique won him immediate success. In 1905 he was appointed professor of the piano at the Royal College of Music, Manchester, but in the same year, having won the Rubinstein prize of 5,000 francs (£200) for piano playing, he gave up his chair and devoted himself to concert tours. He was one of the few youthful prodigies who fulfilled their promise.

Backhouse, SIR ROGER ROLAND CHARLES (1878-1939). British sailor. Born Nov. 24, 1878, he served throughout the First Great War and commanded the Lion, flagship of the 1st battle cruiser squadron of the Grand Fleet, in 1916. Director of Naval Ordnance, 1920-22, he was put in command of the 3rd battle squadron, Atlantic Fleet, in 1926. From 1928 to 1932 he was Third Sea Lord and controller of the Navy; knighted 1933, he became commander-in-chief Home Fleet in 1935. Appointed First Sea Lord and chief of naval staff in 1938, he was promoted admiral of the fleet in 1939, retiring the same year and dying July 15.

Backing Winds. Winds whose direction of change is opposite to that of the hands of a watch, e.g. from E., through N., to N.W. or W. The opposite change is called veering. When the wind in Britain backs, it usually denotes that the centre of a cyclone is passing from W. to E. to the S. of the point of observation. See Buys-Ballot's Law; Meteorology.

Backlash. In machinery, looseness in a transmission gear due to wear, which allows a part to move without moving the part with which it is connected. For example, backlash in the steering-gear of a motor-car makes it possible to rotate the hand-wheel slightly either way without moving the road-wheels.

Back River. Alternative name for the Great Fish (q.v.) river of Canada, discovered by Sir G. Back.

Backscratcher. Toilet implement. Its main use is suggested by its name, but it was also used as a kind of comb for the immense

Backscratcher. From a specimen made of horn

coiffures of the time of George III. It was some 18 ins. in length, made of cane, horn, whalebone, or wood, topped with a hand of carved ivory or other material.

Back to Methuselah. Play cycle by Bernard Shaw, described by its author as a "metabiological pentateuch." It is in five acts ranging through time from the Garden of Eden to A.D. 31,920. Evolution here represents the experiments of the Life Force to perfect an instrument for its purposes. The argument is that unless mankind is prepared to aid the Life Force human beings will be discarded as were the prehistoric monsters. Performed by the Theatre Guild of New York, April, 1922, the play was produced in five parts, Oct. 9-13, 1923, at the Birmingham Repertory Theatre, and at the Court Theatre, London, Feb. 18-22, 1924. It was revived in 1928. Gwen Ffrangcon-Davies played Eve, and Edith Evans the Serpent and the She-Ancient.

Backwell, EDWARD (d. 1683). English merchant and banker, often regarded as the founder of the modern banking system. Belonging to an old family of Somerset, he became a goldsmith in London before 1650, his shop with the sign of the unicorn being in Exchange Alley, off Lombard Street. Like other goldsmiths, he was entrusted with money by his customers, which he began to lend out to merchants, receiving a higher rate of interest than he paid. He had transactions with Cromwell and Charles II. In 1672, the latter owed Backwell nearly £300,000. Backwell was M.P. for Wendover 1679 and 1681, and is mentioned by Pepys.

E. Backwell,
English merchant

Bacold. Town of the Philippine Islands. It stands on the W. coast of Negros island, opposite Iloilo on Panay. It is a port for the sugar industry, though the harbour is too shallow for large vessels. The pop., trebled in 20 years, was 57,703 in 1940.

Bacon. Carcass of the pig when cured, salted, or otherwise treated. The food value of bacon is high, yielding 2,685 calories per lb. as compared with rump steak, which yields 1,110. Under the Agricultural Marketing Act, 1931, schemes were prepared for regulating the marketing of pigs and pig products in Great Britain. The U.K. total supplies of bacon and hams were stabilised at the average of the period 1925-1930, i.e. 10,670,000 cwt., the home industry

being allotted a quota based on the volume of bacon it could undertake to produce, and the remainder being allocated among the various exporting countries. Factories were established for the production of Wiltshire cut sides cured on the Danish principle—known as tank cure, as against the old method of dry salt cure. These sides are produced by sawing the carcass after removing the head and cutting off the leg to the knee joint down the middle, removing the viscera, backbone, blade bone, aitch bone, leaf fat, tender loin, and kidney. After grading they are ready for curing. The fleshy part of the sides receives injections of brine under pressure, after which the sides are placed in tanks containing pickle, where they remain for 96 hours, finally to drain for 48 hours before marketing.

A small trade in dry salt cured bacon is centred mainly round the Midlands and Cumberland districts. Hams will keep over 12 months. When a smoked product is required, bacon and hams are subjected to the action of smoke for three days.

Bacón. Native town of Luzon, Philippine Islands. On the Gulf of Albay, 20 m. S.E. of Albay, it lies in a volcanic but fertile region. The neighbouring volcano, Bacón or Pocdol, is 4,667 ft. high; near it is a remarkable hot spring, the reddish waters of which issue from an elliptical crater. Their temperature is 70° C. Pop. 15,000.

Bacon, DELLA SALTER (1811-59), An American author. She was born at Tallmadge, Ohio, Feb. 2, 1811, of a New England Puritan family, wrote *Tales of the Puritans*, 1837, and became a popular lecturer on history. Inspired by the idea that Bacon wrote the works attributed to Shakespeare, she came to England in 1853, visited Stratford, and launched her theory in *Putnam's Monthly*, Jan., 1856. Her Philosophy of the Plays of Shakespeare Unfolded followed in 1857, with a non-committal introduction by Hawthorne. Later her mind gave way, and she died at Hartford, Conn., Sept. 2, 1859. See *Bacon-Shakespeare Controversy*; consult *Life*, Th. Bacon, 1888.

Bacon, SIR FRANCIS, VISCOUNT ST. ALBANS (1561-1626). English jurist and philosopher. Born at York House, London, Jan. 22, 1561, he was the younger son of Sir Nicholas Bacon, afterwards lord keeper of the great seal, by his second wife, Ann Cooke, and nephew of Sir William Cecil, afterwards Lord Burghley. He entered

Trinity College, Cambridge, in 1573, leaving in 1575. Accepting in 1576 a mission in the service of Sir Amyas

Michael's near
St. Albans

Paulet, newly accredited as ambassador to France, he went to Paris, and he had been there three years when his father died. Thrown upon his own resources, Bacon returned and studied at Gray's Inn, being admitted a barrister in 1582.

About 1591 Bacon made the acquaintance of the earl of Essex (*q.v.*). His ambition was to be attorney-general, and Essex supported his suit, but Bacon had incurred the displeasure of Queen Elizabeth on a question of supplies, and the office was bestowed upon Sir Edward Coke. In 1597 there appeared a prospect of his marriage with the wealthy Lady Hatton, but it fell through, and in 1598 Bacon was arrested for debt. Knighted by James I, he eagerly engaged in political intrigues. In 1606 he married Alice Barnham. Made solicitor-general in 1607, he was appointed attorney-general in 1613, a privy councillor in 1616, lord keeper of the great seal in 1617, and lord chancellor in 1618, when he was created Baron Verulam. He was created Viscount St. Albans in 1620. In 1621 charges of corruption and bribery were preferred against Bacon, but he refused to defend himself, although he confessed his regret. A heavy fine was inflicted, and for a while he was lodged in the Tower. The king remitting his fine, he retired

Francis Bacon at the age of ten.
From a portrait bust at Gorhambury,

from public life. He died April 9, 1626, and was buried at St Michael's church, St. Albans.

The first edition of Bacon's *Essays* was published in 1597. Originally ten in number, embracing, among others, the themes Of Study, Of Discourse, Of Regimen of Health, Of Honour and Reputation, they were expanded to 58 in the last edition, issued in 1625. He speaks of them as being the most current of his works, "for that, as it seems, they come home to men's business and bosoms." In 1605

After Van Somer

appeared *The Two Bookes of the Proficience and Advancement of Learning Divine and Humane*.

Bacon is regarded by men of science of our day as the originator of the modern school of experimental research, an honour great enough to modify undue detracting of the man in other respects. It is worth recalling that there is a clause in his will in which he bequeaths his name to posterity "after some time be past over." Bacon held that "man is the servant and interpreter of Nature," and argued against the schoolmen's deductive method of reasoning then current, expounding with rare facility and keen perception in his *Novum Organum*, 1620, a treatise upon the conduct of the understanding in systems of inquiry, a true and patient understanding and interrogation of Nature through phenomena and facts. "There is much ground," he says, "for hoping that there are still laid up in the womb of Nature many secrets of excellent use, having no affinity or parallelism with anything that is now known, but lying entirely out of the beat of the imagination, which have not yet been found out."

His *New Atlantis* composed before the *Novum Organum* appeared posthumously in 1627 as an appendix to the *Sylva Sylvarum*. In the first he indicates in allegory a model college under the title of Solomon's House or the College of the Six Dayes Works. Groups of individuals were to be employed in bringing in knowledge to the effecting of things. There were to be preparations and instruments; furnaces, perfume-houses, engine-houses, and the like. Some were to sail into foreign countries; some to try new experiments; while others were to formulate things of use and practice for man's life and knowledge. It was in the *New Atlantis* that telephonic communication was anticipated—"means to convey sounds in trunks and pipes to great distance and in curved pipes."

It is held that the *New Philosophy*, of which this was a fragment, had its earliest practical fruit in England in the establishment of the Royal Society of London for the Improvement of Natural Knowledge. The nucleus of that body had existed before 1662, the date of its incorporation, but Bacon's systems of philosophical inquiry had permeated the minds of the men of learning of the period—Evelyn, Wren, Boyle, Wallis, Oldenburg, and others, so that they sought, first and foremost, for ways and means of materialising Bacon's plans.

Bacon's treatise *De Augmentis Scientiarum* appeared in 1623. He had been working continuously since 1605 on this amplification of the original *Advancement of Learning*, and refers to it as "a book I think will live and be a citizen of the world." It forms the prefatory portion of the completed work, the *Great Instauration*, of which the *Novum Organum* was the second part, and presents a summary of existing human knowledge, with criticisms of its deficiencies.

The eloquent prophet of a new era, Bacon supplied the impulse which broke with medieval preconceptions, pointing the way to progress in philosophy and the sciences; these were to be no longer unsettled and speculative, but fixed on the solid foundation of well-considered experience. The weakening of the bonds or scholasticism was foretold: the putting aside of hypothetical systems, the substitution of direct thinking for contentious syllogistic methods. The diversion of human thought into such novel channels, untrammelled by authority was relatively slow, though the leaven of the open mind of scientific research was a vivifying influence silently at work

It would be incorrect to describe Bacon as a man of science, according to the essential meaning of the term. Certainly, as Herschel observes, he was a reformer of science, but his actual contributions to the stock of physical truth were small. Rather should he be regarded as one of the originators of the whole existing plan, design, and fabric of science, whose position is for ever assured.

Bacon, JOHN MACKENZIE (1846-1904). British aeronaut. Born June 19, 1846, son of a Berkshire clergy-

J. M. Bacon,
British aeronaut

man, he was educated at Trinity College, Cambridge, and was for some years curate at Harston, Cambridge, and at Coldash and Shaw, Berkshire. From early life he was interested in astronomy and kindred sciences. In Aug., 1888, he first went up in a balloon, and in 1902 he was the second person to cross the Irish Channel in that manner, his journeys being used for experiments in wireless telegraphy and for photographing the bottom of the sea. He died at Coldash, Dec. 26, 1904. He was the author of *By Land and Sky*, 1900; and *The Dominion of the Air*, 1902. *Consult* *The Record of an Aeronaut*, G. Bacon 1907.

Bacon, SIR NICHOLAS (1509-79). English statesman, father of Francis Bacon. Born of a Suffolk family, and educated at Corpus Christi College, Cambridge, he was called to the bar in 1533, and in 1537 nominated solicitor to the court of augmentations. He received a share of the

Sir Nicholas Bacon,
English statesman
Zuccherò

monastic lands at the dissolution of the religious houses and in 1546 was appointed attorney of the court of wards and liveries—an office which, in spite of his Protestantism, he retained during the reign of Mary. After the accession of Elizabeth in 1558, he was made lord keeper of the great seal and a privy councillor, and was knighted. Queen Elizabeth frequently visited him at his

mansion at Gorbamby, near St. Albans. He died Feb. 20, 1579, and was buried in S. Paul's Cathedral. His son Nicholas was made a baronet in 1611, and his descendants in the baronetcy rank as the premier baronets of England.

Bacon, SIR REGINALD HUGH SPENCER (1863-1947). British sailor. A clergyman's son, he entered the training ship Britannia in 1874. In the Benin expedition of 1897 he was chief of the intelligence department, winning the D.S.O. He conducted the first submarine trials and was director of naval ordnance and torpedoes.

In 1914 he went to France as colonel of the Royal Marines. In 1915, he was appointed vice-admiral in command of the Dover Patrol, a post he held until Jan., 1918, when he was made controller of the munitions inventions department at the admiralty. He was knighted in 1916. In 1932 he published an account of the operations of the Dover Patrol. He wrote a *Life of Earl Jellicoe*, 1936; *Modern Naval Strategy*, 1940. He died June 9, 1947.

Bacon, ROGER (c.1214-94). English scientist and philosopher, called Doctor Admirabilis. He was born at Ilchester, Somersetshire, studied theology at Oxford and Paris, entered the Franciscan order, settled at Oxford, and began experimental researches into the facts of nature, devoting special attention to alchemy and optics. He invented the magnifying glass and an explosive compound of charcoal, sulphur, and saltpetre which anticipated modern gunpowder.

Roger Bacon,
English scientist

Bacon's associates, according to later writers, accused him of dealing in black magic, and the general of the Franciscan order removed him to Paris, where he was kept under restraint for eight years, forbidden intercourse with the outside world, and denied writing materials, books, or instruments. When Clement IV, who as Guy de Foulques was papal legate in England and had heard of Bacon's works, was elected pope in 1265, he wrote asking for a copy. Bacon drew up his *Opus Majus*, an encyclopedia of the then known sciences and sent it, with two of his other works, by the hand of his favourite pupil, John of London. Their

effect was such that Bacon regained a comparative measure of freedom.

On the death of Clement IV, Jerome of Ascoli, the general of the Franciscan order, denounced Bacon, forbade the reading of his works, and imprisoned him in 1278, a sentence confirmed by Pope Nicolas III. When Jerome himself became pope as Nicolas IV in 1288, Bacon sent him a treatise on the means of warding off the infirmities of old age. Whether as a reward or impelled by remorse, Jerome released Bacon, who returned to Oxford, where he wrote in 1292 his *Compendium Studii Theologiae*. He urged the study of Greek, Latin, and Arabic, of mathematics, physical science, and moral philosophy, and declared the possibility of steam vessels, telescopes, microscopes, and other later inventions. The *Opus Majus* has been edited by J. H. Bridges, 1897-1900, and the *Compendium* by A. G. Little, 1911. *Consult Life*, F. W. Woodruff, 1938.

Bacon Beetle. Species of beetle belonging to the genus *Dermestes*. Rather small in size, only one-third of an inch, it takes up its abode in bacon and other dry food, as well as in museum specimens. Most of the mischief is done by the larvae, which are thickly covered with brushes of stiff hair. *See* Beetle.

Bacon-Shakespeare Controversy. Dispute over the theory that Francis Bacon wrote the plays and poems commonly attributed to William Shakespeare. This

theory, which dates from 1856, is based on (1) the assumption that William Shakespeare, of Stratford-on-Avon, was illiterate; (2) parallelisms between the acknowledged works of Bacon and those published in 1623 as the works of William Shakespeare, of Stratford-on-Avon; and (3) the fact that no authoritative Shakespearian text exists. The disputants include orthodox Shakespearians, Baconians, and anti-Stratfordians, i.e. those who, while of open mind on the Baconian theory, contend that William Shakespeare, of Stratford, was not the author of the plays and poems known as Shakespeare's.

The controversy, which is singularly barren of any acceptable result, has had a recent revival, and

Bacon Beetle

the posthumous book of Dr. W. S. Melsome, of Bath, *The Bacon-Shakespeare Anatomy* (1945), rides parallelism to death. "Anybody with some critical apprehension of literary quality must feel that the mind expressed in Bacon's works is not the mind expressed in Shakespeare's," writes R. L. Miegroz after a study of Melsome, and that judgement sums up the whole sterile controversy to date. *See* Shakespeare.

BACTERIOLOGY: STUDY OF MICROBES

John Drew, M.D.

An account of the progress made in this relatively young branch of science and of its application to the study of diseases. Articles on various diseases, Tuberculosis, Typhoid, etc., should be consulted, also those on Health, Infant Mortality, etc.

Bacteriology is the science concerned with the study of those forms of microscopic life known as bacteria, microbes, or germs. It is an independent science because, although the bacteria are generally placed in the vegetable kingdom, they probably occupy an intermediate position, and form a link, between the true plants and the animal kingdom. In number they far surpass the combined total of all other forms of life, plant and animal, inhabiting this earth, and in their ubiquity, adaptability, and simplicity of structure, they are unequalled by either plants or animals. Their activities for good and for evil exert a profound and continuous influence upon all other forms of earth life, and

because of their influence the science of bacteriology has important applications in medicine, veterinary medicine, agriculture, and industry.

The science of bacteriology is still, relatively, in its infancy; because it is less than a century since the researches of Pasteur, Koch, Cohn, and their associates established the existence of bacteria as living entities, and focused human attention upon them as causal agents of disease in man, animals, and plants. As far back as 1700, the great Dutch microscopist, Anthony van Leeuwenhoek, working with microscopes of his own manufacture, had seen living objects "one thousand times smaller than the eye of a big louse" in drops of rain water and of vege-

table infusions; but it was a long time before his observations were confirmed, and it was not until Müller's work was published in 1786 that biologists began the *systematic* study of bacterial forms. The systematic study of bacteria had to wait until Robert Koch, around 1878, devised the necessary technique for making them easily visible by staining them with various dyes, and demonstrated that some of them could be made to grow and multiply on artificial foodstuffs in the laboratory, although, before his discoveries, the work of Pasteur, Davaine, Klebs, and others had established the association of bacteria with certain diseased states of man and animals.

We know that bacteria are abundant in all parts of our planet, except in the Polar regions and in the central areas of large desert regions. They abound in the soil, they populate water both fresh and salt, they are carried high into the atmosphere by wind and other agencies, and they are constantly present on the body surfaces, and in the natural body cavities of men, animals, and plants. Wherever they are found, they have these features in common: simplicity of structure, microscopic size, biological and metabolic activity, and a capacity for adaptation to changing environment.

Morphology of Bacteria

A bacterium consists of a minute speck of protoplasm, enclosed in a delicate, semi-rigid, semi-permeable envelope, or membrane. There is no organized nucleus in the cell, a fact that distinguishes the bacterial cell from other unicellular forms of life; and all bacteria reproduce asexually by a simple fission of the cell. Although the structure of bacteria is so simple, it nevertheless permits of three basic forms, the coccus, the bacillus, and the spirillum. The coccil form has the shape of a minute sphere, in which any one diameter of the cell is approximately equal to any other. Many cocci are true spheres; others are spheroids, while some are ovoidal in shape. According to the way in which they group themselves in growth agglomerations, they are known as staphylococci (irregular clusters), streptococci (chains), diplococci (pairs), tetrads (fours), and sarcinae (packets of eight cocci).

The bacillary form is that of a minute, rigid cylinder, in which the long axis of the cell is always definitely bigger than the transverse axis. The bacilli show wide

variations in length and girth within the limits of the basic cylindrical form, and while some are so short and plump that they are described as coccoid, others are so long and thin that they are described as filamentous. A few species normally imitate the streptococci in their tendency to grow together in chains of varying length, and these are known as streptobacilli.

Spirilla Large and Small

The spirilla constitute a morphological group whose members are either short, curved cylindrical organisms, or elongated, non-flexuous cells showing a spiral structure. The members of the first sub-group are known as vibrios, while the remaining types of spirilla are known as spirochaetes. The spirilla show wide variations in size from the large *Cristispira* to the small vibrio, often called the comma bacillus, that is the causal agent of Asiatic cholera; and equally wide variations in the pitch of the spiral from the saprophytic *Saprosira*, with wide, loose curves, to the pathogenic *Leptospira*, with a screw-like structure.

The division of bacteria, based upon their biological activities, into saprophytes, or free-living forms, and pathogens, or disease-producing forms, has been of value in the systematic study of bacteria, particularly in relation to the study of plant and animal pathogens. This division is not, however, constant because there are many borderline species, the biological behaviour of which is determined by their immediate environment. The bulk of the known bacteria consists of saprophytic species that normally derive their nourishment from the decomposition of dead plant and animal tissues, and utilise dead organic and inorganic compounds as sources of energy. Obligate saprophytes comprise those bacteria that are biologically incapable of living in, or attacking, living plant and animal tissues.

A relatively small number of species derive their essential nourishment from the living tissues of plants and animals. These are the obligate pathogens. Between these biological extremes are many species of facultative bacteria, some of which are normally free-living but can become pathogens under certain conditions, while others are naturally pathogens but can lead a free-living existence under suitable conditions. This grouping bears no

relation to the grouping based upon bacterial morphology. The obligate saprophytes include cocci, bacilli, vibrios, and spirochaetes, and there are obligate pathogenic representatives of each of these basic forms.

The small size of the bacterial cell has made necessary the employment of a particular arbitrary scale of measurement, the basic unit of which is the micron, commonly designated by the Greek letter μ . A micron is the equivalent of 1/1,000 of a millimetre, or, approximately, 1/25,000 of an inch. Bacterial cells can vary so much in size within their microscopic limits, however, depending upon their environmental conditions, that measurements are only valid for constant and controlled environments.

Laboratory Cultures

The largest bacterial cells are far too small to be seen as individual objects by the unaided human eye, but they become visible as aggregates when they grow as compact clusters, or colonies, containing millions of individual cells, on the surface, or in the depths, of various artificial foodstuffs—technically known as media—in the laboratory. The fact that many bacteria can be cultivated on suitable media in the laboratory has been of enormous value to humanity, because it has enabled bacteriologists to isolate many of the plant and animal pathogens from the lesions of disease for which they were responsible and, by careful study of their growth and metabolic activities, to identify them and determine their powers of resistance to natural and to artificial antagonistic influences. In the absence of laboratory cultivation, very few bacteria could be identified with certainty, and the successful treatment of many bacterial diseases of man, animals, and plants has been made possible only by the study of laboratory cultures.

The individual bacterial cell usually requires to be magnified about one thousand times before the human eye can see it clearly, and this magnification is obtainable only by the use of a microscope fitted with an oil-immersion lens, so called because the lens can function only when it is immersed in a film of an oil which is translucent and has the same refractive index as glass. Bacteria are, of course, subject to the same laws that govern optical measurements in general, and from the

operation of these laws we know that any object smaller than half the wavelength of the light employed to illumine it cannot be resolved by any system of lenses. The optical limits of resolution of the modern microscope, using ordinary daylight or electric light as the illuminant, lie between 0.1 and 0.2 of a micron. Some of the bacteria that cause disease in man approach this limit in size; and many serious diseases of plants and animals are caused by much smaller agents, the so-called ultra-microscopic viruses, which will never be visible to us through an ordinary microscope. By using an illuminant with a smaller wavelength than that of ordinary visual light we can, however, render these agents visible to the camera, and so, by the use of ultra-violet rays and of electrons, we can obtain photographs of objects with a diameter as small as one millimicron—i.e. 1/1,000 of a micron.

Method of Multiplication

The biological activities of bacteria are numerous and diverse, and are of decisive importance in distinguishing between saprophytes and pathogens. Bacteria multiply by a process of simple fission, the cell splitting either transversely or longitudinally into two descendant cells. Under optimum laboratory conditions, multiplication may occur with great rapidity, a fresh generation appearing every 20-30 minutes, although it is probable that multiplication never approaches this rate under natural conditions.

Bacteria assimilate food in solution by diffusion through the cell membrane, and they therefore require an adequate supply of water. Desiccation is rapidly fatal to the vegetative cells of most bacteria, and this observation has been applied to the preservation of human foods, notably dried fruits and vegetables, to protect them from bacterial decomposition. They obtain their food through the agency of the ferments, or enzymes, which they make, and with which they are able to break down complex and insoluble compounds into simpler and soluble substances. Many of the disease processes they cause in the plant and animal body are the result of the action of their enzymes upon the tissues of the host. The number of different enzymes made by bacteria is very large, but they can all be placed in a number of well-defined classes, the most important of which are the

saccharolytic, or starch-splitting, and the proteolytic, or protein-splitting, enzymes.

Some bacteria manufacture pigments as an integral part of their biological activity, and these pigments—which cover almost the whole range of the visible spectrum—are of value in the identification of the different chromogenic (pigment-producing) species. Other bacteria emit light as a biological activity. A common requirement of both chromogenic and luminescent bacteria is an adequate supply of free atmospheric oxygen. Oxygen is required for all bacterial respiration, but bacteria can be divided into two groups according to the way in which they naturally obtain and utilise the oxygen they require. These groups are known as the aerobes and the anaerobes. Aerobic bacteria obtain their oxygen from the atmosphere, and the obligate aerobes can only live and multiply in the presence of free atmospheric oxygen. Anaerobic bacteria cannot tolerate free atmospheric oxygen; they obtain their oxygen from the decomposition of compounds containing it, and the obligate anaerobes cannot multiply in the presence of even a trace of free oxygen. There are, however, many bacteria that are facultative in their oxygen requirements and can live and multiply under either aerobic or anaerobic conditions, although they prefer the one or the other.

Self-Propelling Bacteria

Most of the known bacteria are incapable of independent movement, and these bacteria are dependent upon passive transport for their dispersal. Some bacteria are, however, capable of independent movement, in a fluid medium only. These bacteria owe their motility to the possession of minute threads of protoplasm, technically known as flagella, which project from the cell and by their vigorous lashing movements propel it through a fluid medium. Bacterial motility is not a constant possession; it may be lost with the loss of the flagella, and regained with their reproduction. There are only a few motile species of cocci known; but many of the bacilli, and all the known spirilla, are naturally motile organisms.

For the efficient operation of their biological activities, bacteria require an adequate food supply in the form of nutrient solutions, oxygen either free or combined, an even temperature that differs

with the different species, a favourable reaction of the surrounding medium, and protection from the natural inhibitory agencies of sunlight, severe cold, and desiccation. The optimum temperature for any given species usually approximates closely to the average temperature of its natural habitat. Thus the obligate human pathogens have an optimum temperature around 37.5° C., which is the normal temperature of the human body, and therefore laboratory cultures of these germs must be grown at this temperature in special heat-regulated containers known as bacterial incubators. Bacteria that normally live in fresh water have an optimum temperature around 20° C.; many of these saprophytic water species will not grow at 37.5° C., and so, in the bacteriological analysis of drinking water supplies, duplicate cultures must be incubated at 37.5° C. and at 20° C. There is a group of heat-tolerant bacteria, the thermophilic bacteria, whose activities are sometimes responsible for the spontaneous firing of hay-ricks, whose optimum temperature is around 70° C.

Reactions to Environment

Some bacteria have a wide range of tolerance to acid and alkaline reactions of their environment. Some, the acidophilic bacteria, can tolerate high concentrations of acid and cannot live and multiply in an alkaline environment; others require an alkaline environment and cannot tolerate a trace of acid. Most of the pathogenic bacteria are restricted in their reaction range, and many will only live and multiply in an environment that is either neutral or very close to neutrality. This factor of the optimum reaction of the medium, which differs among the different species, has to be carefully controlled in the laboratory in order to obtain satisfactory cultures of bacteria on artificial media. Many bacteria can adapt themselves rapidly, however, to moderate changes in the reaction of their environment, providing that the change is gradual; and it is probable therefore that under natural free-living conditions this factor is not so decisive as it is under artificial living conditions.

Apart from their capacity to adapt themselves to changes in the reaction of their environment, bacteria exhibit remarkable powers of adaptation to cold, to drying, to the action of antagonistic chemical agencies, and to many

Bacteriology. Photomicrographs of six pathogenic bacteria. 1. Typhoid bacilli showing thread-like flagella, the organs of motility. 2. Tetanus bacilli with spores at the ends of the rods. 3. Long and short chains of streptococci, bacteria found in blood poisoning, abscesses, etc. 4. Meningococci occurring in pus from the brain. 5. Cholera vibrios, each short curved organism having a single flagellum. 6. Spirilla of relapsing fever; the round objects are red blood cells

other influences that bear upon them. In some species, special defensive mechanisms in the form of spores and capsules are developed in order to enable the germs to adapt themselves to adverse conditions that would be lethal to the vegetative cell. A bacterial spore is a small oval, ovoid, or spherical body, with a thick and extremely resistant envelope, that forms inside the parent cell, and in which is concentrated the living substance and the vital activities of the cell. When the spore is mature, the relic of the parent cell disintegrates. Bacterial spores are the most resistant form of life on this planet of which we have any knowledge. Some of them can withstand boiling for several hours, and all of them show a greatly increased resistance to chemical disinfectants and to the natural sterilising agencies of sunlight and desiccation, compared with the resistance of the vegetative cells. Strong sunlight is rapidly fatal to the vegetative cells of most bacteria by virtue of its content of ultra-violet rays, which explains why desert regions in tropical latitudes are so free from germs that are injurious to man, but bacterial spores can withstand it for much longer exposures. For-

tunately, the majority of spore-forming bacteria are saprophytes; but the causal agents of anthrax (a serious disease of man and animals), of tetanus, or lock-jaw, and of gas-gangrene, are sporing bacilli, and the resistance of their spores necessitates special precautions in the laboratory investigation of these germs and of the cases of human and animal disease for which they are responsible. When the bacterial spore is placed in a favourable environment, such as the tissues of the human body, it germinates to produce a single vegetative cell, which then multiplies and makes its specific enzymes and poisons. It must be emphasised that bacterial spore formation is not a method of reproduction like the spore formation of the moulds and other fungi, but a purely defensive mechanism that does not provide any multiplication of the germ. The spore-forming bacteria are confined to the bacilli; no coccus or spirillum is known that forms a spore.

A bacterial capsule is a mucoid, or gelatinous, envelope of varying thickness that is secreted by the cell as a protection against antagonistic influences of a particular kind. Many human pathogens form capsules when they have

invaded the body tissues as a defence against the reactions of the tissues, although capsule-formation does not occur when they are cultivated on artificial media outside the body. The pneumococcus, the causal agent of most cases of acute lobar pneumonia in man, is a classical example of a capsulated bacterium; and before the discovery of the sulphonamides, it was the presence of its capsule that made the pneumococcus so difficult a germ to destroy in the human body.

It is natural that the harmful activities of certain bacteria in the human body should cause our attention to be focused upon the pathogenic bacteria; but the ravages of bacteria among the lower animals and among plants are, in their total, almost as dangerous to the continued existence of the human race as their attacks upon human individuals and communities. Man is dependent for his existence upon his flocks and herds of food and draught animals, and his crops of wild and cultivated food plants. His food animals, in their turn, are dependent upon vegetable foods. When the staple crop of a community fails, that community is at once

threatened with famine, and famine is inevitably associated with pestilence, because the individual's resistance is lowered by his lack of nutrition and he becomes more susceptible to the attack of pathogenic bacteria. Bacteria cause many serious economic diseases among man's food and draught animals—tuberculosis, plague, anthrax, and glanders, to name only a few of the diseases they cause. Bacteria can attack the growing plant and destroy it, although their ravages are not so serious as those of the microscopic fungi among growing plants. They attack and spoil our stored foods; the annual economic loss throughout the world caused among our stored foods by bacterial activity is colossal. The putrefaction of meat, the soft rots of fruit and vegetables, and the souring of milk are examples of harm. The applications of bacteriology to agriculture are therefore of importance to us as individuals, and in their influence upon the continued existence and progress of the human race they are as important as the applications of bacteriology to medicine, especially when it is realized that without the beneficent activities of certain species of bacteria there would be no vegetable life, and therefore no animal life, as we know them upon this planet.

Nitrogen-fixing Bacteria

Nitrogen is an essential constituent of all plant tissues, but plants cannot utilise it in its free, uncombined state. The original store of combined nitrogen, in the form of nitrates, in the soil was long ago exhausted by the demands of the primeval plants, except in certain restricted localities like the Chilean saltpetre deposits. Certain species of bacteria, however, are able to extract nitrogen from the inexhaustible store of that element in the earth's atmosphere and fix it in the soil in a form in which plants can utilise it. There are two groups of these nitrogen-fixing bacteria, the free-living, nitrifying bacilli of Winogradsky, that live in the uppermost layers of the soil, and the root-nodule bacteria that work inside the nodules occurring on the roots of leguminous plants like peas, beans, vetches, clover, and lupins. It is the nitrogen-fixing activity of these bacteria that explains why a crop of clover enriches arable land, especially if the clover is harrowed, or cross-ploughed, into the superficial soil when the crop is mature.

Many other saprophytic bacteria exhibit activities that are beneficial, but man has only comparatively recently begun to study them and to seek to control their activities for his own welfare. The iron bacteria derive their energy from the decomposition of iron compounds: and the oxidation of iron, not always a beneficent activity when the erosion of domestic or industrial iron work is concerned, may be caused by bacterial action. The sulphur bacteria attack compounds containing sulphur; and the phenol bacteria attack carbolic acid and other phenols and so play an important rôle in ridding the soil of these sterilising chemicals. The decomposition of dead animal and vegetable matter is due to bacterial activity, and bacteria are the agents that enable the gardener to make compost from the waste greenstuff of the garden. It is generally accepted that the fertility and richness of a soil is proportionate to its content of humus, and, as we have seen, bacteria are the chief agents in the production of humus.

Microbes in the Body

The bacteria that cause human disease are not imbued with any malign purpose; their invasion of the human body is accidental and incidental to the contacts that occur between them and man; but they have become adapted in the course of evolution to live and multiply in the body tissues, and in the course of their life cycle their biological and metabolic activities evoke reactions on the part of the host's tissues that manifest themselves in the symptoms and signs of disease. The pathogenic bacteria are relatively rare inhabitants of the human body compared with the enormous number of obligate and facultative saprophytes that the healthy human body normally harbours. The human skin, the bowels, and the natural external body cavities each harbour a bacterial population that is constant in kind, but variable in number, in the healthy individual, although different individuals show differences in the composition of their bacterial flora.

The bacteria that cause disease enter the human body either by way of the natural cavities that open to the external world, or through breaches in the continuity of the skin or of the membranes (mucous membranes) lining the body cavities. It is doubtful whether any bacterium can penetrate the intact human skin, but

some can pass through the protective barrier of the skin by way of the natural channels—the hair follicles and the ducts of the sweat and of the grease glands—that traverse the skin. This passage may be assisted by unhealthy conditions of the skin; by defective personal hygiene resulting in the clogging of the pores by dirt or cosmetics; by occupational hazards; and by derangements of the functions of the glands in the skin. The common boil, an infection usually due to the germ known as *staphylococcus*, generally starts as an invasion of a hair follicle, into which the germ is pushed by the friction of the clothing, by scratching, or by the use of contaminated cosmetics.

Why We Lay the Dust

Bacteria that enter the body by way of the respiratory tract are drawn into the tract in the air we breathe. They are so light that tiny currents of air suffice to keep them suspended for considerable periods of time, but under the influence of gravity they are deposited from perfectly still air, although they may be suspended again by small air currents. The chief reason for the water-cart, that tours our town streets in dry and dusty weather, is to damp down and wash into the drains the germs that are present in the street dust and so prevent them from becoming suspended in the air that we breathe. Similarly, in hospital wards, factories, theatres, and all places where people congregate indoors, oiling or damping the floors is a valuable protection against infections that enter the human body by way of the respiratory passages. Most of these bacteria are expelled into the air from the respiratory passages of people who are themselves infected, but are not too ill to continue at work or to take their pleasure; of people who are incubating an infection, or of people who are carriers of particular germs. During the acts of coughing, sneezing, and spitting, large numbers of pathogenic germs may be projected into the atmosphere, if the ejected matter is not caught in a handkerchief, or in one's hand.

Bacteria that enter the body by way of the alimentary tract are introduced in the foods that we eat and the fluids that we drink. Their immediate fate after we have swallowed them depends upon the state of our gastric digestion at the time we swallow them, because there are very few bacteria that can survive even a short

exposure to the hydrochloric acid that is normally present in the human stomach at certain times. The state of the individual's "acid gastric barrier" may therefore be the decisive factor that determines whether or no he will contract typhoid fever, or dysentery, or an attack of bacterial food poisoning.

Bacteria that enter the body by way of the genital passages are usually introduced during the act of coitus, and are the causal agents of the group of diseases that are consequently known as the venereal diseases. The human urinary and genital tracts are separate in the female, and in the male except for a common duct that traverses the penis. Infections of the male urinary tract (bladder, ureters, and kidneys) may therefore occur as extensions of a primary genital infection, although they mostly take origin from some other focus within the body, from which the germs are carried to the urinary tract in the circulating blood, or from which they invade the tract by direct extension through connecting tissues. Infections of the female urinary tract may be introduced from the external world, but mostly they invade the tract from foci elsewhere in the body.

How Infection is Carried

The ways in which bacteria spread among the members of human communities are determined by the biological characters of the particular germs, and by their exits from the body of the sick person or the carrier. As a general rule, a bacterium that enters the human body by a particular tract is expelled from the body by way of that tract. For example, the causal agent of typhoid fever, *E. typhosus*, enters the body by the alimentary tract and is expelled from it in the motions. The pneumococcus enters the body by way of the respiratory tract and is expelled from it in droplets of mucoid or purulent matter, or in sputum, by the acts of coughing, sneezing, and spitting. The gonococcus enters the body by way of the genital tract and is expelled from it in the abnormal discharges that exude from the tract during the disease. The staphylococcus that enters the body through the skin is expelled from it in the exudates that are discharged through breaches in the skin. If the bacterium is capable of living for a time outside the human body, then articles upon which it is deposited may passively transmit infection to susceptible people who handle

them, eat them, or otherwise make contact with them. All such articles are grouped under the heading of fomites, and the term can include every article of household, school, and workshop use, all foodstuffs that are eaten uncooked or without further domestic cooking, and fluids such as milk and water. When these are not treated to destroy their bacterial content.

Insect Dissemination

This method of spread, where some inanimate substance serves as the link in the transmission of infection from man to man, is known as indirect contact spread. It is a means of dissemination of hardy bacteria like *M. tuberculosis*, *C. diphtheriae*, and the streptococcus that causes scarlet fever and childbirth fever; but, in most cases, it is the human being, acting as a carrier, who is responsible for these infections. In addition to direct and indirect contact between humans, insects play an important part in the spread of certain bacterial diseases among human communities. In some cases the insect acts simply as a mechanical vector of the germ, as, for example, the common housefly, which contaminates the sticky pads of its feet with the germs of typhoid fever and bacillary dysentery, when it feeds on exposed human excrement deposited by carriers of those germs, and then conveys them to our food. In other cases, the insect acts as a biological vector of the germ, which enters and multiplies within its body and sometimes destroys the insect in the process. Insects that act as biological vectors are all predators on man, subsisting upon human blood as their source of nutriment, and it is during the act of feeding that they transmit the germ they carry to their human host, either by direct inoculation into the host's blood, or indirectly by the inunction of their excrement into the human skin. Thus, the rat flea transmits the germ of bubonic plague from the rat to man; the body louse transmits the germ of typhus fever from man to man; and a mosquito transmits the virus of yellow fever from man to man. These are three examples of many similar relations between the insect world and mankind. Predatory insects may also be the indirect cause of bacterial infections in man, because the irritation that frequently results from their bites impels the victim to scratch or rub the irritating spot and so, if he happens to be carrying pathogenic germs on his fingers

—and such germs are frequently carried for varying periods of time under the finger-nails even by cleanly persons—introduce them into his body through the puncture wound made by the insect.

Pathogenic bacteria can therefore be spread through human communities in a variety of ways, and it is fortunate that the healthy human body is naturally equipped to deal effectively with most of the pathogens that are encountered in the ordinary course of life, and that recognizable infection is rare compared with the frequency of the contacts between pathogenic germs and the human body. Where such infections occur, the science of bacteriology has provided, and is providing, us with knowledge which saves human life, reduces disability, and protects the individual and the community from the spread of disease.

Hitchens, 5th ed., 1939; Veterinary Bacteriology, J. A. Merchant, 1940; Handbook of Practical Bacteriology, T. J. Mackie and J. E. McCartney, 6th ed., 1942.

Bacteriostatic. Word used to describe a substance which prevents sepsis by stopping the growth of bacteria, *e.g.* penicillin.

Bactria or **BACTRIANA**. In ancient geography, a tract of country comprising the N. slope of the Hindu Kush as far as the Oxus river (Amu Daria). It corresponds nearly to the district of Balk (*q.v.*), which has preserved the name, in the modern Afghanistan. According to tradition, Zarathustra or Zoroaster, the founder of the ancient Persian religion, lived and taught here in the time of a legendary King Vishtaspa (c. 1000 B.C.). Its fertility led to early occupation by Iranian peasantry, doubtless preceded by pre-Aryan peoples, who were in constant contact with Altaian nomads on the N. side of the river. For ages it was held by petty chieftains, one of whom may have sent an embassy to the Assyrian Shalmaneser III (c. 858 B.C.) with presents of Bactrian camels.

Cyrus made it a satrapy of the Achaemenian empire (c. 538 B.C.) Alexander the Great overran it in

328 B.C., and established Greek garrisons. After a brief Seleucid domination, Diodotus, the Greek satrap of the capital city Bactra (Balk), rebelled and founded the Greco-Bactrian kingdom (c. 250 B.C.). A splendid series of coins elucidates its history, a 20-stater of Eucratides being the largest gold coin of antiquity. This general usurped the throne (c. 160 B.C.), while his overlord, Demetrius, who had established a new capital S. of the Hindu Kush at Sagala, was advancing down the Kabul valley.

The occupation of the Punjab was completed under his greatest descendant, Menander, the Milinda of Buddhist chronicles. An irruption of the Sakas or eastern Scythians (c. 139 B.C.) submerged this easternmost outpost of Greek culture. They were followed a century later by the Yueh-chi, who founded the Indo-Scythic Kushan empire. Hellenic influences passed permanently into the Buddhist art of India and Chinese Turkistan.

Bactris. Genus of slender S. American palms. Growing on swampy land, river banks, and the

Bactris. Slender S. American palm

sea coast, they are mostly small, more like reeds than trees, their stems being furnished with sharp spines. They grow in clumps, owing to their habit of throwing up numerous suckers from the roots. One species (*B. minor*) has a stem little more than 12 ft. in length and about an inch thick, from which are made the walking-sticks known as Tobago canes. *B. maraja*, which grows on the Amazon, attains a height of 50 ft. It produces bluish black succulent fruits which, though acid, have an agreeable flavour and form the basis of a kind of wine.

Bacup. Mun. bor. and market town of Lancashire, England. It stands on the river Irwell, near its source, 20 m. N. of Manchester by railway. Bacup was incorporated in 1882, and has cotton-spinning and power-loom weaving mills, shoemaking, felt-making, and

Bacup arms

calico-printing works, iron-foundries, and dye-works; there are coal mines and stone quarries in the neighbourhood.

The corporation owns the markets, the library and baths, parks and recreation grounds, and cemetery. The Hempsteads estate was presented to the corporation by J. H. Maden, an ex-mayor. New waterworks were completed in 1910 and a light rly. was opened in the same year. Occupying an elevated position near by is Broad clough Dykes, an ancient camp. Market day, Wed. Pop. 20,606.

Badaga. Primitive tribe in the Nilgiri hills. S. India. Of medium height, and very long-headed, they engage in agriculture and cultivate bearded wheat, barley, and native cereals, but some have abandoned cultivation for the more profitable pursuit of daily labour. They speak a Dravidian dialect and are now Hinduised, with some animism due to contact with other hill tribes.

Badagry. Harbour and district of Nigeria. The district is inhabited by the Egbados, whose chief town is Iaro. The harbour is situated on the lagoon running from Porto Novo (Dahomey) to Lagos, about 38 m. W. of the latter city, and has a small trade in palm kernels. Founded by Benin colonists, it was the starting-place of the expedition of Richard and John Lander in 1830. It has long been superseded as a port by Lagos. The district has an area of 1,167 sq. m. and a pop. of 92,000.

Badajoz. Largest province of Spain, in Estremadura. It borders on Portugal, the Guadiana forming part of the boundary, and is traversed by that river and the Madrid-Lisbon Rly. It produces cattle, goats, wax, silk, wool, pork olive oil, and cork. The capital is Badajoz. Area, 8,349 sq. m. Pop. 776,282.

Badajoz (anc. *Pax Augusta*). A city and episc. see of Spain, capital of Badajoz prov. On the Guadiana, here crossed by a fine granite bridge, 315 m. by rly. S.W. of Madrid, it is close to the Portuguese frontier. It has a cathedral, a Moorish castle, an arsenal, and various manufactures, and carries on a transit trade with Portugal. A frontier fortress it has been several times besieged, notably by the Portuguese in 1660; by the Allies in the War of the Spanish Succession, 1705; by the French, 1808-9 and 1811; and three times by the British (see below). It fell to Gen. Franco's forces in the civil war, Aug. 15, 1936. Pop. 71,648.

Badajoz, BRITISH SIEGES OF. Operations against the French during the Peninsular War. In Feb., 1811, this important frontier fortress was surrendered by the Spaniards to the French, and in May and June two attempts at recovery by the British failed.

Both Wellington and the enemy then made more elaborate preparations. On March 17, 1812, the British began to construct siege works, although on the 19th a sortie from Badajoz, and the wet weather, greatly hindered operations. The batteries were got into position and opened fire on the 25th when the Picurina, a fortified hill just outside the town but within its fortifications, was carried by assault. The British made good use of the captured hill, and early in April two breaches had been made in the southern walls. It was decided to assault on the 6th, after a third had been opened.

Under cover of night one division on the right was sent against the castle, the walls of which were from 18 ft. to 24 ft. high; on the left another division was to attack a bastion to the N., while elsewhere the Portuguese and others were to deliver feigned assaults, the Portuguese on the E. side, where the river Guadiana flowed along the walls. In the centre two storming parties of 500 men each were to assault the breaches.

Here every horror awaited the men as they plunged into the ditch. When more than 2,000 men had fallen in an area not 100 yds. sq., the others were called off. Meanwhile Picton's division, having crossed the little river Rivillas, had assailed the castle walls. At the first attempt they were beaten back; but a dash against the lower part of the wall gave them entrance and the castle was won. Another success was gained at the bastion of St. Vincent, and some men here were the first to enter the town itself.

The breaches of Badajoz were abandoned, and on the next day it was formally surrendered. The British lost nearly 5,000 men, and took a terrible revenge in the pillage of the town. Napier's description of this siege (Peninsular War, vol. iv) is one of his finest pieces of descriptive writing. Consult also History of the Peninsular War, C. W. C. Oman, 1902-11.

Badakshan. Afghan province, bounded S. by the Hindu Kush and N. by the Amu Daria (Oxus). It includes the region of Wakhan. The pop. consists mainly of Tadzhiks, who speak Persian, though Turki

is also spoken. Its capital is Faizabad. A mountainous land, drained by the Kokcha, it is famous for its ruby mines and cliffs of lapis lazuli.

Badakshansk-Gorno. Autonomous province of Tadzhik S.S.R., Russia. It lies in the Pamirs, in the S. of the republic, towards Afghanistan. Chief town: Khorog.

Badalona (anc. *Baetulo*). Coast town of Spain, in the prov. of Barcelona. On the Mediterranean, 10 m. by rly. N.E. of Barcelona, of which city it is really a suburb, it is at the mouth of the river Besos, here crossed by a stone bridge carrying the rly. It has boat-building yards, large glass-works, sugar and petroleum refineries, cotton and woollen and biscuit factories. There are orange groves in the district, which produces grain and fruit. Pop. 49,697.

Badbury Rings. Prehistoric stronghold $4\frac{1}{2}$ m. N.W. of Wimborne, Dorset (Badda's burgh). The hill is 327 ft. high, surmounted by two earthen ramparts separated by a broad berm or pathway from an earthwork, perhaps later, lower down. Water was supplied by a pond. The old road to Old Sarum (Ackling Dyke) was used by the Romans. Its identification with the Mount Badon of King Arthur's last battle in 520 is discredited.

Baddeley, ANGELA (b. 1904). English actress. She was born in London, July 14, 1904, and made her first appearance at the Old Vic in 1915 as the little duke of York in Richard III. She subsequently covered a wide range in serious drama and comedy, as exemplified by the parts of Jenny Diver in *The Beggar's Opera*, 1920-23; Kathryn Howard in *The Rose without a Thorn*, 1932; and Miss Prue in *Love for Love*, 1943. She played opposite Emlyn Williams in his plays *Night Must Fall*, 1935; *The Light of Heart*, 1940; and *The Morning Star*, 1941. She married Glen Byam Shaw.

Her sister Hermione was born at Broseley, Shropshire, Nov. 13, 1906, and made her first appearance on the London stage in *La Boite à Joujou* at the Court Theatre, 1918. Possessing an outstanding talent for burlesque, she specialised in revue, and in 1923 joined *The Co-Optimists* (g.v.). Later she was a mainstay of intimate or sophisticated revues at the Little and other theatres.

Baddeley, ROBERT (1732-94). English comedian. After serving as cook to Foote and valet to a traveller, he became an actor at Drury Lane Theatre, and was

the original Moses in Sheridan's comedy *The School for Scandal*. His wife, Sophia (1745-86), was an actress and singer. Baddeley left money to found a home for decayed actors and to provide the Drury Lane company with wine and cake on Twelfth Night. He died Nov. 20, 1794.

Badderlocks. Rock seaweed of the Phaeophyceae (olive-brown seaweeds) found on the shores of the British Isles, N. Europe, and Iceland. It has a short stem and a long membranous frond, which sometimes reaches as much as 10 ft., and of which the midrib is edible. Honeyware is an alternative name.

Baden. Fourth largest state of Germany. Formerly a grand duchy within the German empire, it became a republic in Nov., 1918, and held that status under Hitler's Nazi regime. It is bounded N. by Bavaria and Hesse-Darmstadt, E. by Württemberg, S. by Switzerland, and separated from France by the Rhine on the W. Shaped like a hatchet, it is broadest in the S., including most of the Black Forest or Schwarzwald. The area is 5,820 sq. m., and the pre-war pop. was 2,518,103.

The mts. of the Black Forest rise 5,000 ft., are carved into gloriously wooded valleys, and drained by tributaries of the Rhine. The rivers Neckar and Main also cross the state. Constance is the only considerable lake. The fertile valleys produce grain, flax, hemp, and vines. Tobacco is grown extensively. The mineral wealth comprises coal, iron, lead, zinc, gypsum, peat, clay, and in smaller quantities gold, silver, and copper. Baden has celebrated mineral springs. Many industries depend on timber: saw-milling, paper-making, wood-carving. Clocks and watches are made, and Pforzheim is a centre of silverware and jewelry. Mannheim specialises in rly. and motor manufacture. The Black Forest folk have traditional skill in making toys and trinkets.

Over half the people are Roman Catholics. Freiburg is an archiepiscopal see; it has also a university, as has Heidelberg. Karlsruhe is the capital (189,850), Mannheim the most populous city (283,801); both have technical universities. Other places are Baden-Baden, Bruchsal, Ettlingen, Villingen, and Lörrach. The rlys. belong to the state.

Baden was taken from the Romans by the Alamanni in 282. In the middle ages it was ruled by counts or dukes. About the

12th century a count Hermann called himself margrave of Baden, and as his successors added to their lands they divided them among their families, so causing the little margraviates such as Baden-Durlach to grow up and contribute to the patchwork quilt, as the map of medieval Germany has often been called. Baden was generally regarded as more progressive and democratic than other German states. Charles Frederick, who ruled from 1738 to 1811, both consolidated territory and received large awards between 1803 and 1806 for aiding Napoleon. He became a grand duke, joined the confederation of the Rhine, and left his successor a dominion quadrupled in size. This duke, Charles, opportunely deserted Napoleon in 1813 and in 1815 joined the Germanic confederation. Strife over the granting and revoking of constitutions occupied the early 19th century; but Baden joined the Zollverein, or German customs union, in 1832 and took a big part in the 1848 revolutions.

Forsaking Austria for Prussia after the war of 1866, and allying with Bismarck against France in 1870, Baden gained admittance to the new German empire as a state. Apart from conflicts with the church, it developed prosperity along liberal lines until the First Great War; and afterwards was one of the last states in which the Nazis made headway. The industrial towns were heavily damaged in the Second Great War, after which Baden came into the French zone of occupation.

Baden. Town and watering-place and district of Austria. On the Schwechat, 17 m. by rly. S.S.W. of Vienna, its sulphur springs and baths attract many visitors. The spa rooms were modelled after those at Harrogate. Meierling, about 4 m. away, is the country house wherein the crown prince Rudolf committed suicide in 1889. The most picturesque spot is perhaps the Helenenthal valley. Baden was captured by Russian troops under Marshal Tolbukhin, April 4, 1945. Pop. est. 22,208.

Baden. Town and spa of Switzerland, in canton Aargau. It stands on the river Limmat, at an alt. of 1,260 ft., 14 m. by rly. N.W. of Zürich. Its sulphur baths, known to the Romans as *Thermae Helveticae*, are visited by sufferers from rheumatism, gout, and lung complaints. From 1426 to 1712 Baden was the seat of the Swiss diet. Pop. 10,258

Baden, TREATY OF. One of the treaties which ended the War of the Spanish Succession. The various treaties arranged at the congress of Utrecht and signed in 1713 and 1714 brought about peace between all the belligerents except France and the Holy Roman Empire. Soon afterwards the representatives of certain princes of the Empire met those of France at Baden in Switzerland, where a treaty was signed, Sept. 7, 1714. By it the frontier between France and Germany was restored to its position on the outbreak of war in 1702, France retaining Alsace, but giving up certain fortresses. See Utrecht, Treaty of.

Baden-Baden. Town and pleasure resort of Germany, in Baden. On the little river Oos, 23 m. by rly. S.S.W. of Karlsruhe, it owed its popularity to its climate, its situation near the Black Forest, and to its saline waters. There are a pump room (Trinkhalle), assembly rooms (Konversationshaus), and baths for both sexes, all fine modern buildings; also gardens and promenades. The chief of the older buildings are the parish church, with monuments to the rulers of Baden, and the 15th century castle, with subterranean vaults. There are also ruins of an older castle. The town has an English and a Greek church. Baden was a Roman town, and remains show that the Romans used its waters. In the Middle Ages it was a stronghold and gave its name to the margraviate of Baden.

The town's modern popularity dates from the beginning of the 19th century, and until 1872, when gaming was suppressed, its tables were a great attraction. Lichtenthal, in the neighbourhood, has a nunnery dating from the 13th century, a church, and a chapel wherein are the tombs of some of the margraves. Towards the end of fighting in Europe in the Second Great War, Baden fell to the French 1st army, April 12, 1945. Pop. 25,692.

Badeni, CASIMIR FELIX (1846-1909). Austrian statesman. Born at Surochov in Galicia, Oct. 10, 1846, he was educated at Cracow. Having held several minor official positions, he was made governor of Galicia in 1888. In 1895, when anti-Semitic feeling was very strong, he was chosen prime minister of Austria-Hungary, but only held the post for two years. His name is chiefly associated with an abortive attempt to give the Czech language a position equal to that of the German in Bohemia and Moravia. Badeni died July 9, 1909.

Badenoch. A district of S.E. Inverness-shire, Scotland. Roughly

40 m. by 16 m. in extent and wildly mountainous, it is traversed by the Spey, contains Loch Erich, and has fine deer forests. It was owned by Robert II's son, the Wolf of Badenoch, and the marquess of Huntly, to whose ancestor it was given in 1452, retains the title of Lord of Badenoch.

Baden-Powell OF GILWELL, ROBERT STEPHENSON SMYTH BADEN-POWELL, 1ST BARON (1857-1941). British soldier. Born Feb.

Lord Baden-Powell, soldier, author, and founder of the Boy Scouts

22, 1857, and educated at Charterhouse, he entered the army in 1876, and as a cavalry officer distinguished himself during the Matabele war, 1896-97. When the South African war broke out in 1899 he was besieged in Mafeking, which he held for seven months until relieved. In 1900 he raised and organized the S. African constabulary of 11,000 men, and in 1903 became inspector-general of cavalry in the U.K. Baden-Powell's military genius lay in the direction of observation and scouting.

In 1908 he founded the boy scouts, following an experimental camp in 1907 on Brownsea Island off the coast of Dorset. The publication in 1908 of *Scouting for Boys* brought the scout movement into being. The first rally, held at the Crystal Palace, London, was attended by 11,000 boys. Some girl scouts wearing appropriate shirts and hats appeared at this rally, and to satisfy girls attracted by

scouting "B.-P." with the help of his sister, Agnes Baden-Powell, started the girl guides (*q.v.*). Agnes became the first president, devoted many years to the movement, and maintained interest in it until her death in 1945. The scout movement grew rapidly, and "B.-P." became chief scout. Other countries organized boy scouts and in a few years an international organization had arisen. "B.-P." was knighted in 1909.

In 1912 he married Olave St. Clair Soames, and in 1921, a year after the first international scout jamboree in London, a baronetcy was conferred upon him. At this jamboree "B.-P." became chief scout of the world. He visited almost every country to attend rallies and meetings of scouts, and Lady Baden-Powell, as chief guide, often accompanied him. In 1929 the coming of age of the scout movement was celebrated by an international jamboree at Arrowe Park, Birkenhead, and the King conferred a barony on "B.-P." He chose Gilwell for his title, because Gilwell Park training centre in Epping Forest was known by all scouts. "B.-P.'s" last public appearance was at the fifth world jamboree in Holland in 1937. Afterwards he retired to his home at Nyeri, Kenya, where he wrote a little but devoted most of his time to water-colour painting. He died there Jan. 8, 1941, and was buried there. Memorial services were held throughout the British Empire and in many countries. Scouts in countries then occupied by the Germans produced memorial cards, although scouting was banned.

"B.-P." wrote and illustrated many books, including *Cavalry Instruction*, 1895; *The Downfall of Prempeh*, 1896; *The Matabele Campaign*, 1896; *Aids to Scouting*, 1899; *Scouting for Boys*, 1908; *Scouting Games*, 1909; *Yarns for Boy Scouts*, 1910; *Indian Memories*, 1915; *My Adventures as a Spy*, 1915; *Wolf Cubs' Handbook*, 1916; *Aids to Scoutmastership*, 1919; *Girl Guiding*, 1917; *Rovering to Success*, 1922; *Life's Snags*, 1927; *Lessons from the Varsity of Life*, 1933. See *Boy Scouts*; *Scouting*. Consult also the official life by E. E. Reynolds, 1942; Piper of Pax, E. K. Wade, 1944.

F. HAYDN DIMMOCK

Bader, DOUGLAS (b. 1910). British airman. Although he had lost both legs in a crash in 1933, Bader persuaded the authorities to allow him to rejoin the R.A.F.

BADGES OF REGIMENTS AND CORPS OF THE BRITISH ARMY

Douglas Bader,
British airman

in 1939. Having been fitted with specially made metal legs, he convinced senior officers of his ability to pilot fighter aircraft. Bader, as a squadron leader, led a Canadian squadron of Fighter Command in the battle of Britain, 1940, and shot down at least 15 machines. He fell into enemy hands on Aug. 9, 1941, by colliding with a Messerschmitt after he had shot down another. One of his legs was damaged when Bader baled out; a spare one was dropped at his prisoner-of-war camp by the R.A.F. He was liberated by the U.S. 1st army near Leipzig, April 18, 1945. Returning to England, he led, as wing commander, the squadrons that flew over London, Sept. 15, 1945, to commemorate the battle of Britain. He was awarded the D.S.O. and bar and the D.F.C. and bar.

Badge. Originally the distinctive mark worn by a knight in battle, *e.g.* the ostrich feathers of the Black Prince. Many badges are hereditary, and are as old as, if not older than, the armorial bearings. Though often placed above the arms on the side of the crest, a badge could not be placed on a wreath or helmet, but could be displayed on livery buttons. Most English sovereigns and princes down to William III had their personal badges.

The word is now used for a distinctive mark of any kind, especially one denoting rank or proficiency in the forces or other uniformed bodies, *e.g.* the boy scouts; also membership of particular schools, colleges, regiments, clubs, and other institutions. It is usually worn in the form of a small device of metal or worsted, attached to or sewn into the clothing. A freemason refers to his apron as a badge.

In the British army every regiment has its badge (*see* colour plate), worn as a collar ornament by officers and on the cap by all ranks. These are of metal or worsted. The navy and air force have each one comprehensive badge. For badges of rank in the services *see* Rank. Badges granted for proficiency in the services include the coveted "wings" of an R.A.F. qualified pilot. *See* Brevet.

During the two Great Wars official badges came to be increas-

ingly used with civilian dress, usually on the coat lapel. A conspicuous early example was the silver badge, introduced Sept., 1916, for officers and men and women of the forces who had been discharged through physical infirmity attributable to their service. Badges were also issued to civilians, male and female, employed on munition work or other essential national service, these usually taking the form of a small metal button, engraved with appropriate lettering. Badges of this kind specifically belonging to the Second Great War included those for A.R.P. workers (later Civil Defence workers), members of the merchant navy and the Home Guard, and various types of special workers, *e.g.* employees of the railways and the B.B.C.

The wearing of certain badges by unauthorised persons is illegal,

Badge issued during
Second Great War
to those invalided
from the services

e.g. any army or air force badge other than regimental badges worn as brooches or similar ornaments; those of the boy scouts, girl guides, British Legion, Royal Life Saving Society, Society or Order of S. John of Jerusalem; and the badges of registered nurses, certified midwives, licensed shoeblack, commissionaire, or messenger in London. While the wearing of uniform in public or at a public meeting by members of a political organization is an offence against the Public Order Act, 1936, a mere badge is not usually regarded as a uniform. *See* Chevron; Medal; Orders; Rank; Ribbon; Stripe.

Badger (*Meles meles*). Mammal of the order Carnivora, but a general feeder. The common badger is nearly 3 ft. in length, grey, with a white head striped with black. It burrows in the ground and is harmless and inoffensive unless molested. It lives

Badger. One of the largest of the
wild carnivora extant in Britain

in woods and among the hills, and spends the winter in a state of partial hibernation. When attacked, the badger is a fierce and courageous fighter; it was much used for baiting, a sport prohibited in Great Britain since 1850.

The animal is found in most parts of the Continent and in the wilder parts of Great Britain, its nocturnal habits causing it to be thought much scarcer than it really is. In China it is a valued article of food, and the hind-quarters were formerly cured as small hams in Great Britain. Its hair is used to make the finer sorts of brushes.

Badghiz. Region in the N.W. of Afghanistan, on the frontiers with Persia and Turkmen S.S.R., between the Hari-Rud and Kushk rivers. The Merv-Kushk railway traverses it on the E.

Bad Lands. Extensive areas of land useless for agriculture in the arid areas on the E. side of the Rocky Mts. in Nebraska, Montana, N. and S. Dakota, and Wyoming, U.S.A. The surface consists of easily eroded rock, which is compact in the dry weather, but is quickly carved away by the heavy rain squalls which are characteristic of arid areas. Because of the rapid run-off of the water, there is no vegetation, and the whole area is made up of deep steep-sloped gullies and narrow ridges, which readily change their shape; such districts are useless for settlement and are shunned by travellers.

Badminton. Popular game in India, introduced into the United Kingdom in 1873. It somewhat resembles lawn tennis, being played over a net, with a shuttlecock and long-handled racquet strung with catgut. The game derives its name from the Gloucestershire seat of the duke of Beaufort.

Badminton is played on a space 44 ft. by 20 ft., divided by a net about 5 ft. in height. Two service lines are drawn, one on each side of the net and parallel to it at a distance of 6½ ft.; a central line, connecting the service and base lines, divides those areas into four courts. The shuttlecock is 5 ins. long and weighs ½ oz.; the racquet should not weigh more than 5 oz. The shuttlecock is sent backwards and forwards across the net with great rapidity; hence the preference, especially in Great Britain, for a court in a covered building, as a strong current of air interferes with the play.

The game is played by one or two each side. It differs from lawn tennis in allowing no service faults.

The server stands behind the service line and must hit the shuttle over the net clear of the service line in the opposite diagonal court, and only the player in that court may return the service. Afterwards, any player may return the stroke at any distance from the net. The serve must always be made underhand, i.e. the shuttle must not be higher than the waist line at the moment when struck. When once in play, a fault may result from the shuttle falling outside the court; from touching the dress of a player, or the roof or side walls of the building; or from a player touching the net with clothes or racquet. The score is counted by aces, 15 aces making a game. At 13 all, the side first reaching that number has the option of setting 5; at 14 all, of setting 3 (the side first obtaining the 3 to 5 aces set winning the game).

Badminton. Residence of the duke of Beaufort in Gloucestershire, England. It is on the border of Wiltshire, in the parish of Great Badminton, which has a railway station. The house, built on three sides of a square, stands in a park 9 m. in circumference. In medieval times the estate belonged to the Botelers, from whom it was purchased about 1600 by Sir Thomas Somerset. From him it passed to the duke of Beaufort. Queen Mary stayed here during most of the Second Great War, returning to London in 1945. The church of S. Michael in the park contains the tomb of Field-Marshal Lord Raglan and others of the Somerset family.

Badoglio, PIETRO (b. 1871). Italian soldier and politician. Governor of Libya from 1928 to 1933, he was appointed C.-in-C. in E. Africa, Nov., 1935. For his services in the conquest of Abyssinia he was made viceroy in 1936; but later resigned and was created duke of Addis Ababa. Badoglio signed the armistice of 1940 with France as Italy's representative. On Dec. 6, 1940, during the Italo-Greek war, he was dismissed from his post as chief of the general staff. When Mussolini (*q.v.*) resigned on July 25, 1943, Badoglio formed a non-fascist government. On the surrender of Italy, Sept. 3, 1943, he signed the armistice terms, and had a conference with Gen. Eisenhower (*q.v.*) on Sept. 29 to discuss the best means of employing Italian armed forces against the Germans. He took over the foreign ministry with the premiership, but resigned June 6, 1944. The high court in Rome having reviewed his record,

Badoglio was expelled from the senate, March 29, 1946, for having helped the fascist regime. He wrote Italy in the Second Great War (Eng. trans., 1948). *Pron.* bad-ole-yo.

Badrinath. Peak of the Himalayas, in the Garhwal district of the United Provinces, India. It is 23,210 ft. high. On its slopes, at an alt. of 10,294 ft., stands the

Badminton. Diagram of a court

celebrated temple of Vishnu, which is visited every twelfth year by some 50,000 pilgrims.

Baedeker, KARL (1801-59). German publisher. The son of Gottschalk Baedeker (1778-1841), a bookseller in Essen, where he was born Nov. 3, 1801, he first started in business in Coblenz in 1827. In 1839, by an arrangement with the London publishing house of John Murray, he brought out a small guide-book on Holland, Belgium, and the Rhine. This was the precursor of the long list of similar works bearing his name and carried on by his successors in the business, which was removed to Leipzig in 1872. Most of the guides are published in English and French as well as German, the first volume in English appearing in 1861. Karl Baedeker died Oct. 4, 1859.

Baedeker Raids. Series of air raids carried out by the German Luftwaffe in April-May, 1942, against historic and cultural centres in England. During the R.A.F. bombing offensive against Germany it was inevitable that damage was done to historic buildings, *e.g.*, at Rostock, Cologne, Lübeck. The Germans thereupon stated that the Luftwaffe would destroy every building in Great Britain marked with two stars in Baedeker's guide-books. The cities chosen for

reprisals were all devoid of war industries but full of precious monuments: a fact admitted by the German press when gloating over the damage done.

Exeter was the first target, on the night of April 24; Bath was attacked the next two nights; Norwich on April 27; York on April 28. In all cities damage was done to churches and old buildings. Canterbury, which had suffered in the battle of Britain, received the last Baedeker raid on the night of May 31; the defences had taken heavy toll of raiders, and the Luftwaffe chiefs evidently decided that they could not spare further aircraft for non-military purposes.

Bael Fruit. Fresh or dried half-ripe fruit of *Aegle Marmelos*, a tree growing both wild and cultivated throughout India. Bael is a sacred tree and is often planted near Hindu temples. The fruit was introduced into European medicine about the middle of the 19th century as a remedy for diarrhoea and dysentery.

Baena. A town of Spain, in the prov. of Cordova. The Roman Baniana, it is situated 32 m. S.E. of Cordova, has farming and horse-breeding industries, manufactures linen, produces olive oil, and trades in grain and wine. The town, which has a castle formerly belonging to Gonzalvo de Cordova, sustained a siege by the Moors in 1292, and was the scene in 1361 of the murder of the Moorish king of Granada, Abu Said, and his courtiers by Pedro the Cruel. Pop. 18,000.

Baetica. Ancient division of Spain. It corresponds to Andalusia and parts of Extremadura and New Castile. A province under the Roman empire, it took its name from the river Baetis (Guadalquivir).

Baetylus (Gr. *baitylos*). In ancient times, a kind of fetish. These baetyli were conical or wedge-shaped stones, said to have fallen from heaven. They were regarded with awe and anointed with wine, blood, and oil.

Baeyer, JOHANN FRIEDRICH WILHELM ADOLF VON (1835-1917). German chemist. Born in Berlin and educated at Berlin and Heidelberg universities, he became professor of chemistry at Strasbourg in 1872 and at Munich in 1875. In 1881 he was awarded the Davy medal by the Royal Society of London for researches in the chemistry of indigo, and in 1905 the Nobel prize for chemistry. He wrote much on organic chemistry, and his collected works were published at Brunswick in 1905. Died Sept. 5, 1917.

Baeza. City of Spain, in the prov. of Jaén. It is 20 m. N.E. of Jaén, in the valley of the Guadalquivir, and is the terminus of a branch rly. It has a cathedral, a once famous university (1533), now a seminary, and the monastery of S. Philip Neri. An annual horse fair is held in the city, and soap, alcohol, and leather are manufactured. The ancient Beatia, it was sacked by the Castilians under Ferdinand III in 1228.

Baffin, WILLIAM (d. 1622). An English navigator and explorer. Born in London about 1584, he took part as pilot, under James Hall, in an expedition in 1612 to Greenland for the discovery of the north-west passage, and in 1613-14 was in command of the English whaling fleet off Spitsbergen. In 1615, under Bylot, he acted as pilot of the Discovery in another search for the north-west passage, during which voyage he explored the bay that bears his name. In 1620 he sailed as master to the E. Indies, and on Jan. 23, 1622, was killed while fighting at Ormuz. Consult *Voyages of William Baffin*, ed. C. R. Markham, 1881.

Baffin Bay. Inland sea of N. America. Within the Arctic Circle, between Greenland and Canada, it opens S. through Davis Strait, N. through Smith Sound and Kennedy and Robeson Channels, and N.W. through Lancaster and Jones Sounds. Its shores are rocky and precipitous, and it is generally ice-covered, being navigable only for about four months in the year. Whales, seals, and bears abound. It was named after William Baffin, who first explored it in 1616. About 825 m. long, it has an average breadth of 280 m. and a maximum depth of 6,890 ft.

Baffin Island. An island of British N. America. Lying W. of Baffin Bay and Davis Strait, E. of Fox Channel and the Gulf of Boothia, and N. of Hudson Strait, and largely within the Arctic Circle, it is mountainous, extremely indented, and barren. It is probably the sixth largest island in the world, its area being about 237,000 sq. m. It is uninhabited except for a few Eskimos along the E. coast.

Bafulabé. A town of French W. Africa, in the colony of French Sudan. It stands on a peninsula between two of the Senegal's head-streams, 95 m. S.E. of Kayes, on the rly. to Bamako. It trades in kola-nuts and millet. Pop. 2,000.

Bagamoyo. Town and harbour of Tanganyika, formerly German E. Africa. It is opposite

the island of Zanzibar, between Dar-es-Salaam and Tanga. Before the construction of railways it was the principal starting-point for caravans to the interior and the great lakes. It is now the capital of a district of the same name, which produces oranges, lemons, citrons, and other fruits. On Aug. 15, 1916, the military coastal station was occupied by British naval forces who remained in possession. Pop. 5,000.

Baganda OR **WAGANDA.** Negroid tribe of Bantu speech and culture, mostly in the Buganda prov. of the Uganda protectorate. Tall, chocolate-hued, brown-eyed, they occupy beehive huts and practise agriculture. Their pottery and basketry are excellent; their barkcloth dress has been ousted by imported calicoes. Through early contact with pastoral Hamites of Galla relationship, they reached the acme of negro civilization, with political institutions and a reigning dynasty traceable for five centuries. Bodily mutilations were prohibited; human sacrifice, formerly rife, has ceased since their conversion to Christianity. See Bantu.

Bagasse. Woody matter left after the juice has been extracted from sugar-cane, sugar-beet, or sorghum. Formerly used as fuel in the sugar factory, it is now utilised as food for livestock, as manure, and in paper-making, etc. Other forms are begass, begasse, megass, and megasse, and other names cane-trash and cane-straw. The word is French, adapted from Spanish *bagazo* (the refuse of sugar-cane, olives, grapes, palms, etc., after pressing), which may be a variant of *bagaje* in the sense of "dregs," "rubbish." See Sugar.

Bagatelle. Indoor game. Notwithstanding the spelling, it is probably not of French origin, but more likely an improvement upon, and development of, an old English game known as shovel board, popular as far back as 1600.

The oldest and most popular form of bagatelle is played upon a table 10 ft. in length and 3 ft. in width. The bed of the table is of slate, covered with green cloth like a billiard table. The top of the table forms a semicircle, and that and the sides are fitted with rubber cushions. At the top of the table, let into the slate bed, are nine holes or cups, numbered 1 to 9. Some tables are fitted with pockets also, while others have neither cups nor pockets. On boards without cups and pockets the game consists entirely

of cannons, and is regarded as the highest form of bagatelle.

In the cannon game three balls are used as they are at billiards, and the method of scoring is the same, a cannon counting two points, while the game is usually from 21 to 50 points up. The cannon game is sometimes played on a table with cups, in which case it is usual for cannons only to count to the striker. Balls that are sent into the cups count to his opponent, but are replaced, the red on a spot 12 ins. below cup 1, its original place, and the opponent's ball midway between cups 1 and 9. A player cannot score any points through driving a ball into one of the cups, unless he has

Bagatelle board

first effected a cannon with the same stroke. If the striker plays at his opponent's ball and misses, he is penalised one point; if he plays at the coloured ball and misses, the penalty is five points.

"Corinthian" bagatelle, much played in the 1930s, was really a different game and far more one of chance. The balls were not struck with a billiard cue, but either pushed from above by a stick or discharged by a spring; they entered numbered cups after negotiating forests of pins on the board. The scores available were multiplied by tens and hundreds, and finally by thousands on the trays with glass covers and electric scorers in pin-table saloons.

Bagdad. Liwa or province of Iraq. Traversed by the Euphrates and bordered in the extreme S.W. by the Tigris, it includes most of ancient Babylonia. Its fertile soil received little attention under Turkish rule, but during its occupation by the British, 1917-30, considerable development took place. Pop. 805,293.

Bagdad OR **BAGHDAD.** City of Iraq. Formerly one of the most populous and important cities of the world, it stands on the Tigris, about 300 m. above the Shatt-el-Arab, or about 330 m. from the Persian Gulf. Before the First Great War it was the capital of a Turkish vilayet of the same name.

Parts of the walls, which once completely surrounded it on both banks of the Tigris, remain. After occupying the city in 1917, the British constructed a boat bridge on the river called after General Maude at a cost of £56,133.

Girt with date-palms, the city, from which rise many minarets and towers, is imposing from the outside, but its streets are mostly narrow, its bazaars far from spacious, and its houses rather mean, the better part being on the E. side of the river. Under the Turks it was dirty and even squalid, with the finest of its old buildings falling into decay. Among these are the Gate of the Talisman and the tomb of Zobeida, the wife of Haroun-al-Raschid; its colleges, once renowned, are crumbling into ruins. The famous Oriental library of over 20,000 volumes, including unique Arabic MSS., was burned by the Turks in March, 1917.

Situated on an extensive plain, and easy of access from E., S., and N., it was long a great centre of trade, but under Turkish rule its commerce suffered a material decline, to which the opening of the Suez Canal, with new routes E. and W., largely contributed. Irrigation is indispensable for assuring adequate crop yields. Bagdad exports wool, gums, galls, opium, dates, skins, hides, and carpets. Its imports include Manchester and Indian cotton goods, coffee, sugar, indigo, pepper, and tobacco. Before the First Great War it had manufactures of red and yellow leather, as well as plush. The climate, though hot in summer, is fairly good. The pop. of perhaps 270,000 is mixed, with the Arab strain predominating.

Bagdad was built in 763 on the ruins of the ancient Ctesiphon and Seleucia by the Abbaside caliph Al Mansur, and within a few years it reached a height of splendour under Haroun-al-Raschid. For a long period it was the capital of the Saracenic empire, a vast emporium, and a home of learning. But in 1258 it was sacked by the Mongols and the Abbaside caliphate perished. Tamerlane in 1400 swept through it, and later both Turks and Persians contended for its possession, the former finally occupying it in 1638. It suffered severely from plague, notably in 1831, when two-thirds of the inhabitants perished. Towards the end of the 19th century the city came into prominence in connexion with the German dream of a rly. from Hamburg and Berlin, which was broken by the First Great War. Bagdad was

captured by the British, March 11, 1917 (*see below*), but its government was respected.

In 1940 the Berlin-Bagdad rly. (*q.v.*) was completed. During the German-inspired revolt of April, 1941, in Iraq, 500 British residents sought refuge in the British embassy and U.S. legation at Bagdad, and were held as hostages until released by the armistice of May 31 between the Iraqi authorities and the occupying British troops. The child-king Feisal II and the regent Emir Abdul Ilah (*q.v.*) returned to Bagdad in state on June 1. *See Iraq.*

Bagdad, CAPTURE OF. British success, March 11, 1917. After the recapture of Kut by General Maude, Feb. 24, 1917, the Turks retreated up the Tigris towards Baghela, and vigorous pursuit soon turned the retreat into a rout. Beyond Baghela Turkish infantry fought a rearguard action, and again at the Nahr Kella Bend, a few miles higher up, where they strongly attacked the naval flotilla harassing them from the river.

The pursuit halted for a while at Aziziyeh, but was renewed on March 5, when the cavalry reached Lajj and fought a Turkish rearguard, which retreated during the night. Next day the cavalry passed Ctesiphon, and on March 7 were at the Diala, which from the N. flows into the Tigris 8 m. below Bagdad. A successful crossing of the Diala was made at several points on the night of March 9-10. East Lancashires and Wiltshires were the first to get across and link up with a small detachment of Loyal North Lancashires which had crossed on the previous night.

On March 10 the Turks evacuated their last position in front of Bagdad on that side of the Tigris, and the British occupied it. In the meantime General Cobbe operated against the Turks on the other side of the river, and met with some opposition. This, however, ceased altogether on March 10. On both banks of the Tigris the British were thus on that day close to Bagdad, and on March 11 it fell into their hands.

Bagdad. General view over the city showing its characteristic flat-roofed houses. Above, boat-bridge across the Tigris, from the east

Bagé. Town of Brazil, in Rio Grande do Sul state. Situated 170 m. by rly. W.N.W. of Rio Grande do Sul, it is the centre of a rich agricultural district, producing fine cattle, horses, wine, wheat, maize, barley, and alfalfa.

Baghot, WALTER (1826-77). British economist and author. Born at Langport, Somersetshire,

Walter Baghot,
British economist
and author

Feb. 3, 1826, son of a banker and shipowner and of French descent, he was educated at Bristol and University College, London, where he won distinction in mathematics, mental and moral philosophy, and also in political economy. After a visit to Paris, where he witnessed and approved the *coup d'état* of Dec., 1851, he was called to the bar, and then became a partner in his father's business. He wrote for *The Prospective Review*, and to *The National Review*, of which he was co-editor with R. H. Hutton, 1855-64, contributed the *Estimates of Some Englishmen and Scotchmen*, later included in his *Literary and Biographical Studies*.

In 1858 Baghot married the eldest daughter of James Wilson, founder of *The Economist*, which he edited from 1860 until his death. His *English Constitution* appeared serially in *The Fortnightly Review* before its issue in book form in 1867. *Physics and Politics*, an attempt to apply the principles of natural selection and inheritance to political society, appeared in 1872, and *Lombard Street: A Description of the Money-Market*, another influential work, in 1873. His *Depreciation of Silver*, *Essays on Parliamentary Reform*, and *Economic Studies* were published posthumously. He died at Langport, March 24, 1877. His house afterwards became the office of the local council.

A man of wide sympathies, culture, humour, wit, and imagination, a scientific thinker, with a clear forthright style and gift of epigrammatic illustration, he sought always for fundamental facts. Sincere as was his regard for learning, he had a greater regard for its application to the practical needs of life. While others saw facts, he saw their relativity. This gift, applied to such subjects as the money markets and politics, made his book *Lombard Street* a factor

in English commercial life, and makes his *English Constitution* a work that may still be consulted by students with profit.

Bibliography. Works, ed. F. Morgan, 1889, and Mrs. Russell Barrington, 10 vols., 1915; Lives, E. I. Barrington, 1914; W. Irvine, 1939.

Baggara (cowherds). African "Arabs," mainly in S. Kordofan. Claiming unmixed descent from Beduin Moslems, their non-Semitic physique, dark-brown skin, and "fuzzy-wuzzy" mop-like hair betoken Hamite-negro infusion. Having driven the aboriginal Nubas into the mountains, they maintain a nomad existence in the plains, where their courage and fanatical fierceness have brought them notoriety. The Mahdi's successor, the khalifa Abdullah (1846-99), was of this people.

Baggara. A typical
warrior of the Eastern
Sudan

Baggy Beds. Subdivision of the Devonian rocks of N. Devon. They occur between the Pickwell Down Sandstone below and the Pilton and Bramerton Beds above. Containing a lamellibranch fauna similar to that of the Coomhola Grits of the S. of Ireland and the Condrosian Beds of Belgium, for the most part they consist of green slates and brown sandstones. They are well exposed on the coast of N. Devon near Baggy Point.

Baghal. Indian state of the Himachal union. A former Simla hill state, it lies S. of the Sutlej river. Area 120 sq. m. Pop. 27,925, nearly all Hindus.

Baghat. Indian state of the Himachal union. A former Simla hill state, it has an area of 33 sq. m. and a pop. of 11,022, mostly Hindus.

Baghelkhand (Country of the Baghelas). Region of Central India, including the former states of Rewa, Nagod, Maihar, Sohawal, Taraon, and Kothi, now all in the Vindhya union. It has an area of 14,323 sq. m. and is rich in timber and minerals. Rewa, the old capital, has a pop. of 25,206.

Bagheria or **BAGARIA.** Town of Sicily, in the prov. of Palermo, 8 m. by rly. S.E. of Palermo. The Villas Palagonia and Butera contain curious works of art. Pop. 19,500.

Bagimond's Roll. Document giving the value of all church property in Scotland in the 13th century. The word is a corruption of Boiamund, the name of a cleric who drew up the roll at the request of Pope Gregory X, by whom he was sent to Scotland to collect a tenth of all church revenues for the purpose of a crusade. Ecclesiastical taxes were assessed in accordance with it for some centuries.

Bagirmi. Region of Africa. Lying S.E. of Lake Chad, it forms the Bagirmi dept. of Chad Territory, French Equatorial Africa. To the N. is the circumscription of Bas-Shari, to the E. Wadai, and to the W. Cameroons. The Bagirmi country, which does not exactly correspond to the political division, extends some 250 m. N. to S., and about 170 m. W. to E. A southern extension of the Lake Chad depression, its surface is generally flat, the greatest heights being about 3,000 ft. above sea level, and the mean alt. 1,000 ft. Well watered by the Shari and Logone rivers and their tributaries, it contains numerous swamps, but suffers from severe droughts.

The Bagirmi are a mixed negroid people and include numerous Fula and Arabs. The pop. of the dept. is about 75,000 and its area approx. 30,000 sq. m. It has three subdivisions, Massénia, Malfi, and Bousso. Massénia (pop. 10,000) is the seat of the French administrator. Considerable powers remain, however, in the hands of the native rulers.

Bagirmi was visited by Denham in 1823, Heinrich Barth in 1852, and Gustav Nachtigal in 1872. In 1871 it was conquered by the sultan of Wadai, and was later overrun by Rabah, by whom the first French expedition, under Paul Crampel, was imprisoned. French authority was established in 1901.

Bagnacavallo. Town of Italy, in the prov. of Ravenna. The ancient Tiberiacum, it is 14 m. by rly. W. of Ravenna. Its ancient walls, and a church founded 5th cent., are preserved, though the town suffered some damage in the Second Great War. Canadian troops of the 8th army captured it Dec. 21, 1944.

Bagnères-de-Luchon. Town and inland watering-place of France, in the department of Haute-Garonne. In a beautiful valley of the Pyrenees, a few miles from the Spanish frontier, and a tourist centre for the Central Pyrenees, it has hot sulphur springs, known to the Romans, a fine bathing establishment, and a casino.

Bagnes. Name given to certain French prisons abolished in 1852. The word comes from the Italian *bagno*, a bath, probably because in Constantinople the prison stood near the seraglio baths. When the use of galleys was discontinued in the French navy, about 1715, it was necessary to find other employment for long-term criminals, and many were put to labour in the dockyards. They lived on the old galleys, but prisons on shore, the *bagnes*, were opened later for them at Toulon, Brest, and Rochefort.

Bagni di Lucca. Spa of Italy, in the prov. of Lucca. Beautifully situated in the Lima valley, 15 m. by rly. N.N.E. of Lucca, its hot springs, known in the 11th century as the *Bagni* (baths) di Corsena, attract numerous visitors. Ponte a Serraglio, where are the best baths, has a casino; at Villa there is an Anglican church, and *Bagni Caldi* has mud baths and a grotto with a natural vapour bath.

Bagnigge Wells. Former London pleasure garden. It was in King's Cross Road, once Bagnigge Wells Road. Bagnigge House, a central feature, is said to have been a summer residence of Nell Gwynn. The place became fashionable after the discovery here, in 1757, of a ferruginous chalybeate well and a cathartic well. Later the tea gardens, concerts, dancing, etc., became attractions. The last entertainment was given here in 1841, and the site is partly covered by a modern tavern.

Bagnold, ENID. English author. She was educated at Godalming and Paris, and wrote her first book, *A Diary without Dates*, in 1917. With *National Velvet*, 1935, the story of a racehorse and its child owner who win the Grand National, she established her reputation. A film based on this novel was made in 1945. After writing *The Squire*, 1938, Enid Bagnold scored a success with a play, *Lottie Dundass*, a study in abnormal psychology culminating in murder. This was produced at the Vaudeville Theatre, London, in 1943. In 1920 Enid Bagnold married Sir Roderick Jones, former principal proprietor of Reuters.

Bagnold, RALPH ALGER (b. 1896). British scientist and soldier, whose exploits in the Middle East are noticed under Long Range Desert Group.

Bagot, BARON. English title borne since 1780 by the family of Bagot. A Bagot held land in 1086 in Staffordshire, where his descendants lived for hundreds of

years, and Bagot's Bromley perpetuates their name. Sir John Bagot was a man of importance in the time of Henry IV and Henry V. One of his descendants, Sir Hervey Bagot, a staunch Royalist, was made a baronet in 1627. His four successors in the title were all members of parliament for Staffordshire, as was Sir William Bagot (1728-98), who was created a baron in 1780. He had a large family, and

William, 2nd Baron Bagot
After Hoppner

from him several existing branches of the Bagots are descended. In 1946 the title came to Caryl (b. 1877), 6th baron. The family estates are in Staffordshire and Denbighshire.

Bagot, RICHARD (1860-1921). British novelist. Born Nov. 8, 1860, he was educated privately. In early life he made his home in Italy, where he became known as a novelist and an authority on Italian literature and public affairs. His novels include: *A Roman Mystery*, 1899; *The Just and the Unjust*, 1902; *Donna Diana*, 1903; *The Passport*, 1905; *The House of Serravalle*, 1910; and *The Gods Decide*, 1918. Among his other

works are *My Italian Year*, 1911; *The Italians of To-day*, 1912. He died Dec. 11, 1921.

Bagpipe. Musical wind instrument. It has a wind reservoir, filled by the breath, and the sound is produced by reed-tongues in pipes, several providing the characteristic drone, while one, called the chanter, which is governed by finger-holes, gives the melody.

A pipe with the bag attached was one of the earliest musical instruments in Europe, and was known in Asia. In Italy it is shown on a famous coin of the days of Nero (A.D. 54-68). The Lincolnshire bagpipe is mentioned by Shakespeare. The Northumbrian pipe was identical with the Lowland Scottish instrument. It was blown by means of bellows, and, like the Highland pipe, had first one and then two drones. The third or great drone and the great size of the whole instrument in its latest stage apparently originated in the Scottish Highlands.

The Irish pipe is scientifically the most complete form of bagpipe. It is blown with a bellows by a performer who is seated, while the Highland piper always stands or walks up and down. It has three drones all fixed in one stock, which are carried horizontally on the arm. The Highland pipe has only nine notes—from A to A with an additional G. A is the

Bagpipes. 1. Specimen dated 1409. 2. Modern Scots bagpipe. 3. Old German, c. 1680. 4. Northumbrian pipe. 5. Irish pipes, with bellows attachment

key-note, and to it the drones are tuned. The scale of the Irish pipe is nearly perfect, and the drones are provided with keys, as is the chanter. The Northumbrian pipe had originally eight notes, and was also sometimes provided with keys.

There is a great wealth of Scottish bagpipe music, much of which is not suitable for the clarsach (small harp), the great indoor instrument of the Gael. Much of the music of the western clans has been written down in *Cannlatair-acha*, its own ancient notation. That of the eastern clans has still to be recorded. The Highland piper was thoroughly taught during a long apprenticeship at the schools for pipers kept by the MacCrimmons of Skye, and others. The last of the MacCrimmons died in 1822.

The pipes were as popular in the Lowlands as in the Highlands and at court, where it is on record (Exchequer Rolls) in 1362 that the king had his pipers. One or more were employed by every burgh. Perth had its town pipe as late as 1837. The office, like that of the clan pipers, was hereditary. One of the finest of Scottish ballads (by Semple of Beltrees) commemorates the death of the burgh piper of Kilbarchan. Not every pipe tune is a pibroch, as is generally assumed. *Piobaireachd* or *Ceol mor* means simply great (classical) music, and this includes only the "gathering," the "salute" or welcome, and the "lament." It proceeds on a regular *urrlar* (ground work) of ten sections, each section trebled before the next starts.

Bagramyan, IVAN. Russian soldier. Born near Kirovabad, Azerbaijan, of Armenian ancestry, he became a cavalry officer in the Red Army. Having been a regimental commander, passed through the Frunze academy at Moscow, and served as a staff instructor for three years, he was in the Ukraine when Germany attacked Russia in 1941. Promoted to general after victories at Kharkov and Vitebsk, he led the 1st Baltic army to the capture of Nevel, Oct. 7, 1943, and in an offensive below Riga in 1944. On Jan. 28, 1945, his troops took Memel and liberated Lithuania S.S.R.

Bagration, PETER IVANOVITCH, PRINCE (1765-1812). Russian soldier. He entered the service in 1783 and fought in Russia's various campaigns. He is famous for his great stand with 6,000 men against 30,000 French under Murat at Hollabrúnn in 1805, by which at cost of losing half his men he

Prince Bagration,
Russian soldier
From an engraving
of 1808

covered the retreat of the main Russian army under Kutusov. Bagration also took part in the battles of Austerlitz, Eylau, and Friedland, and in 1808 he captured the Aaland Islands. He died of wounds received at Borodino, Sept. 7, 1812.

Bagshot Beds. A series of white, grey, yellow, and brown sands, with occasional pebble-beds, overlying the London clay in the London and Hampshire Basins, and forming the middle member of the Eocene System (*q.v.*). They occupy large tracts in Berkshire, Hampshire and the Isle of Wight, Dorset, and Surrey, and smaller areas in Middlesex and Essex. The white sands are largely used in glass making. They are well exposed in Alum Bay in the Isle of Wight, and at Studland in Dorset.

Bagshot Heath. Sandy district of N.W. Surrey, England. Starting 3 m. S. of Ascot, it extends 50 sq. m. It was formerly a royal forest, and in coaching times was frequented by highwaymen. Bagshot Park is crown property. The mansion is in the Tudor style, and was a hunting seat of James I.

Bagster, SAMUEL (1772-1851). English publisher. Born and educated at Northampton, he started business in London in 1794, and was the first to supply cheap and portable polyglot Bibles, with notes, to which the patent of the universities and the king's printer did not apply. The first of his many polyglot editions was The English Version of the Polyglot Bible, 1816, containing more than 60,000 parallel references. He died March 28, 1851.

Baguet (Fr. *baguette*). Architectural term for a small convex moulding or bead of cylindrical or semicircular section. See Moulding.

Baguio. Town in the Philippine Islands, in the mountain prov. of N. Luzon. It is the summer seat of government, and is about 40 m. N.E. of Lingayen. Pop. 27,000.

Another Baguio is a seaside village in Bataan, where an open-air hospital was set up during the U.S. defence against the Japanese.

Bahadur Shah. Title of two Mogul emperors of Hindustan. The first, named Muazim, was the son of Aurungzebe. On his father's death he defeated his brother

Azam, and, adopting the title of Bahadur Shah, was emperor from 1707 to 1712. Bahadur Shah II was nominally emperor of Hindustan at the time of the Mutiny, 1857. Having held the empty title since 1837, he was living in Delhi when the mutineers hailed him as their ruler. He was taken prisoner and tried, his sentence of death being commuted into one of transportation. He died at Rangoon, Nov. 7, 1862. Under the name of Safar, or Victory, he wrote poems.

Bahai, SIR ABDUL BAHÁ ABBA (1844-1921). Indian reformer. Head of the Bahai cult, advocating universal brotherhood and sex equality, he had great influence in the Middle East, and was knighted, 1920, dying Nov. 28, 1921.

Bahama Channel, OLD AND NEW. Two straits communicating between the Gulf of Mexico and the Atlantic. The old channel separates Cuba and the new Florida from the Bahama Islands.

Bahamas OR LUCAYOS (Span. *Los Cayos*). Group of islands and rocky islets in the British West Indies. They include 29 islands, over 650 cays or islets, and nearly 2,400 rocks, extend for some 650 m. between Florida and Haiti, cover an area of 4,404 sq. m. Estimated pop. is 68,846. The chief islands are New Providence, Great Abaco, Grand Bahama, Eleuthera, Andros, San Salvador or Cat, Acklin, Long Island, Great Inagua, Crooked, and Mayaguana. About twenty of the group are inhabited. Geographically the Caicos and Turks Islands belong to the Bahamas, but politically they form a dependency of Jamaica.

Of coral formation, the islands are low lying, generally long and narrow, and, except in Andros, devoid of streams. The highest alt., 410 ft., is reached in Cat Island. The mean temperature in the summer is 88° F. and in the winter 70°. The soil, though poor, produces oranges, lemons, pineapples, tomatoes, maize, cotton, sisal hemp, and vegetables. The waters abound in fish, which are taken in considerable quantities. The cultivation of sisal, formerly a progressive industry, has somewhat diminished; and in recent years the once flourishing sponge fishing industry has been almost wiped out by disease. Straw articles are widely made. Negroes, descendants of former slaves, form about 85 p.c. of the population; the white people are mainly descendants of emigrants from New England. The islands are administered by a governor, with

the assistance of executive and legislative councils and a representative assembly of 29 members. The duke of Windsor (*q.v.*) was governor 1940-45. Nassau, on the island of New Providence, is the seat of government.

The Bahamas were the first land discovered by Columbus in 1492, and one of them he named San Salvador. Settled by the British in 1629, their possession was frequently disputed by the Spanish until their cession to Great Britain in 1783. During the American Civil War they prospered greatly in consequence of the closing of the southern ports of the United States, Nassau then becoming a station for the blockade-runners. In 1866, 1883, and 1945 great damage was caused by cyclones. Prohibition in the U.S. caused a great expansion of trade in Nassau in the 1920s, and the Bahamas subsequently attracted many tourists. In 1940 sites for air and naval bases on the E. side were leased to the U.S.A. under the Anglo-American naval agreement.

Bahawalpur. Punjab state, since 1947 in Pakistan. Bounded N.W. by the Sutlej and Indus rivers and S. by the Rajputana Desert, and with an area of 16,434 sq. m., it is level, arid, and sandy, but fertile where irrigated, and produces cotton, sugar, and indigo. The capital, Bahawalpur, is near the left bank of the Sutlej, 69 m. by rly. S. of Multan. It contains a fine palace and manufactures silk. Pop. of state, 1,341,209, mostly Mahomedans; town, 18,750.

Bahía. Maritime state of central Brazil. Largely mountainous, but fertile, and traversed by the São Francisco, navigable for 600 m., its tributaries, and many other rivers, it has an area of 217,670 sq. m. It produces 96 p.c. of the country's output of cocoa; also coffee, sugar, Brazil-wood and cedar, cotton, tobacco, maize, rice, beans, copal, mangoes and other fruits, and rubber. Some gold, iron, copper, and diamonds are found. It is served by the Bahía-São Francisco rly. and other lines. Pop., including a large number of negroes, 4,292,900.

Bahía or São Salvador. Seaport and city of Brazil, the capital of Bahía state. Built on a cliff and the shore of the Bahía de Todos Santos (All Saints' Bay), it has an excellent harbour and is the centre of rly. and telegraph systems. The seat of an archbishop and formerly the metropolis of the Brazilian Church, it has a handsome marble cathedral, an archiepiscopal palace,

Bahamas. Group of coral islands in the W. Atlantic, the first land sighted by Columbus on his voyage of discovery in 1492

numerous churches, a museum, and a library. A university was inaugurated here in 1946. Coffee, cocoa, sugar, tobacco, cotton, hides, and timber are exported, and textiles, boots, hats, snuff, and beer manufactured. Settled in 1510, Bahía was the capital of Brazil from 1549 to 1763. Pop. 363,726.

Bahía Blanca (Span., white bay). City and seaport of Argentina, in the prov. of Buenos Aires. On the Naposta, 3½ m. from its mouth in the bay, and 398 m. by rly. S.W. of Buenos Aires, it dates from 1828. The port has four divisions: Puerto Belgrano, which has been taken over by the government and has excellent facilities for handling cargo; Puerto Militar, a military and naval station of the republic; Puerto Galvan, where elevators can store 46,000 tons of grain; and Puerto Ingeniero White, with warehouses, elevators, and timber mole. They owe their origins almost entirely to rly. companies. Bahía Blanca serves the rich farming area of the neighbourhood by exporting wheat and wood. It is a modern city with pop. 119,086.

Bahía Honda (Span., deep bay). Harbour on the N.W. coast of Cuba. It is 55 m. W.S.W. of Havana, trades in sugar, and is a coaling station of the U.S.A.

Bahima or WAHUMA. People of Hamitic descent, mostly in the Uganda Protectorate. Tall, fair, often handsome, with one-fourth caucasoid and three-fourths negro blood, they retain their ancestral pastoralism, forming an aristocracy in Unyoro, a ruling caste in Toro, and a dynastic domination in Ankole. In Buganda they have become servile herdsmen. In the region, formerly German, between the Victoria and Tanganyika lakes, they are called Batutsi, and Barunda. The singular of Bahima is Muhima. The women, scrupulously dressed, are the only Central Africans who are veiled. The Bahima were specially studied by the Mackie Ethnological Expedition in 1919.

Bahr. Arabic word for a body of water generally. It frequently occurs in the names of rivers and seas in the Middle East.

Bahraich. Municipality of India, in the United Provinces. The capital of Bahraich district, 70 m. N.E. of Lucknow by a branch rly., it is a popular place of pilgrimage, both for Mahomedans and Hindus, and contains the tomb of Masaud, killed in battle, 1033. It manufactures fireworks and cloth. The inhabitants are almost equally Hindus and Mahomedans. Pop. 27,371. Bahraich district is in the Faizabad division of Oudh,

is 2,645 sq. m. in extent, and has a pop. some four-fifths of which consist of Hindus.

Bahram. English racehorse. A colt by Blandford out of Friar's Daughter, in 1935 he won the Two Thousand Guineas, the Derby, and the St. Leger, thus gaining the triple crown for the Aga Khan. F. Fox was the jockey in the first two races, C. Smirke in the last. Like many of the Aga Khan's horses, Bahram was named after a character in oriental history.

Bahrein Islands. Group of islands in the Persian Gulf, 20 m. off El Hasa, Arabia. Bahrein Island, the largest, is 27 m. long and 10 m. wide, the next being Muharrak, N.E. of Bahrein, 4 m. long and 1 m. wide. Other islands are Sitra, Nabi Saleh, Jidi, Raka, and Um Nahsan, the last three uninhabited. Manama, on Bahrein, the capital and chief port of the group, has a pop. of 28,000, and Muharrak, on the island of the same name, has 18,000. The pop. of the group is about 120,000, chiefly Persians and Arabs. Most are of the Shia sect.

The islands are ruled by a native sheikh under British protection. Pearl-fishing employs about 277 boats for 6 months. The islands produce dates, citrus fruits, lucerne, and a fine breed of white donkeys. Oil was discovered in 1932 and is being worked. Sailcloth and mats are made. The islands contain many thousands of conical tombs, varying in size, some being as much as 300 ft. in diameter and 40 ft. in height. Their origin is unknown, but they are of very ancient date, and, covering many miles of ground, constitute the largest cemetery in the world. Some 200 fresh-water springs serve for purposes of irrigation.

On Sept. 10, 1939, the sheikh of Bahrein tendered to Great Britain the support of himself and the resources of his state in the conflict with Germany. Bahrein was of strategic importance in the defence of India, and her oil wells contributed a valuable quota of petroleum to the Allied armies in the Middle East. Throughout the war, Bahrein provided a stage in the air route to India.

Bahr-el-Abiad. Arabic name for the White Nile, applied to that part of the Nile from the junction of the Bahr-el-Jebel and Bahr-el-Ghazal at Lake No to the confluence with the Bahr-el-Azrek, which flows from the highlands of Abyssinia. It continues N. and is thereafter known as the Nile. It receives the waters of the Sabat

and the Bahr-el-Zeraf. When the Nile flood fills the valley below Khartum the waters of the Bahr-el-Abiad are dammed and spread over the surrounding lowlands; they drain away during the rest of the year and are responsible for the general level of the river at Cairo during those months. The

Bahram. Famous racehorse, owned by the Aga Khan, which won for him the triple horse-racing crown (1935)

river banks are lined in parts by extensive forests of gum acacia, rubber creeper, ebony, and bamboo. Cotton-growing has been started in the district of Gezira. Khartum and Kodok (formerly Fashoda) are situated on the banks, and mark the N. and S. limits of the Bahr-el-Abiad. Lake No is 603 m. S. of Khartum. The elevation of this lake is 1,276 ft. and of Khartum 1,256 ft. above sea level. See Nile.

Bahr-el-Aswad. Arabic name for the Atbara (g.v.) or Black Nile.

Bahr-el-Azrek. Arabic name for the Blue Nile. A tributary of the Nile, about 1,000 m. long, it issues from Lake Tsana in Abyssinia, taking off the excess of water from the heavy summer rains, and flows ultimately N.W. to the White Nile at Khartum. With the Atbara it is responsible for the Nile flood which occurs between June and October. During these months the river is a raging torrent overloaded with silt; during the rest of the year it is almost dry. The chief towns on its course are Roseires, Senga, Sennar, and Wad Medani. Roseires is 402 m. S.S.E. of Khartum and 1,525 ft. above sea level, while Lake Tsana has an elevation of 5,756 ft. The Blue Nile, long considered the principal branch of the Nile, was ascended by James Bruce in 1770-71.

Bahr-el-Ghazal (Arabic, river of gazelles). A tributary of the Nile. Flowing into that river at Lake No, 603 m. S. of Khartum, it

receives several tributaries and drains the country S. of Darfur. It is a sluggish river and formerly was frequently blocked with masses of sudd (decayed water-plants), but from the earliest years of the 20th century successful efforts have been made to keep the channel open.

Bahr-el-Ghazal. Province of the Anglo-Egyptian Sudan. Bordering on the Ubangi-Shari-Chad territory, the Belgian Congo, and the Lado Enclave, it has an area of 114,100 sq. m., and is traversed by many rivers running from the Congo-Nile watershed towards the Nile. The headquarters of the prov. are at Wau, 898 m. S.S.W. of

Khartum on the Bahr-el-Ghazal, and 295 m. from Lake No. The forests of the province yield large quantities of rubber of excellent quality. Before the rise of the Mahdi it was held by the Egyptian government, when an attempt was made to suppress the slave-trading activities of Zubeir Pasha.

The task of restoring order was given to Romolo Gessi Pasha in 1878, and after his death, April 30, 1881, to Frank Lupton, who in 1884 had to abandon the prov. In 1898 the Egyptian flag was again hoisted. The prov., depopulated during the regime of the Mahdi, is peopled by various tribes, including the Niam-Niam or Zande (plural Azande), who inhabit the hilly country of the southern plateau, and the different Dinka clans. The territory was administered for a few years by the Belgian Congo on lease, but this was abrogated by the British government in 1906.

Bahr-el-Jebel (mountain river). Arabic name of the upper Nile applied to that portion of the river between Murchison Falls and Lake No. For the last 800 m. of its course it flows through almost level country in constantly decreasing volume; part of the water evaporates, much of it flooding and turning the neighbouring country into marsh. Rejaf is 493 m. upstream S. of Lake No and its altitude is only 922 ft. higher. The stream branches into many channels, mostly short, except the most easterly, the Bahr-el-Zeraf. See Nile

Bahr-el-Yemen. Arabic name for the Red Sea (*q.v.*).

Bahr-Lut. Arabic name, meaning Sea of Lot or Dead Sea (*q.v.*).

Baiae (mod. *Baia*). An ancient Italian town, in Campania. Situated on a bay 10 m. W. of Naples, its natural beauty and hot sulphur springs made it a favourite resort of the Roman emperors and the wealthy. Here Julius Caesar, Marius, Nero, and Alexander Severus built villas, and Tiberius and Hadrian died. In Roman times it was notorious for its luxury and immorality. It afterwards fell into decay, and is now only a miserable village. It contains remains of three Roman baths, once wrongly identified with parts of temples.

Baidyabati. Town of India, in Bengal. Close to the Hooghly river, 15 m. by rly. N. of Calcutta, it is a market town and manufactures jute and hempen ropes.

Baikal (Mongolian *Dalai Nor*). The largest fresh-water lake in Asia and tenth largest in the world. It is in the S. of the E. Siberian prov. of Russia, enclosed by the Baikal Mts., a spur of the Sayansk Altai. It is 390 m. long, from 18 m. to 60 m. broad, and covers an area of 13,250 sq. m.; its altitude is about 1,560 ft. above sea level, and soundings have shown a maximum depth of over 5,000 ft. The Selenga is the largest of the many rivers flowing into it, the Lower Angara carries away its outflow to the Yenisei, and of several islands on its surface Olkhon is the most considerable. Salmon, sturgeon, seals, and herrings are largely caught by the Buriats and Tunguses who inhabit the shores, and oil is extracted from the golomynka (*Callionymus baikalensis*), a fish peculiar to the lake. The construction in 1904 of a line skirting the S. end of Lake Baikal completed the Trans-Siberian Rly.

Bail (Lat. *baulare*, to carry, take charge of). When a person has been in custody, and is released for a time, but is bound to come up to answer the charge at a future date, very often one or more persons undertake, under a pecuniary penalty, that he shall be forthcoming at the proper time. This is called admitting to bail. The surety or sureties have to sign a recognizance binding themselves to pay to the king the sum named if the accused absconds. In such an event the bail is said to be estreated.

In amount bail ought not to be excessive; and when an inferior magistrate refuses to grant bail, a

judge of the high court may do so on a proper application. Bail is also used in Admiralty proceedings. When a ship or cargo is arrested, the owner thereof can have it released on finding bail not exceeding the amount of the property arrested or the amount of the claim, whichever is the smaller.

The term is applied to the persons who stand security and also to the amount of the security.

Baildon. Urban dist. in the W. Riding of Yorkshire, England. It is $4\frac{1}{2}$ m. N. of Bradford, has a rly. station, and is a centre of chemical manufactures. Near is Baildon Hill, with old entrenchments. Pop. 7,794.

Baile Atha Cliath. Erse name for the city of Dublin (*q.v.*).

Bailey (late Lat. *ballium*, wall). In architecture, the court of a feudal castle between the outer wall and the keep. The term was originally applied to the wall enclosing such a court. In a fully developed Norman stronghold there were an outer and an inner bailey; the outer comprised the stables and outhouses of the stronghold, and was separated from the inner by a fortified wall with a gate-house; the inner bailey was the area within which stood the keep. See Castle.

Bailey, SIR ABE (1864-1940). S. African financier. He was born in S. Africa, Nov. 6, 1864, and educated in England. Returning to S. Africa, he became interested in the gold and diamond industry at Johannesburg. For his share in the Jameson raid (*q.v.*) he was sentenced to two years' imprisonment, and during the S. African War he served on the British side. A well-known owner of racehorses, he was knighted 1911 and created a baronet 1919. He married Mary Westenra (b. 1890), daughter of the 5th Lord Rossmore, afterwards famous as an airwoman. Sir Abe died Aug. 10, 1940. He had provided in his will for the establishment of a trust of £250,000 to be called after his name. The chief objects of the trust were to further the progress of the S. African people of British and Dutch stock, and the encouragement of Afrikaans (*q.v.*) in all English-speaking schools in the Union.

Bailey, HENRY CHRISTOPHER (b. 1878). English author. He was born in London, April 1, 1878, and was educated at the City of London School and Corpus Christi College, Oxford. He was, 1901-46, on the staff of the Daily Telegraph. He became well known for his detective novels, especially the

series dealing with the adventures of Mr. Fortune. As an undergraduate he made a reputation by an historical novel, *My Lady of Orange*, and followed this with several others in the same genre.

Bailey, PHILIP JAMES (1816-1902). British poet. Born at Nottingham, April 22, 1816, son of Thomas Bailey, the editor and proprietor of the Nottingham Mercury, he was educated at Glasgow. Called to the bar at Lincoln's

Philip James Bailey
Elliott & Fry

Inn in 1840, he never practised. Meanwhile, resolved to write his own version of the Faust legend, he had settled down in 1836 at his father's residence at Old Basford, near Nottingham, and in three years produced his masterpiece, *Festus*. Published anonymously by Pickering in 1839, *Festus* had an enormous vogue for many years. But revisions, additions, and the incorporation of later works, *The Angel World*, 1850, and the *Universal Hymn*, 1867, which swelled the bulk of the book and swamped its poetry in dull theology and obscure metaphysics, diminished its original popularity. He died at Nottingham, Sept. 6, 1902.

Bailey Bridge. Device used extensively by British and Allied armies in the Second Great War. Invented by Sir Donald Bailey, of the ministry of Supply, it was designed to cross gaps up to 240 ft. in length without the use of pontoons or supports. The bridge is built up of 10-ft. welded steel lattice-work panels. The panels, which are carried ready assembled in 3-ton lorries, are fitted with handles so that they can be lifted by six men. The panels are locked together with 6-lb. pins, and support the wooden roadway, which is laid as the bridge is assembled. Road guides serve the dual purpose of keeping the traffic central and holding down the deck planking. Two footways for infantry are carried outside the roadway, so that there is no confusion between foot and

H. C. Bailey,
English author

wheeled traffic. The bridge can be constructed with single panels and single tiers so as to take moderately heavy traffic immediately. Additional panels and tiers to increase the load capacity can be added while the bridge is in use. The heaviest type of Bailey bridge, which consists of three tiers of panels and is provided with cross-struts on the top tier, can carry the largest tanks.

The bridge is built on shore in 10-ft. lengths complete with roadway, and is then pushed forward on rollers almost to the point of balance, when the next section is added and the bridge pushed forward again. A false nose is fitted to the heavy section, and when this has crossed the gap it gives support while the final

of the rivers in the Italian and Burma campaigns, and they carried Allied infantry and armour across the Rhine. Under the name of the panel bridge, the U.S. army adopted the Bailey bridge, and components of British and American-made bridging became interchangeable. *See* Bridge; Pontoon.

Bailie. Scottish form of the word bailiff, signifying a high municipal officer. A bailie of a corporation is, by virtue of his office, a justice of the peace, and is exempt from serving on juries. The bailie of Holyrood, who was appointed by the duke of Hamilton, had jurisdiction within the precincts of the sanctuary.

Bailiff (Lat. *bairulus*, carrier, person in charge). Name given to various officials. It was first ap-

plied in England to the chief officer of a hundred, and also to the king's servants generally, *e.g.* the high bailiff of Westminster and the bailiff of Dover Castle. Lords and others also began to have their bailiffs, and on manors the name was given to an official who looked after the lord's interests.

The word is now applied to an official employed by a sheriff to serve writs, carry out distrainments, make arrests, collect fines, summon juries, and perform other work of that kind. Every county court has a high bailiff, and under him are bailiffs who do the work of the court. These bailiffs give sureties that they will execute their duties and are consequently called bound bailiffs, or more popularly bum bailiffs. In the rural districts of England, a bailiff is one who looks after an estate or farm for another. In the Channel Islands the bailiff is a high official. In each of the larger islands he presides over the royal court and at meetings of the states. The French equivalent is *bailli*.

Bailiwick. The wick (Lat. *vicus*) or village of a bailiff, also the district over which his powers extend. Since the bailiff is actually the servant of the sheriff, the word refers generally to a county, this being the sheriff's district. It was applied to a town or city granted the privilege of being outside the control of the sheriff of the county.

Bailleul. Town of France, in the department of Nord. It lies near the Belgian frontier, 46 m. by rly. S.E. of Calais, and before the First Great War, during which it suffered much damage, it had

panels are completed. The nose and rollers are removed before locking the bridge in position. Only 17 different parts are used in making the bridge proper, and another nine in constructing the supports on which it rests. Provided there is no great preparatory work in levelling ground, 40 men can bridge a 240-ft. gap in six hours. During the 1939-45 campaigns Bailey bridges, long, short, easy or difficult, averaged not more than 24 hours in construction, even under shellfire.

Using pontoons or the supports of a bridge that has been destroyed the Bailey bridge can cover almost any distance. One of the longest erected on piers was the 1,200-ft. bridge thrown across the Sangro river in Italy in Nov., 1943. The longest Bailey bridge on pontoons spanned the 1,096-ft. Chindwin in Burma in Dec., 1944. Bailey bridges were used to cross most

Bailey Bridge. This quickly built bridge consists of interlocking latticed panels of steel, used with or without supports. It proved invaluable in the Second Great War. Upper picture shows a 1,200-ft. bridge across the R. Sangro, Italy; lower, a three-tier type on the autobahn nr. Bielefeld, Germany

woollen, cloth, and leather manufactures. Hops are extensively cultivated, and much lace is made in the neighbourhood. The town gave its name to the Baliol family. Captured by the Germans, April 15, 1918, it was regained by the British on Aug. 30, 1918. A remarkable war memorial was erected, representing a war-shattered church, with figure of an angel. In the Second Great War the town was in German-occupied France from May, 1940, to Sept., 1944.

Baillie, LADY GRIZEL (1665-1746). A Scottish poet. Born Dec. 25, 1665, she was the daughter of the Sir Patrick Hume who became 1st earl of Marchmont. In 1692 she married George Baillie of Jerviswood. This was the outcome of a romantic adventure, as Grizel, when a child, had been sent with a letter from her father to George's father, Robert Baillie, then in prison on the charge of complicity in the Rye House Plot. She was equally courageous in taking food to her father when he was in hiding from arrest, and spent some years in exile with him in Holland. Lady Grizel, who returned to Scotland after 1688, wrote both prose and verse, and some of her poems are in Allan Ramsay's and other Scottish collections. She died Dec. 6, 1746. From her daughter the earls of Haddington descend.

Baillie, JOANNA (1762-1851). British dramatist and poet. Born at Bothwell, Lanarkshire, she came to London when quite young, and was many years resident at Hampstead, where she died Feb. 23, 1851.

Her *Plays on the Passions*, three volumes, 1798, 1802, and 1812, violate the principles of drama by ignoring in tragedy external circumstances, and making the development of a single passion the whole story, but show great skill in delineation of character. *De Montfort* was produced at Drury Lane, 1800, with John Kemble and Mrs. Siddons in the chief rôles, and revived by Kean, 1821. The *Family Legend* was produced at Edinburgh, 1810, and at Drury Lane, 1815.

Baillie-Stewart, NORMAN (b. 1910). Former British army officer, sentenced to 5 years' penal servitude in 1933 for communicating military secrets to Germany.

Baillie
After Sir W. Newton

While awaiting trial he was popularly spoken of as "the officer in the Tower." On his release he lived in Austria and Germany, applying for naturalisation papers. He had not obtained these before the Second Great War began. Technically still a British subject, he then broadcast German propaganda, and for this was sentenced in Jan., 1946, to 5 years' penal servitude. His sentence dated from May, 1945, when he had been arrested, and he was released in May, 1949.

Bailly, JEAN SYLVAIN (1736-93). French scientist and revolutionary politician. He was born in Paris, gained a European reputation as an astronomer, and was a member of the three French academies, his greatest work being his *History of Astronomy*. On the outbreak of the Revolution he was elected president of the National Assembly and mayor of Paris, but incurred odium by allowing the soldiers to fire on the crowd in the Champs de Mars, July 17, 1791. He was arrested by the Jacobins and guillotined, Nov. 12, 1793.

Bailment. In law, the delivery of a chattel by one person, the bailor, to another, the bailee, to be handed over to a third person, or to be returned to the bailor in a certain event. Thus, a carrier is bailee of the goods carried, and a pawnbroker of the goods pawned. A borrower, except of money or consumable goods, is bailee of the goods borrowed.

In English law a bailee must not use the chattels bailed otherwise than in accordance with the contract. If he does, he may be liable to pay to the bailor the full value thereof. Nor must he damage the goods. If he is a bailee for valuable consideration he is liable for negligence. If he is a gratuitous bailee he is only liable for gross negligence. When a bailor lets out chattels on hire, they must be "as fit for the purpose for which they are hired as care and skill can render them." If not, and any injury is caused to the hirer, the bailor is liable in damages. A public carrier, e.g. a rly. company, is liable for damage to or loss of the goods carried, whether negligence is proved or not, unless there is an "owner's risk" contract, i.e. one limiting liability.

Bailly, EDWARD HODGES (1788-1867). British sculptor. A native of Bristol, where he began his professional career as a modeller in wax, when 19 years old he went to London, becoming a pupil of John Flaxman. In 1809 he entered the

Academy Schools, became A.R.A. in 1817, and R.A. in 1821. The duke of Wellington, Charles James Fox, Lord Mansfield, Byron, and others sat to him for either figure or bust, and the Nelson statue in Trafalgar Square and the sculpture on the Marble Arch, London, are his work. Eve at the Fountain, 1818, established his reputation. He died at Holway, May 22, 1867.

Baily, FRANCIS (1774-1844). A British astronomer. He was born at Newbury, Berkshire, April 28, 1774.

Francis Baily,
British astronomer

After being on the London stock exchange, in 1825 he retired with a fortune, and fitting up an observatory at his house in Tavistock Place, London, devoted himself to astronomical study. One of the founders and afterwards president of the Astronomical Society, he re-edited the *Star Catalogues of Ptolemy*, Tycho Brahe, Halley, Flamsteed, and others. His estimate of the weight of the earth is still accepted as a close approximation to the truth. The phenomenon since known as Baily's beads (*vi.*) was first observed by him. He died Aug. 30, 1844.

Baily's Beads. Phenomenon of an eclipse of the sun, discovered by Francis Baily at the solar eclipse of May 15, 1836.

At a total eclipse the moon gradually covers the sun's surface until only a thin crescent remains. If the moon were truly spherical this crescent would gradually shrink as totality approached. The moon's surface is, however, irregular: mountain peaks interrupt the crescent before geometrical totality, and sunlight shines through valleys after the theoretical instant of disappearance. At the last moment the appearance is of a number of bright points or "beads," the apparent size of which is magnified by irradiation (*q.v.*). A similar effect occurs at the end of the total phase as the sun reappears.

Bain, ALEXANDER (1818-1903). Scottish philosopher. He was born June 11, 1818, in Aberdeen, and was professor of logic and English

E. H. Baily,
British sculptor
R. M. Marks

literature in the university of Aberdeen, 1860-81, when he was elected lord rector.

Association is the foundation of his psychology. The external and internal worlds, object and subject, are correlated: things are given to us only in relation to our consciousness. There is no object without a subject, and conversely, we can only speak of a world presented to our own minds. All intellectual life is based upon association due to contiguity (contact in space and time) and similarity.

His chief works are: *The Senses and the Intellect*; *The Emotions and the Will*; *Logic*; *Mind and Body*. He died at Aberdeen, Sept. 18, 1903. *Consult* English Psychology, Th. Ribot, Eng. trans. 1873; *Autobiography*, 1904.

Baines, EDWARD (1774-1848). British journalist and politician. Born at Walton-le-Dale, in Lancashire, Feb. 5,

1774, and apprenticed to a Preston printer, he became proprietor of the *Leeds Mercury* in 1801, and made it the chief Liberal paper in Yorkshire.

He was Liberal M.P. for Leeds 1834-41. He wrote a *History of the Reign of George III*, 1823, and a *History of the County Palatine and Duchy of Lancaster*, 1836. He died Aug. 3, 1848, and was given a public funeral. His second son, Edward (1800-90), was M.P. for Leeds 1859-74, wrote *A History of Cotton Manufacture in Great Britain*, 1835, and a *Life of his father*, 1851, and was knighted in 1880.

Bairaktar, MUSTAPHA (1755-1808). Turkish statesman. Beginning life as a soldier, and so winning his surname of Bairaktar, or standard-bearer, he was made pasha of Rustchuk, and in 1808 took a leading part in the revolution at Constantinople in which the sultan, Mustapha IV, the nominee of the janissaries, was deposed. He was responsible for putting Mahmoud II on the throne, and became grand vizier. He desired to crush the janissaries, but failed, and killed himself while they were attacking the palace, Nov. 15, 1808.

Bairam OR **BEIRAM.** Turkish and Persian word for the Moslem three-day festival which succeeds the fast of Ramadan. The name is also given to the four-day festival celebrated seventy days later, in the last month of the Arabic

year, in memory of Abraham's sacrifice of Isaac.

Baird, SIR DAVID (1757-1829). British soldier. Born at Newbyth, Scotland, Dec. 6, 1757, he went to India as a captain in the 73rd regiment in 1779. In the attempted relief of Arcot the force to which Baird was attached was cut to pieces by the army of Hyder Ali, and Baird was held captive for over three years. In 1799, as a major-general, he led the detachment which stormed Seringapatam.

The expedition sent from India to Egypt to trap the French army left by Napoleon was under his command, and in 1801 he captured the popular imagination by his brilliant march from Kosseir across the desert to the Nile. Knighted in 1804, he was sent in 1805, as lieutenant-general, in charge of the expedition which took Cape Town in 1806. He bombarded Copenhagen in 1807, and was in the retreat to Corunna, 1809. He was made a baronet in 1810 and died Aug. 18, 1829.

Baird, DOROTHEA (1873-1933). British actress. She was born in Northumberland May 20, 1873. After gaining experience in Shakespearean parts in Ben Greet's company she made an instantaneous success as Trilby at the Haymarket Theatre in the dramatized version of Du Maurier's novel of that name. In 1896 she married H. B. Irving (*q.v.*) and acted in a number of her husband's productions in America and Australia. She was the original Mrs. Darling in Barrie's *Peter Pan*, 1904. In 1912 she left the stage to devote herself to infant welfare, and died at Broadstairs, Sept. 25, 1933.

Baird, JAMES (1802-76). Scottish ironmaster. His father, Alexander Baird, established himself in the rich Lanarkshire coalfield early in the 19th century, owned several mines, and started furnaces for dealing with the ironstone. After his retirement, James and his three elder brothers reorganized themselves as William Baird & Co., and eventually employed 10,000 men and produced from their 40 or 50 furnaces 500,000 tons of iron a year. From 1851 to 1857 James represented the Falkirk burghs in Parliament. He died June 20, 1876, leaving no children.

A great benefactor to Presbyterianism, his devotion to orthodoxy contrasted strangely with his unconventional speech and manners. He endowed schools, founded the Baird Lectures, and in the Baird Trust gave £500,000 to the Established Church of Scotland.

Baird, JOHN LOGIE (1888-1946). British television pioneer. The son of a Presbyterian minister, he

was born in Scotland and educated at the Royal technical college and Glasgow university. For many years he was engaged in important scientific experiments, giving his first demonstration of television on Jan. 27, 1926. The transmission of television across the Atlantic was achieved in 1928, and next year the B.B.C. began a television broadcasting service with the Baird system. Baird experimented with and developed colour television and gave a demonstration of television in relief and full natural colour, Dec., 1941. He also invented the Noctovisor, an apparatus for seeing in the dark by invisible rays, first demonstrated in 1926. Baird died at Bexhill, June 14, 1946. *Consult* Life, R. F. Tiltman, 1933.

J. L. Baird, British television pioneer

Baireuth OR **BAYREUTH.** Town of Bavaria, in Upper Franconia. Standing on the Red Main, about 60 m. by rly. N.E. of Nuremberg, it has an old church with tombs of the margraves, 15th and 18th century palaces, the old opera house, and modern public offices. It manufactures cotton and woollen goods, beer, spirits, bricks, and earthenware, and trades in grain. Until 1791 it was the chief town of a little principality ruled by margraves belonging to the Hohenzollern family, remains of whose residence here still exist. Baireuth was taken by the U.S. 11th armoured division April 15, 1945, after a period of bombardment owing to the garrison's refusal to surrender.

Richard Wagner lived and was buried here, as were Franz Liszt and Jean Paul Richter. The chief Wagner memorial is the theatre standing on a hill about a mile from the town, built, with the co-operation of Ludwig II of Bavaria, on lines suggested by Wagner. Here also is a training school for Wagner opera. Pop. 36,892.

Baireuth Festival. Musical festival held periodically in honour of Richard Wagner. The Festival Theatre was opened 1876 with a performance of the *Nibelungen Ring*. The second festival took place in 1882, when Parsifal was presented. Since then one has been held

nearly every year. Everything was directed towards perpetuating the ideas of Wagner, the orchestra being concealed, applause discouraged and ignored, and the staging designed to produce effects of mystery and power.

Bairnsdale. Town of Victoria, Australia. On the Mitchell river, 170 m. by rly. E. of Melbourne, it is a rly. terminus at the E. end of the Great Valley of Victoria. A tourist centre for steamer trips on Mitchell river and the Gippsland lakes, it is the coastal terminus of the road over the Australian Alps to the tourist resorts Omeo and Bright to the river Murray and New South Wales. It ships grain, fruit, etc., to Melbourne. Gold is mined in the vicinity.

Bairnsfather, BRUCE (b. 1887). British humorous artist. Born at Murree, India, the son of a soldier, he was educated at the United Services College, Westward Ho, and became a civil engineer. In the first Great War he went to France with the Royal Warwicks, serving there until the end of 1916, when he joined the staff at the War Office. He won a great reputation by his humorous sketches in black-and-white of life at the front, which first appeared in *The Bystander* and were afterwards published in volumes entitled *Fragments from France*. His creations, Old Bill and his two companions, figured in a play, *The Better 'Ole*, written by Bairnsfather and A. Elliot, 1917, and a silent film, 1924. Bairnsfather was attached to the U.S. army in Europe, 1942-44, publishing *Jeeps and Jests*, 1943.

Bairstow, SIR EDWARD CUTHBERT (1874-1946). English musician. Born Aug. 22, 1874, he studied the organ in London under Sir F. Bridge. After holding appointments as church organist, in 1913 he went to York Minster. Durham University gave him a professorship in 1929, and in the same year he was president of the R.C.O. He was knighted 1932. A composer of church music, he died May 1, 1946.

Bait. For the various types of bait used by anglers, see Angling.

Baixo Alemtejo. Largest prov. of Portugal, with an area of 5,319 sq. m., and a pop. of 355,771. It is part of the old prov. of Alemtejo (q.v.), *baixo* meaning lower.

Baize (fr. *bai*, bay-coloured). Coarse, long-napped woollen or cotton cloth. It is used mainly for coverings, curtains, and linings, usually green or red. The name apparently alludes to the original colour, and, like chintz, is a plural

form used as a singular. The original baize was a finer and lighter material, and was used for clothing. Baize was first manufactured in England in 1561 by refugees from France and the Netherlands. The principal seat of the industry was

Bayreuth, Bavaria. Views of the interior and exterior of the festival theatre built for Richard Wagner. See p. 865

Colchester, where the old singular form of the word survived in the name of the Dutch Bay Hall.

Baja. Municipality of Hungary, in the county of Bács-Bodrog. It is on the Danube at the first place where the river is crossed by the rly. S. of Budapest, 66 m. by rly. E. of Ujdombovár on the main line Budapest-Fiume, and is a converging point for the rlys. from the S. and E. across the Alföld (q.v.). It makes alcohol and trades in grain and swine. Of the population four-fifths are Roman Catholic Magyars. Pop. 27,940.

Baja California. Mexican name of the state described under California, Lower.

Bajan or **BEJAN.** Name given in various medieval universities to new undergraduates or freshmen. Surviving in the universities of St. Andrews and Aberdeen, it is supposed to come from the French *bec jaune*, yellow beak or young bird. The university of Paris had an abbot of the bajans in the 15th century.

Bajaur. Dist. of Pakistan. On the Afghan border of the North-West Frontier province, it has an area of about 375 sq. m. It came under British protection as a result of a conference in 1893 between the ameer of Afghanistan and Sir M. Durand. The Region has iron ore deposits.

Bajocian. In geology, name applied to the lower portion of the Middle Jurassic rocks of

Parkinsoni and Marchisonae.

Bajus or **DE BAY, MICHAEL** (1513-89). Flemish theologian. He was born at Melun, and was educated at Louvain, where in 1541 he became head of one of its colleges, and in 1544 professor of philosophy. He represented Louvain at the council of Trent in 1561 and was chancellor when he died, Sept. 16, 1589.

His system of theology, called Baianism, presented the doctrines of man's original innocence, fall, and redemption in phraseology that was condemned by Popes Pius V and Gregory XIII. Jansenism was a direct result of his teaching.

Bakalahari (Kalahari-people). Bantu negroid tribe in the Kalahari veld, South Africa. They may have descended from the old Batau (lion-people), the earliest Bechuana to cross the Zambesi. They still display their racial aptitude for cattle-rearing and agriculture.

Bakalai. Bantu negroid tribe S. of the Ogowe, French Equatorial Africa. Immigrant from the S.E., they formerly practised slave-raiding. Their native copper and iron work is decaying. The chief traders of the equatorial coast, their Bakele speech is widespread. See Bantu.

Bakel. Fortified town of Senegal, French W. Africa. On the left bank of the Senegal, about 280 m. E.S.E. of St. Louis, it was founded 1820 and is a caravan centre, trading in dates, rice, cattle, ivory, and gold-dust.

France, derived from Bayeux, near Caen. The equivalent of the inferior oolite series of Britain, it consists mainly of oolitic limestones, white and ferruginous, with a characteristic ammonite-fauna including the zone-species

"**Bakelite.**" Proprietary name of a synthetic resin made from phenol and formaldehyde, invented by Leo Baekeland (1863-1944), a Belgian-American, in 1909. As the result of chemical combination a hard amber-coloured material is produced, soluble in alcohol and fusible at about 120° F. At a higher temperature the material becomes insoluble but remains fusible. It is ground into powder to serve as a moulding material; an inert filler such as wood flour is incorporated, and suitable colouring matter is added. The powder can now be pressed in heated moulds to any desired shape, and at a temperature of about 350° F. it becomes hard and infusible. It is termed a thermo-setting plastic, since it sets under the heat-and-pressure operation, and cannot thereafter be melted. Until about 1920 "Bakelite" held the field for its purpose; later other artificial resins were discovered, some of them of the thermo-plastic class, which could be moulded at high temperatures but did not then undergo such chemical change as to make them infusible. "Bakelite" can be made into varnishes or cements. A laminated material can be built up of fabric impregnated with the soluble "Bakelite" and then processed to form a sheet having the same characteristics as moulded powder products. "Bakelite" is used for small fancy articles, for electrical smallware and for such articles as door knobs. See Plastics; Resins, Synthetic.

Baker. Lake of North-West Territories, Canada. It is the lowest of an extensive system of lakes and rivers, the chief of which are the Dubawnt and Kazan, both of which enter the lake. The whole forms the N.W. corner of the drainage area of Hudson Bay (approx. 100,000 sq. m.), into which the lake outflows by Chesterfield Inlet. Its area is 1,029 sq. m.

Baker, Mount. Volcanic mt. of Washington, U.S.A., W. of and detached from the Cascade range. Snow-capped and covered with forests, it is 10,827 ft. high. There were serious eruptions in 1854-55, 1870, and 1880.

Baker, Sir Benjamin (1840-1907). British civil engineer. Born at Keyford, Somerset, March 31, 1840, Baker served as an apprentice at the Neath Abbey Ironworks and, having gone to London, in 1861 joined the staff of the engineering firm, under Sir John Fowler, of which he rose to be a partner in 1875. He was actively concerned with Fowler in

the construction of the London underground rlys., 1861-69, the Forth Bridge, 1883-90, and the London tube rlys. In Egypt he was consulting engineer for the dam at Assuan, 1898-1902, and similar enterprises, and he designed the special vessel that carried Cleopatra's Needle to London. In later life he was associated with Sir J. Wolfe Barry, and worked on docks, bridges, etc., at Avonmouth, Barrow, and elsewhere. He was created K.C.M.G., 1890, and died May 19, 1907. He is commemorated by a window in Westminster Abbey.

Baker, Henry (1698-1774). British scientist. He was born in London, and received from the Royal Society the Copley medal for his researches on saline particles. The Bakerian lecture, founded by him, commemorates his name. His acquaintance with scientists abroad led him to introduce the rhubarb plant into England. He was also the inventor of a system of teaching deaf mutes. With Daniel Defoe, whose youngest daughter he married, he issued in 1728 the Universal Spectator and Weekly Journal, adopting the pseudonym of Henry Stonecastle.

Baker, Sir Herbert (1862-1946). English architect. Born June 9, 1862, he was educated at

Sir Herbert Baker.
English architect

Tonbridge, became an architect, and went in 1892 to S. Africa, where he started to practise his profession. The buildings designed by him in S. Africa include cathedrals in Cape Town, Johannesburg, and Pretoria, Groote Schuur, for Cecil Rhodes, Government House at Pretoria, and the Rhodes Memorial on Table Mountain. He returned to England in 1913, and was architect of the Bank of England, Rhodes House at Oxford, S. Africa House, India House, the Church House in London, and the Winchester College war memorial. He was also associated with Sir Edwin Lutyens in the designing of New Delhi. He was knighted in 1926 and made an R.A. in 1932. He died Feb 4, 1946.

Baker, Sir Richard Chaffey (1842-1911). Australian statesman. Born June 22, 1842, at Morialta, S. Australia, he was educated at Eton and Trinity College, Cambridge, and afterwards called to the bar. Returning to his home

and entering political life, he was made attorney-general of S. Australia in 1870, and minister of justice and education in 1884. From 1893 to 1901 he was president of the legislative council. Baker, who was knighted in 1895, took part in the formation of the Commonwealth, and became the first president of its senate, 1901. He resigned in 1906 and died March 18, 1911.

Baker, Sir Samuel White (1821-93). British explorer. Born in London, June 8, 1821, the son of a West India merchant, he was in Ceylon from 1845 to 1855, and in 1859-60 superintended the construction of a railway across the Dobrudja.

Sir S. W. Baker,
British explorer

In 1861, accompanied by his wife, a Hungarian, Baker started from Cairo on a journey of exploration into Central Africa, chiefly with a view to discovering the sources of the Nile. After exploring the Atbara and the tributaries of the Nile, he proceeded southwards, and at Gondokoro, Feb., 1863, met Speke and Grant. Hearing from them of the supposed existence of another immense lake besides Victoria Nyanza, which they had discovered, Baker proceeded on his journey, and on March 14, 1864, sighted the new sheet of water, which he called Albert Nyanza. He returned to Khartum in May, 1865, and in 1866 he was knighted.

In 1869 he was commissioned by the khedive and with the rank of pasha organized an expedition to the Upper Nile to suppress the slave trade and open up the country. He achieved considerable success, and in 1874 returned to England. Baker's remaining years were spent in travel in Cyprus, India, and Japan. As a hunter of big game in every country he visited he was without a rival. He died at Sandford Orleigh, Devonshire, Dec. 30, 1893. His works include: The Albert Nyanza, 1866; The Nile Tributaries of Abyssinia, 1867; Ismailia, 1874; Wild Beasts and Their Ways, 1890.

Baker, Valentine (1827-87). British soldier, also known as Baker Pasha. Born April 21, 1827, at Enfield, a younger brother of Sir Samuel Baker, he began his military career as an ensign in the Ceylon Rifles, and after serving in the Kaffir War, 1852-53, and at

the siege of Sevastopol, 1854-55, he became known as an authority on cavalry tactics. By 1874 he was assistant quartermaster-general at Aldershot.

Dismissed from the army as the result of his conviction, Aug. 2, 1875, on a charge of assault, he took service under the sultan on the outbreak of the Russo-Turkish War of 1877-78, and at Tashkessan saved the situation by a skilfully conducted rearguard action. In 1882 he entered the Egyptian service and was in command of the police until his death at Tel-el-Kebir, Nov. 17, 1887. His writings include *Clouds in the East*, 1876; *The War in Bulgaria*, 1879.

Bakerloo. Name popularly given to the London electric underground railway from Baker Street to Waterloo. The first section of the line was opened in 1906; later that year it was extended S. to the Elephant and Castle. Extensions were made N. to Watford in 1917 and to Stanmore in 1939. The Bakerloo was controlled from 1933 by the L.P.T.B., from 1948 by the London Transport Executive. Brit. Rlys.

Bakers Company, THE. London city livery company. A company of White Bakers existed in

Bakers' Company arms

1307, the Guild of White and Brown Bakers was incorporated in 1509, and a separate charter was granted the Brown Bakers in 1622, but the two were united again in the second half of the 17th century. The present administration of the company dates from 1874. Bakers' Hall, Harp Lane, Great Tower Street, E.C., residence in 1435-46 of John Chichele, chamberlain of London, was burnt in 1715, rebuilt 1719, and in 1825 restored under John Elmes. It was totally destroyed by bombs in the Second Great War.

Bakersfield. City of California, U.S.A., the co. seat of Kern co. On the Kern river, which supplies power for factories, it is 168 m. N.W. of Los Angeles, on the Southern Pacific and the Atchison, Topeka, and Santa Fé rlys. It has oil refineries, railway carriage works, and foundries, and in the neighbourhood gold, oil, and natural gas are found. The city dates from 1872. Pop. 29,252.

Baker Street. London thoroughfare, Marylebone, W. It connects Orchard Street, Portman

Square, with York Place and Upper Baker Street leading to Regent's Park, and was named after Sir Edward Baker, a Dorset neighbour of the Portmans. Bulwer Lytton was born and Grattan died in this street; Mrs. Siddons died in Upper Baker Street. The Portman, later Baker Street Bazaar, now the Portman Rooms, was the home of Madame Tussaud's waxworks, 1833-84, and of the Smithfield Club's annual show, 1839-61. Baker Street station, Metropolitan line, is a link between most parts of London and the line serving the residential districts of Buckinghamshire as far as Aylesbury. The street was much damaged by bombing, May 10-11, 1941. It has been made famous in fiction by Conan Doyle, whose Sherlock Holmes lived at the imaginary No. 221b.

Bakewell. Urban district and market town of Derbyshire, England. It stands on the Wye, 25 m.

Bakewell arms

N.W. of Derby by the railway and the London-Glasgow road A6. The cruciform church of All Saints, mentioned in Domesday, has a fine octagonal spire and contains monuments of the Vernon and Manners families. In the churchyard is a cross dating probably from the 8th century. The Lady Manners school was founded in 1637, and there are almshouses of earlier date. Bakewell has cotton and woollen industries established by Sir Richard Arkwright. It makes electric storage batteries. Chert is mined for use in the potteries. Its chalybeate spring and warm baths are noted. Haddon Hall, seat

Bakewell, Derbyshire. Church of All Saints; the original foundation is mentioned in Domesday

of the duke of Rutland, and Chatsworth, the seat of the duke of Devonshire, are in the vicinity. Market day, Monday. Pop. 3,500.

Bakewell pudding (or tart) is a sweet named from this town. The foundation of it is pastry which is covered first with jam, and then with a crust made of flour and yolk of egg. It is baked for half an hour and then garnished with castor sugar and white of egg beaten together into froth.

Bakewell, ROBERT (1725-95). British agriculturist. Born at Dishley, Leicestershire, he was the son of a farmer and himself followed the same calling. To the theory and practice of stock-breeding he brought unusual intelligence and foresight, and among his successes were heavier kinds of sheep and cattle and a special breed of black horses, useful for farm and army work. He established a club to secure greater purity of breed, and the offspring of his animals were highly prized by other graziers. He was equally successful in growing feeding stuffs. Bakewell's experiments were costly and he was bankrupt before he died, Oct. 1, 1795.

Bakhtegan OR NIBIS. Salt lake of Persia, in Fars prov. It is 60 m. long and averages 8 m. in breadth. It partly dries up in summer, when immense quantities of salt are obtained.

Bakhtiaris. Nomad tribe in the western uplands of the Bakhtiari range between Isfahan and Susa, Persia. Numbering about 250,000, they are allied to the nomad Lurs of Luristan. Horse-riding, frugal, independent hill-men, addicted to raiding the lowlands, they may represent in part the Median stock of Persia. See Kurds.

Bakhuisen OR BACKHUYSEN, LUDOLF (1631-1708). Dutch painter and engraver. He was born at Emden, Westphalia, Dec. 18, 1631, and at the age of 28 went to Amsterdam, where he became a pupil of the landscape painter Albert van Everdingen. But he virtually abandoned landscape in favour of shipping subjects. His work was quickly appreciated. He died at Amsterdam, Nov. 17, 1708.

Bakhuisen's method of study was very thorough; he hired fishermen to take him out to sea in a tempest, and exposed himself for hours observing effects of sea and sky from the shore. He is represented in the National Gallery by a picture of Dutch shipping; in the Louvre by The Dutch Squadron and other seascapes.

Baking (A.S. *bacan*). Method of preparing food by subjecting it to dry heat, usually in an oven. The latter should be heated to the appropriate temperature before the food is put in, and opening and shutting of the oven door avoided so far as possible. The top shelf is usually the hottest.

Meat should be placed on a grid in a deep dish and baked first in a very hot oven to seal up the surface and prevent too much of the juice escaping. When this has been done the heat must be lessened by means of the regulator found in modern gas and electric cookers, or by a damper in a coal range. This slower baking enables the meat to be cooked gradually all through. All kinds of pastry also need a very hot oven at first, to expand the air enclosed in the mixture, so that it raises and lightens the flour. If the temperature is not sufficiently high to set the pastry quickly, the air will escape and the pastry sink again and become heavy. Cakes should be started in a hot oven, and the heat decreased twice afterwards. Milk puddings are baked slowly on the lowest shelf.

Baking utensils include double baking pans for meat, patty-pans for mincepies, etc., raised pie moulds and cake tins, the bottom being removable, dishes and pans in fireproof earthenware and glass.

The term baking is also applied technically to the hardening or firing of tiles, earthenware, and bricks. *See* Brickmaking; Pottery.

Baking Powder. Powder used as a substitute for yeast in raising bread and cakes. It is composed of tartaric acid and bicarbonate of soda, mixed with ground rice or flour, in the proportions of 4 oz. each of the rice and soda to 3 oz. of the acid. When moistened, the acid acts on the bicarbonate of soda and produces carbonic acid gas, giving an effect similar to that of yeast.

Bakony Wald or **BAKONY FOREST** (Magyar, *Bakonyerdő*). Upland district of Hungary. Running N.E. from Lake Balaton to the Danube near Budapest, it is 70 m. long and 25 m. wide. In its dense oak and beech forests large herds of swine are fed, and marble is worked. The ridge rises sharply from the lake to an average level of 1,000 ft., and W. and N.W. of Veszprem isolated hills exceed 2,000 ft., the highest being 2,340 ft. The Danube makes a sharp turn to flow S. at Vazs between the end of the upland and the lower Carpathian hills to the N.; Buda

is on the edge of the ridge. There was heavy fighting here between Germans and Russians at the beginning of 1945.

Baksheesh (Persian, gift). Common Oriental term for a tip or gratuity. Samuel Purchas, the 17th century compiler of travel books, uses the word in the sense of "free" or "gratis." The slang word buckshee is a debased form.

Bakst, **LEON NICOLAIEVITCH** (1866–1924). Russian painter and theatrical designer. A pupil of the academy at St. Petersburg, he later studied in Paris. In 1906 he settled there and devoted his rare imaginative power to designing richly decorative stage costumes and settings, winning fame by his designs for the productions of the Diaghilev ballet, including *Les Sylphides* and *Aurora's Wedding*. He died Dec. 27, 1924.

Baktshi Serai or **BAKHTCHISARAI**. Town in the Crimean pen., R.S.F.S.R. It is 21 m. by rly. S. of Simferopol. Lying in a narrow and picturesque valley, it was formerly the residence of the Tartar khans of Krim, whose palace, built in the 16th century, is the chief object of interest. Tobacco is grown and there are soap and candle factories: sheep-skin coats are made.

Baku. Seaport on the Caspian Sea, capital of Azerbaijan S.S.R., and fifth city of Russia; pop. 809,347. It is on the Apsheron Peninsula, is connected by rly. with Batum, 559 m., and Poti, 535 m., on the Black Sea, and has steamer communication with Krasnovodsk, the terminus of the Transcaspian Rly., Astrakhan, and other ports.

A fine natural harbour, used also as a naval station, has made Baku a commercial centre for merchandise dispatched from the Transcaspian provinces and Persia; but it owes its great prosperity almost entirely to the vast petroleum deposits in the neighbourhood, the production of which is 75 p.c. of all the Soviets' output and in 1939 amounted to 23 million tons.

Besides the oil refineries, situated E. of the town, there are tobacco, flour, and chemical industries. A medical institute trains 2,500 students.

In 1918 a military expedition was undertaken by Great Britain to forestall possession of the Baku oil wells by German, Turkish, or Bolshevik forces. The city was held from Aug. 4 to Sept. 14, when its evacuation was compelled by Turkish pressure. At the Armistice of Oct. 30 the Turks agreed to Allied reoccupation, but it was evacuated in 1919.

The German drive into Russia to the Sea of Azov in the autumn of 1941, and the subsequent offensive against the Crimea, were directed primarily at securing the oilfields and pipelines at Baku.

Bakunin, **MIKHAIL** (1804–76). Russian anarchist. Born at Torjok, he belonged to the aristocracy, and served in the Imperial Guards, 1832–38. He began to associate with revolutionary leaders in Switzerland and Germany, taking part in the outbreaks of 1848–49 at Berlin and Dresden. His property had been confiscated in 1847, and in 1855 he was sent by the Russian government to Siberia, whence in 1859 he escaped to the U.S.A. and to London. In 1869 he founded the Alliance of Social Democracy in rivalry with Marx's International.

Whereas Marx urged the proletariat to achieve supremacy through political methods, Bakunin's programme involved the total overthrow of the state by armed insurrection. In 1872 Marx was successful in getting Bakunin expelled

Baku. Oil wells seen from the electric railway that runs from Baku through the oilfields to Sabounchi

from the Workmen's International Congress, and the latter retired to Switzerland, where he died, at Berne, June 13, 1876.

Bakwiri. Bantu-speaking negro tribes in the mountains N. of the Cameroons delta. They are lighter-hued than the Duala, their coastal neighbours to the S. Both migrated from the eastward, and have dominated the earlier negro population. Their village chiefs control the clans in warfare and the chase. Both peoples practise a secret drum-language. *See* Bantu.

Bala. Lake of Merionethshire, Wales. The chief source of the river Dee, it extends 4 m. S.W. from Bala town, and is about $\frac{1}{2}$ m. broad and 530 ft. above sea level.

Bala. Market town and urban district of Merionethshire, Wales. On the Dee at the N. end of Bala Lake, it is 14 m. S.W. of Corwen by railway. It has a theological college, a grammar school founded in 1712, breweries and flannel factories, and is a great resort for tourists and anglers. Market day, Thurs. Pop 1,395.

Balaam. Semi-heathen magician mentioned in the O.T. Despite divine warning, he was bribed by Balak, king of Moab, to curse Israel; but, against his will, uttered blessings and foretold Israel's triumph over Moab. While serving with Midian against the Israelites, he was slain in battle (Num 22-24; Micah 6; Rev. 2).

Balacava. Little village and harbour in Crimea, Russia. On the shores of the Black Sea, 8 m. S.W. of Sevastopol, it is famous for the charge of the British cavalry, Oct. 25, 1854.

The British and their allies were besieging Sevastopol, and holding the harbour of Balacava as a base. Around were hills defended by lines of earthworks. On Oct. 25 a Russian force, coming through a dip in the hills, attempted to relieve the fortress by breaking these lines. First they drove off some Turks on the heights and seized their guns; then their cavalry moved towards the plain, where the British horsemen were.

This plain between the sea and the hills is really two valleys, with a ridge between them, and, owing to their situation, they were called the North Valley and South Valley. In the South Valley was the Heavy Brigade under General Scarlett, and as the Russian horsemen advanced across the ridge the British crashed into them and drove them back in disorder. The Russians, in their retirement, passed close to the Light Brigade under Lord Cardigan, but no attempt was made to complete their rout. All this was done in a few minutes.

The Russians had retreated behind their own guns, and the Light Brigade were near the end of the South Valley, when Lord Raglan sent an order to Lord Lucan commanding the cavalry. "Lord Rag-

lan wishes the cavalry to advance rapidly to the front and try to prevent the enemy from carrying away the guns." Lucan questioned the correctness of the order, and had an altercation about it with Captain Nolan, who bore it. Raglan evidently meant the guns on the right—those captured from the Turks—not those at the end of the valley, but Lucan, misled by a hasty movement of Nolan's arm, took it to mean those at the end of the valley, over a mile away.

Lucan, therefore, gave the order to Lord Cardigan, who led the Light Brigade towards the Russian guns. As the men rode, the guns on either side of the valley opened fire on them, and soon those at the end did the same, making Tennyson's famous description literally accurate: "Cannon to right of them, cannon to left of them, cannon in front of them." However, some of the men reached their goal and cut down the gunners, but only a remnant returned. Others straggled in later, but the brigade had 110 killed and 134 wounded out of a total of 673.

Other occurrences of the day were the stand of the 93rd Highlanders, who broke up a Russian cavalry attack, and a charge by mounted Chasseurs d'Afrique which saved the Light Brigade from annihilation. The Russians kept the guns and the position. *Consult* *Invasion of the Crimea*, vol. v A.W. Kinglake, 6th ed., 1877.

Balacava. The charge of the Light Brigade, Oct. 25, 1854. One of the most spectacular episodes in the annals of the British army. Although originating in a blunder it furnished an imperishable tradition of obedience to orders.

R. Caton Woodville. By permission of H. Graves & Co.

Balaklava. Map of the Crimean battleground, showing the relative positions of the forces and lines of the charges of the Light and Heavy Brigades

Balaklava Helmet. Woollen headgear knitted in one piece and pulled over the head, providing a warm covering both for day wear in cold climates and for sleeping out in the open. These helmets were first worn in the Crimea, and vast numbers were supplied to British troops during the First and Second Great Wars.

Balaklava helmet

Balafré, LE (Fr., the scarred). Nickname given to Francis, duke of Guise (*q.v.*), from a wound on his cheek received at the siege of Boulogne in 1545; also to his son Henri; also to Ludovic Lesly, in Scott's *Quentin Durward*.

Balaghat (above the Ghats). Division, district, and town of India, in the Central Provinces. The district, a lofty plateau 3,132 sq. m. in extent, and covered with forests, is mainly waste land and has few roads. The town pop. is composed mostly of Hindus.

Balakirev, MILI ALEXEIVITCH (1836-1910). Russian composer. Born at Nijni-Novgorod (Gorky), Dec. 31, 1836, he was a founder of the national school of Russian music. He started the Free School of Music at St. Petersburg (Lenin-

grad) in 1862, and became director of the imperial chapel in 1869. Usually brilliant in scoring, his works include 30 songs, two collections of folk and national songs, two symphonic poems, Russia and Tamara, several overtures and one symphony for orchestra, and a number of pianoforte pieces. He died at St. Petersburg, May, 1910.

Balalaika. Popular Russian musical instrument of the guitar type. It has a triangular body and two, three, or four strings, plucked with the fingers. See *Guitar*.

Balance OR SCALES (Lat. *bis*, twice; *lanx*, dish, plate). The most exact of the numerous weighing devices or instruments. For many purposes such instruments must possess extraordinary accuracy. The investment of enormous sums of money depends on the determination of small quantities of gold and other metals in various geological strata a question of life or death may depend on ascertaining the exact amount of a very small quantity of poison; the discovery of helium, argon, and neon was due to most accurate observations on the weight of the gases contained in the atmosphere. The discovery of the nature of atoms and the possibility of nuclear fission depended in part on the accuracy with which atomic weights had been determined. Modern scientific research, especi-

ally in the various divisions of chemistry, demands balances as sensitive and reliable as man can make them and such instruments have attained to a very remarkable degree of accuracy.

The manufacturers of a great number of chemicals must be continually taking samples of their products and analysing them, whether they are needed for fertilisers, dyestuffs, drugs, or other purposes, and the manufacturers therefore maintain well-equipped chemical laboratories and large staffs of competent analysts. So, too, those engaged in the manufacture of medicinal products, of foodstuffs and infant foods, and those engaged in the study of the problems of nutrition and the ever growing science of bio-chemistry, are obliged to make use of the best scientific appliances, including balances. Public analysts and all others engaged in chemical research must be provided with the best instruments.

A modern balance consists of a rigid metal framework, that is in essence a double lever of two equal short lengths of metal, balanced on a knife-edge of agate; on another agate knife-edge at each end of this rigid framework is suspended a metal pan; into one of these the object to be weighed is placed; in the other pan a number of very carefully prepared weights are placed until an exact counterpoise is obtained. A long metal pointer is rigidly attached

Balalaika, Russian musical instrument

to the movable framework: when the weights in the two pans are exactly equal the pointer is exactly vertical and the pointer is sometimes fitted with a small mirror so that the degree of departure of the pointer from the vertical is greatly enlarged on a suitable screen.

The weights used are the gram and its multiples and decimal fractions. The gram weight and its multiples are usually made of brass, lacquered for ordinary use but platinised for very accurate use. The fractions of a gram are made of platinum, gold alloy, nickel-silver, or aluminium.

A graduated horizontal rod of metal is attached to the mechanism of the balance and on this bar a small stirrup of fine wire, called a rider, can be placed to make an

exact counterpoise; the nearer this rider is to the end of the bar, or lever, the more it deflects the pointer from the vertical and even when the counterpoise is not quite perfect a calculation can be made from the position of the rider on the bar and the angle the pointer makes with the vertical that will give an accurate indication of the weight of the body under examination. The rider is usually a small hook of platinum wire which can be shifted along the beam without the need of opening the glass case in which the balance is enclosed. The standard weight of the rider is one centigram, a hundredth part of a gram, and the graduation of the rod into ten parts will give weight-differences corresponding to milligrams or thousandth parts of a gram. Riders are also made of aluminium and special alloys.

Maintenance of a Balance

Mechanical means are adopted to arrest any movement of the balance during loading and unloading the pans and to support the framework and pans when the balance is not in use. Special precautions are taken to maintain the perfection of the balance; it should be supported on the most rigid table that can be obtained and should be kept in a cool room with a steady temperature. The balance is contained in a glass case and the person using it should keep as far away from the balance as possible so as to avoid any change in temperature. In some determinations it is desirable to resort to double weighing, that is, weighing the object in one pan and then repeating the weighing with the object in the other pan.

A balance capable of weighing 100 grams of material or less should weigh to an accuracy of about one ten-thousandth of a gram and larger balances will weigh to an accuracy of at least one part in a million of the maximum load. Allowance must, in some cases, be made for the buoyancy of the atmosphere.

For very precise weighings of small quantities of material several types of quartz micro-balances have been constructed for special work, for instance in measuring the density of gases. With such instruments it has been possible to detect a difference in weight of less than a millionth part of a milligram in a load of 250 milligrams.

Torsion balances make use of a different principle. The beam of the balance is suspended by a torsion thread so that it can

rotate about the axis of the thread. During the last fifty or sixty years threads of quartz, first made by Boys, have been used for this purpose. If a weight is hung on a twisted thread there is a force tending to untwist the thread and so rotate the beam. This rotation can be measured on a graduated scale and hence the weight can be calculated with a considerable degree of accuracy.

Stephen Miall, LL.D., B.Sc.

Balance of Power. The name given to a theory of international politics, more or less operative in Europe since the end of the Middle Ages, *i.e.* about 1450. It means that no one state shall be allowed to become sufficiently powerful to threaten the independence of the others. In other words, there must be sufficient strength, actual or potential, on the side of a country to balance that of its rivals. The foreign policy of Britain, more perhaps than any other country, has been influenced by it.

There was something in the nature of a balance of power in the relations of the city-states of ancient Greece to one another, but it disappeared during the centuries when Rome dominated the world. It was present in the minds of those who controlled the European states that came into existence in the 9th and 10th centuries, but its definite appearance is generally assigned to the early 16th century, and Wolsey is sometimes spoken of as having been the first to realize its importance. In his time Francis I of France and Charles V, ruler of Germany and Spain, were rivals, and Henry VIII, by swinging his weight from one to the other, kept the balance between them. His father, Henry VII, had done something of the same kind, and the idea was certainly present in the minds of Maximilian I, Ferdinand of Spain, and other astute contemporaries, as it was with those who ruled the little independent states of Italy.

With the revival of learning and the general widening of human interests that marked the age of Columbus, there came a greater knowledge of the affairs of other countries, and no ruler would willingly see a rival, or even a friend, reach a position of dominance if he could help it. This, indeed, had always been true, and in a sense the idea of the balance is as old as society itself. When the balance was fairly even the idea slumbered, passing only into the realm of actual politics as soon as one country threatened to disturb it.

The dominance of Spain was destroyed by the defeat of the Armada in 1588 and still more by her internal decay, and then in the 17th century came the rise of the French monarchy. Concurrently there came into existence, largely as the work of Grotius, some idea of international law, which depends for its validity on a balance of power or something very like it.

The danger to the balance of power that came from the France of Louis XIV led to a series of wars against that monarch and his successors, waged between 1667 and 1763 by groups of powers of which Britain was usually the chief. The policy of the balance was well illustrated in the wars carried on between 1740 and 1763. In the earlier ones Britain and Austria were allies; in the later one Britain joined Prussia, formerly the ally of France, who secured, instead, the aid of Austria. The danger was still more real from the France of Napoleon, but this, too, was overcome, and this phase may be said to have ended in 1815. The Congress of Vienna re-established something like a balance of power, the central feature of which was the existence of five great European states—Austria, Prussia, Russia, France, and Britain—but this took no account of forces outside Europe. However, for a time the balance was fairly maintained, for the troubles of the first half of the 19th century came rather from risings of the peoples, as in 1830 and 1848, than from wars arranged in the interests of statecraft.

German Menace Arises

The next serious threat to the balance came from the German Empire. With the unification of Germany following Prussia's victories over Austria and France, came the new menace. The result was the First Great War. Whatever the immediate *casus belli* for Great Britain, it is difficult to see how she could have avoided entering the struggle when the balance of power was so obviously in danger of destruction.

As a result of that grim and protracted struggle the conception of the balance of power was modified and the phrase itself outmoded. The treaty of Locarno (*q.v.*) was an ingenious attempt to achieve a three-sided equilibrium under penalty, one potential aggressor being confronted by an alliance of the other two parties to the treaty; but it was denounced by Hitler before it could be put to the test. In 1939 a

despairing attempt was made to restore a balance by the formation of a united front against the Axis powers. But all such actions were nominally taken within the framework of the League of Nations. This organization was designed to create an equilibrium not of one group of powers as against another but of one overriding world combination as against any single one of its component units that might dare to challenge its authority. Japan, Italy, and Nazi Germany in turn did so dare, and thereby demonstrated the League's practical weakness rather than any unsoundness in its theory.

Thus it has been twice amply demonstrated within the space of a lifetime that a balance between opposing groups is not of itself any greater insurance against the threat of aggression than is the maintenance of an extreme isolation; on the contrary, it tends to inflame suspicions and jealousies, leading to the probability of ultimate conflict.

Balance of Trade. Difference in value between a country's imports and exports of merchandise. When there is an excess of imports, the balance of trade is said to be adverse. This conclusion is not justified, as the returns are not sufficiently informative. Imports and exports of high significance are not included, and the method of valuing imports tends to exaggerate their relative importance. The old term is falling into disuse in favour of a modern balance of payments that will give a complete record of all financial transactions between residents and non-residents. Although the balance of trade of Great Britain has been consistently adverse, the balance of payments was just as consistently favourable until 1931 (war years excepted), when the world financial crisis caused it to fluctuate on the margin until the beginning of the Second Great War in 1939. Balances due to normal trade and long term investments automatically adjust themselves, but those due to short term lending and the transference of liquid capital in search of higher returns or safety cause crises which call for one or more of the following palliatives: exchange depreciation or control (making foreign exchange dearer); deflation (issuing less currency at home); devaluation (reducing gold in sovereign); reducing imports (tariffs); stimulating exports (subsidies), with the inevitable aftermath of distress and unemployment.

Balance-sheet. A document showing the financial position of a public or private company, business, society, club, or undertaking. A general balance-sheet consists of two parts or sides, each of which totals the same amount, hence the name. It has a statement of assets on the right or credit side, and one of liabilities on the left or debit side. The former gives the value of all goods and stock in hand, the amount of money due to the concern, and the value of all its property and investments, due allowance being made for depreciation, bad debts, etc. The debit side shows the money owing to creditors and other liabilities; on this side appears the amount of capital, really a debt of the business, and all reserve funds. The balance is completed by the amount of profit or loss. A balance-sheet is also accompanied by a profit and loss account, showing the results of the operations of the period under review.

The directors of a company within the Companies Act, 1948, must once in every year lay before the company a profit and loss account and balance sheet made up to a date not earlier than nine months before the company meeting and giving a true and fair view of the company's position. The balance sheet must contain the information required by the Eighth Schedule of the Act, including the following: details as to capital; preliminary expenses; discounts and commissions on shares and debentures; capital and revenue reserves; provisions; liabilities; assets, distinguishing fixed from current; goodwill, patents, and trade-marks; trade and other investments; options on unissued shares; arrears of fixed cumulative dividends; charges on assets to secure liabilities of any person

other than the company; the basis on which the company's liability to income tax is calculated. The corresponding accounts for each item in the previous year must be shown.

Companies with subsidiaries must in general present group accounts. These normally take the form of a consolidated balance sheet and profit and loss account, and must give a true and fair view of the affairs of the company and its subsidiaries.

All balance sheets must be signed by two directors (or the sole director), and their report must be attached. The auditors must report on the balance sheet, profit and loss account, and any group accounts. A copy of the balance sheet must be sent to all members of the company, whether the company is public or private, and must be annexed to the annual return sent to the Registrar of Companies. See Book-keeping; Company Law.

Balanchine, GEORGES (b. 1907). Russian dancer and choreographer. Born at St. Petersburg (Leninград), he studied at the imperial ballet school and the imperial conservatoire of music, after which he worked as a dancer and producer in various theatres. In 1927 he left Russia and joined the Diaghilev company, for which he produced a number of ballets, including *The Gods Go A-Begging*, *Cotillon*, and *The Prodigal Son*. After Diaghilev's death he left the company and produced ballets in Paris, Copenhagen, and the United States. Among his later works were *Concerto Barocco* and *Night Shadow*.

Balanophoraceae. Small family of leafless, succulent plants. The genus *Balanophora*, has eleven species. Parasitic on the roots of other plants, they are chiefly

natives of hot countries. Like many other parasites, they are without any green colouring, being some shade of yellow or red. The simple flowers, usually unisexual, are produced in crowded heads a few inches above the ground. The plants attack the roots of trees and vines. The Japanese *Balanophora elongata* produces wax from which candles can be made.

Balapur. Town of India, in the Akola district of Berar. It is 12 m. W. of Akola, and is noted for its fort, completed in 1757 by Ismail Khan, the first nawab of Ellichpur. Near the town are the ruins of the palace built at Shapur by Akbar's son, Sultan Murad. Many of the people are Mahomedans.

Bala Series. In geology, the uppermost subdivision of the Ordovician System. It is so called from Bala in N. Wales, where rocks of this series are well developed. They consist mainly of slates, shales, and grits, with beds of volcanic ash, and at least two important beds of limestone. The Bala series was deposited during a period of intermittent volcanic activity, which made itself felt more particularly in the region of N. Wales.

The series, especially the limestones, contains a varied brachiopod and trilobite fauna as well as abundant remains of cystids. In addition to N. and S. Wales the rocks of this series occupy a large area in the S. of the English Lake district, and in the S. of Scotland exist in the form of black shales with a highly characteristic graptolite fauna. The Bala series is also represented in Scania and the Baltic countries, more especially in the Gulf of Finland and the valley of the Dniester, by trilobite and graptolite-bearing shales. In America the series is represented by the Hudson river or Cincinnati group, which comprises shales and sandstones that contain graptolites, trilobites, and brachiopods characteristic of the Bala rocks. See Caradoc Series; Cystidia.

Balasinar. Former state of India, now merged in Bombay prov. It had an area of 189 sq. m., ruled by a nawab. It was administered by the Baroda and Gujarat states agency 1933-44, and by the W. Indian states agency 1944-47. Balasinar, the former capital, is 50 m. N. of Baroda. Pop. 61,151.

Balasor. Coastal district and town of India, prov. of Orissa. The district has an area of 2,085 sq. m., and produces salt and rice. The town, the capital of the district, is 118 m. by rly. S.W. of

Calcutta; in 1633 it was a considerable port on the Burhabalang river. Later it had English, Dutch, Danish, and French trading factories, but the river-mouth has silted up so that the town is now 7 m. inland. Until 1947 the French owned 38 acres. The district is peopled mainly by Hindus.

Balas Ruby. In mineralogy, term wrongly applied to a rose-tinted variety of spinel (*q.v.*).

Balassagyarmat. Town and district of Hungary, in Nograd and Hont co. The town is on the river Eipel on the southern fringe of the Carpathians, 69 m. by rly. N. of Budapest. The pops. of town and district are three-quarters Magyar.

Balata OR SURINAM GUTTA-PERCHA. Substitute for gutta-percha, formerly used in making belting for machinery. It is made from a gum obtained from the bullet tree, *Mimusops globosa*, found in tropical America. As it contains more resin, it is inferior to gutta-percha (*q.v.*).

Balaton (German, Plattensee). The largest lake of Hungary. Lying 55 m. S.W. of Budapest at an alt. of 426 ft., it has a length of 50 m., maximum breadth of 10 m., and area of about 250 sq. m. or, with adjacent marshes, often inundated, 420 sq. m. Fed by over 40 streams, it has a depth of 20 ft., and discharges through the Sió and the Kapos river and canal into the Danube. The S. shore is low, the N. hilly and vine-covered. The waters normally are clear, though brackish, and during storms become bluish. They hold abundance of fish, particularly the fogash, a highly esteemed variety of perch. Steamboats ply on the lake. The scenery is picturesque, and the lake is famous in Magyar poetry and folk-lore.

Balawat. Ruined city 10 m. E. of Nineveh. There in 1879 the two-leaved door of an Assyrian palace was discovered by Hormuzd Rassam. It is 27 ft. high, of 4-in. cedar, each leaf being adorned with seven horizontal bronze bands 8 ft. long, 9 ins. wide. It is now in the British Museum. Each band bears a double row of scenes stamped in repoussé, depicting campaigns of Shalmaneser III, 858-823 B.C.

Balbi, GASPARO. Venetian traveller and merchant. He was a very wealthy dealer in jewels, and lived in India 1579-88. His Travels in the East Indies, 1590, was the first account of India beyond the Ganges, and, while it contains many incredible

stories, conveys much useful information, including an account of the Burmese kingdom of Pegu.

Balbinus, DECIMUS CAELIUS (d. 238). Roman emperor. He was one of the two emperors chosen by the senate in April, 238, as rivals to Maximinus, who had been selected by the soldiers on the Rhine. Balbinus, an orator and a poet, prepared to restore order in Rome, while his more warlike colleague Maximus Pupienus set out against Maximinus. Balbinus defeated the rebels and was about to march against the Goths when he and Maximus were killed in Rome by praetorian guards, Aug., 238.

Balbo, ITALO (1896-1940). Italian soldier and airman. Born June 6, 1896, he served as an officer in the Alpini during the First Great War, being twice decorated for bravery. After the war he joined the fascist movement and was one of the four leaders of the "march on Rome," Oct., 1922. He was appointed under-secretary of state for Air in 1926, and minister for Air in 1929. He was a skilled pilot and led several long-distance formation flights. In 1933 Balbo was promoted marshal and governor-general in Libya, which post he held at the outbreak of the Second Great War. On June 28, 1940, it was reported from Italy that he had been killed in an air battle over Tobruk, but the British foreign office denied that there had been any such battle. As Balbo had been opposed to the policy of Italian cooperation with Hitler, it was suspected that his death might have been contrived by the Italian government.

Italo Balbo,
Italian airman

Balboa. Silver coin. The monetary unit of the Panama Republic, Cent. America, it is the legal equivalent of the U.S. dollar, which equals two silver Panama pesos. It is named after the discoverer Vasco Núñez de Balboa, whose head appears on it.

Balboa, Panama
silver coin

discoverer Vasco Núñez de Balboa, whose head appears on it.

Balboa OR PORT OF ANCON. Port of Panama city. It lies at the base of Ancon Hill, at the Pacific end of the Panama Canal.

to the opening of which its existence is due. Its harbour is approached by a channel 4 m. long, 500 ft. wide, and 35 ft. deep at low water. There is no anchorage room, and vessels are moored alongside the wharves. Additional space has been provided for this purpose. The dry dock, which can accommodate the largest vessels, is 1,000 ft. long, 29 ft. deep at mean low water, and 110 ft. wide at entrance. The harbour is equipped with two floating cranes, coaling plant, and oil tanks with a capacity of 200,000 barrels. It is named after Vasco Nuñez de Balboa (v. i.). Balboa has a wireless station, telephone communication with Panama, Colon, and the Canal Zone, and rlys. connecting with Ancon and Panama.

Balboa, VASCO NUÑEZ DE (1475-1517). Spanish navigator and discoverer. In early life Balboa sailed to the New World and settled in Santo Domingo, but being obliged to flee from his creditors, he joined an expedition to Darien. Of this colony he became ruler. He was the first European to set eyes upon the Pacific Ocean, Sept. 25, 1513. He named there the Gulf of San Miguel, and took possession of the ocean for the Spanish king. He remained in Darien, but in 1514 was superseded as governor by Pedrarias Davila, by whom in 1517 he was beheaded.

Balbriggan (Gaelic, Brecon's town). Seaport and watering-place of co. Dublin, Eire. It is 22 m. N. of Dublin by railway, and has a coastguard station and a small fishing harbour. Its fine hosiery, muslins, calico, and cotton are so noted that the name Balbriggan is used to designate varieties of cotton-knit articles wherever they are made. Pop. 2,273.

Balch, EMILY GREEN (b. 1867). American economist. Born in Jan., 1867, she studied in Paris and Berlin. Her connexion with the Women's International League for Peace and Freedom began in 1919, as secretary; she became hon. president in 1936. Miss Balch was joint recipient of the Nobel peace prize for 1946.

Balchin, NIGEL MARTIN (b. 1908). For biography of this British writer, see N.V.

Balcon, SIR MICHAEL (b. 1896). British film director, born in Birmingham, May 19, 1896. The founder of Gainsborough Pictures, he became director of production for Gaumont-British Pictures, 1931-36, then producer for Metro-Goldwyn-Mayer. He returned to independent British production in

1938 and became director of Associated Talking Pictures and of Ealing Studios. His films include *Rome Express*, *The Good Companions*, *A Yank at Oxford*, *The Captive Heart*, *Hue and Cry*, *The Overlanders*, *Nicholas Nickleby*, *Scott of the Antarctic*, and war-time films for government depts. He was knighted 1948.

Balcony (Ital. *balcone*, projection). In architecture, an unroofed structure built out from a wall. Distinguished from a loggia, it consists of a floor and low parapet supported by brackets. In medieval times balconies adorned only palaces and other important buildings, and were generally built of stone or marble; but in the 18th century the use of iron for the parapet became common in France and Germany, and balconies constructed entirely of metal are now common. The cantoria inside Italian churches was a form of balcony, as also were the minstrels' galleries in the halls of castles and mansions. The interior balcony, more often alluded to as gallery, is a common feature of modern churches, and in theatres and other places of public entertainment. See Cantoria.

Baldacchino. Italian word for the canopy borne over the Host in processions of the Blessed Sacrament in the Roman Catholic Church. It consists of a rectangular framework covered with cloth of gold or white silk, and supported by four, six, or eight staves.

Baldachinum (Italian *baldacchino*). Eccles. term for the canopy over an altar. The word is derived from Baldacco, the Italian for Bagdad, which supplied the textile fabrics of which the later canopies were made. Erected to give dignity to the holy table, it was made originally of wood, stone, or metal, and generally supported on four columns. Its use is first mentioned in the 4th century. With the development of Gothic architecture the baldachinum was gradually displaced. The most magnificent baldachinum in the world is over the high altar in S. Peter's, Rome, executed by Giovanni Bernini for Pope Urban VIII.

Balder. Sun-god in Norse mythology. In the Icelandic Prose Edda, Balder is described as the beautiful, white, and gentle second son of Odin, and husband of Nanna, the moon goddess. His house in Asgard was Breidablik or Broad-Shining. Early in the Odinic reign he had dreams of evil, and his mother, Frigg, made all things, excepting the mistletoe, promise not to

harm him. Loki, the mischief-maker, having found this out, had a mistletoe twig magically turned into a dart. With this he went to the place where the gods were throwing weapons at Balder to prove his invulnerability, and persuaded Hoder, Balder's blind brother, to join in the game by throwing the mistletoe, and so Balder was killed. His body was put on a funeral pyre on a ship, and when Nanna saw it being pushed out to sea she fell dead of grief, and was laid beside him.

His spirit passed to the lower world, a place of bliss for the good and punishment for the wicked. Odin sent a messenger to Hel, the goddess of the lower world, begging Balder back, and she replied that if all Nature wept for him he might return. Loki, alone among the world's creatures, refused to weep, and thus Balder never returned, though he sent the magic ring of rejuvenation back to his father. See Mythology.

Baldness (*Alopecia*). Scarcity or absence of hair in human beings. A natural change usually associated with advancing years, it may also occur after acute illness; as the result of parasites such as ringworm; or of seborrhoea, an infection of the scalp. The cure of the cause with stimulating treatment of the scalp by massage and tonic lotions, results in the cure of relatively simple cases.

It is now recognized, however, that worry is a cause of baldness. Some nervous reflex would seem to starve the scalp by denying it a blood supply, and such cases must be seen by a psychologist. Diet in war years can also be blamed because of the absence of the Vitamin B complex; and of certain fats, for which reason avocado oil has been usefully added to cosmetic preparations. Some patches of baldness are of unknown origin and do not respond to any treatment. Premature baldness is essentially a disease of the male, and can begin very early in life with sexual maturity. This little understood condition must bear some relation to the male hormone acting on a predisposition of the victim.

Baldock. Urban district of Hertfordshire, England. It lies 37 m. N. of London and 5 m. N.E. of Hitchin by railway; it is also on the Great N. Road. The G.P.O. has an important wireless transmitting and receiving station here. Once a market town, it has a fine partly Norman church, S. Mary's. Near the town in 1923

a Roman cemetery was unearthed, yielding interesting finds which are now in the Letchworth museum. Pop. 3,171.

Baldovinetti, ALESSIO (c. 1427-99). Italian painter. Born at Florence and admitted to the guild of S. Luke in 1448, he is stated to have assisted Andrea del Castagno and Domenico Veneziano in the decoration of S. Maria Nuova (1439-53), but no trace of the work remains. Baldovinetti invented a new, but unsuccessful, method of mixing colours; hence most of his works are badly preserved or have perished. An Annunciation by him in the Uffizi Gallery and a Holy Trinity in the Academy at Florence reveal him as a not too skilful colourist. He was more successful in mosaic work, and restored the mosaics in the cupola of the baptistery of Florence cathedral. He died in the hospital of San Paolo at Florence, Aug. 29, 1499, and was buried in the church of San Lorenzo.

Baldric (Latin *balteus*, belt). A girdle or belt, now rarely used.

Baldric. Medieval girdle, usually made of leather

Usually of leather, it was worn sometimes hanging over one shoulder, across the breast and under the opposite arm, and sometimes round the waist. It was used to support a sword or bugle. The name was also given to the strap round the neck which held the shield.

Baldung, HANS (c. 1480-1545). German painter and engraver. He was a pupil of Albrecht Dürer at Nuremberg. An altar-piece of S. Sebastian, painted in 1507, which, formerly in the cathedral at Halle, passed into the Lippmann collection at Vienna, is the first extant painting ascribed to him. In 1509 Baldung settled at Strasbourg, where he died. His masterpiece is the chief altar-piece in the cathedral at Freiburg. His reputation rests otherwise chiefly on his designs for engraving.

Baldwin. Masculine Christian name. It was borne by a succession of counts of Flanders, two of whom were rulers of the Latin empire of Constantinople or Romania. This powerful family was founded by Baldwin I, called Iron Arm, who died in 879. His descendant, another Count Baldwin, was regent of France and took part in the in-

vasion of England by his father-in-law, William the Conqueror. Another family of this name, that of the counts of Boulogne, provided Jerusalem, after its capture by the Crusaders, with five kings.

Baldwin I (c. 1171-1205). Latin emperor of Constantinople or Romania. As the count of Flanders he took part in the crusade in which Constantinople was captured in 1204. He was chosen ruler of the new realm, which included only the city and a small district around it, and some Aegean islands. Taken prisoner by the Bulgarians while besieging Adrianople in April, 1205, he soon afterwards died in prison.

Baldwin II (c. 1217-73). Latin emperor of Constantinople or Romania. The son of the emperor Peter and nephew of Baldwin I, he became emperor in 1228. John of Brienne, king of Jerusalem, was chosen regent, and in 1234 Baldwin married his daughter. Neither John nor Baldwin was able to strengthen or increase the little kingdom. The latter's reign ended when Michael Palaeologus took Constantinople in 1261 and the Latin kingdom came to an end. See Romania.

Baldwin I (c. 1058-1118). King of Jerusalem. Of the family of the counts of Boulogne, Baldwin went with his brother Godfrey of Bouillon on the first crusade. Having left the main body, he made himself ruler of Edessa, and remained there until the death of Godfrey. Crushing the rival pretensions of Dagobert, he secured undisputed possession of Jerusalem, where he reigned 1100-18. He carried his arms as far as Egypt.

Baldwin II (c. 1070-1131). King of Jerusalem. The nephew of Godfrey of Bouillon, he went on the first crusade. In 1100 he was called to succeed another uncle, Baldwin I, as ruler of Edessa. In 1118 Baldwin again succeeded his uncle, this time as king of Jerusalem, adding much to the area and strength of his kingdom. He was constantly engaged in conflict with the Mahomedans, and was for some time their prisoner.

Baldwin III (1130-1162). King of Jerusalem. The son of King Fulk, he began to reign in 1143, but the real ruler until 1152 was his mother, Melisande. His ten years of personal rule were mainly occupied in fighting. He married Theodora, daughter of the East Roman emperor Manuel. The chronicler speaks highly of Baldwin's ability and knowledge.

Baldwin of BEWDLEY, STANLEY BALDWIN, 1ST EARL (1867-1947). British statesman. Born

Aug. 3, 1867, son of Alfred Baldwin, head of a large engineering firm, he went to Harrow and Trinity College, Cambridge. He did much to develop the family business, so that at his father's death on 1908 he controlled one of Britain's largest engineering firms, Baldwins Ltd. He succeeded his

Earl Baldwin.
British statesman

father as Conservative M.P. for Bewdley, Worcs., 1908, retaining the seat until his retirement and elevation to the peerage in 1937. He became parliamentary secretary to Bonar Law in 1916, financial secretary to the Treasury in 1917, a privy councillor in 1920, and president of the Board of Trade, 1921. His speech at a party meeting in Oct., 1922, played an important part in the immediate downfall of Lloyd George's coalition government, and Baldwin became chancellor of the exchequer under Bonar Law, succeeding him as prime minister in May, 1923.

For 14 years he played a leading part in the political life of the U.K. Appealing to the electorate for a mandate for a moderate protective tariff, Dec., 1923, he led his party to temporary defeat, a majority of 77 being converted to a minority of 103. Resigning Jan. 21, 1924, to give place to the first Labour government, he returned to the premiership after the election of Oct., 1924, with a majority of 227. His administration was confronted by grave problems, including relations with Soviet Russia, unemployment, and industrial unrest culminating in the General Strike (*q.v.*) of May, 1926. In 1929 he went to the country on a slogan of "safety first," and as a result was temporarily out of office, though surviving attempts by the popular Conservative press to oust him from the party leadership. The economic crisis of 1931 led to the formation in Aug. of a national government, and Baldwin served under Ramsay MacDonald as lord president of the council and lord privy seal. The Conservatives were predominant in the house, and Baldwin's influence in the government was thereby strengthened. On MacDonald's retirement, June, 1935, he became premier again for almost two years. This third and final premiership was marked by growing tension in Europe following the rise to power

of Hitler and Mussolini and their challenge to the League of Nations which Baldwin was pledged to support; also by the constitutional problem inherent in the abdication of King Edward VIII. Baldwin handled the latter problem with much skill and tact, almost single-handed in order to avoid the possible emergence of strong popular feeling; but events showed him to have been less successful in facing the threat from Europe.

Generally esteemed for personal integrity and a high sense of patriotism—his secret gift to the treasury in 1919 of one fifth of his total wealth was characteristic—he was criticised by opponents for an alleged slowness in appreciating the growing strength of the dictators and for failure to redeem his promise of an adequate air force for Great Britain. His defence was the prevalent state of public opinion as expressed in the so-called Peace Ballot (*q.v.*), 1935. On his retirement from political life, May, 1937, he was made an earl and a K.G. He died Dec. 14, 1947, and was succeeded by his son Oliver (*v.i.*).

Always an effective speaker on a wide range of subjects, not necessarily political, Earl Baldwin collected many of his speeches into volumes, including *On England, Our Inheritance*.

Baldwin, Oliver RIDSDALE BALDWIN, 2ND EARL (b. 1899). British politician. Son of the above Stanley Baldwin, he was born March 1, 1899, and went to Eton. Serving as lieut.-col. in the Armenian army, 1920–21, he was imprisoned in turn by Bolsheviks and Turks. Labour M.P. for Dudley 1929–31, and elected by Paisley in 1945, he was known as Viscount Corvedale from 1937 until succeeding in 1947 to the earldom. He was governor of the Leeward Is. from 1948. His publications include *Six Prisons and Two Revolutions*; *The Questing Beast*; *Unborn Son*; *Oasis*.

Bale (late Lat. *bala*, round body). Term for a canvas-covered package, generally hoop-bound and compressed. Packages of textile goods in bale canvas without hoops are known as trusses. The bale is a rough measure of the weight of textile raw materials. Raw cotton is bought and sold in quantities denoted as bales. The American cotton bale is 500 lb., Egyptian 700 lb., W. African 400 lb. The Australian bale of raw wool averages 330 lb., and the S. American wool bale 1,000 lb. The bale of raw jute is 400 lb.

Bâle. French name of a Swiss canton and city; in English, Basle; in German, Basel (*q.v.*).

Bale, John (1495–1563). English bishop and dramatist. Born at Cove, Suffolk. He went from the

John Bale, English bishop and dramatist

Carmelite convent at Norwich to Jesus College, Cambridge, where he became a Protestant and a vigorous controversialist. After holding livings in Suffolk, Hants, and Norfolk, he was made bishop of Ossory in 1552. He retired to the Continent, 1540–47 and 1553–58, and died a prebendary of Canterbury. Blending scholarship with scurrilous invective, Bale edited Leland, on two of whose works and his own study of monastic libraries he founded his Latin history of British writers, published in 1548–49 and 1557–59. His morality or interlude, *Kyng Johan* (c. 1548; ed. J. P. Collier, 1838), marks an important departure in the evolution of the English drama.

Balearic Isles (Span. *Baleares*, Lat. *Baliares*, Slingers' Islands). Group of four large and eleven small islands in the Mediterranean. They are situated off the E. coast of Spain, of which they form a province with area 1,936 sq. m. Apart from Majorca, the largest, Minorca, Ibiza, Formentera, and Cabrera, the rest are rocky islets. They are hilly and belong geologically to the mountain system of Andalusia. The climate is fine, but variable, and the flora and fauna

are similar to those of the nearest mainland. The soil is moderately fertile, and minerals abound, as do prehistoric remains.

The inhabitants are Spanish, with a mixture of Moorish blood. In ancient times they had a reputation as slingers in the armies of Carthage and Rome. They are a hard-working manufacturing people. The standard of education is fairly high. Communication with Spain is frequent and regular, especially with Barcelona and Valencia. The chief products are cereals, wine, oil, and fruit, and these, with marble, limestone, and salt, are exported. The local breeds of pigs and mules are highly esteemed. Typical manufactures are silver filigree work and majolica ware. The capital and chief port is Palma; Port Mahón, in Minorca, has an excellent fortified harbour. Pop. of islands, 437,339.

Colonised by the Phoenicians and Carthaginians, the islands were conquered by Romans, 123 B.C., Vandals, A.D. 423, and Moors in 798, becoming a Moorish kingdom in 1009. Port Mahón was captured by the English in 1708, and Minorca was a British possession until 1756, and again 1763–82, being finally ceded to Spain 1803.

During the Spanish Civil War, 1936–39, Palma was a naval base for Gen. Franco's troops, and the Italians constructed aerodromes there. Minorca, which had adhered to the republican govt., surrendered to Franco, Feb. 9, 1939.

Balestier, Charles Wolcott (1861–91). American journalist and author. Born at Rochester, New York, Dec. 13, 1861, he was educated at Cornell and Virginia

Balearic Isles. Possessing a chequered history of over 2,000 years, these Mediterranean islands have been Spanish since 1803

universities. He was part-author, with Rudyard Kipling, his brother-in-law, of *The Naulahka: a Story of West and East*. He died at Dresden, Dec. 6, 1891.

Balfe, MICHAEL WILLIAM (1808-70). Irish music composer. He was born in Dublin, May 15, 1808, and studied under several teachers in Ireland, and later in London and Italy, and in Paris under Giulio Bordogni. He made a name as an operatic baritone in Paris, as Figaro in Rossini's *Il Barbiere*. Composer of an Italian version of *Falstaff*, he is now chiefly remembered by his light opera in English, but of numerous compositions of this class only *The Bohemian Girl*, 1843, keeps its place in the repertory. His most famous song is *I dreamt that I dwelt*, regarded as unlucky by theatrical tradition. He died Oct. 20, 1870. *Consult* Memoir, C. L. Kenney, 1875.

Michael Balfe, Irish music composer

Balfour, EARL OF. U.K. title, held by the family of Balfour since 1922. The first three earls are considered separately. The heir is known as Viscount Traprain.

Balfour, ARTHUR JAMES BALFOUR, 1ST EARL OF (1848-1930). British statesman. Born at Whittingehame, East Lothian, July 25, 1848, he was the nephew of the 3rd marquess of Salisbury and godson of the great duke of Wellington. He was educated at Eton and Trinity College Cambridge, and first entered parliament as Conservative member for Hertford in 1874. As private secretary to Lord Salisbury, then foreign secretary, he accompanied Lord Beaconsfield on his mission to Berlin in 1878. In opposition after the election of 1880 he attached himself for a time to Lord Randolph Churchill's "Fourth Party," though he was the least active member of that group. At the 1885 election Balfour was returned for E. Manchester, a seat he held for the next 21 years.

His first ministerial office came with his appointment as president of the Local Government Board, 1885, but that post was soon changed for the secretaryship of Scotland; then in 1887 he became chief secretary for Ireland, an office that gave him for the first time an opportunity of revealing his full abilities. Political passions

ran high in Ireland at that time, the land war being at its height. But under Balfour the country was ruled with unflinching firmness. He was long spoken of there as "bloody Balfour," but the Irish Nationalists, who began by stoning him, passed through all the stages of surprise, respect, and admiration. Indeed he proved himself to be the strongest minister in the House of Commons, and became its leader on the death of W. H. Smith in 1891. Between 1892 and 1895 he was leader of the opposition, taking a foremost part, with Joseph Chamberlain, in attacking the Gladstone and Rosebery administration.

From the return of the Unionists to power in 1895 until the end of 1905 Balfour was first lord of the Treasury and leader of the House of Commons. When Lord Salisbury retired in July, 1902, he became prime minister. The dominating influence of Chamberlain was then at its height, and Balfour was by no means in complete accord with his powerful lieutenant on the issue of tariff reform, still less on the best way of presenting the issue to the country. The party was therefore split and its majority reduced to impotence. In the general election of 1906, not only were the Unionists routed at the polls, but Balfour himself was unseated at E. Manchester.

Shortly afterwards he became M.P. for the City of London, and retained the seat until raised to the peerage in 1922. The next five years brought strenuous and heated political conflict, Balfour leading the opposition against such Liberal measures as the Licensing Bill of 1907, the Lloyd George budget of 1909, and the Parliament Bill abolishing the peers' veto. His physical strength being overtaxed, Balfour resigned the leadership in Nov., 1911, but continued to give active support to his successor, Bonar Law.

The First Great War opened a new phase of his career. He offered his unofficial services in any capacity, and in the first coalition government formed May, 1915, he became first lord of the Admiralty. In Lloyd George's coalition he was transferred to the foreign office, and in 1917 served the Allied cause

brilliantly as head of the British mission to the U.S.A. American publicists described him at the time as the most successful British envoy ever to visit the U.S.A.

During the Versailles conference of 1919 his position as foreign secretary brought a large share of responsible duties, performed to the admiration of all the Allies. After the signing of the Versailles treaty he left the foreign office, becoming lord president of the council. In 1921-22 he led the British delegation to the Washington naval conference, and on his return was made successively a knight of the Garter and an earl. With the fall of the coalition government in 1922 he retired from active politics and died March 19, 1930.

Balfour, who remained a bachelor, loved music, philosophy, and golf. He wrote *A Defence of Philosophic Doubt*, 1879, *The Foundations of Belief*, 1895, and his Giffard Lectures on Theism and Humanism. His honours included the O.M. and the F.R.S. His personal ascendancy during his long period in the House of Commons was due to an exceptional charm of manner, a staunch loyalty to his friends, and the possession of striking intellectual gifts. On his resignation as leader of his party his great political rival Asquith referred to him as being "by universal consent the most distinguished member of the greatest deliberative assembly of the world." See *Balfour Declaration*; *Education Acts*. *Consult* Lives, Webb and Kenyon, 1931; B. E. C. Dugdale (niece), 1936.

Balfour, GERALD WILLIAM BALFOUR, 2ND EARL OF (1853-1945). British politician. Born April 9, 1853, he was educated at Eton and Trinity College, Cambridge, of which he became a fellow and lecturer. He was Conservative member for Central Leeds from 1885 until 1906. He was chief secretary for Ireland, 1895-1900, president of the Board of Trade 1900-05, and president of the Local Government Board for a few weeks. Defeated at the 1906 election, he retired from politics. On the death of his brother, the above 1st earl, in 1930, he succeeded to the title by special remainder. He married in 1887 Lady Betty Lytton (d. 1942). He died Jan. 14, 1945.

Balfour, ROBERT ARTHUR LYTTON BALFOUR, 3RD EARL OF (b. 1902). British politician. Educated at Eton and Trinity College, Cambridge, he succeeded his father in the earldom in 1945. As Viscount Traprain he was chairman of

Balfour

the Scottish Special Housing Association 1938-44, and in 1942 was appointed regional controller for Scotland for the ministry of Fuel and Power. He was grand master mason of Scotland, 1939-42.

Balfour, LADY FRANCES (1858-1931). British author. Daughter of the 8th duke of Argyll (*q.v.*), she married in 1879 Colonel Eustace Balfour (d. 1911), younger brother of the above 1st earl and prime minister. Taking an active interest in public life, she advocated the enfranchisement of women and their wider educational opportunities. She wrote memoirs of Lady Victoria Campbell, 1911; Dr. Elsie Inglis, 1918; the 4th earl of Aberdeen, 1922; and Lord Balfour of Burleigh, 1925. She died Feb. 25, 1931.

Balfour, FRANCIS MAITLAND (1851-82). British scientist. The third of four brothers, the eldest being Arthur J. Balfour, he was born in Edinburgh, Nov. 10, 1851.

In early boyhood he showed an interest in science, which he continued at Harrow and at Trinity College, Cambridge, where he began to specialise in animal morphology. After taking his degree he continued his studies at Naples. He was elected fellow of Trinity and university lecturer in animal morphology, and in 1880-81 published his work on Comparative Embryology. A special professorship had just been created for him, when he was accidentally killed on the Alps, July 18 or 19, 1882.

Balfour, SIR ISAAC BAYLEY (1853-1922). British botanist. Born at Edinburgh, March 31, 1853, son of Prof. John Hutton Balfour, he was professor of botany at Glasgow 1879-84, and Sherardian professor of botany at Oxford 1884-88, and became professor of botany at Edinburgh in 1888. He wrote on the flora of Rodriguez, and died Nov. 30, 1922.

Balfour, JABEZ SPENCER (1849-1916). British company promoter. Educated abroad, he became the principal promoter of the Liberator Building Society, 1868, and an allied group of similarly speculative concerns, including the Lands Allotment Company and the House and Land Investment Trust. All these concerns failed in 1892, with total liabilities of £8,360,000, in-

volving in ruin a large host of small investors. Balfour, who was Liberal M.P. for Tamworth, 1880-85, and Burnley, 1889-93, and first mayor of Croydon, 1883, fled to Buenos Aires in 1893, but was arrested. Sentenced at the Old Bailey in 1895 to 14 years' penal servitude for fraud and conspiracy, and released in 1906, he died Feb. 23, 1916. *See Liberator Frauds.*

Balfour, SIR JAMES (d. c.1584). Scottish judge. For complicity in the plot to murder Cardinal Beaton (*q.v.*) he served a sentence in the French galleys from 1547-49, gaining his freedom by abjuring his creed. He is supposed to have drawn up the bond for Darnley's murder. Made governor of Edinburgh Castle by Bothwell during Murray's regency, he was president of the court of session, and was probably part-author of the earliest text-book on Scottish law, known as Balfour's Practicks. Balfour was "the most corrupt man of his age," who, according to P. F. Tytler, "had served with all parties, had deserted all, yet had profited by all."

Balfour OF BURLEIGH, BARON. Scottish title, created 1607. The 3rd and 6th barons are noticed separately below. The 7th baron, George John Gordon Bruce, was born Oct. 18, 1883, and succeeded his father in 1921. In 1945 he was chosen to succeed Lord Wardington as chairman of Lloyds Bank.

Balfour OF BURLEIGH, JOHN BALFOUR, 3RD BARON (d. 1688). Scottish nobleman, only son of Robert, second baron, whom he succeeded in 1663. He is sometimes confused with the covenanter, John Balfour of Kinloch, one of the principals in the assassination of Archbishop Sharp in 1679, and the "John Balfour Burley" of Scott's Old Mortality. The third Lord Balfour of Burleigh was not a covenanter.

Balfour OF BURLEIGH, ALEXANDER HUGH BRUCE, 6TH BARON (1849-1921). British politician. Born at Kennet, Alloa, Jan. 13, 1849,

Jabez Balfour, company promoter

the son of a commoner, in 1869 he was given the title of Balfour of Burleigh, forfeited by one of his maternal ancestors in 1716. Educated at Eton and Oriel College, Oxford, he entered public life in 1874. As a Conservative he was parliamentary secretary to the Board of Trade, 1889-92, and from 1895 to 1903 secretary for Scotland, a post he resigned owing to his hostility to Chamberlain's tariff reform proposals. In 1916 he was chairman of the Committee on Commercial and Industrial policy. He was the author of Rise and Development of Presbyterianism in Scotland, 1911. He died July 6, 1921.

Balfour OF INCHRYE, HAROLD HARTINGTON BALFOUR, 1ST BARON (b. 1897). British politician. Born Nov. 1, 1897, and educated at the Royal Naval College, Osborne, he joined the 60th Rifles in 1914, transferred to the R.F.C. in 1915, and served with the R.A.F. until 1923. In 1929 he became Conservative M.P. for the Isle of Thanet and was still holding the seat when created a baron at the dissolution of 1945. He was under-secretary for Air 1938-44, and minister resident in W. Africa, 1944-45.

Balfour Declaration. Letter dated Nov. 2, 1917, from A. J. Balfour, then British foreign secretary, to Lord Rothschild, chairman of the British Zionist Federation. Promising to seek the establishment of a Jewish national home in Palestine, this document became the keystone of Zionist politics. *See Zionism.*

Balham. Residential suburb of S. London. It is one of the E. wards, and, with Tooting, a parl. constituency returning one member, of the borough of Wandsworth. An offshoot of the parish of Streatham, it is fringed by Tooting Common. Pop. 53,982. *See London.*

Bali. Island of Indonesia. It lies E. of Java, from which island it is separated by a narrow,

Bali. Native life in the Dutch E. Indies. Street of Singaradia, in the Island of Bali, with a Hindu temple

shallow strait. The channel between Bali and Lombok (*q.v.*) is known as Wallace's line. Bali is mountainous in the centre, the volcano Gunung-agung attaining 10,497 ft., and has an area of 2,160 sq. m. In climate, flora, and fauna it resembles Java. Akin to the Malayan-Javanese, the natives are clever workers in sculpture and metal work. The chief products are rice, cotton, coffee, sugar, and tobacco. Buleleng is the capital. Bali was not brought under Dutch suzerainty until the late 19th century. Pop., with Lombok, 1,802,683.

The Japanese landed in Bali, Feb. 20-22, 1942, and remained in occupation until Dutch troops arrived March 2, 1946. A period of guerrilla war and terrorism by Balinese against the Dutch followed, ending June, 1948, with the surrender of 750 young rebels. Bali was made one of the 13 dists. of the federal state of E. Indonesia, Dec., 1946. See Indonesia.

Balieff, NIKITA (1877-1936). Russian impresario. He began his career at the Moscow Arts Theatre, subsequently evolving La Chauve-Souris (The Bat), a carabet entertainment which was to make his name famous throughout W. Europe and the U.S.A. Balieff left Russia during the revolution of 1917, and organized a troupe of dancers, singers, and actors into a highly drilled company. La Chauve-Souris consisted of songs and sketches, timed and ordered with the utmost precision. He died in New York, Sept. 3, 1936.

Balikesir OR **BALIKISIRI**. Town of Asiatic Turkey. Famous for its great annual fair in Aug., it lies 75 m. S.W. of Bursa, on the rly. from Panderma to Soma. Standing in a plain of remarkable fertility, it produces grain and fruit. Pop. of town, 25,740. It gives its name to a vilayet with pop. 526,265.

Balik-Papan. Seaport on the S.E. coast of Dutch Borneo. Some 15 million barrels—one fifth of the oil from Indonesia—were produced annually in or near Balik-Papan. When the Japanese invaded Borneo in 1942 the Dutch fired the wells on Jan. 22. The Japanese occupied Balik-Papan, Jan. 27, and got the wells into production again. During June, 1945, the area was heavily bombed by U.S. and Australian aircraft. The Australian 7th div. landed here July 1, and secured the town by July 4.

Balilla. Name of the young boys' state organization set up by the Italian fascist government in

April, 1926, to embody all boys' organizations. Its ostensible purpose was the physical and moral training of the young, and athletic drill in the schools by specially trained teachers. Its real aim, however, was to take in hand the younger generation at an early age and prepare it for the pre-military stage which was reached at 14. The Balilla also had branches in all foreign countries, wherever Italian communities lived. It was named from the Genoese youth Balilla, who in 1746, by throwing a stone at an Austrian soldier, started a popular revolt against the Austrians then occupying Genoa.

Baliol, EDWARD (d. 1367). King of Scotland. The eldest son of John Baliol (d. 1315), whose French estates he inherited. He invaded Scotland in 1332, and was crowned king at Scone, and did homage to Edward III of England. A pawn in Edward's hands, in 1356 he finally surrendered the whole of Scotland to the English king in return for a pension. He died without issue at Wheatley, near Doncaster.

Baliol, JOHN (1249-1315). King of Scotland. He was the third son of John Baliol (d. 1269), founder with his wife of Balliol College, Oxford. On the death in 1290 of Margaret, the Maid of Norway, he claimed the Scottish crown through his maternal grandmother, Margaret, eldest daughter of David, earl of Huntingdon, grandson of David I. He was recognized as king by Edward I of England, crowned at Scone, Nov. 30, 1292, and did homage to Edward. In 1295 he made an offensive alliance with France, and in 1296, when Edward made war on France, the Scots invaded England. Edward promptly returned, defeated the Scots, and Baliol surrendered the crown in July, 1296. He was imprisoned in the Tower until 1299, and then released, retiring to his French estates. He died in Normandy. The name Baliol comes from Bailleul in Normandy.

Bali Straits, BATTLE OF. Naval operation of the Second Great War. On Feb. 19, 1942, a large Japanese force landed on the island of Bali, wiped out the small Dutch military garrison there, and captured the aerodrome at Den Pasar. This success provided the

enemy with a base from which to furnish air cover for the ferrying of large forces across the narrow Bali Strait to Java (*q.v.*). Some days before the capture of Bali, Dutch reconnaissance aircraft had reported large concentrations of Japanese transports and warships in the Macassar Strait and in the South China Sea, obviously intended for the invasion of Java. Although the covering force of Japanese cruisers was known to be at least three times as great as that available to the Allies, Vice-Admiral Helfrich, who had been appointed C-in-C. Allied naval forces, S.W. Pacific, ordered Rear-Admiral Doorman to attack the enemy with his forces in the Indian Ocean. Doorman's fleet consisted of two Dutch cruisers and one Dutch and two American destroyers; a second force consisting of the Dutch cruiser Tromp and four small American destroyers was ordered to sail from Surabaya for Bali.

The Dutch plan was for Doorman's force to proceed at full speed to Lombok Strait and engage the Japanese first, and for the second Allied force to attack a few hours later when the enemy would, it was thought, be in confusion. The operation depended wholly on surprise. It was probable the enemy had already closed in on the Strait of Bali. Before the attacking warships could open fire on the enemy's invasion craft, it would be necessary to light up the entire bay with star shells, so giving warning of the Allied ships' approach. By the time Doorman's warships reached Bali, the Japanese had captured the island, but it was decided to attack the enemy ships before midnight of Feb. 19, 1942, when the invaders would be busy with landing operations.

At 9 p.m. the operation began. First, in line ahead, came the Dutch cruisers De Ruyter and Java, followed by the Dutch destroyer Piet Hein. The two U.S. destroyers, under Commander Binford, brought up the rear. The De Ruyter opened fire first, her star shells lighting up a number of Japanese ships at close quarters. The Java hit and set on fire a large transport, but by that time the Japanese had recovered from their surprise, and their warships opened up on the Allied vessels. The Java was hit in the stern by an 8-in. shell, though no vital damage was done, and the De Ruyter was slightly damaged. The Piet Hein released her torpedoes and hit a Japanese cruiser, but

John Baliol,
King of Scotland

shortly afterwards she was herself hit in the boiler-room, and while helpless was torpedoed and sunk.

The two American destroyers steamed into the middle of a formation of Japanese transports and destroyers and loosed off their torpedoes, doing considerable damage. Although the Allied attack lasted only ten minutes, the enemy had been thrown into complete confusion and had lost a number of transports and possibly some warships. But by the time Doorman's force had broken through the enemy, the admiral realized that the Japanese were too strong in heavy cruisers for him to turn and engage them once more. Accordingly, he returned to Surabaya. Shortly after midnight the Tromp and the four American destroyers appeared on the scene and opened fire on the Japanese ships, some of which were lit by arc lights to enable their crews to repair the damage sustained in the earlier raid. The Dutch cruiser opened fire at short range and immediately registered hits on a large vessel to port. Then the Tromp herself nearly met disaster. In the darkness she had passed an enemy warship unawares against the dark background of the island. The Japanese vessel had sighted the Dutchman, and, turning, opened fire from a few thousand yards on the Tromp's starboard beam. The Tromp's fire-control system was destroyed by an 8-in. shell, but her 6-in. gun turrets fired independently at the searchlights which the Japanese warship had switched on to light up the Tromp. Within a few minutes the enemy vessel's fire

ceased. The Tromp, however, had received nearly a dozen direct hits from 8-in. shells and many of her crew were dead. Accordingly, her captain decided to withdraw.

In the meantime, the U.S. destroyers had each launched their dozen torpedoes, hitting a cruiser, several destroyers, and a number of transports. The American attack took the enemy completely by surprise, throwing them into confusion, with wild shooting in all directions. One of the American destroyers was holed in the stern, but was able to follow the Tromp out of the battle. Two others, which had been cut off by the Japanese, turned and steamed away southwards.

The success of the action denied to the enemy the use of Bali for the attack on Java by land forces, though the Japanese ultimately invaded the archipelago by two other routes.

David Le Roi

Balk. Town of Afghanistan. Anciently known as Bactra, and reputed to be the birthplace and burial place of Zoroaster, it is still described as the mother of cities. In the 3rd century B.C. Bactra, capital of the ancient Bactria, rivalled Nineveh and Babylon, and was the capital of a powerful Greco-Bactrian monarchy. It was destroyed by Jenghiz Khan A.D. 1220, and superseded by Mazar-i-Sharif as capital of the prov. 1877.

Balkan Air Force. Composite group of the Mediterranean Allied air forces formed Aug. 5, 1944, under the command of Air Vice-Marshal W. Elliot. The Balkan Air Force centralised the conduct of air operations in the Balkans,

except strategic bombing, and intensified the air attacks on the enemy forces engaged by Yugoslav partisans. Bombing the escape routes of Axis troops withdrawing from Tirana, Nov. 11, 1944, was a typical operation.

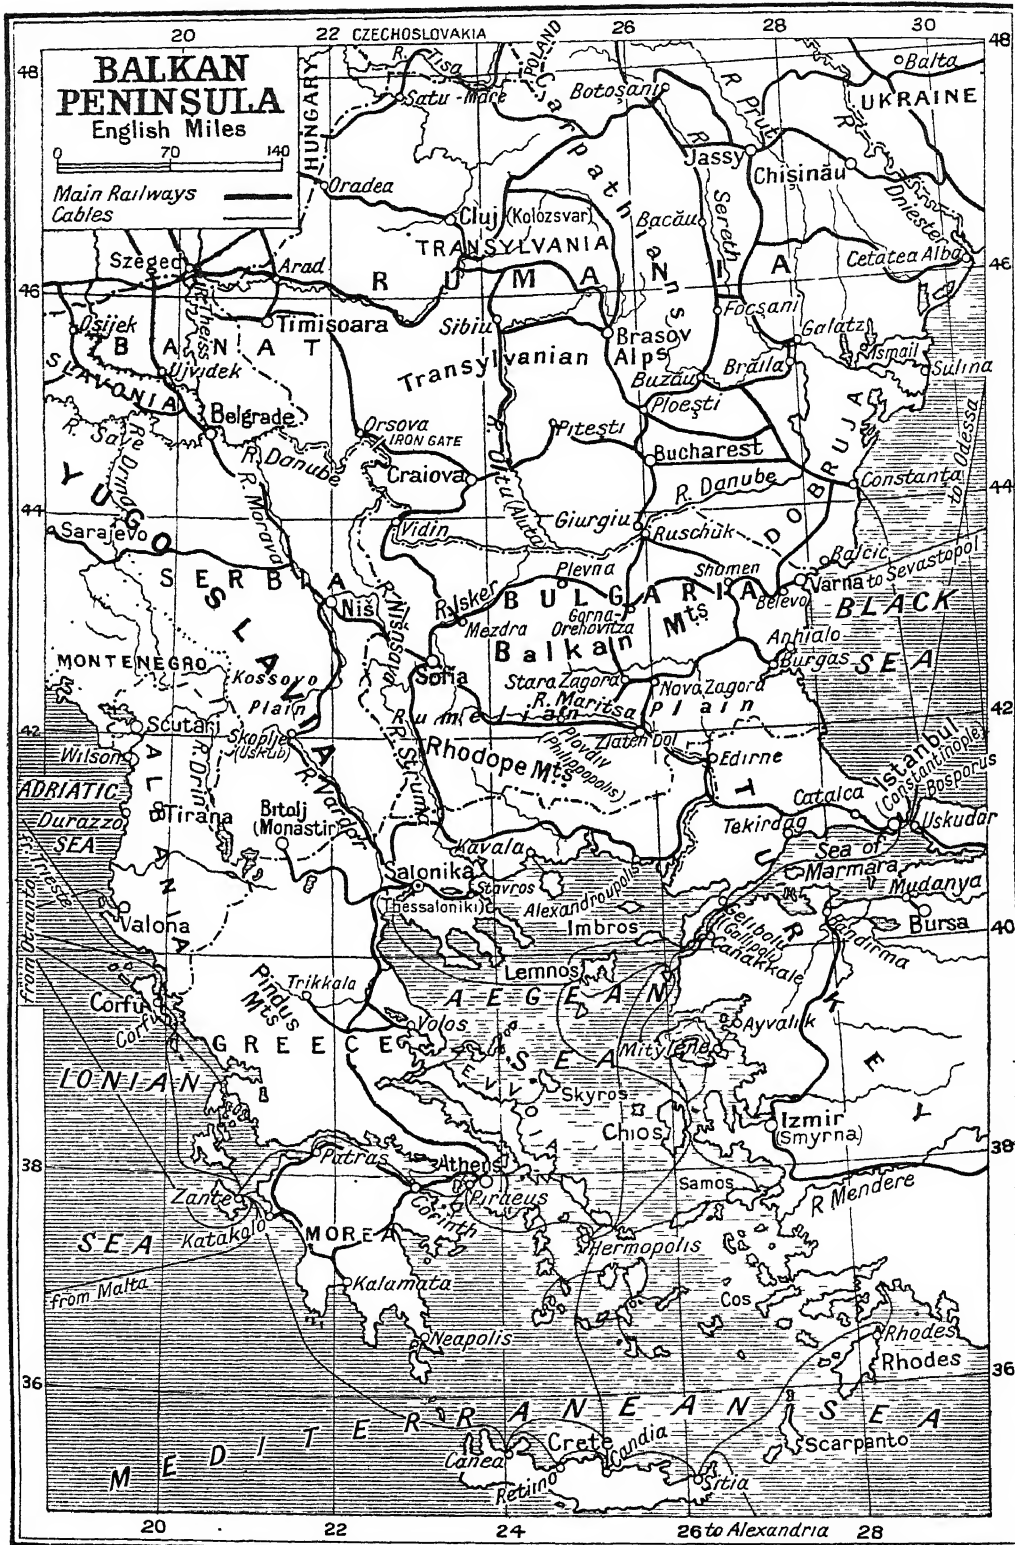

Balkan Entente. Regional pact between Greece, Turkey, Yugoslavia, and Rumania, concluded on Feb. 9, 1934, whereby the signatories mutually guaranteed their Balkan frontiers and pledged themselves to abstain from independent action with any non-signatory Balkan state. A secret protocol provided for joint action if a signatory were attacked by a non-Balkan power and a Balkan state joined in the aggression. A second secret protocol specified the measures to be taken against Bulgaria if she intervened. At a conference in Belgrade, Feb., 1940, the Balkan Entente was renewed for a further period of 7 years and the desire for a policy of neutrality in the Second Great War was emphasised. The political developments arising out of that war made the entente a dead letter.

Balkan Mountains (anciently Haemus). Mt. range of S.E. Europe. Traversing Bulgaria from W. to E., with the Stara Planina on the Serbian boundary, it extends from the Iron Gates of the Danube to Cape Eminch on the Black Sea. These mts. form a portion of the great east-west mt. system of Eurasia, of which the Alps and Himalayas are the best known members. Southwards the Balkans present a steep face, but to the N. fall more gently, opening out into a plateau sloping to the Danube. Among the loftiest peaks are Yumrukchal, 7,786 ft.; Kadimlia, 7,478 ft.; and Ambarika, 7,317 ft. The eastern ridges are lower and more broken, with an average alt. of 3,000 ft. Geologically the Balkans are composed chiefly of sedimentary strata, consisting of limestone with a core of crystalline schists and granites containing iron, copper, and lead. Troyan, Rosalita, and Shipka are the best known passes. See Rhodope Mts.

Balkan Peninsula. Easternmost of the great peninsulas of southern Europe, also called the Illyrian Peninsula. It is bounded N. by the rivers Danube and Save, S. and S.E. by the Black Sea, the Sea of Marmara, and the Aegean, and W. by the Adriatic and the Ionian Sea. It consists of Bulgaria and Turkey in Europe on the E., parts of Yugoslavia, and Albania and Greece, the total

Balkan Mountains. The monastery of Rilo, looking towards the Djúmaia pass, amid the magnificent mountain scenery of Bulgaria

Balkan Peninsula. Map showing the Balkan States, with boundaries as they were at the beginning of 1939

area being in the region of 180,000 square miles.

The S. part of the peninsula is the Morea, the S. portion of Greece, virtually an island. Most of the peninsula is mountainous. The central range of the Balkans proper, which gives it its name, runs through Bulgaria from W. to E.; below this range are the southern Balkans and the Rhodope Mts., the latter rising to about 10,000 ft. In the centre are various mt. chains, and on the W. the Dinaric Alps, the Albanian Mts., and the Pindus Mts., Mt. Dinara being over 6,000 ft. Except the plain of Rumelia in Bulgaria, and the much smaller Kossovo Plain, in Serbia, the plains are of small extent.

The mountainous character of the peninsula makes the rivers short and rapid, and thus mostly unfit for navigation. The Danube, which receives the Morava, Isker, and other streams, flows to the Black Sea; the Maritza, Struma, and Vardar are the largest of the rivers falling into the Aegean Sea; and the Narenta, Viosa or Voyusa, and Drin are the most considerable streams emptying into the Adriatic. The principal lakes are Scutari, Ochrida, and Prespa.

The Morava-Vardar valleys form the main route from Belgrade to Salonica both by rail and road; the upper part of this route as far as the Nishava is that of the Orient Express, which goes up the Nishava to Sofia and Istanbul. In Bulgaria rlys from Sofia and from Varna connect with the Rumanian systems; from Salonica lines run E. to Istanbul and W. to Bitolj (Monastir), the Greek railways serve N.E. Greece S. to Athens, from which a line runs on to Corinth and round the Morea. The peninsula experiences a great variation of climate. In the central portion and on the E. coast it ranges between that of Central Europe and S. Russia. On the Aegean coast the winters are quite mild. Rainfall is fairly uniform throughout the year in the central portion and on the E. coast, scanty on the Aegean coast, and copious on the W. coast. The products are wheat, maize, cotton, tobacco, plums, grapes, olives, and mulberries, and cattle, sheep, pigs, and goats. When Constantinople was taken in 1453 by the Turks, they swept across the land, but in the 16th century they began to be pushed back, and, before the First Great War, mainly as a result of the Balkan Wars, had lost all the small portion E. of the Maritza, and S. of lat. 42° N. See Bulgaria; Greece; Rumania, etc.

THE BALKAN WARS OF 1912 AND 1913

Robert Machray, Writer on Foreign Affairs

Below are described the war carried on by the Balkan States against Turkey in 1912-13 and the succeeding war against Bulgaria. See also under Adrianople; Kirk Kilisse. Salonica, etc.

During the summer of 1912 Bulgaria, Serbia, Greece, and Montenegro formed themselves into the Balkan League with the object of liberating Macedonia from the Turkish yoke. In this region, largely inhabited by Bulgars, Serbs, and Greeks, the Turkish Government had promised to institute reforms, but had never carried them out, in spite of pressure from the Great Powers. The general programme of the league contemplated the ultimate ejection of the Turks from Europe, and this might have been achieved in the first war had the Bulgars shown bolder generalship. Each member of the league also had some individual purpose, e.g. Serbia was bent on obtaining access through Albania to the Adriatic, while the others desired territorial gains of one kind or another.

First Bulgaria and Serbia entered into a military convention against Turkey, with the practical adhesion of Montenegro, which was in close sympathy with Serbia. Greece joined them later, and before war began Turkey made strenuous but vain attempts to induce her to break away. The massacre of a number of Bulgars at Kotchana in N.E. Macedonia by the Turks early in Aug. led to a formal protest to Turkey, who, however, disregarded it. The league was actively working for war, and mobilisation took place in Sept. in Bulgaria, Serbia, and Montenegro, Greece following suit in the first week of Oct., when Turkey also began mobilising; but she was badly prepared for such a course, as a few weeks before she had disbanded an army of 120,000 men concentrated at Smyrna to repel an Italian invasion.

Outbreak of Hostilities

By diplomacy and threats the Great Powers vainly endeavoured to prevent the outbreak of hostilities. On Oct. 8 Montenegro declared war on Turkey, and her troops, with whom were the Mirdite and Malissori Albanians, advanced on Scutari. Greece proclaimed her full sovereignty over Crete, and the league sent a note to Turkey demanding the immediate establishment of autonomous provinces in Macedonia, with Christians as governors. Turkey replied by withdrawing her diplomats from the Balkan states, and, having made peace with Italy, declared war on Oct. 17. On

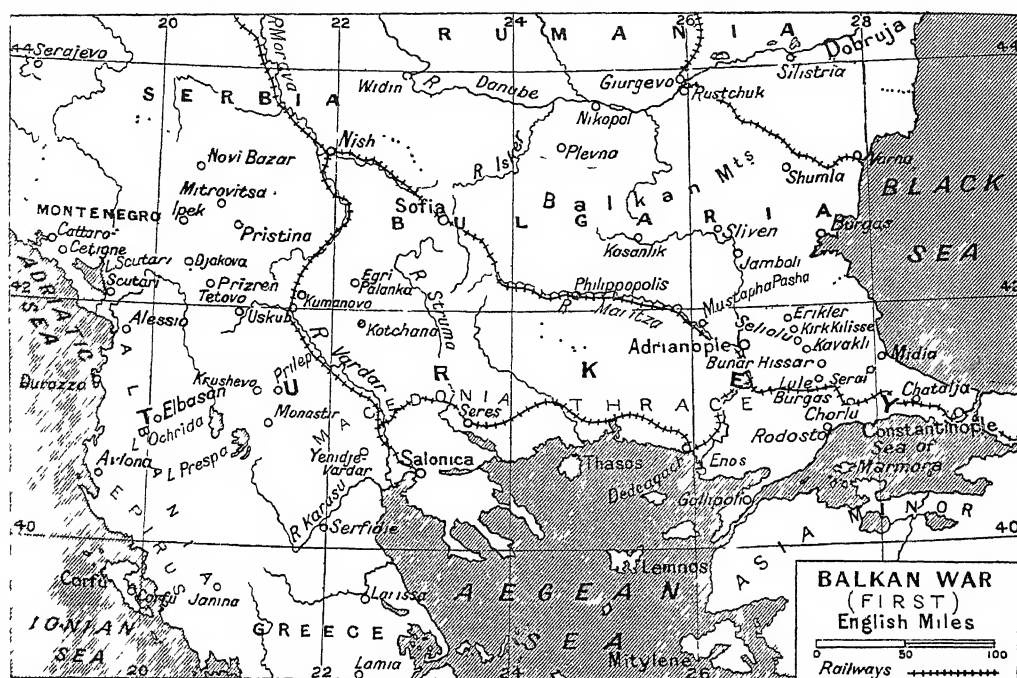

the following day Bulgars, Serbs, and Greeks invaded Turkish territory at various points—the Bulgars entering Thrace from the N., and the Serbs and the Greeks entering Macedonia from the N. and S. respectively.

The two main theatres of war were Thrace and Macedonia; there was some fighting in the Novi Bazar district, in Epirus, and in Albania, but here the contest was of secondary importance. In round numbers Bulgaria put into the field upwards of 300,000 men, Serbia 190,000, Greece 110,000, and Montenegro 35,000. Turkey had considerable forces in Asia Minor, but these were not available at the beginning, while the Greek fleet controlled the Aegean and barred the Turks from dispatching troops by water to Macedonia. When war broke out, Turkey had about 190,000 men in Thrace, and nearly 200,000 in Macedonia and Albania, under the chief command of Nazim Pasha; the Balkan allies thus had a preponderance of almost two to one.

Turkish Calculations Upset

The general plan of the Turks was to stand on the defensive. They believed that the main theatre of the war would be Macedonia, not Thrace, and made preparations accordingly; but the discovery that an active offensive in Thrace was part of the plan of the league upset their calculations. Under the military convention between Bulgaria and Serbia, one-third of the Bulgarian army was to cooperate with that of Serbia in Macedonia. Notwithstanding this arrangement, however, except one division which worked through E. Macedonia towards Salonica, the whole Bulgar army concentrated on Thrace in three armies, with General Savoff in chief command, General Ticheff being chief of staff.

The second army, under General Ivanoff, about 90,000 strong, advanced on Adrianople and occupied Mustapha Pasha on Oct. 18. It invested Adrianople on the W., N.W., and N. four days later. The third army, under General Dimitrieff, 80,000 strong, marched from Jamboli towards Kirk Kilisse, while the first army, under General Kutincheff, 80,000 strong, advancing between the two other armies, defeated a Turkish force at Selolu and pursued it to Kavakli.

Balkan War of 1912. Territorial position in the peninsula when the Balkan states of Greece, Bulgaria, Serbia, and Montenegro combined to emancipate Macedonia and Thrace from Turkish tyranny

The Turks, under Abdullah Pasha, had about 130,000 men in the field, with 60,000 men in garrison at Adrianople under Shukri Pasha, and Abdullah, on the line Adrianople-Erikler, undertook an offensive, but it failed under Bulgarian attacks on Oct. 22. Dimitrieff drove on to Kirk Kilsse, an important junction of roads defended by two forts, on Oct. 23-24 defeated three Turkish corps under Mahmud Mukhtar Pasha, and entered the town on Oct. 24. He wished to push on, but Savoff overruled him, and the Bulgars halted for four days, which allowed Abdullah to make good his retreat to the Karagatch-dere, and to reorganize his troops. On Oct. 28 the Bulgars were driven back to the heights of Karagatch, and furious fighting developed on the front Bunar Hissar-Lule Burgas, lasting until the night of Oct. 31 around Lule Burgas, which was taken by the Bulgars on that day, and around Bunar Hissar until Nov. 2, the Turks, whose losses had been severe, falling back unpursued through Chorlu and Serai on the Chatalja lines. Had Dimitrieff pressed on after his victory at Lule Burgas he probably would have been able to march on to Constantinople, but in obedience to instructions from Savoff he halted, and this gave the Turks time

to fortify themselves at Chatalja, which he did not reach until Nov. 12. His attempt to storm the Chatalja lines on Nov. 17-18 failed.

Meanwhile the Serbians and Greeks had been successful in Macedonia, and the Montenegrins, though they were held up in front of Scutari, had taken Ipek and Djakova. In the Novi Bazar district the Serbians captured the town of Novi Bazar on Oct. 21, took Mitrovitsa two days afterwards, and by Oct. 29 had the whole of the sanjak in their hands.

Serbian Successes

A second Serbian group stormed Pristina on Oct. 22. But the main contest was between the first army of the Serbians, under the crown prince Alexander and General Bojevitch, about 90,000 strong, aided on the E. by the second army, of about 25,000 men, near Egri Palanka, and the Turkish army of the Vardar, under Zekki Pasha, consisting of 85,000 troops, supported by 20,000 Albanians.

In the battle of Kumanovo the Turks were decisively defeated on Oct. 23-24, the Serbs occupying Uskub without opposition on Oct. 26. The Turks fell back on Prilep and Tetovo (Kalkandelen), followed slowly by the Serbs. In Nov. the second Serbian army, under General Stepanovitch, was transferred to Adrianople to assist the

Bulgars besieging it, and in the beginning of that month the first army advanced southward on Monastir, after taking Tetovo on Nov. 1. It captured Prilep on Nov. 5, and Krushevo on the following day.

After a great battle on Nov. 16-18, Monastir passed to the Serbians on Nov. 18, and the Turks had lost the campaign in that part of Macedonia. Nor were they more fortunate in the southern section, where they were attacked by the Greek army, with the crown prince Constantine as commander-in-chief, General Danglis being chief of staff. This army, except one division which was in Epirus watching Janina, comprised all the Greek forces. Moving towards Salonica, it defeated the Turks, under Hassan Tahsin, at Serfidie (Sarantoporon) on Oct. 22, and again at Yenidje-Vardar on Nov. 1-2. Forcing the Vardar, the Greeks obliged Salonica to surrender on Nov. 9.

During Nov. the Serbs, after a magnificent march through the mountains of Albania, reached the Adriatic at Alessio and Durazzo, and held all N. Albania by the beginning of Dec. This excited the jealousy of Austria, and led to the establishment of the independence of Albania by the Great Powers, who later put pressure on Serbia to withdraw from Albania, which, however, she did not do until the

autumn of 1913, under threats from Austria. On Dec. 3 an armistice was arranged between Bulgaria and Serbia on the one hand and Turkey on the other, but Greece continued the struggle into Feb., 1913, when the general conflict was renewed.

A conference in the meantime had met in Dec. in London, which was attended by representatives of the Balkan states and Turkey, but no settlement was reached, though the independence of Albania was provisionally proclaimed. The features of the second phase of the first war were the successful resistance of the Turks at Chatalja, their loss of Janina to the Greeks on March 6, and of Adrianople to the Bulgars and Serbs on March 25-26. Turkey admitted defeat, and a second armistice was signed at the end of March, except by Montenegro, who continued the siege of Scutari, which fell to her on April 22, but which the Great Powers compelled her to evacuate on May 6. The first Balkan War was ended on May 30 by the treaty of London, whereby Turkey ceded to the Balkan League her European territory west of a line drawn from Midia, on the Black Sea, to Enos, on the Aegean, as well as Crete.

Second Balkan War

The second Balkan War was fought in 1913 between the Bulgarians on the one side and the Serbians and Greeks on the other. The treaty of London, which ended the first Balkan War, had scarcely been signed when the Balkan League went to pieces, its members disagreeing as to the division of the ceded territory. In May, 1913, Serbia and Greece signed a military convention for common action, and on June 29-30 the second Balkan War broke out, Bulgaria starting it by a sudden treacherous attack.

Dimitrieff commanded the Bulgars, General Putnik the Serbs, and Constantine, who in March had succeeded to the throne, the Greeks. The Bulgars, with Ivanoff in local command, attacked the Greeks in the Drama-Seres region and drove them back, but themselves were held up by July 1, and, defeated at Gevgheli and Kilkis, evacuated Kavalla. But the main Bulgar attack was directed by Dimitrieff against the Serbs about Krivolak, which they lost, and on the general line of the Bregalnitz, where the struggle was most severe. At first the Bulgars gained ground, but by July 9 were decisively beaten in the battle of the Bregalnitz. An assault made on the Serbs farther N. also failed.

Balkan Wars. The extent of territory lost by Turkey as a result of the fighting during 1912-13

On July 10 Rumania intervened to impose peace and exact part of the Dobruja from Bulgaria. Her troops advanced into Bulgaria unopposed; Turkey saw her opportunity and reoccupied Adrianople without resistance. The Serbs took Egri Palanka on July 14, and pressed the Bulgars back. On July 25-27 the Greeks defeated the Bulgars at Semitli, and by July 30 Bulgaria was surrounded and her position hopeless. Next day she was granted an armistice. Peace was made on Aug. 10 by the treaty of Bukarest between Bulgaria on the one side and Rumania, Serbia, Greece, and Montenegro on the other. Later Bulgaria and Turkey signed a treaty of peace.

Price, 1914; The Balkan Wars, 1912-13, J. G. Schurman, 1914; The Rise of Nationality in the Balkans, R. W. Seton-Watson, 1917.

Balkaria-Kabardin. Autonomous republic of the R.S.F.S.R. In the N. Caucasus, it is bordered on the S. by Georgia S.S.R. Nalchik is the chief town.

Balkhash. Saltlake of Kazakh S.S.R., also called Tengis. After being a large body of water, and then decreasing much in area, it began to rise, with every appearance of approaching its old limits. Situated about 120 m. from the Chinese

frontier, it is 330 m. long and at its widest 53 m. broad. With an area of some 8,500 sq. m., it is fed by the Ili and other streams, but has no outlet. It lies about 800 ft. above sea level. Kounrad, on the N., is the principal town; here are copper beds, while in the vicinity occur zinc and molybdenum. Kounrad is on the air line from Alma-Ata to Akmoinsk. See Pribalkhash.

Ball. A spherical or globular body, either natural or artificial. The word in this first sense is derived from the Icelandic *bolli*, meaning a globe. In its second sense, that of a large social dance, it comes—through the French *bal*—from late Latin *ballare*, to dance; Gr. *ballizein*, to throw the leg about. The different ball games are described under the various headings, e.g. Croquet; Football.

Ball, JOHN (d. 1381). English priest and social rebel. First heard of at York, and later at Colchester, he was for 20 years an itinerant priest, preaching and organizing the social insurrection which took place under Wat Tyler, 1381. His doctrine was revolutionary, and remarkable for its advocacy of social equality, at that time a novel theory. Ball's sermon to the peasants at Blackheath is given in Froissart, and his activities were conspicuous throughout the insurrection. He was excommunicated for his social "errors, schisms, and scandals against the bishops and

clergy" by three successive archbishops of Canterbury, and was in prison at Maidstone when the rising began. Released by the rebels, he was taken at Coventry on the suppression of the rising and hanged at St. Albans, July 15, 1381.

Besides writing many letters and rhymes urging revolt, he adopted for his text the couplet: When Adam dived and Eve span, Who was then the gentleman? The Dream of John Ball, by William Morris, is an appreciation in romance. *Consult* Leaders of the People, J. Clayton, 1910.

Ball, Sir Robert Stawell (1840-1913). Irish mathematician and astronomer. Born at Dublin, July 1, 1840, the son of the naturalist Robert Ball (1802-57), he was educated at Trinity College, Dublin, and in 1874 became royal astronomer of Ireland. In 1892 he was appointed Lowndean professor of astronomy and geometry at Cambridge university.

Ball's *Treatise on the Theory of Screws*, 1900, is a lasting contribution to mathematical science. He was known as a lucid and popular writer and lecturer on astronomy. He was knighted in 1886, and died Nov. 25, 1913. *Consult* Reminiscences and Letters, edited by his son, W. Valentine Ball, 1915.

Ballad. Form of poetry, usually narrative. The term derives from the Italian *ballare*, to dance, and in Italy was originally equivalent to the ancient *carole* or dance-lyric of France. The English term was, so far as is known, first applied, as it still is, to a species of lyric-epic preserved in Great Britain, and, under different designations, in other countries, mainly in tradition. In English the word is also applied, in a wider sense, to satirical and other abusive rhymes; also to short narrative verse.

The original ballad of tradition is, however, after a fashion epic as well as lyrical. It was at first probably sung to the accompaniment of the dance—as, indeed, it still is in the Faroe Isles—the chorus adding to the effect by the repetition of a refrain. The ballad is a narrative song or recital, but is distinguished from purely epic verse by its conciseness, its limitation to a single episode, and its impersonal and

elementally dramatic character. Its main appeal is to the stronger or more serious passions or emotions; its story is usually intensely, and sometimes painfully, tragical, and its function is the production of an impressive dramatic climax, to aid in which it often uses the device of incremental repetition. It seeks to concentrate the attention on the thing done or suffered rather than on the doer or sufferer. It is the exact antithesis of didactic poetry. In its older form it is destitute of moral intent, even apart from the fact that it has closer relations with paganism than with Christianity.

Medieval Origin

In many instances we do not even possess any traditional pure form of the ballad. Still, even when little is left of the original text of a ballad, the story in its general form, and frequently also the refrain, remain. Comparatively excellent examples of the ballad have been preserved in fairly early MSS. Prof. Child tells us that the incidents of many ballads are such as might occur anywhere and at any time, that tales and songs were the chief amusement of all classes of people during the Middle Ages, and that the Crusades brought the chief European nations into close intercourse with each other and made them acquainted with the East. There is thus no *a priori* reason for confounding the ballad with the ancient tale, or for having recourse to such vague, assumptive phrases as the "folk fancy." Child moreover concludes that "the traditional form of the ballad is always a more or less deteriorated form," and laments that "so few ballads have been written down early." Gaston Paris adduces evidence for assigning their origin to poets of the later Middle Ages, who have given an original colour to themes found in popular tradition, in earlier poetry, in old romances, in actual events, and in surviving pagan beliefs and superstitions. This species of poetry is in form and style a kind of blend of the epic *chanson* and the lyrical *carole*. Some would find its cradle in France, others in Scandinavia.

Tragedies consequent on incest, adultery, love, jealousy, and bride-stealing are the most common themes of the older ballads. A piquant form of the love tragedy is produced by employment of the wiles of wicked spirits, dwarf kings, and fairies; or a weird element is introduced by appeal to old beliefs in magic, necromancy, the

return of the dead, and other impressive superstitions. A species of ballad common in Denmark and Spain is a derivative of the *chanson de geste*, and in Britain a similar variety is represented in the Robin Hood ballads and the later ballads of the Borders. In Scandinavia many themes are derived from the old sagas, and a few deal with historical incidents of the 13th century. With the exception of The Gude Wallace, derived from Blind Harry's poem, the theme of no British historical ballad is of earlier date than the 14th century; and in Spain, France, Italy, and Provence the historic themes are not of earlier date than the 16th.

The short, intensely dramatic ballad with the refrain and incremental repetition is the older form of the ballad. An excellent English example is Robin and Gandelyn, preserved in a MS. of 1450. As for the best existing versions of Scottish ballads, some are of doubtful authenticity. Of the sources of the remarkable versions of Earl Brand, Sir Patrick Spens, and other ballads sent by Lord Hailes to Bishop Percy, and published by him in his *Reliques*, 1765, or of Edom o' Gordon, printed from a copy furnished by Lord Hailes in 1755, there is no explicit information. The best ballads in Scott's *Border Minstrelsy* owe much of their magic charm to the genius of Scott himself. *See* Poetry.

Ballade. Verse form of French origin. Developed probably by Guillaume de Machault (1295-1377) from the native dance songs of his country, and perfected by François Villon, Eustache Deschamps, and Charles d'Orléans, the ballade was introduced into England in the 14th and 15th centuries, and revived with success in the 19th century, notably by Andrew Lang and Austin Dobson. ☐

The ballade consists of three stanzas, usually of eight lines with

Sir Robert Ball,
Irish astronomer
Russell

identical rhyme arrangement, ababbcb, and a fourth stanza, called the envoy, of four lines rhymed bcbc, the last line of all four stanzas being the same. The three stanzas should contain varied presentations of the motive thought of the poem; the envoy sums up its permanent element. Written usually in pentameter or tetrameter lines, the ballade lends itself to lighter themes than the sonnet, and is an excellent medium for expressing delicate fancy.

Ballade. In music, an instrumental piece, with a literary background either declared or left to the hearer's imagination. Examples are the ballades of Chopin for the pianoforte.

Ballad Opera. English stage entertainment of the 18th century. First introduced in 1728 with *The Beggar's Opera* (*q.v.*), it became a leading fashion in theatrical entertainment during the ensuing decade, to the great detriment of the Italian opera which had previously held the field. Over 70 ballad operas were staged in London between 1729 and 1733. Their characteristic feature was a rapid alternation of spoken dialogue with simple songs set to popular tunes of the day. Later musical productions of the same century, *e.g.* Arne's *Love in a Village*, differed from the true ballad opera in that the music was newly composed.

Ballance, JOHN (1839-93). New Zealand statesman. Son of an Ulster farmer, Ballance emigrated

to New Zealand, where he founded a newspaper at Wanganui. He served in the Maori War, and in 1875 was chosen a member of the legislature. In 1878 he joined

the ministry of Sir George Grey, and was treasurer until 1879. From 1884 to 1887 he was minister for lands and native affairs in Sir Robert Stout's ministry. He had strong influence in the party, which led New Zealand into experiments in state socialism. Leader of the Liberal party from 1889, he became premier in 1891. His programme of reform, much of which became law, included the imposition of a graduated income-tax and a land tax, the abolition of life membership of the second chamber, and women's suffrage. He died April 27, 1893.

J. Ballance, New Zealand statesman

Ballantine, WILLIAM (1812-87). British lawyer. Born in London, the son of a London police magistrate and educated at S. Paul's School, he was called to the bar at the Inner Temple in 1834, and became a serjeant-at-law in 1863. Acquiring a large practice in criminal cases, he appeared for Arthur Orton, the Tichborne claimant, in 1871, and successfully defended Malhar Rao, gaekwar of Baroda, on a charge of attempted murder, 1875. He died at Margate, Jan. 9, 1887. A familiar figure in the theatrical and literary life of his time, he is supposed to be the original of Chaffanbrass in Trollope's novel *Orley Farm*. He wrote *Some Experiences of a Barrister's Life*, 1882.

Ballantrae. Parish, seaside resort, and fishing village of Ayrshire, Scotland. On the Stinchar river, 12 m. S.W. of Girvan, it has

Ballarat. Sturt Street, main thoroughfare of a gold-mining centre originally laid out on garden city lines

Courtesy of the Australian Govt.

a pier and small harbour, herring and salmon fisheries, and was notorious for smuggling. It was apparently not the scene of Stevenson's *Master of Ballantrae*. Pop. 1,076.

Ballantyne, JAMES (1772-1833). Scottish printer and journalist. Born at Kelso and educated for the law, he founded *The Kelso Mail* in 1797, and with Sir Walter Scott's help started in 1802 the printing establishment in Edinburgh where Scott's works were printed. With his brother John (1774-1821) he had a half-share in a bookselling business in 1808, Scott holding the other half. He became part proprietor of *The Edinburgh Weekly Journal* in 1817, and was involved in the bankruptcy of Constable & Co. in 1826. He died Jan. 17, 1833.

Ballantyne, ROBERT MICHAEL (1825-94). British writer for boys. Born at Edinburgh, April 24, 1825, a nephew of James Ballantyne the printer, in 1841-47 he served as

R. M. Ballantyne, British author
Frédéric & Young

a clerk of the Hudson's Bay Company in Rupert's Land, describing his experiences in his first book, *Hudson's Bay* (1848). After holding a post in the publishing house of Constable of Edinburgh from 1848-1855, he devoted himself to literature. He published more than 80 volumes of stories, including *The Coral Island*, *The Gorilla Hunters*, and *Ungava*. He died at Rome, Feb. 8, 1894.

Ballarat or **BALLAARAT**. Third city of Victoria, Australia. It is 74 m. by rly. W.N.W. of Melbourne, and is an important rly. junction. Apart from gold-mining, its main industry, it has iron foundries, woollen mills, flour mills, breweries, and distilleries. It was laid out originally on garden city lines; is the seat of Anglican and Roman Catholic bishoprics, has municipal art galleries, a museum, botanic gardens, and a school of mines. Its elevation of 1,437 ft. gives it a cool and healthy climate.

Its rise is due to the discovery in 1851 of one of the richest alluvial goldfields in the world.

The mines are working auriferous quartz at deep levels, over 2,500 ft. At Bakery Hill, at 180 ft. depth, was found a nugget weighing 2,217 oz. Pop. 39,470.

Ballast (Swed. *bar*, bare, mere; *last*, load). Small stones and sand in varying proportions derived from alluvial or glacial deposits. In its English sense, the name is derived from material dredged in the lower reaches of the Thames and used to steady the trim of a slightly laden ship. During the Second Great War, ships arriving in Britain with war material from the Dominions and America and returning empty were ballasted with rubble from bombed sites. Most vessels, irrespective of their lading, require a certain amount of ballast for trim, and modern steamships are fitted with water tanks which are filled according to trimming requirements. (*See Navigation*.) In some types of pleasure craft iron ballast is carried in the form of ingots moulded

to the shape of the hull. Balloons carry sand ballast which is released to compensate for the contraction of the gas in the envelope.

Industrially, ballast is used as an aggregate for the making of concrete, and watered ballast forms the foundation of macadam roads. Crushed ballast mixed with tar is used as a surfacing material for roadways and footpaths. Crushed ballast is also employed for gritting tarred or bitumen-sprayed roads.

Ballater (Gael., town on hill-side). Police burgh and summer resort of Aberdeenshire, Scotland. It is on the Dee, here crossed by a fine bridge, and is 43 m. W.S.W. of Aberdeen by railway, being the terminus of the Deeside branch. It was founded in 1770 to furnish

accommodation for visitors to the Pannanich medicinal springs, situated about 3 m. N.E. About 9 m. to the W. is Balmoral Castle. Pop. 1,225.

Ball Bearings OR **ROLLER BEARINGS**. Bearings in which a series of steel balls or rollers is interposed between the revolving surfaces in order to lessen friction. *See Bearings.*

Balleny Islands. Group of five mountainous islands in Antarctica. They lie 220 m. N. of North Cape, S. Victoria Land, in lat. 66° 45' S., long. 163° E. Of volcanic origin, and glacier-covered, Freeman's Peak, on Young Island, is nearly 12,000 ft. high. The islands are named after John Balleny, the whale-fisher, who discovered them in 1839.

BALLET: CLASSIC AND MODERN

Cyril W. Beaumont, author of many books on Ballet

This article explains the meaning of this fascinating branch of theatrical art, and traces its evolution through five centuries, citing outstanding examples from Italy, France, Russia, England, and America. See also Dancing; Theatre, etc.

Ballet (Fr., from late Lat. *ballare*, to dance) is the term applied to a specific branch of the art of the theatre, when a particular theme or mood is expressed solely in terms of dancing and mime, inspired and controlled by music or a rhythmical base. Ballet is a composite art in which dancing, mime, music, costume, and setting all play their part.

The person responsible for the steps, movements, groups, and actions which make up a ballet is called the choreographer (Gk. *khoreia*, dance, and *graphia*, writing). Ballet embraces a whole vocabulary of movement, the human body being subjected to a rigorous discipline and elaborate training to enable it to be used as a superlative means of expression. The miming consists of a number of conventional gestures, probably bequeathed from ancient times, supplemented by borrowings from the *Commedia dell'Arte* and the stylised gestures of everyday life introduced by Michel Fokine. Although theoretically the best costume for the ballet dancer is none, in practice costume is essential in order to indicate to the spectator the qualities and station of the various characters. Scenery or lighting is used to establish a certain period, place, or mood.

A peculiar characteristic of ballet is that, because it is wordless, it differs from opera and the spoken drama, where sung or

verbal reference can be made to past or future events. In ballet every incident or action must be seen by the spectator, and if it is required to show the chronological past, this can be done only in the form of a flash-back.

Music is the mainspring of ballet. Some ballets are inspired by existing music, e.g. Massine's *Symphonie Fantastique* (Berlioz); some have music specially composed, e.g. Tchaikovsky's *La Belle au Bois Dormant* (The Sleeping Princess). Some scores are the product of direct collaboration between composer and choreographer, e.g. Stravinsky's *L'Oiseau de Feu*. Others consist of various selections arranged to form a homogeneous work, e.g. *Comus* (Purcell-Lambert).

Ballet, within certain limits, is an elastic medium of stage expression. It can present the most realistic of themes, as well as the most fantastic; it can conjure up a particular mood, or become a purely abstract composition in line and form. The highest form of ballet requires music, movement, and action to be so perfectly fused that they appear inseparable, while the dancing is expressive in itself and the mime danced.

Originally ballet was a costly entertainment devised by and for the aristocracy. It derives from the mummings, masquerades, and interludes of the 14th and 15th centuries. A famous interlude given in 1489 by Bergonzio di

Botta, of Tortona, took the form of a great feast at which each dish was presented with an appropriate dance.

The new fashion was warmly sponsored by Catherine de' Medici (1519-1589), who introduced it to the court of France, one of the most important spectacles being the Ballet Comique de la Reine (1581). In England ballet found expression in masques. Henry VIII (1509-1547) had his disguisings and revels, and these became more elaborate during the reign of Elizabeth.

In France under Louis XIV (1643-1715) ballet became dignified. The king himself danced in many ballets, and the art made great progress because of his refined taste and his practice of inviting the collaboration of the best talents in his realm; for instance, Lully composed the music, Molière wrote the themes, and Berain designed the costumes. In 1669 Louis XIV established the Académie Royale de Musique, to which in 1672 a school of dancing was added. This, later, became the state ballet, which spectacle presently passed from restricted performance at court to the public theatre.

First Women Dancers

Up to this period, ballets were really operas with opportunities for dancing. The personnel was composed of men alone, the women's rôles being taken by youths of feminine build, whose faces were concealed by masks, then a fixed part of the dancers' costumes. In 1681 a ballet, *Le Triomphe de l'Amour*, was given at St. Germain, in which the composer Lully introduced female dancers drawn from the court ladies. When this ballet was given publicly at Paris in 1683 the Académie supplied four *danseuses*, led by Mlle. Lafontaine, the first *première danseuse*.

Under Louis XV (1715-1774) the grandiose in ballet gave place to a refined artificiality. During this reign there were many innovations: Camargo's shortening of the skirt to facilitate foot technique; Heinel's introduction of the *pirouette à la seconde*, Sallé's dancing in a simple classical-style dress of muslin; Gardel's abolition of the mask; and the publication of Noverre's famous *Lettres sur la Danse et les Ballets* (1760), which demanded the substitution of dramatic action and expressiveness for mechanical technique. In 1832 a young Italian *danseuse*, Marie Taglioni, achieved a triumph in *La Sylphide*, the first of the

ballet's many contributions to the romantic movement. Previously ballets had depended mainly on classical mythology for their themes; after *La Sylphide*, wilis, peris, sylphs, and similar mysterious beings became the rage. The year 1841 saw the production of *Giselle*, which, with Carlotta Grisi in the title rôle and choreography by J. Perrot and J. Coralli, represents the supreme achievement of the romantic ballet.

Towards the middle of the century ballet in France and England began to decline. In England a revival took place in the 1870s as a result of the establishment of the Alhambra and Empire theatres, which, although devoted to vaudeville, made a strong feature of ballet, this position being maintained until 1914.

Great Russian Choreographers

The new stimulus to ballet as an art form was to come from Russia, where a state school of ballet had been founded in 1735. The great architect of the Imperial ballet was Marius Petipa (1822-1910), who controlled the ballet for the best part of fifty years, during which he composed 54 new ballets. His contribution was an incessant effort to develop and exploit technique, which he employed with brilliant effect in such ballets as *La Belle au Bois Dormant* (1890). Early in the 20th century a great new Russian choreographer, Michel Fokine (1880-1942), arose. He insisted that dance and mime should be employed only in expression of the theme; that gesture should partake of the whole body; and that expressiveness should reside in every part of the choreographic design. When Serge Diaghilev (1872-1929) wished to present Russian ballet to western Europe, he selected Fokine as his choreographer. This resulted in the presentation of *Les Sylphides*, *Le Carnaval*, and the production of the *Polovtsian Dances* from Prince Igor (1909), *Petrouchka* (1911), *Le Spectre de la Rose* (1911), and other famous ballets. Later, Diaghilev presented works by other Russian choreographers who achieved notable success, e.g. Massine's *Les Femmes de Bonne Humeur* and *La Boutique Fantastique* (1917), *Le Tricorne* (1919), Nijinska's *Les Biches* (1924), and Balanchine's *Le Fils Prodigue* (1929).

Diaghilev's success inspired the formation of other companies, such as the Ballets Suédois of Rolf de Maré, the Ballet Russe

of René Blum and Col. de Basil, also several English companies of varying size: Ballet Rambert. Sadler's Wells, Markova-Dolin, London, and International ballets. Some of the original compositions of these English companies, e.g. Howard's *Lady into Fox*, Ashton's *Apparitions* and *Dante Sonata*. De Valois's *Job* and *The Rake's Progress*, and Tudor's *Jardin aux Lilas* represent decided artistic achievements.

In the U.S.A., too, considerable ballet activity developed and resulted in the formation of American companies: Ballet Caravan, Philadelphia ballet, Page-Stone ballet, and the San Francisco ballet. In Soviet Russia the change of regime did not lessen the interest in ballet. The state schools were maintained, and many of the famous old productions associated with the Imperial ballet were given. In Russia ballets tend to be based on the national folk dance, which offers almost unlimited scope in its richness and variety.

Ballet. Term used in music. (1) A madrigal, in the harmonic style, as distinguished from the true madrigal, in which free part-writing of a contrapuntal nature was the outstanding feature. Regular simultaneous rhythm, suitable for dancing, also appeared in the ballets. (2) Music for dancing associated with the stage, in a series of movements of varied character and pace, often with some kind of story as a background.

Ball-flower. An architectural ornament. It is a ball almost enclosed by flower petals, and is a characteristic feature of mouldings in the English Decorated period, where its repetition at short intervals gives points of light to a strip of dark hollow.

Ball-flower ornament in architecture

The windows of the tower of Hereford Cathedral and the upper parts of the towers and spires of Lichfield provide fine examples. See Decorated Period.

Ballia. Town and district of India, in the Benares division of the United Provinces. On the Ganges, 70 m. N.E. of Benares, the town is famous for its November

IMPORTANT BALLETS OF 150 YEARS

Title	Choreographer	Produced
<i>La Fille mal gardée</i>	Dauberval	Bordeaux, 1786
<i>Flora et Zéphire</i>	Didelot	London, 1796
<i>I Titani</i>	Viganò	Milan, 1819
<i>La Sylphide</i>	F. Taglioni	Paris, 1832
* <i>Giselle</i>	Perrot & Coralli	Paris, 1841
<i>La Esmeralda</i>	Perrot	London, 1844
<i>Le Corsaire</i>	Mazilier	Paris, 1856
<i>The Humpbacked Horse</i>	Saint-Léon	St. Petersburg, 1864
* <i>Coppélia</i>	Saint-Léon	Paris, 1870
* <i>La Belle au Bois Dormant</i>	Petipa	St. Petersburg, 1890
* <i>Le Lac des Cygnes</i>	Petipa & Ivanov	St. Petersburg, 1895
* <i>Les Sylphides</i>	Fokine	St. Petersburg, 1908
<i>Petrouchka</i>	Fokine	Paris, 1911
<i>L'Après-Midi d'un Faune</i>	Nijinsky	Paris, 1912
<i>Les Femmes de Bonne Humeur</i>	Massine	Rome, 1917
<i>Le Tricorne</i>	Massine	London, 1919
<i>Les Biches</i>	Nijinska	Monte Carlo, 1924
<i>Le Fils Prodigue</i>	Balanchine	Paris, 1929
<i>Job</i>	De Valois	London, 1931
<i>The Green Table</i>	Jooss	Cologne, 1932
<i>L'Épreuve d'Amour</i>	Fokine	Monte Carlo, 1936
<i>Lady into Fox</i>	Howard	London, 1939
<i>Dante Sonata</i>	Ashton	London, 1940
<i>Pillar of Fire</i>	Tudor	New York, 1942
<i>Hamlet</i>	Helpmann	London, 1942
<i>Miracle in the Gorbals</i>	Helpmann	London, 1944

* These earlier ballets marked with an asterisk were still in the repertory of many companies in 1950.

English ballet received its stimulus from the experiments of the Sadler's Wells and Rambert schools. Until the 1930s the Russian companies were supreme in W. Europe, but full-length works in the classic tradition forming the basis of the academic school, as opposed to that of Diaghilev, were successfully per-

formed by English companies. The upper picture shows Margot Fonteyn in a graceful pas de trois in Tchaikovsky's Swan Lake. The break in tradition carried on by the de Basil company after Diaghilev's death is illustrated in the lower picture. This ballet, Union Pacific, was first produced in 1932

BALLET: CLASSIC AND CONTEMPORARY STYLISM OF THE DANCERS' ART

Photos, Sedgwick and N.Y. Times

The Sadler's Wells company is seen in the upper picture in *The Rake's Progress*, a ballet in six scenes by Gavin Gordon, décor and costumes by Rex Whistler (after Hogarth). First produced 1935, this series of animated Hogarth pictures was a tragi-comic inter-

pretation of English society during the 18th century. The lower picture shows a scene from *Wedding Bouquet*, music by Lord Berners, choreography by Frederick Ashton, "asides" by Gertrude Stein. This also was first produced by the Sadler's Wells company in 1935

BALLET: 18th AND 20th CENTURY LIFE EXPRESSED IN DANCING

Photos, Sedgwick

bathing festival. The district of Ballia produces rice, barley, and sugar. Of the town pop. five-sixths, of the district nearly all, are Hindus.

Ballina. Urban district, seaport, and market town of co. Mayo, Eire. On the river Moy, 8 m. S. of Killala, it has a station on the Eire state rlys. It has important salmon-fisheries and trades in corn, beer, coarse linens, and snuff. It communicates by two bridges with Ardnaree, its suburb in co. Sligo. Taken by the French, Aug. 25, 1798, it was held by them for three weeks. Market day, Mon. Pop. 4,872.

Ballinasloe. Urban district and market town of co. Galway, Eire. On the river Suck, 93 m. W.S.W. of Dublin by rly., it has carriage-building, flour-milling, and tanning industries. Its October fair (horses, sheep, and cattle) is one of the largest in the country, and it holds an annual race-meeting in July. Near by are Aughrim battlefield and Garbally Castle, the seat of the earls of Clancarty. Market day, Sat. Pop. 5,243.

Balliol College. One of the oldest and most famous colleges of the university of Oxford. It ranks

Balliol College arms

second in age on the official list. Founded by John Baliol of Barnard Castle in Durham (d. 1269) and his wife Devorgilla between 1263 and 1268, the society consists of a master, 28 fellows, and a number of scholars. John Wycliffe was once master. Especially during B. Jowett's mastership, 1870-93, Balliol had a great reputation, and furnished a large proportion of the professors and teachers of the university. Another powerful influence at Balliol was the philosopher T. H. Green. Among the statesmen educated here were Lord Oxford and Asquith, the marquess of Lansdowne, Lord Curzon, and Viscounts Grey and Milner. Writers who were at Balliol include Adam Smith, Southey, Clough, Calverley, Matthew Arnold, Swinburne, Belloc; among churchmen were Manning, Tait, and both Archbishops Temple. Its scholarships are coveted distinctions; most of them are open, but a few are restricted to Blundell's School, Tiverton, and some exhibitions to Glasgow. In 1887 New Inn Hall was incorporated with the college, which occupies a site at the corner

Balliol College, Oxford, fronting on St. Giles, with the Martyrs' Memorial to Ridley and Latimer

Valentine

of Broad Street and St. Giles. The buildings are mainly modern, and include a large hall, the chapel, and the library. Two fellowships, founded in 1906 by Lord Newlands, commemorate Dr. Jowett. Alone among Oxford colleges Balliol has the right to elect its own visitor. Its Sunday evening concerts have become famous.

Ballista or **BALISTA** (Gr. *ballein*, to throw). Military engine used in ancient and medieval warfare for hurling missiles.

Ballistic Pendulum. Instrument for the measurement of the momentum of a moving body. It provides one of the oldest methods of measuring the velocity of a small arms bullet. In this method the ballistic pendulum used is a box containing sand or some other material which is capable of stopping the bullet, suitably suspended from a fixed support so that it is able to swing back and forth in much the same way as the pendulum of a clock. The bullet is fired into the box, which therefore swings back. From a measurement of the length of this swing the velocity of the bullet can be deduced. As a means of velocity measurement, the ballistic pendulum has long been superseded, but it is still used in ballistic measurement. Attachments for reducing the recoil of guns have been tested by suspending the gun so as to form a ballistic pendulum.

Ballistics. Science dealing with the motion of warlike projectiles. It is divided as follows: (1) internal ballistics, which deals with the motion while the projectile is still in the bore of the gun and when it is moving under the influence of the gas pressure acting on its base; (2) external ballistics, which treats of the motion after the shell has left the gun and when it is moving under the influence of gravity and the resistance of the air; (3) terminal ballistics, which deals with

the motion of the missile during the penetration of armour plate.

Internal ballistics includes a study of the burning of the propellant charge, the gas pressure developed, and the velocity of the projectile as it travels along the bore of the gun. The internal ballisticians can forecast the ballistic performance of a given gun and propellant charge. He can also calculate the weight of propellant

and the size of sticks, tubes, or flakes making up the charge which will give the highest muzzle velocity without exceeding a specified maximum gas pressure.

The ancient theory of external ballistics emanated from Galileo and ignored the resistance of the air. Elementary works on dynamics show that the path of the projectile is, in these circumstances, a parabola. This elementary theory is of little practical value since modern artillery projects shell with high velocities, and the air's resistance has a large effect in retarding the motion of the shell. This retardation depends on the mass, diameter, and shape of projectile, on the density of the air, and on the velocity of the shell. The first three factors are allowed for by a quantity called the standard ballistic coefficient of the shell, which can be regarded as a measure of its carrying power. Today the shell is usually spun about its axis by means of a copper driving band and a rifled gun barrel. The purpose is to keep the nose of the projectile pointing along the trajectory and to preserve stability in flight. The trajectory can be calculated accurately.

The study of the motion of projectiles as they penetrate armour plate (terminal ballistics) has received much attention. It is possible to estimate with fair accuracy the thickness of armour likely to be penetrated by a shot of given mass and diameter striking with given velocity and direction. The discussion of the fragmentation of a shell when it bursts also lies within the province of this study. A discussion of the motion of rocket projectiles is rather different from that of a shell fired from a gun. The division between internal and external ballistics is usually made at the instant when all the propelling charge has been burnt. See Artillery; Gun, Naval.

Ballistic Test. Technical term for the evaluation of certain properties of explosives, propellants, guns, and projectiles. (1) The power of blasting explosives may be determined by the employment of the ballistic pendulum.

(2) Ballistic properties of propellants are determined by measuring the actual pressure caused by their explosion in a gun by means of the Crusher gauge, at the same time determining the propulsive effect by measuring the velocity with which the projectile leaves the weapon.

(3) The ballistics of a gun are evaluated by firing standard projectiles from it with a propellant whose properties have previously been determined, the range, accuracy, and velocity of the projectile being measured. (4) Projectiles undergo ballistic tests to determine their range, accuracy, and steadiness of flight when fired from standard guns with known propellants, and their capability of penetrating armour or other protective material when striking it at various velocities.

Ballistite. Smokeless powder introduced by Alfred Nobel (*q.v.*) in 1887. It consisted essentially of nitro-cellulose gelatinised with nitro-glycerine. The earlier products received an addition of benzene to aid solution; later camphor was added to the early powders to increase their stability. Ballistite caused considerable erosion of the gun. It was adopted for a time by Italy (military use) and Germany (naval use), and came into favour to some extent for sporting cartridges. The modern method of manufacture is based on the process of Lundholm and Sayers. See Explosives; Smokeless Powder.

Ballonet. Subsidiary air- or gas-filled chamber forming part of a balloon (*q.v.*). In some airships the ballonet held gas and was used to trim the vessel; in other types the loss of gas from the buoyancy chambers was counterbalanced by forcing air into one or more air-ballonets.

Ballon-sonde. Small balloon filled with hydrogen and equipped with self-registering meteorological instruments. It is released in order to collect data relative to the upper atmosphere. See Atmosphere; Radio-sonde.

Balloon (Fr. *ballon*, large ball). Bag of impermeable fabric inflated with gas lighter than air. Roger Bacon (1214-94) had visualised a big globe filled with "ethereal air, or fire atmosphere," and Francesco

de Lana proposed a lighter-than-air craft consisting of four hollow globes from which the air had been removed. But nothing practicable was put forward until 1767, when Joseph Black (1728-1799) suggested the possibility of inflating a bladder with hydrogen gas.

The earliest balloons of the brothers Montgolfier, de Rozier, Charles, and Robert (all made in 1783) are described under Aeronautics. Early in 1784, de Rozier and Romaine decided to put to practical test a theory they had evolved for combining hydrogen and hot air to inflate a balloon. The hydrogen was to supply the buoyancy, and the hot air below it was to maintain its volume, so enabling the balloon to retain its lifting power despite loss of gas through expansion. In theory the idea was sound, but in practice it was disastrous; a spark from the heating apparatus reached the hydrogen, and the balloon burst into flames, both men being killed.

The first balloon ascent in Great Britain was made at Edinburgh on Aug. 27, 1784, by James Tytler; Vincenzo Lunardi ascended over London on Sept. 15. The first sea crossing by balloon took place on Jan. 7, 1785, when Jeffries and Blanchard ascended from Dover and landed near Calais. Blanchard later opened a Balloon and Parachute Aerostatic Academy at Vauxhall.

Inflation with hydrogen was so difficult and costly that ballooning did not achieve any great popularity until 1825, when Charles Green (1785-1870) hit upon the idea of inflating with ordinary coal gas. Green also invented the guide, or trail rope, which acted as an automatic equilibrator. On Nov. 7, 1836, Green, Monck Mason, and

Robert Holland, M.P., made their famous flight in the Great Balloon of Nassau. The balloon, which had a capacity of 70,000 cu. ft. and carried 1,000 lb. of ballast in addition to instruments, provisions, and parachutes (*q.v.*), ascended from Vauxhall, and landed near Weilburg, Nassau; the voyage of 500 m. took 18 hours.

The modern balloon, which, though differing in shape, is fundamentally the same as those designed by Green, has an envelope of either varnished cloth or gold-beater's skin. Over the envelope is a network of fine cord, from which is suspended the basket or gondola. At the top of the envelope is a valve operated by a cord hanging down inside the balloon which regulates the release of the gas. A rip panel is fitted so that in emergency the envelope can be torn open and instantly emptied of gas. Auxiliary equipment includes anchor, guide-rope, and ballast bags filled with sand.

Ballooning as an aid to scientific investigation of the upper air was pioneered by Gay-Lussac, who, in 1804, rose to 11,000 ft. and took notes of pressure and temperature. Later he ascended to 13,000 ft. In England a number of scientific ascents were made by Henry Tracey Coxwell and James Glaisher (first treasurer of the Aeronautical Society). They carried instruments for atmospheric observation and attempted to take photographs. On Sept. 6, 1862, they ascended from Wolverhampton and reached a height at which both men lost consciousness. When Glaisher recovered, the altimeter registered 29,000 ft., and as their descent was then 1,000 ft. per minute, he calculated that they must have reached 36,000 ft.

The taking of temperature and other records in the upper air remains one of the principal modern uses of the balloon. In Jan., 1934, a Soviet army balloon reached a height of 13½ m., but crashed and the three occupants were killed. In 1935 Auguste Piccard reached a height of over 10 m. The envelope

Balloon. Auguste Piccard in the gondola of the balloon with which he explored the stratosphere in 1935

of his craft was made of cotton and was 96 ft. in diameter, supporting an aluminium pressure-cabin which with instruments, occupants, and ballast weighed 2,640 lb. During the ascent many valuable data were collected regarding cosmic radiation (*q.v.*). On Nov. 11, 1935, Capt. O. A. Anderson and Captain A. W. Stevens of the U.S. Army Air Corps reached an altitude of 14 m. in the stratosphere balloon Explorer II.

Data are also collected from the upper air by means of unmanned balloons. They carry self-recording instruments and when the balloon bursts through pressure of the gas in the rarefied atmosphere at the great heights reached, the instruments float to the ground on parachutes. In 1936 an automatic sounding balloon or ballon-sonde (*q.v.*) ascended from Moscow and reached a height of 25 m. It carried a radio transmitter which automatically recorded its progress.

Balloons were early adopted for military use. At the battle of Fleurus, June 26, 1794, the French artillery was directed by an officer observing from a captive hot-air balloon. Balloon observation was employed by Napoleon in Egypt in 1798. Balloons were extensively used during the American Civil War, and at the siege of Paris in 1870 they were used both for observation and for carrying letters and dispatches from the beleaguered capital. During the S. African War, mobile balloon units were formed by the Royal Engineers.

Kite Balloons

During the First Great War the Germans introduced the kite balloon for artillery observation. This balloon, which was quickly adopted by all the belligerents, was sausage-shaped, with air-filled fins or stabilisers. It was secured to the ground like a kite and placed obliquely against the wind. The interior of the envelope was divided by a horizontal, gas-tight partition; the larger upper half contained the gas, and the lower air, or air and gas mixed. The envelopes were made of two layers of cloth, covered with rubber dissolved in benzene or treated with dope and having between them a sheet of vulcanised rubber. A kite balloon possessed remarkable stability, could remain aloft in a high gale, and the envelopes were practically unharmed by small-arms fire, though they were quickly fired by incendiary bullets. Kite balloons were also used to support nets of thin steel cables as an A.A. defence.

Apart from the barrage balloon (*q.v.*), neither free nor captive balloons were extensively used during the Second Great War. The kite balloon was too vulnerable for observation purposes, and its function could better be performed by aircraft. The Japanese used free balloons to carry explosives and incendiaries across the Pacific to the U.S.A. These balloons were made of oiled paper and inflated with hydrogen; they were 30 ft. in diameter and carried a

load of 80 lb. of explosives. They took about five days to cross the Pacific, and were fitted with a time fuse set to release the explosive. These weapons, however, were completely ineffectual as they could not be directed against any specific target. Experiments with somewhat similar incendiary weapons were made by Great Britain against crops in occupied Europe. See Aeronautics; Airship; Meteorology; Zeppelin, etc.; *consult also* the Andrée Diaries. 1931.

BALLOON DEFENCES IN MODERN WAR

Air Marshal Sir Leslie Gossage, K.C.B., C.V.O., D.S.O.
and Squadron-Leader Jack Davies, R.A.F.

The Air Officer Commanding, R.A.F. Balloon Command, 1941-44, has cooperated in this detailed explanation of the nature and purpose of balloon barrages and similar forms of defence. Parallel articles are those on Anti-Aircraft Command; Coastal Command; etc.

The idea of using balloons as a means of defence against air attack was considered before and during the First Great War. During 1917-18, France, Italy, and Germany all flew forms of balloon barrages, while in England series of so-called balloon aprons were flown as a counter to the Giant Gotha aircraft which constituted the chief air menace to London at that time. There were 10 aprons deployed at intervals between Lewisham and Tottenham. Each comprised three balloons joined together at the top of their flying cables by a cross cable from which hung, at intervals of 25 yds., a number of weighted wire streamers. The whole flew at a height of between 7,000 and 10,000 ft. The only case of an aircraft flying into an apron occurred in Jan., 1918, when a Gotha flew into one near Chingford; the aircraft was undamaged, but the apron suffered considerably. In their effect on enemy morale, however, the aprons were more successful. In March, 1918, a report was made to Gen. von Höppner, commander of the German Military Air Service, that they "... added greatly to the difficulties of attack. If they increased and improved much more they would make a raid on London almost impossible." But the aprons had major disadvantages. They could not be flown in medium or strong winds, and they were expensive to maintain, particularly in manpower. In consequence, shortly after the end of the war the aprons, and the organization responsible for them, were regarded as obsolete.

THE INTER-WAR PERIOD. The question of employing balloons in A.A. defence was not abandoned.

At first the intention was to provide a high altitude barrage; but with the concurrent improvement in the all-round performance of aircraft (particularly with regard to ceiling) and in bombing technique, it was decided that balloons could best be used in barrage form as a defence against low flying attack. In effect, they were not to bring aircraft down but to keep them flying high.

BALLOON BARRAGES. A balloon barrage consists of a number of balloons each flying a cable from its own winch, and deployed over and around the area which it is to protect. A large barrage to protect a target of the size of London may have as many as 450 balloons; a barrage to protect a small target, such as an aircraft factory, may require only 24 balloons.

The kite balloon designed for barrage work was known as the L.Z. (Low Zone) kite balloon. Hydrogen-inflated, it flew to 6,000 ft. carrying a cable with a breaking strain of not less than 3½ tons. Its volume was 19,150 cu. ft., length 62·8 ft., weight 565 lb., and it was designed to operate in wind speeds up to 60 m.p.h. See Barrage Balloon.

The purpose of a balloon barrage is to deny air space to the enemy and to force his aircraft to fly to a height at which they can be effectively engaged by guns and fighter aircraft. In order to prevent aircraft flying through barrages, therefore, balloon cables must be lethal to aircraft. This was achieved by fitting a cutting device to each end of the standing (or flying) part of the cable; above the cutting device at the top, and below it at the bottom, was fixed a bag containing a parachute; the parachutes, in

turn, were attached to the cable in between the cutting devices and as near to them as possible. When an aircraft struck the cable, the force of impact sent a tension wave up and down it, causing the cutting devices to sever it at each end before the aircraft had time to do so at the point of impact. The aircraft thus carried away the major (central) portion of the cable, pulling the parachutes attached to both ends out of their bags. The parachutes opened and the resulting drag on the aircraft caused it to stall and crash.

FORMATION OF BALLOON COMMAND. In the autumn of 1938 balloon barrages were established at London, Birmingham, Derby, Liverpool, Widnes, Runcorn, Manchester, Bristol, Portsmouth, Southampton, Plymouth, Cardiff, Tyne and Tees, Sheffield, Hull, and Glasgow. To administer these barrages, Balloon Command, R.A.F., was formed on Nov. 1 with Air Vice-Marshal O. T. Boyd as Air Officer Commanding. The new command came directly under the Air Ministry for all matters except that operationally it was under the orders of Fighter Command. Five group headquarters were formed to control the 18 balloon centres which serviced and supplied the 48 squadrons which were to fly the balloons. The barrages were manned by a nucleus of R.A.F. personnel; but the bulk of the original force was provided by the Auxiliary Air Force. In 1941, when the manpower situation had become critical, airwomen of the W.A.A.F. were trained as balloon operators and substituted for airmen in many barrages.

In Sept., 1939, some 642 balloons were flying; two years later there were over 2,400. At first the enemy tried to combat balloons by shooting them down (on Aug. 31, 1940, the entire Dover barrage of 23 balloons was shot down in 6 minutes); and next fitted their aircraft with a balloon fender along

the entire length of the mainplane rather than on the lines of a bumper on a car. The intention was that the fender should either break the cable or, alternatively, push it to one side. As the fender weighed about 800 lb., it considerably reduced the performance of the aircraft and was eventually abandoned in favour of a cable cutter.

FLYING POLICY. The original policy was that the balloons should go up at the outset of war and remain up night and day, except possibly in gales or thundery conditions. It was soon apparent, however, that controls would have to be imposed upon them for the benefit of friendly aircraft, and the balloons were frequently grounded at the request of flying commands. Nevertheless, friendly aircraft were destroyed as the result of collisions with balloon cables, and it was evident that a new flying policy had to be found. Late in 1941, Air-Marshal Sir L. Gossage, who had succeeded Air Vice-Marshal Boyd, suggested a reversal of the original policy. Balloons were to be grounded at all times except when an attack was threatened or when they were required to fly for training purposes. Certain coastal barrages were excluded from this rule because it was not possible to give them adequate warning of attack. From this time the toll of friendly aircraft diminished.

During the first two years of the war balloons were regarded as a static form of defence, but in 1942,

when the Germans initiated the series of Baedeker raids (*q.v.*) against cathedral cities, mobile squadrons were formed and rushed to protect the cities. The success of this manoeuvre was acknowledged.

Balloons were best able to prove their practical value during the summer of 1944, when the enemy launched flying bombs against London. A curtain barrage, which eventually comprised 2,015 balloons, was deployed in the home counties to defend the capital. Hundreds of flying bombs were destroyed by guns and fighter aircraft before they reached the balloon curtain; of those that did reach it, 278 were brought down.

OVERSEAS SQUADRONS. The use of balloons was not restricted to the British Isles: 11 squadrons were formed in England for service in the Middle East; 5 more squadrons were dispatched to India and Ceylon. All these units, trained and equipped by Balloon Command, provided valuable protection for targets varying from installations on the Suez Canal to R.A.F. maintenance units.

During the invasion of Sicily and Italy balloons were successfully used during offensive operations. Specially trained airmen landed their balloons with the first assault troops in order to give protection against dive-bombing attack. The effect on the morale of the attacking troops is said to have been considerable. Balloon units repeated this rôle during the invasion of

Balloon Defences. Section of the balloon barrage set up in southern England against the flying bomb attacks of June–Sept., 1944. See also illus. in p. 896

Photo, British Official. Crown copyright reserved

Normandy. Ships, landing craft, and the assault beaches were all provided with balloon cover. Further balloon barrages were flown in Italy, Holland, and finally to protect bridges across the Rhine over which Allied troops moved into Germany.

Balloons were useful not only in protecting land targets but also at sea. A mobile balloon barrage flotilla escorted the Channel convoy from Sheerness to Southampton and back on 166 occasions, despite every effort of the enemy to destroy both ships and balloons. As a result of this success and because of the increasing air attacks on shipping in home waters, the Admiralty decided to protect coastwise shipping by equipping each ship with a balloon. Series of shore servicing stations were established around the coast and by July, 1941, they were responsible for 1,200 transfers of balloons from ship to shore and shore to ship every week. Two years later this figure had been trebled, and the scheme was extended to ships sailing in the Mediterranean, and the Indian and Arctic Oceans.

THE MARK VI BALLOON. The balloon used by ships and by squadrons operating overseas differed from the Low Zone balloon. Known as the Mark VI (and later the Mark XIII) balloon, it had a capacity of 2,500 cu. ft. and was flown from light 15-gauge piano wire at an altitude of 2,000 ft. It was armed in a similar manner to the L.Z. balloon except that instead of having parachutes at each end of the cable it had a parachute at one end and an aerial mine at the other. The principle was the same. When the aircraft carried away the central portion of the cable, the parachute was pulled out of its bag at one end, and the aerial mine was freed at the other. The drag of the parachute pulled the mine on to the wing where it exploded on impact.

During the winter of 1940-41, Balloon Command was responsible for operating a free balloon barrage. This, in effect, was an aerial minefield. Hundreds of small balloons, each carrying a trailing length of piano wire attached to the end of which was an aerial mine, were released on two or three occasions in the path of attacking aircraft; but they were not considered successful. Similar small balloons carrying leaflets over occupied territory had greater success. The leaflets were released

Balloon Defences. Examples of balloons moored to barges and used for the protection of merchant ships in convoy

by the operation of a slow-burning time fuse. In the Western desert, a Mark VI balloon flight was used to protect the train which ran daily between Alexandria and Capuzzo. This form of defence could be used only where there were no bridges over the permanent way. Balloons were also used to train parachutists, and at one training school alone over 100,000 jumps were made from balloons, each pupil doing at least two before progressing to aircraft descents.

Early in 1945 the Allies held complete control of the air over the British Isles. Balloons were no longer required for home defence purposes and Balloon Command was given the order to stand down.

Balloon Mine. Canister filled with high explosives and suspended by a thin steel cable from a small, free, hydrogen-filled balloon. During the Second Great War balloon mines were released in the path of enemy bombers and were fused to explode when any part of the aircraft touched the canister, wire, or balloon. Balloon mines were not extensively used, as they could not be controlled and were liable to become dangerous to friendly aircraft. A later and more successful development of the balloon mine was to attach the canister to the cables of captive barrage balloons.

Ballot (Fr. *ballotte*, little ball). System of secret voting. It has been adopted in both ancient and modern times in all important states at the election of representatives to serve on public bodies, the object being to prevent intimidation and bribery. At first small balls were used in balloting, hence the name, and this method still obtains in electing members to private clubs, one black ball or a certain proportion of black balls excluding the candidate.

In elections of other kinds the usual plan is for the names of the candidates to be printed on a voting paper in alphabetical order, and for the voter to make a cross opposite the name of the person or persons whom he supports. This marking takes place in a private compartment at the local polling station, and the marked paper is folded up and placed by the voter in a ballot box, to which no one has access until the votes are counted. Only when there is a scrutiny of the votes can the voting of any citizen be traced by the official pencilling of his registration number on his ballot paper.

Vote by ballot was first employed in England in the case of the London School Board Election of 1870. The Ballot Act for fixing the procedure in parliamentary and municipal elections was passed in 1872, after the method had been debated in the House for thirty years. See Election; Vote.

Ballymena (Gael., middle-town). A borough and market town of co. Antrim, N. Ireland. On the river Braid, it is 33 m. N.W. of Belfast by rly. It has important brown linen and flax industries. Close by is Ballymena Castle. Market day, Sat. Pop. 13,510.

Ballynahinch (Gael., town on the island). Market town of co. Down, N. Ireland. On the river Annacloy, it is 21 m. S. of Belfast, and has a railway station. Near are chalybeate springs. Market day, Thurs. Pop. 1,667.

Ballyshannon. Seaport and market town of county Donegal, Eire. On the Erne estuary, in Donegal Bay, it is 15 m. S.S.W. of Donegal by rly. Pop. 2,170. A new hydro-electric scheme, linked with the Shannon development scheme, has greatly transformed the character of the town, involving the narrowing of the Erne, the disappearance of the famous falls of Assaroe, the flooding of 900 acres above Ballyshannon, and the virtual end of the Erne as a great salmon-fishing river. See Erne; Shannon.
